The figure illustrates the timing of availability (as indicated by the arrows) of vaccine during waves of the pandemic. Timing A represents a vaccine available after the first wave but before the second wave, a schedule that may occur in some developed counties in the northern hemisphere. Timing B indicates that a vaccine will become available after the start of the second wave, which may be a more likely scenario for developed countries. Timing C indicates that vaccines will not become available until after the second wave of the pandemic. This scenario is likely in many developing and transitional countries in the northern hemisphere and southern hemisphere. – Cette Figure illustre le moment auquel les vaccins seront disponibles (indiqué par les flèches) pendant les vagues de la pandémie. Le moment A représente un vaccin disponible après la première vague mais avant la seconde, un calendrier que l'on pourra rencontrer dans quelques pays développés de l'hémisphère Nord. Le moment B indique qu'un vaccin sera disponible après le début de la deuxième vague, ce qui correspond à un scénario plus probable pour les pays développés. Le moment C indique que les vaccins ne seront pas disponibles avant la fin de la deuxième vague de la pandémie. C'est le scénario probable pour de nombreux pays en développement et en transition de l'hémisphère Nord et de l'hémisphère Sud.

WHO predicts 'explosion' of swine flu cases

CTV.ca News, 21 August 2009 8:35AM EDT
https://www.ctvnews.ca/who-predicts-explosion-of-swine-flu-cases-1.427425?cache=pawumraq%3FclipId%3D263414

The World Health Organization on Friday urged governments to prepare for a second wave of swine flu this fall, estimating that as many as 2 billion people could become infected over the next two years.

That's about one-third of the world's population. The WHO has stressed that most cases are mild and require no treatment, but the fear is that a rash of new infections could overwhelm hospitals and health authorities, especially in poorer countries.

WHO Western Pacific director Shin Young-soo predicted many countries may see swine flu cases double every three to four days for several months until peak transmission is reached.

"At a certain point, there will seem to be an explosion in case numbers," Shin told a symposium of health officials and experts in Beijing. "It is certain there will be more cases and more deaths."

While areas in the southern hemisphere such as Australia appear to be experiencing flu seasons not much more severe than average, it is in developing countries where the fast spread of swine flu poses the greatest threat.

In those countries, it will place underequipped and underfunded health systems under severe strain, Shin said. Governments must do what they can now to prepare their health systems, said Shin.

"We only have a short time period to reach the state of preparedness deemed necessary," Shin said. "Communities must be aware before a pandemic strikes as to what they can do to reduce the spread of the virus, and how to obtain early treatment of severe cases."

In a video address to the symposium, WHO chief Margaret Chan also warned: "We cannot say for certain whether the worst is over or the worst is yet to come."

"We need to be prepared for whatever surprises this capricious new virus delivers next... constant random mutation is the survival mechanism of the microbial world," she said

She reminded that pregnant women face a higher risk of complications. The virus also has more severe effects on people with underlying conditions such as asthma, heart disease, diabetes, autoimmune disorders and diabetes.

Chan said the issue of how to ensure adequate vaccine supplies worldwide needed to be tackled "head on."

"We need to gather advice on priority groups for initial protection," Chan said.

"This is one of the most difficult decisions governments around the world will need to make, especially as we know that supplies will be extremely limited for some months to come."

WHO urges restraint on use of Tamiflu

The World Health Organization also offered new advice to doctors Friday on the use of antiviral medications such as Tamiflu, saying otherwise healthy with mild to moderate cases do not need the medication.

Those at risk for complications from swine flu – children younger than five years old, pregnant women, people over age 65 and those with other health problems like heart disease, HIV or diabetes – should get the drug, WHO said.

The agency also recommended that all patients who develop worsening cases, with breathing difficulties, chest pain or severe weakness, should get Tamiflu immediately, perhaps in higher doses than now used.

The advice contradicts some current government policies, particularly those in England. There, the health agency has been liberally handing out Tamiflu to anyone suspected of having the infection.

By contrast, Tamiflu is given in Canada only to those with severe cases or when the patient is at a great risk for complications.

But in Britain, where stockpiles of Tamiflu are more plentiful than in Canada, residents can call a national hotline to get Tamiflu without seeing a doctor. It is given out by call centre operators who have no medical training. Scotland, Northern Ireland and Wales decided not to participate in the swine flu phone line.

Some experts have criticized the approach, warning it increases the chances of resistant strains emerging.

Flu expert Hugh Pennington of the University of Aberdeen has called the strategy "a very big experiment" and said England's approach was out of step with the rest of the world.

So far, only a handful of cases of Tamiflu-resistance in swine flu have been documented, including one in a Quebec man. But there has been widespread drug resistance in other H1N1 strains that are not swine flu.

DW Made for minds.

Health alert

Deutsche Welle, 21 August 2009
https://www.dw.com/en/who-forecasts-explosion-of-swine-flu-cases/a-4588419

The WHO has arrived at its prognosis by studying how the illness has been progressing in the southern hemisphere - in Southeast Asia and Australia, for example - where countries are currently experiencing winter and their annual influenza season.

The agency's Western Pacific director, Shin Young-soo, said on a visit to China on Friday that there would soon be a further global spread of the virus. He predicted that is was likely that most countries would see swine flu cases "double every three to four days for several months" until a peak transmission period is reached.

Earlier this year, the WHO declared the swine flu strain, (A)H1N1, a pandemic. Through last week, the illness had killed almost 1,800 people worldwide and spread to 180 countries with more than 177,000 confirmed cases.

Study says 'vaccinate children'

New research has suggested that the best way to protect against the spread of the virus was to vaccinate school-age children and their parents. Unlike most strains of flu, which are usually most dangerous to older adults, (A)H1N1 targets younger people, according to a report published in the journal Science on Thursday.

The report recommends making children the top priority because they are the influenza's prime transmitters and their parents are the virus' bridge to the rest of the community. Inoculating spreaders, the report contends, would create a 'cocoon' around the people most at risk.

Many countries, including Germany, have begun stockpiling millions of doses of vaccine in anticipation of a second, and more significant, outbreak of swine flu when the northern hemisphere's winter begins a few months from now.

Prism Webcast News

Fear, Intimidation & Media Disinformation: U.K Government is Planning Mass Graves in Case of H1N1 Swine Flu Pandemic

Prism Webcast News, 22 August 2009.
https://prismwebcastnews.com/2009/08/22/fear-intimidation-media-disinformation-uk-government-is-planning-mass-graves-in-case-of-h1n1-swine-flu-pandemic/

An official UK government report – quoted extensively in Britain's tabloid media – is warning the British public that there will be countless deaths in the case of a swine flu pandemic. According to the WHO, a Worlwide public health emergency situation will take place in the Fall. A high death toll is predicted without corroborating evidence. The official report confirms government plans to set up mass graves for the victims of the swine flu pandemic:

"Plans for mass graves have been drawn up to cope with a second wave of swine flu this Autumn. The chilling proposals are spelled out in a Home Office document discussed at a meeting of Whitehall officials and council leaders last month.

It warns emergency plans may be needed in areas where there are not enough graves to cope.

The 59-page document talks about using "a grave that is for a number of unrelated persons, excavated mechanically in advance and designed for efficient preparation and use". (The Sun, Augsut 19, 2009)

The mass graves, according to the report, "are being planned to deal with the rising death toll from swine flu if the pandemic escalates":

"The grim revelation will see the mass burial sites dug in advance to cope with any potential crisis.

The Government is planning to create a series of communal graves to cope with the second outbreak expected in the autumn and through the winter.

A Home Office document published earlier this year sets out plans for how local councils should deal with a high death toll - estimates of the number of deaths range from 55,000 to as high as 750,000 from the H1N1 killer virus - including setting up temporary mortuaries.

So far, 44 people in England have been confirmed as dying after contracting swine flu and another five have died in Scotland. The document says that while most cemeteries have sufficient burial capacity for a number of years, this could be put to the test at the peak of a pandemic. (Daily Express, August 19, 2009)

Table

The chilling proposals contained in the government report serve to intimidate the British public and create an atmosphere of panic. A public health crisis is being planned in a diabolical fashion.

The report suggests unequivocally that there will be countless deaths resulting from the level 6 WHO pandemic, which require the development of mass graves:

Within weeks of a full-blown pandemic emerging, the number of burials could more than double. Inner city areas "may experience a shortage of grave space", the report stated.

Freight containers and "inflatable" storage units may be needed to provide extra mortuary space. But it stated that "refrigerated vehicles and trailers should not be used".

Other contingency plans being suggested were the need for cemeteries and crematoriums to work seven days a week and to hire extra staff to cope with demand.

There may also be a need for more "basic and shorter services at the chapel" or for "memorial services" to be held at a person's home instead.

Retired doctors could be called back to work to issue death certificates so GPs can focus on patients, while NHS Blood and Transplant has appealed to the public to give blood to ensure banks were well stocked.

A Home Office spokeswoman said: "This is prudent, precautionary planning that has been taking place over a number of years, with the health service, other essential services and local authorities. It is important to stress that these are possible scenarios, not certainties, so that our stakeholders can plan for the worst and be prepared to deal with the outbreak effectively." (Ibid)

These assertions are totally fabricated. There is absolutely no scientific evidence to support these claims. Realities are turned upside down. The British government is deliberately misleading the British public. With some exceptions, the British media bears a heavy burden of responsibility in failing to analyse these "authoritative" statements emanating from Her Majesty's Government.

The WHO has not provided the evidence, nor has the British government.

There is ample evidence, documented in numerous reports, that the WHO's level 6 pandemic alert is based on fabricated evidence and a manipulation of the figures on mortality and morbidity resulting from the N1H1 swine flu.

The data initially used to justify the WHO's Worldwide level 5 alert in April 2009 was extremely scanty. The WHO asserted without evidence that a "global outbreak of the disease is imminent". It distorted Mexico's mortality data pertaining to the swine flu pandemic. According to the WHO Director General Dr. Margaret Chan in her official April 29 statement: "So far, 176 people have been killed in Mexico". From what? Where does she get these numbers? 159 died from influenza out of which only seven deaths, corroborated by lab analysis, resulted from the H1N1 swine flu strain, according to the Mexican Ministry of Health.

The swine flu has the same symptoms as seasonal influenza: fever, cough and sore throat. What is happening is that the widespread incidence of the common flu is being used to generate the data pertaining to the H1N1 swine flu. And all of sudden, the British authorities are predicting widespread mortality resulting from an influenza related ailment. What is the evidence. Big Pharma is behind the official reports and the media disinformation campaign.

Similarly, in the US the intervention of the military (as well as martial law provisions) are being envisaged in the case of a public health emergency.

Is this emergency being planned ahead of time. Are these various national emergencies (Britain, France UK) being coordinated through inter-governmental consultations, which serves to trigger a Worldwide public health emergency, based on fabricated evidence?

Deadly Vaccines

On the other hand, amply documented and denied by Western governments, the proposed vaccines could result in more deaths than those caused by the H1N1 influenza, as confirmed by Britain's Health Protection Agency:

A warning that the new swine flu jab is linked to a deadly nerve disease has been sent to the Government by senior neurologists in a confidential letter.

The letter from the Health Protection Agency, the official body that oversees public health, has been leaked to The Mail on Sunday, leading to demands to know why the information has not been given to the public before the vaccination of millions of people, including children, begins.

It tells the neurologists that they must be alert for an increase in a brain disorder called Guillain-Barre Syndrome (GBS), which could be triggered by the vaccine.

GBS attacks the lining of the nerves, causing paralysis and inability to breathe, and can be fatal.

The letter, sent to about 600 neurologists on July 29, is the first sign that there is concern at the highest levels that the vaccine itself could cause serious complications.

It refers to the use of a similar swine flu vaccine in the United States in 1976 when:
* More people died from the vaccination than from swine flu.
* 500 cases of GBS were detected.
* The vaccine may have increased the risk of contracting GBS by eight times.
* The vaccine was withdrawn after just ten weeks when the link with GBS became clear.
* The US Government was forced to pay out millions of dollars to those affected. (Mail on Sunday, August 16, 2009)

The British government has announced that more than 13 million people will be innoculated. The proposed vaccines for the H1N1 swine flu have not, as yet, been tested.

PRESSTV

UK Prepares Mass Graves for Swine Flu Victims

PressTV, 22 August 2009, 09:46:26 GMT

https://web.archive.org/web/20090827104257/http://www.presstv.ir/detail.aspx?id=104187&sectionid=351020601

London is to set up mass graves for the victims of the swine flu pandemic after a 59-page official report predicted that Britain will be witnessing the pandemic disease in fall.

Britain's Department of Health has warned the UK officials and policy-makers to announce a state of emergency in the country.

The official report confirms the UK government plans to set up mass graves for the victims of the swine flu pandemic.

It is predicted that if no concrete measures are taken for preventing the spread of swine flu, the number of swine flu victims will reach to two billion worldwide in 2011 that will undoubtedly result in deaths of 10 to 20 percent of the patients.

One of the countries with a high likelihood of swine flu pandemic within next year is Britain. Hence, the UK Home Office has announced that it plans to construct mass graves to bury the victims in case the disease spreads quickly.

In its latest report published on August 21, the World Health Organization (WHO) has announced over 182,000 confirmed cases worldwide, 1,800 of which have been fatal.

Slate

L'OMS met en garde contre une deuxième vague de grippe

Slate.fr - 23 août 2009 à 2h00
https://www.slate.fr/story/9481/loms-met-en-garde-contre-la-deuxieme-vague-de-grippe

L'Organisation mondiale de la santé (OMS) est inquiète. Elle a appelé la planète à se tenir prête au choc de la deuxième vague du virus «capricieux» de grippe porcine oun grippe A, qui a tué près de 1 800 personnes. Elle lance son appel au moment où les pays de l'hémisphère nord, où vivent 5/6ème de la population mondiale, se prépare à entrer dans une saison plus fraîche, propice à la propagation.

Nous devons nous préparer à toute surprise que nous réserve ce nouveau virus capricieux», a insisté l'OMS, martelant: il faut se «préparer à une seconde voire à une troisième vague comme nous l'avons vu lors des précédentes pandémies».

A l'approche de l'automne, les pays du Nord sont sur la ligne de front, alors que l'épidémie commence à reculer dans les zones tempérées de l'hémisphère sud, où elle a sévi durant l'hiver austral. L'onde de choc y a été virulente, le virus A(H1N1) se répandant à une vitesse fulgurante au point de supplanter la grippe saisonnière, souligne l'Organisation mondiale de la santé.

En tout 1799 personnes sont décédées dans le monde depuis l'apparition de cette forme de grippe en mars 2009. Cette nouvelle grippe est parvenue à se propager dans 177 pays, où elle a contaminé plus de 182 000 personnes. L'OMS a déclaré ce virus première pandémie de grippe du XXIème siècle le 11 juin, en raison de sa vitesse de propagation et de sa nouveauté, privant la population mondiale d'immunité.

«L'OMS est toujours mobilisée et inquiète», explique ainsi un porte-parole de l'agence onusienne, Gregory Hartl rappelant que le virus n'avait pas encore passé son premier hiver dans les pays de l'hémisphère nord.

L'inquiétude est d'autant plus perceptible que la grippe, dont les contours se précisent lentement, se montre finalement «plus virulente» que sa cousine saisonnière, même si la majorité des cas restent bénins. Sous pression avant la réouverture des écoles, propice à la propagation, les pays du Nord ont pris leurs précautions. Toujours d'après l'OMS, ils ont d'ores et déjà commandé plus d'un milliard de doses de vaccins, considérés comme l'arme la plus efficace contre la maladie.

Plus d'une vingtaine de sociétés pharmaceutiques dans le monde entier travaillent d'arrache-pied mais le médicament ne pourra être prêt avant octobre. Même alors, il ne sera pas suffisant pour tout le mondel.

En attendant, sont mis en place des moyens de défense différents prévoyant les conditions de fermeture des écoles, la livraison d'antiviraux, le renforcement des structures d'accueil des hôpitaux ...

«Tout le monde doit être prêt», prévient M. Hartl car «il est impossible de dire si le A(H1N1) ne reviendra pas avant» octobre-novembre, période d'apparition habituelle de la grippe saisonnière. Ce qui est «probable» en tous les cas, c'est qu'il «devienne le virus de grippe dominant au début des mois d'hiver», prévoit l'OMS.

The New American

Dire Swine Flu Warnings from White House

The New American, 25 August 2009
https://thenewamerican.com/us/healthcare/dire-swine-flu-warnings-from-white-house/

The President's Council of Advisors on Science and Technology issued a dire warning Monday about the spread of the swine flu virus later this year, titled "On US Preparations for 2009-H1N1 Influenza." It claimed that a "plausible scenario" would be "infection of 30–50 percent of the U.S. population this fall and winter, with symptoms in approximately 20–40 percent of the population (60–120 million people), more than half of whom would seek medical attention."

While acknowledging that the true impact is impossible to predict, the report said the H1N1 virus could result in up to 1.8 million hospital admissions with as many as 300,000 requiring hospitalization in intensive care units. This would place "enormous stress" on intensive care units, with between 50 to 100 percent of beds occupied.

On an even more ominous note, the report warned of the possibility of between 30,000 and 90,000 deaths attributable to the virus – mostly among children and young adults. But to put that in perspective, the regular seasonal flu is usually responsible for between 30,000 to 40,000 deaths per year.

"It's a plausible scenario that we need to be prepared for," said Marty Cetron, the Center for Disease Control's director of the Division of Global Migration and Quarantine. But CDC director Thomas Frieden told the *Los Angeles Times* that flu outbreaks are very unpredictable and "cautioned" that the effects this winter could be "much milder."

The government report, available on the White House Web site, stressed that it was not a prediction, but rather a tool for planning the government response. "The scenario illustrates that an H1N1 resurgence could cause serious disruption of social and medical capacities in our country in the coming months." It also noted that "By way of comparison, it is less severe by a factor of three (in terms of expected deaths per capita) than the 'reasonable worst case' planning assumptions, publicized by the UK government, for the H1N1 resurgence in that country."

Health and human services secretary Kathleen Sebelius took the opportunity to promote the vaccine for the seasonal flu and the swine flu, saying the H1N1 vaccine must be considered the nation's defense against the virus. "I think it's important that people begin to anticipate that we will have a vaccine," she explained on NBC's Today show. The first doses are expected to be ready by mid-October. "We think it's likely that we're going to need two shots for the vaccine." She also noted that the focus should be on pregnant women, healthcare workers, and people with medical conditions, also noting that "We want the population that is most at risk to begin their seasonal flu vaccine now."

The report also issued a number of recommendations including increased CDC "surveillance systems" to detect new variants of the virus, accelerated vaccine production and putting one senior White House official in charge of coordinating "all decision making about the pandemic."

Whether or not cases of swine flu spread in the coming months, should the federal government really be behaving as Americans' nannies and doctors? Presumably this is all justified in politicians' minds by the infamous "general welfare" clause of the Constitution, but a cursory review of the Federalist Papers would quickly reveal that this is not what the Founding Fathers had in mind. The co-chair of Obama's advisory council that issued the report, John Holdren, actually co-authored a book titled *Ecoscience* calling for forced abortions, mass sterilization, and a "planetary regime" with the power to enforce the sick notions. Is this who Americans really want in charge of these policies?

It is past time for the government to stop acting as a savior and for it to start obeying the Constitution. People need to take personal responsibility. And the media should fulfill its role in informing the people, who can then decide with their healthcare providers and their families what the most appropriate course of action would be. People like Barack Obama and John Holdren have no business dictating national healthcare policies.

THE JERUSALEM POST

Largest-ever biological attack drill set for January

The Jerusalem Post, 30 August 2009, 00:31
https://www.jpost.com/israel/largest-ever-biological-attack-drill-set-for-january

Threat scenario will include IDF Home Front Command, Magen David Adom, Israel Police, IDF Medical Corps, the IDF Spokesman's Office and the Fire and Rescue Service.

In preparation for a non-conventional attack on Israel, the National Emergency Authority will hold the largest-ever exercise to train security forces how to respond to a city-wide biological attack.

The drill will begin on January 1 and is being prepared by the NEA, a branch of the Defense Ministry established after the Second Lebanon War to coordinate between all of the civilian and military bodies that provide services during a nationwide emergency.

Until now, previous exercises have focused on the Health Ministry's ability to continue to run hospitals during a non-conventional biological attack.

The threat scenario will include a biological attack on a major Israeli city and will include the IDF Home Front Command, Magen David Adom, the Israel Police, the IDF Medical Corps, the IDF Spokesman's Office and the Fire and Rescue Service. Syria, according to foreign reports, is believed to have developed offensive biological capabilities. A military facility near the city of Cerin is reportedly suspected of being used for the development and production of biological agents. Syria also has a significant arsenal of long-range Scud-C and Scud-D missiles that would be capable of carrying the agents.

Diseases known to have been weaponized include Ebola, anthrax, Q fever and smallpox. The exercise will focus on some of these diseases. One possibility that will be considered during the drill will be to close down and quarantine the entire city in the event that the disease spreads.

Officials will hold hourly assessments during the drill and discuss the option of immunizing the entire country. If such a decision is made, it will be carried out by the IDF, which has the manpower and infrastructure to open immunization centers.

In June, the IDF and NEA held the largest civil-defense exercise since the Second Lebanon War called "Turning Point" and which for the first time included the sounding of a siren throughout the country.

The IDF plans to begin returning gas masks to the public starting in November. Since the Defense Ministry began collecting the public's gas masks in 2006, almost 90 percent of the masks have been collected and most of them refurbished.

World Health Organization

List of Members of, and Advisor to, the International Health Regulations (2005) Emergency Committee concerning Influenza Pandemic (H1N1) 2009

Geneva, WHO, August 2009

https://web.archive.org/web/20100812193029/http://www.who.int/ihr/emerg_comm_members_2009/en/index.html
https://cdn.who.int/media/docs/default-source/documents/ihr/ihr-committee-members-h1n1-orginal-list.pdf?sfvrsn=7e49f574_2
https://www.who.int/groups/h1n1-ihr-emergency-committee

Members:

1. Dr Lawson Ahadzie
Former Head of Surveillance Department, Ghana Health Service/Ministry of Health, Accra, Ghana (Dr Ahadzie's membership was suspended after the fifth Emergency Committee Meeting on becoming a WHO staff member)

2. Mr André Basse
Counsellor, Embassy of Senegal, Paris, France

3. Dr Muhammad Akbar Chaudhry
Principal, Professor of Medicine, Fatima Jinnah Medical College, Lahore, Pakistan (Dr Chaudry's membership commenced with the sixth Emergency Committee Meeting)

4. Dr Supamit Chunssuttiwat
Senior Expert in Disease Control, Department of Disease Control, Ministry of Public Health, Bangkok, Thailand

5. Dr Nancy Cox
Director, Influenza Division, Centers for Disease Control and Prevention, Atlanta, USA

6. Dr Anthony Evans
Chief, Aviation Medicine Section, International Civil Aviation Organization, Montreal, Canada

7. Professor John Mackenzie
Professor of Tropical Infectious Diseases, Division of Health Sciences, Curtin University, Perth, Australia

8. Professor Arnold Monto
Professor, Department of Epidemiology, University of Michigan, Ann Arbor, USA

9. Dr Fernando Otaiza
Coordinator, National Infection Control Program, Ministry of Health, Santiago, Chile

10. Dr Rogelio Pérez Padilla
Director General, Instituto Nacional de Enfermedades Respiratorias "Ismael Cosío Villegas", Mexico City, Mexico

11. Dr Wing Hong Seto
Chief of Service, Department of Microbiology, Queen Mary Hospital, Hong Kong Special Administrative Region, China

12. Dr Masato Tashiro
Director, Department of Viral Diseases and Vaccine Control, National Institute of Infectious Diseases, Tokyo, Japan

13. Dr Claude Thibeault
Consultant in Aviation Medicine and Occupational Health, Montreal, Canada

14. Dr John Wood
Principal Scientist, Division of Virology, National Institute for Biological Standards and Control, Herts, United Kingdom

15. Professor Maria Zambon
Head of Respiratory Virus Unit, Virus Reference Department, Health Protection Agency, Centre for Infection, London, United Kingdom

Advisor to the Emergency Committee

Professor Neil Morris Ferguson
Chair in Mathematical Biology, Department of Infectious Disease Epidemiology, Imperial College Faculty of Medicine, London, United Kingdom

Declaration of Interests

Dr Nancy Cox
Her public health and surveillance research unit at the US Centers for Disease Control & Prevention (CDC) receives financial support from IFPMA for activities of CDC as a WHO Collaborating Centre in the field of influenza vaccine research and virus isolation work.

Professor Arnold Monto
He has declared current and past consultancies in the field of pandemic and/or seasonal influenza for GSK, Novartis, Roche, Baxter and Sanofi. The remuneration for each of these consultancies is below US$10 000. In addition, his research unit at the University of Michigan has received a grant from Sanofi Pasteur for a clinical trial conducted in 2007-2008 on the comparative efficacy of inactivated and live attenuated influenza vaccines.

Dr Claude Thibeault
Since 2004, he is the Consultant Medical Advisor to International Air Transport Association.

Dr John Wood
His research unit at the National Institute for Biological Standards and Control (NIBSC), a centre of the UK Health Protection Agency, has performed contract research for Sanofi Pasteur, CSL, IFPMA, Novartis and Powdermed in the field of influenza vaccine research and development.

Professor Maria Zambon
The UK Health Protection Agency Centre for Infection receives funding from vaccine manufacturers, including Sanofi, Novartis, CSL, Baxter and GSK, for contract work in Dr Zambon's laboratory.

Professor Neil Morris Ferguson (Advisor)
He has acted as a consultant for Roche and GSK Biologicals (ceasing in 2007), with total remuneration from all such work being under US$7 000 in 2007.

The interests summarized above do not give rise to a conflict of interest such that the experts concerned should be partially or totally excluded from participation in the Emergency Committee. However, following WHO's policy, they were disclosed within the Committee so that other members were aware of them. All other Members of the Emergency Committee declared no relevant interests.

THE TIMES OF INDIA

Kounteya Sinha

'Most H1N1 fatalities in age group of 16-45 years'
Around 44% of those who died of H1N1 swine flu in India till

Times of India, 2 September 2009, 02:39 IST
https://timesofindia.indiatimes.com/india/most-h1n1-fatalities-in-age-group-of-16-45-years/articleshow/4960468.cms

New Delhi: Around 44% of those who died of H1N1 swine flu in India till August 30 perished within three days of being hospitalised. On an average, all those who died visited two private healthcare facilities before finally reaching a designated government hospital. Around 45% of those who died suffered from co-morbid conditions like diabetes, heart and liver diseases.

These are the main findings of the health ministry's analysis of the first 82 deaths in India till August 30. The number of fatalities in the country has since risen to 101.

The age group of 16-45 years has been the worst affected with the virus, with 55 of the 82 who died belonging to this category. The virus hasn't really behaved any differently among men and women. Of the 82 deaths studied, the National Institute of Communicable Diseases (NICD) found 43 to be males and 39 females.

The time interval between hospitalisation and death oscillated from one day to 12 days. In almost 44% of the cases, the patient died within three days of being hospitalised. The average time length of onset of illness and administration of Tamilfu has been found to be just over five days. The duration is the same for onset of illness of those who died and when they reported to the hospital. Around 75% of those who died came from urban areas. Reacting to the findings, NICD director Dr Shiv Lal said, "It is clear that delayed reporting caused most of the deaths. People must understand that reporting early to a designated H1N1 testing and treatment facility is vital. People should avoid visiting hospitals not designated for H1N1 care, which leads to loss of vital time. Patients with co-morbid conditions should be extra careful and go immediately to a designated H1N1 facility if they have swine flu symptoms."

However, one significant finding during this analysis has come especially as a relief for the country's health ministry. After studying 42 samples (National Institute of Virology-31 and NICD-11) of the H1N1 virus circulating in India, scientists have found that it had not undergone any mutation.

Globally and in India, scientists are keeping a close watch on the virus fearing it could mutate and become a deadlier bug. A mutation would also mean that the vaccines presently being developed and expected to roll out by October-end globally could become redundant.

A finding, which is also vital, is that in some countries like India, majority of those who died were in intensive care and on ventilator support. The virus till now is behaving exactly how a pandemic virus is expected to do --infecting reproductive and the healthy age group.

The analysis showed that only one death occurred in the over 65 year category and five deaths in the 0-5 age group. The age group of 36-45 years has been worst affected with 24 deaths.

The WHO earlier had said that majority of those who got infected worldwide recovered within a week without any medical treatment. WHO has estimated that as many as 2 billion people could become infected over the next two years with swine flu, nearly one-third of the world's population.

POTOMAC INSTITUTE FOR POLICY STUDIES

Lung damage in fatal swine flu cases more bird flu than seasonal flu: expert

Potomac Institute, 3 September 2009

https://potomacinstitute.org/featured-news/1724-book-review-the-singularity-series-by-william-hertling

Summary: A study of about 70 fatal cases of swine flu revealed similarities in lung damage to victims of H5N1 avian influenza, the chief of infectious diseases pathology at the CDC said. The avian flu virus has killed 60 percent of the 440 people known to have been infected with it. To date, that virus hasn't acquired the capacity to spread easily from person to person.

Analysis: This week's news continues to underscore the elusive nature of the influenza virus. The novel influenza A/H1N1 has manifested differently than seasonal flu since it first emerged in Mexico earlier this year. Its significant impact on younger victims is one reason this disease has been so closely followed. While indicators appear to show H1N1 causing more severe illness than its seasonal cousins, it bears repeating that even seasonal flu produces serious and sometimes fatal complications.

Scientists and health officials will continue to monitor H1N1 for signs of mutation to a more serious form. This includes observing all strains in animals, the reservoir from which flu migrates to humans. At this time, it remains impossible to project how H1N1 will change, or if it will at all. It is also important to recognize that this flu is different than previous and seasonal varieties. The risks posed and impact of the disease must be evaluated specific to this strain, as direct correlations to other strains hold limited validity.

Because the infection rate has continued unabated through the normally flu free summer months, there is reason to believe that flu season will see a significant increase in H1N1 spread. This, of course, points to continued vigilance with regard to everyday precautions, staying home if ill, and early immunization.

Hindustan Times

Swine flu deaths climb past 2,800: WHO

Hindustan Times, 4 September 2009, 05:13 PM IST
https://www.hindustantimes.com/world/swine-flu-deaths-climb-past-2-800-who/story-aQnCmpTpIOdyeNvVlnjtNP.html

The World Health Organisation said on Friday that at least 2,837 people had died from swine flu virus infections.

"There are now at least 2,837 deaths attributable to pandemic H1N1," said Gregory Hartl, spokesman for the UN health agency.

The data mark an increase of 652 deaths from the last toll of 2,185 published a week ago.

Hartl said the increase in the number of deaths is due to the overall rise in the number of people who have caught the A(H1N1) virus, and not because of the virus becoming more virulent.

Britain lowers potential swine flu death toll

Reuters, 4 September 2009, 1:47 AM GMT+8
https://www.reuters.com/article/idUSTRE58259H/

London (Reuters) - Government scientific advisors have scaled back the potential number of swine flu deaths the NHS should plan for, officials said Thursday.

Using findings from how the pandemic has progressed so far, such as rates of infection, scientists advised that planning for the pandemic should now be based on a lower fatality rate, reducing the worst case scenario to 19,000 deaths from 65,000.

But England's chief medical officer Liam Donaldson said that while new cases of flu had eased, the number of those patients in hospital remained very unusual for the time of year and stressed the death figure was an assumption not a prediction.

"We do not want to create any complacency," Donaldson told reporters. "We want NHS staff to continue to work very, very hard for what we anticipate will still be a very pressurised winter."

The latest figures are based on 30 percent of the population becoming infected, Donaldson said, adding that the modelling showed that if only one in 20 people were to become infected the number of deaths could be as low as 3,000.

The number of new cases in England has continued to ease, with 4,500 new cases last week, down from 5,000 the previous week. The total number of UK deaths has risen to 70, 61 of which were in England.

Donaldson said the new potential death figures did not take into account any possible vaccination program for at-risk groups, due to begin in the UK in October if a licence is approved by European medical regulators.

"We are unlikely to see a peak before the second half of October which is something that we are pleased about as we are expecting to be able to start using the vaccine during October," he said, but added that the NHS should continue to plan for the worst case scenario.

China faces grim situation as H1N1 escalates: minister

Reuters, 8 September 2009, 3:44pm EDT
http://www.reuters.com/article/healthNews/idUSTRE58717220090908

Beijing (Reuters) - China faces a grim situation in containing the H1N1 strain of flu, as schools start up again and the number of domestic cases, as well as clusters of cases, rises, China's Minister of Health said on Tuesday.

China has reported 5,592 cases of H1N1 flu, from which 3,852 people have recovered. No-one has died in China, although a patient in Shanghai is in a coma, with multiple organ failure.

"There are some recent developments in H1N1 in China that mean we are facing a grim situation," said Chen Zhu, one of only two ministers in China who do not belong to the Communist Party.

He listed a rapid surge in domestic cases, after an initial phase when most cases in China were of foreigners who arrived with the disease. Since the beginning of September, there has also been a spike in the number of clusters of outbreaks, which now number 128.

Finally, there has been an increase in the number of confirmed H1N1 cases among people with flu symptoms. Chen said the Shanghai patient, as well as another serious case in Zhejiang province, had stabilized.

China plans to begin rolling out a vaccination program this week, Chen said, with priority going to children, health care workers, the military and the public security apparatus.

"With 1.3 billion people, we are limited in our ability to provide vaccines for all," Chen said.

"Therefore, we have to continue with protective measures, especially the ability of the population to protect itself."

The Chinese government on Friday ordered 7.3 million doses of vaccines for the H1N1 strain of flu from domestic firms Sinovac Biotech and Hualan Biological.

THE FLU CASE

Rothschild-controlled news wires "Reuters" hypes swine flu danger in China

The Flu Case, 9 September 2009 11:13
https://web.archive.org/web/20090917025413/http://www.theflucase.com/index.php?option=com_content&view=article&id=539%3Arothschild-controlled-news-wire-qreutersq-tries-to-hype-swine-flu-danger-in-china&catid=1%3Alatest-news&Itemid=64&lang=en

Reuters is maintaining that China is facing a "grim" situation as the H1N1 "escalates" even though China has had not a single death from the swine flu.

Orwellian propaganda is increasingly detached from any facts as WHO and their funders, the Rothschilds and Rockefellers, prepares to pass off their deliberate, planned triggering of a pandemic through mass vaccinations and other measures as a natural act.

Le Monde

Grippe A: "On ne peut pas accepter une justice d'exception"

Le Syndicat de la magistrature avait révélé les mesures envisagées sur la justice par le gouvernement en cas de pandémie

Le Monde avec Reuters, 8 Septembre 2009, à 13h 47

https://www.lemonde.fr/societe/article/2009/09/08/grippe-a-on-ne-peut-pas-accepter-une-justice-d-exception_1237329_3224.html

Un seul magistrat, faire juger les mineurs par les tribunaux pour majeurs, prolonger automatiquement les délais de détention provisoire… tel est le visage que pourrait prendre la justice en cas de pandémie de grippe A(H1N1) selon le Syndicat de la magistrature, qui affirme avoir eu connaissance de projets de textes modifiant l'organisation et le fonctionnement de la justice et circulant *"dans le plus grand secret"*.

Après la diffusion de ces informations, Michèle Alliot-Marie a assuré qu'il n'y a "a*ucun plan secret". "On a demandé aux ministères de prévoir tous les cas de figure et notamment le cas où quasiment l'ensemble de la France serait bloquée par une épidémie"*, a affirmé la garde des Sceaux devant des journalistes dans les couloirs de l'Assemblée, soulignant que *"ces mesures n'ont même pas encore été arbitrées"*, refusant toutefois de détailler les mesures en question.

Pour sa part, le Syndicat de la magistrature dénonce un *"dispositif liberticide"* concernant les mesures d'exception envisagées par le gouvernement et adresse mardi 8 septembre une lettre à la Chancellerie pour appeler à un dialogue autour de cette question. Emmanuelle Perreux, présidente du syndicat, critique les atteintes aux libertés individuelles suscitées par une série de dispositions qui concernent principalement la justice pénale.

Pour Mme Perreux, réunir les différents acteurs – magistrats, avocats, fonctionnaires – suffirait à mettre en place des mesures garantissant les libertés individuelles afin d'assurer un fonctionnement normal de la justice. La présidente du Syndicat de la magistrature juge inacceptable *"qu'une pandémie grippale conduise à accepter une justice d'exception"* par ordonnances gouvernementales.

Elle espère que ce signal d'alarme interpelle le Parlement.

Le ministère de la justice a répondu qu'il s'agissait d'un *"document de travail provisoire"* datant du mois de juillet qui envisageait alors une situation sanitaire extrême, scénario qui n'est plus d'actualité.

"C'était un projet d'ordonnance dans le cadre de travaux exploratoires au cas où l'on serait face à une crise sanitaire grave empêchant les juridictions de fonctionner normalement", a déclaré son porte-parole, Guillaume Didier, mardi.

Une cinquantaine de responsables politiques et syndicaux, de médecins et autres personnalités ont signé un appel *"pour une gestion démocratique de la pandémie"*, appel publié dans *Libération* de mardi.

La lettre du Syndicat de la magistrature adressée à la ministre de la justice Michèle Alliot-Marie.

THE FLU CASE

French judges protest secret pandemic tyranny decrees

The Flu Case, 9 September 2009, 10:08
https://web.archive.org/web/20090917140913/http://www.theflucase.com/index.php?option=com_content&view=article&id=529%3Afrench-judges-protest-secret-pandemic-tyranny-plans&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The union of judges and lawyers in France has written a letter of protest to the French Justice Minister over plans to strip people of their civil liberties during the swine flu pandemic, which were made "in the greatest secrecy."

According to a report in Le Monde on Tuesday, the lawyer's union has fiercely criticised the decree which would dismantle the civic rights of the people of France in the name of a pandemic emergency and which was issued without any "democratic debate".

Emmanuelle Perreux, president of the judge's union said that it was "unacceptable" for the government to remove people's fundamental liberties by secret decree on the pretext of a pandemic emergency.

She said that she hoped that parliament would intervene after the revelation on Tuesday that the French Minister of Justice Michele Alliot-Marie had circulated orders in secret in July instructign judges to allow children to be put on trial in adult courts and detentions without any court order in the name of a pandemic emergency.

Alliot-Marie denied that there was "any secret plan" and claimed the secret orders were a provisional working document as outrage in France over the secret vaccination and detention plans that are now attracting widespread coverage in the mainstream media mounts.

The Sydney Morning Herald

Swine flu in France more widespread

The Sydney Morning Herald, 8 September 2009, 9.02am
https://www.smh.com.au/world/swine-flu-in-france-more-widespread-20090908-feqv.html

In case of a swine flu pandemic the French government has a plan to introduce emergency measures that would gut legal protections for citizens, the daily **Liberation** reported on Tuesday.

According to documents provided to the daily by a judges' union, the plan would extend the period police can keep a suspect in detention without charge or a hearing before a judge to up to six months.

Suspects would also not be able to contact a lawyer until after spending 24 hours in custody.

Under the plan children could be tried in adult courts and more trials held behind closed doors.

The Syndicat de la Magistrature called the measures "revolting" and said they would amount to "liberticide," and called on Justice Minister Michele Alliot-Marie to abandon the plan.

The union was due to release on Tuesday the text of the government plan, which it said was provided to heads of courts in great secrecy in July, the newspaper reported.

Swine flu, or the A(H1N1) virus, the first pandemic to be declared by the World Health Organisation in this century, has so far claimed 15 lives in France, out of at least 2,837 worldwide.

The French government has conducted extensive planning to prepare for an expected new wave of infections as the autumn flu season approaches in the northern hemisphere.

And now, "la bise," the cheek-to-cheek peck that the French use to say hello or goodbye, has come under pressure from swine flu.

Some French schools, companies and a Health Ministry hotline are telling students and employees to avoid the social ritual out of fear the pandemic could make it the kiss of death, or at least illness, as winter approaches.

Mainland France has so far counted only three swine flu deaths. The tally is worse in French southern hemisphere holdings now in winter, like the South Pacific island of New Caledonia, with seven deaths and 35,000 cases overall, according to local officials.

Across France, authorities and school officials are taking few chances - while trying to avoid stirring panic when the academic year started last week. In recent months, a few schools in France have been temporarily shut after cases of swine flu emerged.

For kids in two schools in the town of Guilvinec, in France's western Brittany region, the first lesson of the year came from local officials - no more cheek kisses to teachers or other students.

"I asked the children not to kiss anymore," town mayor Helene Tanguy said by phone. "I felt that the protections sought - to wash hands regularly, not throw used handkerchiefs around, and not cough any old way - had no meaning if we let the kids keep kissing."

"It seems we were the first town to do so," she said. It's just part of an effort to adopt new and more sanitary habits, and there's no punishment involved for those who do exchange bises, she added.

As a playful alternative, some teachers in the town have set up "bise boxes" - pupils slip heart-shaped greetings inside before they're exchanged in class, Tanguy said.

Many in France see a threat to cherished customs.
"Swine flu has already changed our life," read the headline of an article in Monday's Le Parisien about banning the bise.

The national government isn't calling for a ban. But the Health Ministry, on its swine flu phone hotline, recommends that people avoid "close contact - including shaking hands and giving the bise."

A ministry web site on the pandemic recommends avoiding "direct contact" with people, "not kissing, shaking hands or caressing the face" of others - especially sick people.

It advises keeping a one-metre buffer zone as a minimum, or wearing masks if that's not possible. It doesn't specifically mention la bise.

THE FLU CASE

French outrage at secret pandemic tyranny laws escalates

The Flu Case, 8 September 2009, 15:16
https://web.archive.org/web/20090917020654/http://www.theflucase.com/index.php?option=com_content&view=article&id=524%3Afrench-outrage-at-secret-pandemic-tyranny-laws-escalates-as-mainstream-newspapers-report&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French newspaper Liberation today published a major report, fiercely attacking the draconian legal measures the French government has put in place, in secret, to deal with a so-called "pandemic", including detentions for up to six months without seeing a judge and the trial of children in adult courts.

Under the headline, "Flu A: menace to our liberties", the paper publishes the demand of "us, politicians, union leaders, researchers, associates to the public authorities" to have a proper debate "as quickly as possible" on the military-style emergency measures outlined in a secret document sent by the government to the heads of the courts of France in July.

Le Monde

Sophie Landrin et Patrick Roger

L'Etat s'organise pour assurer la continuité de ses services en cas de pandémie
Deux scénarios de crise ont été élaborés pour faire face à un fort absentéisme des personnels

Le Monde, 9 Septembre 2009, à 13h58
https://www.lemonde.fr/planete/article/2009/09/09/l-etat-s-organise-pour-assurer-la-continuite-de-ses-services-en-cas-de-pandemie_1237931_3244.html#xtor=AL-32280184

Comment assurer la continuité de l'Etat et des services publics en cas de forte pandémie de grippe A? Le gouvernement se prépare à une situation sanitaire difficile dès la mi-octobre. A cette date, la grippe pourrait, selon certains scénarios, avoir largement gagné le territoire.

Depuis la fin du mois d'avril, un centre interministériel de crise (CIC) réunit chaque semaine et sous l'autorité du ministre de l'intérieur, Brice Hortefeux, les représentants du gouvernement pour anticiper la crise. Chaque ministère a été prié de présenter *"un plan de continuité des services"* qui concerne ses propres services et les administrations et services publics sous sa tutelle. *"Nous validons ces plans en regardant si les dispositifs proposés correspondent à la doctrine générale,* explique un responsable du CIC. *Si c'est le cas les instructions sont transmises aux services déconcentrés."*

Deux scénarios ont été élaborés, pour faire face à une administration en *"mode dégradé"*: l'un avec un seuil de 25 % d'absentéisme des personnels, l'autre, plus alarmiste, avec un plafond de 40 % d'absentéisme. Le plan du ministère de la justice dévoilé, mardi 8 septembre, par *Libération* et qui suscite l'inquiétude des magistrats et des avocats s'inscrit dans cette logistique. Il prévoit notamment une modification de la composition des formations de jugement, avec la généralisation du juge unique en correctionnelle. Le Syndicat de la magistrature (SM, gauche) a dénoncé une *"justice d'exception"*. La garde des sceaux, Michèle Alliot-Marie a assuré qu'il s'agissait seulement d'hypothèses de travail *"en cas de situation catastrophique"*.

La chancellerie, comme les autres ministères, s'est vue dans l'obligation d'établir une hiérarchisation des fonctions qui restent indispensables en cas d'absentéisme massif. La *"doctrine générale"* du CIC prévoit pour les détenteurs de ces postes stratégiques des mesures de prévention et de protection particulière. Au besoin, les administrations pourront avoir recours aux heures supplémentaires, à la réduction des congés ou à l'embauche de contractuels.

S'agissant du sommet de l'Etat et du cas particulier du président de la République et du premier ministre, des précautions d'usage ont été prévues - vaccination, stock de Tamiflu et hospitalisation au Val-de-Grâce. *"Il ne faut pas dramatiser,* fait-on valoir au CIC. *Nous ne sommes pas en train d'anticiper la vacance du pouvoir. Nous sommes en présence d'un virus à la propagation ultra rapide, mais sans impact létal considérable."*

A l'Assemblée nationale comme au Sénat, l'objectif est identique: assurer la continuité de l'activité, mais sans dramatiser. Pas question d'envisager une suspension des travaux parlementaires. *"Si cette question devait être soulevée, elle ne le serait qu'en dernier recours et après concertation de tous les groupes et des autorités sanitaires"*, affirme le président de l'Assemblée nationale, Bernard Accoyer.

Chacune des deux chambres a préparé un plan d'action contre la grippe A. Le Sénat avait arrêté des dispositions dès le mois de mai, consistant notamment en l'achat de masques et de flacons de solution hydroalcoolique. Des stocks importants ont été constitués. L'Assemblée nationale vient à peine, de son côté, de commander des masques, qui ne sont pas encore disponibles.

Les personnels ont reçu pour instruction de suivre les recommandations du ministère de la santé. Des fiches d'information ont été distribuées et il est recommandé aux personnes présentant des symptômes de rester chez elles. En cas de pandémie déclarée, des mesures de distribution de masques et de limitation des contacts seront prises; les conditions dans lesquelles elles s'appliqueront ne sont pas encore arrêtées.

De son côté, le Sénat a prévu, au cas où l'épidémie de grippe s'aggraverait, l'installation d'un second cabinet médical spécifique pour les consultations des personnes potentiellement atteintes et des procédures à suivre pour les personnes ayant été en contact avec une personne atteinte. Des correspondants "grippe A" ont été désignés dans chaque service. Une cellule de suivi a été mise en place.

Enfin, concernant la vaccination, l'Assemblée nationale prévoit *"la vaccination volontaire des élus, fonctionnaires et collaborateurs dès que le vaccin sera disponible"*, tandis que le Sénat s'en tiendra au *"respect du plan établi par le gouvernement"*.

THE FLU CASE

French government prepares for pandemic "crisis" in mid-October

The Flu Case, 11 September 2009, 12:38
https://web.archive.org/web/20090923002751/http://www.theflucase.com/index.php?option=com_content&view=article&id=571:french-government-prepares-for-pandemic-qcrisisq-in-mid-october&catid=1:latest-news&Itemid=64&lang=en

The French government is preparing for a pandemic "crisis" from the middle of October, according to a report in Le Monde.

The government intends to start an unprecedented mass vaccination campaign from the beginning of October in vaccine centers located outside hospitals and GP practises, reinforcing fears that the government knows that the "swine flu" vaccines will kill and injure people, and has made plans to use the crisis created by this as a pretext to implement tough martial law measures.

One French government scenario foresees 40 per cent fewer people at work, indicating a huge toll of injury and death.

According to the report in Le Monde, key functions in France have also been run, in effect, by the WHO and the UN, operating through a special crisis committee (CIC), set up in the ministry of interior and under the authority of WHO as a result of the implementation of the International Health Regulations (IHR) 2005 and the French national pandemic plan, since the end of April.

Because all the 194 states that have signed the IHR are obliged to follow the same orders from WHO in the event of a pandemic emergency, it is reasonable to assume that all countries have instituted special "crisis comittees" operating under WHO from the end of April and also secret plans to set up "vaccine centers" and institute detentions without a trial as the French government.

New CDC guidelines stress quick treatment for H1N1

Reuters, 9 September 2009, 4:24
https://www.reuters.com/article/healthNews/idUSTRE5875Z820090908?sp=true

Washington (Reuters) - Patients who have flu-like symptoms and are having trouble breathing should get quick treatment with the antiviral drugs Tamiflu or Relenza, even before getting a flu test, U.S. officials said on Tuesday.

And doctors should consider setting up a system so that patients most likely to become severely ill from H1N1 swine flu have a prescription on hand so they can just call up to get the go-ahead to take the drugs if they develop symptoms, the U.S. Centers for Disease Control and Prevention said.

"Treatment should not wait for laboratory confirmation of influenza because laboratory testing can delay treatment and because a negative rapid test for influenza does not rule out influenza," the CDC says in updated guidelines, availablehere.

"The very young and very old, people with chronic medical conditions and pregnant women in general ought to be treated with antivirals when they have an influenza-like illness," the CDC's Dr. Anne Schuchat told reporters.

But most people will not need any treatment at all for H1N1 because most of those infected so far have recovered on their own. "They can be cared for with mom's chicken soup at home, lots of fluids and rest," Schuchat said.

The latest guidance suggests officials are keen to make sure people who need it get very quick treatment, while making sure people who do not need the drugs do not abuse them.

Both GlaxoSmithKline's Relenza and Roche AG's Tamiflu can help save the lives of patients severely ill with any influenza, if given within a day or so of symptoms starting. They can also ease the misery of milder cases and even prevent flu if people take it just after exposure.

Developing Resistance

But supplies are not infinite and health officials worry that the more people take them, the quicker the virus will evolve resistance, rendering them useless. Two older flu drugs, amantadine and rimantadine, are already useless against seasonal flu.

The CDC is clear that some people should take the drugs prophylactically - to prevent infection. That includes some healthcare workers and people with high-risk conditions such as asthma who know they were in close contact with an infected person.

But the new guidance adds an option to watch and see if the person gets a fever. "Instead of the preventive use of antivirals, clinicians may consider watchful waiting," Schuchat said.

A vaccine against H1N1 swine flu is being tested but will not be available until mid-October. The CDC recommends that about 160 million people line up for the first doses starting then.

"Virtually all the influenza circulating now in the United States is the 2009 H1N1 strain," Schuchat said. It has not mutated and the vaccine is still a good match, she said.

She said only a handful of cases of resistance to Tamiflu, known generically as oseltamivir, have been reported.

In the United States, 24 elementary, middle or high schools closed because of H1N1 outbreaks last week, letting 25,000 students out of class. The CDC advises against closing schools unless so many students or staff become ill that the school is overwhelmed.

The virus "is causing increased disease and it is time to pay attention," Schuchat said.

John Griffing

Swine Flu: Path to Martial Law?

Pakalert Press, 10 September 2009
https://web.archive.org/web/20091026091318/http://pakalert.wordpress.com/2009/09/10/swine-flu-path-to-martial-law/

Could a form of martial law be imminent? Obama appears ready to cross the Rubicon, and all he needs is a killer virus.

Let’s connect some dots.

Remember President Obama’s Executive Order basing 80,000 active troops at home for the first time in the history of the peacetime military establishment to "help with civil unrest and crowd control or to deal with potentially horrific scenarios such as massive poisoning and chaos in response to a chemical, biological, radiological, nuclear or high-yield explosive, or CBRNE, attack…."

Now connect that information to the recent announcement that the military has established regional deployment locations all across the United States to "assist civilian authorities in the event of a significant outbreak of the H1N1 virus this fall, according to Defense Department officials."

Civil unrest and crowd control? Significant outbreak of the H1N1 virus this fall? What do they know that we don’t?

Swine flu has been made into a crisis in the minds of the public, even though swine flu, or H1N1, is the most non-lethal "killer" virus ever uncovered. As a cataclysmic event demanding military assistance, it ranks near zero. It is doubtful whether swine flu could even be classified as an "epidemic," much less a "pandemic."

Regular influenza, the common flu, kills 36,000 people every year. The 1918 flu pandemic killed an estimated 50-100 million people worldwide over a period of two years, approximately one-third the population of Europe at that time. Global swine flu deaths topped just 1,000 this year.

But President Obama is predicting death tolls of 90,000 and possible infection of up to half the US population.

While every life matters, in statistical terms swine flu is a comparatively minor problem, which makes the hype by those in government and the military all the more suspicious.

The National Guard is even practicing mock takeovers of public schools in the event of an "H1N1 riot," a description that elicits mixed responses. What kind of riot could arise out of a flu that has only killed 1,000 worldwide? Washington certainly seems to be looking for some rationale for enhanced domestic military involvement, whether credible or not.

Martial law has essentially been on the table since President Obama took office, thanks to the Bush Administration’s dramatic revisions of the Posse Comitatus Act – which limited deployment of the US military at home – in the wake of Hurricane Katrina. With impeccable timing, Secretary of Defense Robert Gates has gone before Congress asking for the unprecedented authority to base 400,000 soldiers in communities all across the United States.

A recent US Army War College Report even outlined the conditions under which martial law could be introduced, listing:

> …unforeseen economic collapse, loss of functioning political and legal order, purposeful domestic resistance or insurgency, pervasive public health emergencies, and catastrophic natural and human disasters are all paths to disruptive domestic shock. [Emphasis added.]

The CDC is finalizing quarantine regulations formulated during the Bush years that provide for quarantining "a large group of persons" suspected of having swine flu or other illnesses listed in an executive order. This means that President Obama can quarantine anyone as long as they have an illness he determines to be dangerous. These new regulations even permit "provisional" quarantine of persons not actually carrying any virus. In one section, the regulations empower the president to quarantine anyone that does not agree to be vaccinated, an ominous condition since recent investigations have revealed that swine flu vaccines can cause serious medical complications. Thousands of doctors have voiced strong opposition to the proposed swine flu vaccine, due to its association with neurological disorders. No matter, a bill before the Massachusetts State Senate would permit authorities to enter homes and detain without warrant citizens who do not agree to be forcibly vaccinated. Iowa just released a new Orwellian quarantine policy directive that states in the event of a swine flu outbreak, "your home and other less restrictive alternatives are not acceptable." These moves appear to be the result of federal incentives advancing mandatory vaccination.

The Army hasn't missed a step, putting out ads for "Internment/Resettlement Specialists." And, though most of the wild claims about "FEMA camps" have been appropriately and properly discredited, the fact remains that the Homeland Security Department has signed a $385 million contract with Halliburton subsidiary KBR Construction to build such facilities on an "as-needed" basis.

If you're not already feeling nervous, revisit President Obama's spine-chilling campaign pledge:

We cannot continue to rely on our military in order to achieve the national security objectives we've set. We've got to have a civilian national security force that's just as powerful, just as strong, just as well-funded.

With the Serve America Act, this alarming proposition has become reality. The broad authority given to this force is staggering. Section 1505 gives the newly created National Civilian Community Corps the power to address national "needs" related to "natural and other disasters," "infrastructure improvement," "environmental stewardship and conservation," "energy conservation," and "urban and rural development." The legislation reiterates that the corps will "combine the best practices of civilian service with the best aspects of military service."

Nowhere have these two spheres ever been combined that tyranny has not resulted.

If these recent events were mere coincidence, Americans could peacefully go about their business. But Obama is no ordinary President. This is the man who began his political career in the home of terrorists Bill Ayers and Bernadine Dohrn, former members of the notorious Weather Underground that plotted the deaths of 25 million Americans in "re-education camps."

Even so, it sounds crazy, doesn't it? Mass internment and quarantine of Americans? Martial law used illegally to quell opposition to government policies? After all, this is America, not some banana republic.

But this is not the America of even 10 years ago. This is President Obama's brave new America. Differences of opinion are criminalized, violating freedom of conscience in the deepest sense. Freedom of the press is assaulted with newspaper "bailouts" and diversity requirements imposed on local radio

stations. Children face the possibility of weeklong, year-round education, effectively circumventing parents and making children wards of the state. Czars govern in the place of elected officials. Key private sector companies are now under the direct control of the President.

The President has even proven willing to use healthcare reform to target the elderly, recasting human life in terms of the collective good. The White House has even urged fellow citizens to inform on opponents of Obama's healthcare bill. In this environment, the prospect of martial law doesn't sound that far-fetched.

But isn't this unconstitutional? No matter. The Constitution means nothing to President Obama, who has repeatedly implied the need to "break free from the essential constraints that were placed by the Founding Fathers in the Constitution…."

Thomas Jefferson had a different view:

> Confidence is everywhere the parent of despotism…In questions of power, then, let no more be heard of confidence in man, but bind him down from mischief by the chains of the Constitution.

But when the President considers the Constitution to be nothing more than an archaic suggestion, no travesty is unthinkable. And the unthinkable is only a manufactured flu pandemic away. I desperately hope I am wrong in connecting these dots, but in light of the President's stated agenda, and his known track record on ethical issues, the possibility of abuses must be considered. After all, stranger things have happened.

GHSI Global Health Security Initiative

Special Ministerial Meeting on Pandemic (H1N1) 2009

Global Health Security Initiative, Brussels, Belgium, 11 September 2009
http://ghsi.ca/ministerial-statements/brussels-september-2009/

We, Ministers / Secretaries / Commissioner of Health today concluded a Special Ministerial Meeting on Pandemic (H1N1) 2009 in Brussels.

Our collective efforts in the Global Health Security Initiative over the past years have helped lay a foundation of preparedness and have supported the actions which we have taken in responding to the 2009 H1N1 influenza virus. Since the onset of the H1N1 outbreak, the GHSI has played a role in supporting national and global response by facilitating information-sharing, identifying gaps in knowledge, promoting frank dialogue and exchange, and by contributing to a multinational evidence base which can be used to support important decisions by our respective governments.

Mindful of the potential genetic changes of the H1N1 influenza virus and the anticipated further spread of the disease in the months ahead, our deliberations today addressed a range of important issues for an effective pandemic response. Having surveyed the current global epidemiological situation including the impact of the H1N1 influenza virus in the southern hemisphere, we remain vigilant with regard to the global spread of the virus, particularly during the upcoming fall and winter seasons in the Northern Hemisphere.

Today we have also discussed progress and challenges toward H1N1 vaccine development, safety monitoring, clinical assessment and vaccination strategies. We used the opportunity afforded by our meeting today to share national strategies and approaches. We ask GHSI's Pandemic Influenza Working Group to regularly update members on information relevant to public perception and on development, especially with regard to vaccine authorization and target groups. In order to support future decision-making and timely authorization of vaccines, we acknowledge the importance of ongoing sharing of information and best practices relevant to vaccine strategies and are committed to sharing the results of publicly-funded clinical trials. At this time, member countries all intend to start vaccination programmes after market authorization. We further agree to collaborate on the post-market surveillance of H1N1 vaccines and to monitor their safety.

We have also received preliminary information on the issue of dosage that could be of considerable importance for our vaccine strategies and any remaining procurement decisions. We expect that the new information will be reviewed by relevant authorities as rapidly as possible.

Together, we shared challenges and best practices in risk communication reinforcing its importance as a key public health measure. Sharing information with the public helps to minimize the impact of the disease by communicating risks appropriately and in a timely manner. Public messages assist citizens in making choices that promote and protect their health.

We acknowledge the unique challenges faced by developing countries in responding to the H1N1 influenza pandemic. We recognize the dual threat that H1N1 poses to these countries in terms of health and societal impacts and will work with the WHO to strengthen the pandemic readiness of developing countries, in areas such as rapid needs assessment, surveillance and health system

strengthening, and access to vaccines and antivirals. As part of the global community, we share a common goal that vaccine supplies are used as effectively as possible. We will continue to work with the WHO and other UN agencies to that end.

We also reaffirm the conclusion reached as a result of our deliberations in Brussels in December 2008 that even highly restrictive measures, such as general border closures, would be unlikely to prevent the spread of the virus and could aggravate the economic and social consequences of an influenza pandemic.

We remain firm in our resolve and commitment to work together. We will continue to coordinate our efforts in the interest of global health security and we look forward to re-convening later this year in London.

This statement was endorsed by the following Health Ministers, Secretaries and senior officials:

- Ms. Androulla Vassiliou, Commissioner for Health, European Commission, joined by Mrs. Maria Larsson, Minister for Public Health and Elderly Care, Sweden, as representative of the European Union Council of Ministers
- Dr. Klaus Theo Schröder, Secretary of State, Federal Ministry of Health, Germany
- Dr. Mauricio Hernández Ávila, Undersecretary of Health Promotion and Disease Prevention on behalf of the Honourable Dr. José Angel Córdova Villalobos, Secretary of Health, Mexico
- Dr. Fabrizio Oleari, on behalf of the Honourable Maurizio Sacconi, Minister of Labour, Health and Social Policies, Italy
- Ms. Jane Billings, Senior Assistant Deputy Minister, Public Health Agency of Canada, on behalf of the Honourable Leona Aglukkaq, M.P., Minister of Health, Canada
- Professor Didier Houssin, Director General of Health, on behalf of the Honourable Roselyne Bachelot-Narquin, Minister of Health and Sport, France
- Dr. Masato Mugitani, Assistant Minister, Ministry of Health, Labour and Welfare, on behalf of the Honourable Yoichi Masuzoe, Minister of Health, Labour, and Welfare, Japan
- Professor David Harper, Director General, Health Improvement and Protection, on behalf of the Honourable Gillian Merron, M.P., Minister of State for Public Health, United Kingdom
- Dr. Nicole Lurie, Assistant Secretary for Preparedness and Response, Department of Health and Human Services, on behalf of the Honourable Kathleen Sebelius, Secretary of Health and Human Services, United States of America

Launched in 2001, the **Global Health Security Initiative (GHSI)** is an informal, international partnership among like-minded countries and organizations to strengthen public health preparedness and response globally to threats of chemical, biological, and radio-nuclear terrorism (CBRN), as well as pandemic influenza. - http://ghsi.ca/

The Global Health Security Initiative (GHSI) is an informal network of countries and organizations that came together shortly after the September 11, 2001 terrorist attacks to exchange information and coordinate practices within the health sector for confronting new threats and risks to global health. Delegations of the GHSI include Canada, France, Germany, Italy, Japan, Mexico, the United Kingdom, the United States, and the European Commission. The World Health Organization (WHO) serves as an observer. - http://ghsi.ca/about/

The GHSI has contributed significantly to improving global health security. Through coordination with the WHO and other institutions, it has improved prevention and preparedness capacities worldwide through stronger coordinated surveillance, detection, and response efforts.

Medimmune Patented H1N1 Swine Flu Virus back in 2008

Fight Back, 12 September 2009, 06:01 PM

https://web.archive.org/web/20090915181629/http://www.fightbackh1n1.com/2009/09/medimmune-patented-h1n1-swine-flu-virus.html

New York: According to Dr. T. Ott the Swine Flu patent is owned by none other than Medimmune who stands to profit around $151 million dollars from US taxpayers.

MedImmune

MedImmune, LLC, headquartered in Gaithersburg, Maryland, became a wholly owned subsidiary of AstraZeneca in 2007. Since being acquired, MedImmune has remained a Maryland-based biotechnology development enterprise.

It produces Synagis, a drug for the prevention of respiratory infections in infants, which accounted for $1.06 billion of its $1.2 billion in revenue for 2005, and FluMist, a nasal spray influenza vaccine introduced in 2004.

FluMist was approved for children two years of age and older in 2007, but initially was approved only for healthy people ages 5 to 49, a significant limitation because it eliminated a significant market - the millions of young children who find injections objectionable. Sales of FluMist fell short of analysts' expectations for the first two years the drug was sold. FluMist was initially sold in a frozen form, which was difficult for doctors to store

According to MedImmune website they are making a signficant, rapid response with a vaccine to the H1N1 variant of influenza, known as Swine flu. In early June 2009 it won a Department of Health and Human Services (HHS) contract, worth $90m.

Under the contract with HHS, MedImmune will continue to make its seasonal FluMist vaccine and also develop a vaccine targeted specifically at the H1N1 virus MedImmune then won a second contract to test its nasal spray flu technology as a viable treatment for the H1N1.

And now according to Dr T Ott investigation Medimmune applied for and received the patient for Swine Flu Virus back in 2008.

But according to WHO "officially" H1N1 is created naturally and it's a new strain of influenza virus, first identified in April 2009. If so how could Medimmune get the patent for the same back in 2008?

ASIA-Plus

Number of swine flu cases reaches 275,000 worldwide

Asia-Plus, 14 September 2009, 13:38
https://old.asiaplustj.info/en/news/world/20090914/number-swine-flu-cases-reaches-275000-worldwide

The number of confirmed swine flu infections has reached 275,000 with more than 3,500 deaths worldwide, Russia's consumer watchdog Rospotrebnadzor reported on Monday citing the World Health Organization.

The number of confirmed swine flu infections has reached 275,000 with more than 3,500 deaths worldwide, Russia"s consumer watchdog Rospotrebnadzor reported on Monday citing the World Health Organization.

"By September 13, 2009, the number of confirmed A/H1N1 infections stood at 274,896 with 3,555 deaths," the statement says.

According to the latest data, 319 people have been diagnosed with of A/H1N1 virus in Russia. Most of infections are among people who recently returned from trips abroad.

Russia began clinical tests of a live swine flu vaccine in the northwest city of St. Petersburg on September 10.

Swine flu death rate similar to seasonal flu: expert

Reuters, 16 September 2009, 11:13 pm
https://www.reuters.com/article/us-flu-deaths-idUSTRE58E6NZ20090917/

The death rate from the pandemic H1N1 swine flu is likely lower than earlier estimates, an expert in infectious diseases said on Wednesday.

New estimates suggest that the death rate compares to a moderate year of seasonal influenza, said Dr Marc Lipsitch of Harvard University.

"It's mildest in kids. That's one of the really good pieces of news in this pandemic," Lipsitch told a meeting of flu experts being held by the U.S. Institute of Medicine.

"Barring any changes in the virus, I think we can say we are in a category 1 pandemic. This has not become clear until fairly recently."

The Pandemic Severity Index set by the U.S. government has five categories of pandemic, with a category 1 being comparable to a seasonal flu epidemic.

Seasonal flu has a death rate of less than 0.1 percent – but still manages to kill 250,000 to 500,000 people globally every year.

A category 5 pandemic would compare to the 1918 flu pandemic, which had an estimated death rate of 2 percent or more, and would kill tens of million of people.

An estimate published in the journal Eurosurveillance last month by the French Institute for Public Health Surveillance put the mortality rate far higher, at 0.4 percent for all age groups.

Higher Mortality?

Lipsitch took information from around the world on how many people had reported they had influenza-like illness, which may or may not actually be influenza; government reports of actual hospitalizations and confirmed deaths.

He came up with a range of mortality from swine flu ranging from 0.007 percent to 0.045 percent.

Either way, having new information about how many people were infected and did not become severely ill or die makes the pandemic look very mild, he said.

"The news is certainly better than it was in May and even better than it was at the beginning of August," Lipsitch said.

But another expert cautioned this does not mean the pandemic will not have severe effects on people and communities because it will infect more people than seasonal flu usually does in any given year.

"This is not a severe pandemic," said Dr. Jeffrey Duchin of Seattle & King County Public Health and the University of Washington.

"We are going to see probably twice as many people die from the flu as we do in a typical flu season. That is tens of thousands of people. And many of these people are going to be younger."

H1N1 swine flu was declared a pandemic in June after flashing around the world in six weeks, in part because most people have virtually no immunity to it. Experts all said a true death rate would not be clear for weeks because it is impossible to test every patient and because people with mild cases may never be diagnosed.

This lack of information made the epidemics in various countries and cities look worse at first than they actually were, Lipsitch said. People sick enough to be hospitalized are almost always tested first.

"Yes, there's been hype, but I don't think it's been an outrageous amount of hype," Lipsitch said.

Seasonal flu is usually far worse among the elderly, who make up 90 percent of the deaths every year. In contrast, this flu is attacking younger adults and older children, but they are not dying of it at the same rate as the elderly do during seasonal influenza, Lipsitch said.

THE WHITE HOUSE

President Announces Plan to Expand Fight Against Global H1N1 Pandemic

The White House. 17 September 2009
https://web.archive.org/web/20090918121332/https://www.whitehouse.gov/the_press_office/President-Announces-Plan-to-Expand-Fight-Against-Global-H1N1-Pandemic/

Today, President Obama announced the United States will continue to act aggressively to stop the global spread of the pandemic 2009-H1N1 influenza virus and is prepared to make 10 percent of its H1N1 vaccine supply available to other countries through the World Health Organization (WHO). In recognition that diseases know no borders and that the health of the American people is inseparable from the health of people around the world, the United States is taking this action in concert with Australia, Brazil, France, Italy, New Zealand, Norway, Switzerland, and the United Kingdom. The United States will make the H1N1 vaccine available to the WHO on a rolling basis as vaccine supplies become available, in order to assist countries that will not otherwise have direct access to the vaccine.

This week, the Food and Drug Administration officially licensed the 2009-H1N1 influenza vaccine. Last week, the Department of Health and Human Services and the National Institutes of Health announced that one dose of the vaccine – instead of two doses – will be effective in developing immunity in most adults, and HHS Secretary Sebelius announced the vaccine would be available in the coming weeks, earlier than originally anticipated. We remain confident that the United States will have sufficient doses of the vaccine to ensure that every American who wants a vaccine is able to receive one. We continue to recommend that early priority at home and abroad should be given to pregnant women, health care workers, individuals caring for infants less than 6 months of age, and other high-risk populations.

There is broad international recognition that the 2009-H1N1 pandemic presents a global health risk. Millions of people around the world have been affected, thousands have died and the virus continues to spread across international borders. The United States recognizes that just as this challenge transcends borders, so must our response. We invite other nations to join in this urgent global health effort. Working together, we can ensure that this vaccine limits the spread of the disease, reduces the burden on health care systems, reduces the risk of an even more virulent strain emerging and, most importantly, saves lives – in the United States and around the world.

World Health Organization

Pandemic vaccine donations for the developing world

Geneva, WHO, 18 September 2009

https://web.archive.org/web/20090922171635/http://www.who.int/mediacentre/news/statements/2009/pandemic_vaccine_donations_20090918/en/index.html

WHO applauds and welcomes the announcement of donations of pandemic vaccine made today by the United States of America, in concert with Australia, Brazil, France, Italy, New Zealand, Norway, Switzerland, and the United Kingdom.

The announcement demonstrates the commitment of these countries to fairness in sharing of scarce resources as the 2009 H1N1 influenza pandemic continues to evolve.

Current supplies of pandemic vaccine are inadequate for a world population in which virtually everyone is susceptible to infection by a new and readily contagious virus.

Given that current demand outstrips supply, these donations, together with the doses pledged by manufacturers, will help increase supplies of pandemic vaccines to populations that would otherwise not have access.

WHO continues to support developing countries to ensure donated vaccines are distributed where they are most needed.

David P. Coleman

PANAMAX 2009 Tests Pandemic Outbreak in Exercise

Story Number: NNS090918-14
18 September 2009, 2:40:00 PM
https://web.archive.org/web/20090924211932/http://www.navy.mil/search/display.asp?story_id=48357

Panama CITY, Panama (NNS) – Representatives from 10 U.S. government agencies are holding a two-day table-top exercise in cooperation with the government of Panama to assist in responding to any future influenza pandemic Sept. 16.

The agency representatives are in Panama in conjunction with Fuerzas Aliadas PANAMAX 2009, a 12-day military security training exercise involving 20 countries.

The representatives discussed how the United States and the Panamanian government can manage an influenza outbreak by utilizing their agencies' assets to combat a pandemic.

"Our goal is to work as close as possible with the Panamanians in case there is a real threat, such as a pandemic influenza," said U.S. Navy Capt. Miguel A. Cubano, a medical doctor and command surgeon for the U.S. Southern Command. "We want to help them set up a plan so a pandemic outbreak does not have a great impact on their economy, stop people from going to work and school and stop the operations of the Panama Canal."

The agencies present included the Department of State, Department of Homeland Security, Department of Agriculture, Department of Commerce, Federal Aviation Administration, U.S. Agency for International Development, Department of Health and Human Services, U.S. Army, U.S. Coast Guard and U.S. Navy.

Since the severity of flu outbreaks is difficult to predict, the U.S. agencies are sharing tools and information to help Panama combat any level of influenza outbreak.

Influenza usually starts suddenly, with symptoms that include fever, headache, tiredness, coughing, sore throat, runny or stuffy nose, body aches, diarrhea and vomiting. Many different illnesses, including the common cold, can have similar symptoms, so diagnosis and communication are key to anticipating an unusually severe flu outbreak.

The U.S. Navy is working with the Panamanian government and other U.S. agencies to build a preventive plan to fight all diseases, not just the flu.

According to U.S. Coast Guard Cmdr. Joselito S. Ignacio, head of the Coast Guard's Environment Health Division, Navy and Coast Guard vessels could play an important role in combating future epidemics.

"The Coast Guard will work diligently to provide maritime support in our role to help the people of Panama defeat a pandemic outbreak," Ignacio said.

The pandemic exercise is not directly part of the FA PANAMAX 2009 maritime exercise, but is occurring concurrently.

FA PANAMAX 2009 is one of the largest multinational training exercises in the world, and is taking place in the waters off the coasts of Panama from Sept. 11-22 with the participation of civil and military forces.

More than 20 vessels and a dozen aircraft are involved in the exercises. Participants are focusing on a variety of responses to any request from the Government of Panama to protect and guarantee safe passage of traffic through the Panama Canal, ensure its neutrality, and respect national sovereignty. Simulated ground forces are also participating at Fort Sam Houston in San Antonio, Texas.

DOTHAN EAGLE

Lauran Neergaard

Study tries to detect flu before the first sneeze

Dothan Eagle // The Associated Press, 18 September 2009
https://dothaneagle.com/news/study-tries-to-detect-flu-before-the-first-sneeze/article_dea3a84f-8155-57fa-b6f5-48c1297eedf5.html

Washington (AP) – Coughed on by somebody with the flu? Duke University researchers are developing a test to determine – with a mere drop of blood – who will get sick before the sniffling and fever set in. And they're turning to hundreds of dorm-dwelling freshmen this fall to see if it works.

It's a novel experiment: Students report daily whether they have any cold or flu symptoms. If they do, a team swoops in to test not just the sneezer but, more importantly, seemingly healthy friends and hallmates who might be incubating the infection.

"We're redefining the definition of being ill," says Col. Geoffrey Ling, a physician with the Defense Research Projects Agency, the Defense Department's research arm, which came up with the idea.

The reason: The military faces huge problems when flu or other viruses sweep through crowded barracks, and knowing an outbreak was brewing could allow them to separate and protect those not infected. We're not just talking about the challenge of replacing fevered soldiers on the day's patrol. Your body may be slowing down even before that fever erupts, as it tries to fight off a brewing virus.

And flu is contagious up to 24 hours before people show symptoms, one of the insidious ways that it spreads.

"If you've got a group of people living together and you can identify who's likely to become sick, you can much more efficiently use whatever your intervention is – a vaccine, an antiviral – to prevent disease," explains Duke infectious disease specialist Dr. Christopher Woods.

Respiratory viruses sweep through crowded college dorms just as easily as military squads, and with the new swine flu – the 2009 H1N1 strain – targeting mostly the young, Duke scientists may learn sooner than they had hoped just how well their experimental test really works.

It's based on a simple principle: Your immune system revs up to fight infection long before you show symptoms or before today's tests could detect the actual virus in your body. The Duke team discovered a so-called genomic fingerprint, a pattern of subtle molecular changes as genes are activated to fight viral respiratory infections.

Working with colleagues at the University of Virginia and in London, the Duke team first dripped various viruses into the noses of healthy volunteers. The people were quarantined, and scientists collected daily blood, saliva and nasal-fluid samples. Sure enough, they spotted the RNA-based fingerprint that separated who got sick from who didn't, in a few cases just hours after the person was exposed.

But does it work in the real world?

Armed with a $19.5 million Defense grant, Duke is trying to find out – and to create an easy-to-use test kit that could read a blood drop in minutes and signal with, say, a color change who's going to get sick.

"A vision for this would be similar to a diabetic who pricks their finger every day," says project leader Dr. Geoffrey Ginsburg, director of Duke's Center for Genomic Medicine. "The science will tell us what the limitations will be."

Enter the Duke dorm study. It's enrolling up to 800 students who agree to log onto a Web site every day and report if they have any cold- or flu-like symptoms.

Researchers signed up Sean Cadley, a freshman from New York City, when she walked by them already hacking. She admits being enticed in part by $75 in compensation for the pokes and prods of testing.

"I'm getting something out of being sick, which is always nice," said Cadley, a sharp cough still punctuating every few sentences nearly two weeks later.

Cadley, 18, thought nothing of the bug at first, but a fever of 103 hit a few days after the cough and she says she didn't leave her room for two days. Researchers won't say if it was the flu or another virus. But they quickly e-mailed her dorm-mates to say someone in the building was sick, and Cadley's friends raced to volunteer for up to five days of tests – pocketing $150 apiece – to see if they, too, would fall ill.

Beyond the pre-symptom test, the dorm study could shed crucial new light on how flu ripples through communities. Using sophisticated mapping techniques, researchers will tease out social aspects of infection – how close you must be to the sick to catch their bug, for example. And they may identify hot spots of transmission where they can warn students to take extra precautions.

If the study pans out, the Defense agency's Ling hopes to seek Food and Drug Administration approval for a pre-symptom test within two years, aimed at crowded quarters like the military, colleges, nursing homes, even hospital intensive care units.

To Ginsburg, the work is only the beginning. He envisions catching deadly bacterial or fungal infections far earlier in vulnerable people like organ transplant recipients, or even a day when there's a treatment for the common cold – should you detect it early enough.

"Infectious disease is ripe for this," Ginsburg says.

Swine flu 'could kill millions unless rich nations give £900m'

The Guardian, 20 September 2009, 00.08 BST
https://www.theguardian.com/world/2009/sep/20/swine-flu-costs-un-report

UN report says pandemic may result in anarchy unless western world pays for antiviral drugs and vaccines

The swine flu pandemic could kill millions and cause anarchy in the world's poorest nations unless £900m can be raised from rich countries to pay for vaccines and antiviral medicines, says a UN report leaked to the Observer.

The disclosure will provoke concerns that health officials will not be able to stem the growth of the worldwide H1N1 pandemic in developing countries. If the virus takes hold in the poorest nations, millions could die and the economies of fragile countries could be destroyed.

Health ministers around the globe were sent the warning on Thursday in a report on the costs of averting a humanitarian disaster in the next few months. It comes as officials inside the World Health Organization, the UN's public health body, said they feared they would not be able to raise half that amount because of the global downturn.

Gregory Hartl of WHO said the report required an urgent response from rich nations. "There needs to be recognition that the whole world is affected by this pandemic and the chain is only as strong as its weakest link. We have seen how H1N1 has taken hold in richer nations and in the southern hemisphere. We have been given fair warning and must act soon," he said.

The report was drawn up by UN officials over the last two months. It was commissioned in July after Ban ki-moon, the UN's secretary general, expressed concern that the H1NI virus could have a severe impact on the world's poorest countries.

It paints a disastrous picture for the world's most vulnerable people unless there is immediate action. "There is a window in which it will be possible to help poor countries get as ready as they can for H1N1 and that window is closing rapidly," it says.

"Countries where health services are overburdened by diseases, such as HIV/Aids, tuberculosis and malaria, will have great difficulty managing the surge of cases. And if the electricity and water sectors are not able to maintain services, this will have serious implications for the ability of the health sector to function.

"If suppliers of fuel, food, telecommunications, finance or transport services have not developed plans as to how they would continue to deliver their services, the consequences could be significantly intensified," it adds.

The 47-page report provides a detailed breakdown of the basic needs of 75 vulnerable countries with the weakest capacity to withstand an escalation of the virus. Six countries from Latin America, including Cuba and Bolivia, 21 countries from Asia and the Pacific such as North Korea and Bangladesh, and 40 countries from Africa such as Congo and Eritrea are included in the survey.

UN officials say in the report that £700m should be spent on antiviral drugs and vaccines to protect health care workers and other essential personnel as well as cover those suffering from severe illness. They have identified 85 countries that do not have the ability to access vaccines from any other source and intend to cover 5-10% of each population.

A further £147m should be put aside to organise vaccine campaigns, improve communications, monitor levels of illness and improve laboratory capacity in 61 countries, the report claims. The remainder should be used to pay for the WHO and other UN-related organisations to help in these countries as well as an emergency fund for additional antiviral medicines, it argues.

The UN's efforts were boosted last week when nine countries, including Britain and the US, pledged to give the equivalent of a 10% share of their swine flu vaccine supply to help fight the deadly virus's global spread. In Britain, Douglas Alexander, the development secretary, pledged to give £23m.

Some officials within WHO believe, however, that this will not be enough. One said that richer countries were reluctant to pay out all of the money that was needed. "The downturn means that governments countries are reluctant to give," he said.

Another said: "The money is a trickle, not a flood. It is going to be a struggle. If we are not careful, the virus could destroy a burgeoning economy or democracy."

The UN's request for the money comes as the virus begins to establish itself in some of the world's most vulnerable countries. On Wednesday, health officials told one website that the African continent had recorded 8,187 confirmed cases of swine flu and 41 deaths.

Swine flu was declared a pandemic in June and has since been identified in 180 countries. Pandemic experts believe that the western world, including Britain, is facing a second wave of the virus.

BBC NEWS РУССКАЯ СЛУЖБА

Минздрав РФ отрицает случай смерти от свиного гриппа

BBC News, 21 сентября 2009
https://www.bbc.com/russian/russia/2009/09/090920_russia_swine_flu_death

Минздравсоцразвития России не подтвердило информацию о первом в стране случае смерти от свиного гриппа.

"На территории Российской Федерации не выявлено ни одного случая, который бы закончился летальным исходом, то есть смертью", - заявила на брифинге в понедельник заместитель министра Вероника Скворцова.

По ее словам, скончавшаяся 19 августа женщина, о которой говорил в воскресном интервью телеканалу "Россия" директор НИИ вирусологии Дмитрий Львов, умерла не от гриппа A/H1N1, а от целого букета других болезней, среди которых были сахарный диабет, двусторонняя пневмония с дыхательной недостаточностью и врожденный порок сердца.

Член Российской академии медицинских наук Дмитрий Львов, тем не менее, стоит на своем. "Свиной грипп уже среди нас", - говорит он.

Подтвердить нельзя?

По словам Вероники Скворцовой, "основной диагноз, от которого умерла больная - острая внебольничная пневмония, дыхательная недостаточность на фоне врожденного порока сердца и других сопутствующих патологий".

Замминистра уверена, что с учетом всех заболеваний, которые имелись у покойной, подтвердить связь ее смерти с вирусом гриппа A/H1N1 нельзя.

Женщина, работавшая медсестрой в подмосковной больнице, 3 августа вернулась с отдыха в Болгарии, вскоре почувствовала себя плохо и была госпитализирована в пульмонологическое отделение своей же клиники. 12 августа в связи с ухудшением состояния ее перевели в специализированную столичную клинику, однако спасти больную врачам не удалось.

Скворцова подчеркнула, что исследование на выявление антител к вирусу A/H1N1, показавшее положительный результат, проводилось на незарегистрированном оборудовании, а тестирование всех лиц, контактировавших с покойной, ни у кого не выявило наличия вируса.

"Ни в одной пробе, ни от одного обследованного не было выявлено носительства", - заявила она.

По данным Минздравсоцразвития, число заболевших свиным гриппом в России на 21 сентября составляет 381 человек.

Позиция академика

Между тем член Российской академии медицинских наук Дмитрий Львов от своих слов отказываться не намерен.

"Я сказал то, что я сказал. У меня есть для этого аргументы", - заявил он агентству "Интерфакс" в ответ на просьбу прокомментировать слова Вероники Скворцовой.

В телеинтервью 20 сентября он выразил мнение, что скрытыми носителями вируса уже являются десятки тысяч россиян, и "распространение свиного гриппа в России уже не удастся остановить".

"Он [свиной грипп] уже среди нас. По моим расчетам, десятки тысяч зараженных больных. Я сию минуту доказать это не могу. Через пару недель у меня в руках будут такие факты, где я скажу, что вот так оно и есть", - заявил эксперт.

Что касается конкретного летального исхода, то, по словам Львова, лабораторные пробы пациентки были направлены в возглавляемый им институт лишь за сутки до ее смерти.

"Какие-то меры принять мы были не в состоянии, потому что она скончалась на следующий день", - сказал Львов.

По последним данным ВОЗ, число заболевших свиным гриппом в мире превысило 296 тысяч человек, из которых коло 3,5 тысяч умерли.

H1N1 FluMist ~ the Nasal Spray that Keeps on Giving!

Associated Content, 23 September 2009

https://web.archive.org/web/20091023091136/http://www.associatedcontent.com/article/2205843/h1n1_flumist_the_nasal_spray_that_keeps.html?cat=70 (link is corrupted)

Everyone has to be responsible for their own decisions. If you are afraid of catching the H1N1 flu this year. You may be pondering whether to get a flu shot or using the H1N1 FluMist. The FluMist is administered into your nostrils. Before making your final decision, you may want to ask some questions and think of some consequences to taking the H1N1 FluMist nasal spray.

The H1N1 FluMist is made with "live" virus. This means that the H1N1 flu will be a part of the nasal spray formula. It's supposed to be just enough to start your immunity to build defenses to it. The shot is supposed to be a killed virus.

If you take the H1N1 FluMist, you will in fact become a carrier of the H1N1 flu. Information on this drug states that *you can and will shed the virus for up to 21 days*. That means as you are visiting with your elderly family members, or shopping in the isles of your grocery store or sitting in church with young children and people with immune problems, YOU are going to be shedding the virus H1N1 germs.

If you are a person that cannot tolerate the shot or the FluMist for the H1N1 flu, you are a sitting duck when it comes to being around people who have taken the FluMist. The use of FluMist is for people ages 2 - 49. How many people do you come into contact each day that don't fit the age range?

Drugs.com says that you should be careful when coming into contact with "FluMist with anyone who has a weak immune system caused by disease (such as cancer, HIV, or AIDS), or by certain medicines such as steroids, cancer chemotherapy, or radiation treatment. A person with a weak immune system can become ill if they have close contact with you after you have recently received a an influenza vaccine." Pregnant women are also on this list of people who should NOT use FluMist.

What happens when anything gets in your nose? You sneeze! Please be a responsible user of the FluMist and cover your face when you sneeze and cough. Remember, you are passing the H1N1 flu germs. The flu is passed from person to person with the sneezing, the coughing and germs from your hands. So if you take FluMist for the H1N1 flu, please practice good hygiene for the rest of us and wash, wash, wash your hands! => the next page is blocked

H1N1 FluMist ~ the Nasal Spray that Keeps on Giving!

September 23, 2009 by Sherry Tomfeld

McGill

2009 International Swine Flu Conference
Conférence internationale sur la grippe porcine 2009

McGill, 23 September 2009
https://healthenews.mcgill.ca/2009-international-swine-flu-conference/

The International Swine Flu Conference (ISFC) is designed to help you better meet the threat of a swine flu pandemic as well as to meet your planning requirements – on time, under budget, and with a minimum of disruption to your operations. This two-day event will include presentations, panel discussions, 15 concurrent breakout sessions and over 60 speakers.

We encourage you to share your specific issues and concerns and take advantage of the open-discussion collaborative environment of our summit workshops.

Toronto, November 23-24, 2009

La Conférence internationale sur la grippe porcine (CIGP) est conçue pour vous aider à mieux faire face à la menace d'une pandémie de grippe porcine et à répondre aux exigences de la planification : être prêt à temps, avec un budget réduit et en perturbant le moins possible vos activités. Cet événement de deux jours offrira des présentations, des débats, 15 ateliers simultanés et plus de 60 conférenciers.

Nous vous encourageons à partager vos problèmes et inquiétudes spécifiques et à profiter de l'environnement de discussion ouverte et de collaboration des ateliers de notre sommet.

Toronto, Le 23 et 24 novembre 2009

Next International H1N1 Swine Flu Conference

=> International Swine Flu Conference. – Toronto, Canada, 23-25 November 2009.
=> International Swine Flu Conference. – London, UK, 2-3 December 2009.
=> International Swine Flu Conference. – London, UK, 10-12 March 2010.
=> 2nd International Swine Flu Conference. – Washington, DC, 18-19 August 2010.

World Health Organization

Dr Margaret Chan

Director-General Statement
following the fifth meeting of the Emergency Committee

Geneva, WHO, 24 September 2009
https://www.who.int/news/item/24-09-2009-director-general-statement-following-the-fifth-meeting-of-the-emergency-committee

The Emergency Committee held its fifth meeting, via e-mail, concluding on 23 September 2009.

The Committee considered a proposal from the WHO Director-General regarding the continuation of three temporary recommendations issued under the IHR with respect to the on-going public health emergency of international concern. There was a consensus on continuing the three temporary recommendations proposed by the Director-General.

Having considered the views of the Emergency Committee, and the ongoing pandemic situation, the Director-General determined it was appropriate to continue these temporary recommendations, namely:

- countries should not close borders or restrict international traffic and trade;
- intensify surveillance of unusual flu-like illness & severe pneumonia; and
- if ill, it is prudent to delay international travel – if ill after travel seek care.

United Nations seeks $1.5 billion for swine flu

United Nations health officials claim in a new report they need nearly $1.5 billion to prevent the swine flu epidemic from spiraling into a global catastrophe

NBC News, 25 September 2009, 9:11 AM + 08
https://www.nbcnews.com/id/wbna33005574

United Nations health officials claim in a new report they need nearly $1.5 billion to prevent the swine flu epidemic from spiraling into a global catastrophe.

But for a virus from which most people recover without ever being treated, not all experts are convinced swine flu merits such attention – and some critics even suspect the U.N. is using the pandemic as a convenient way to raise money.

On the sidelines of the U.N. General Assembly, World Health Organization chief Margaret Chan was meeting Thursday with other top officials to discuss the swine flu funding appeal, which was authored by WHO and two other U.N. agencies.

Experts said the global community should closely track how the swine flu money gets spent.

"When $1.5 billion is pledged, it's a reasonable question to ask about the details behind it," said Orin Levine, an associate professor at Johns Hopkins Bloomberg School of Public Health. "We should be very careful to watch where the money goes."

WHO spokesman Gregory Hartl denied WHO was using the H1N1 swine flu virus as a pretext for fundraising and said the appeal was a necessary response to the global health emergency.

"If we don't try to fund H1N1, we would be remiss in our public health responsibility to the world," he said.

In the U.N. funding appeal, the agency says nearly 80 percent of the requested money would be used to buy antivirals and vaccines. The rest would go mostly to "strengthening country readiness."

Influenza viruses like swine flu are unpredictable. Since the H1N1 virus first emerged in spring, experts have worried it might mutate into a more lethal form.

So far, those fears haven't panned out. Experiments at the U.S. Centers for Disease Control and Prevention showed swine flu lacks certain traits to help it easily morph into a more dangerous version.

Hartl said even if the virus doesn't turn deadlier, the agency expects to see a spike in cases that might crush health systems in poor countries. "There are a lot of signs that we need to take this seriously," he said.

3,500 have died so far

Globally, WHO estimates more than 3,500 people have died of swine flu – far fewer than those killed by diarrhea, pneumonia, or road accidents. That leads some experts to contend that WHO's prediction the virus could lead to "civil disruption" in poor countries may be overblown.

A sum of $1.5 billion is a lot to ask for considering swine flu is unlikely to be one of the world's top killers, said Christopher Murray, director of the Institute for Health Metrics and Evaluation at the University of Washington.

"Given that the world spends about $22 billion on all global health problems, is it really wise to spend $1.5 billion only on swine flu?"

Some experts said WHO's funding appeal went beyond the boundaries of its mandate.

"I am concerned WHO's communications is corrupted by the fact they push the buttons in the public's brains that will raise the most funds," said William Aldis, a retired senior WHO official who worked on the bird flu crisis.

"That is incompatible with what the organization should be doing: serving the public with technically correct factual information, pure and simple."

Others accused WHO of sacrificing science for dollars.

"WHO is peddling an alarmist, unscientific agenda to raise funds," said Philip Stevens, a director at International Policy Network, a London-based think tank. "The U.N. is operating on pure conjecture that we will face anarchy and chaos in the developing world should the virus mutate," he said.

HIN1 overshadowing other pressing problems?

In countries where health systems are too weak to effectively mass distribute antivirals and vaccines, some experts questioned WHO's spending plan, particularly since most of the money will benefit the drug industry.

"If we want to reduce the mortality that will be caused by the H1N1 pandemic, we cannot rely only on the vaccine," said Dr. Christophe Fournier of Medecins Sans Frontieres.

Aldis warned that in countries with few resources, giving people a swine flu shot might come at the expense of a vaccine for measles or diptheria.

Some experts said the U.N.'s billion-dollar swine flu appeal could overshadow other pressing health problems.

"I would prioritize other areas like maternal and child health, where the need is urgent and huge," Murray said.

The severity of pandemic H1N1 influenza in the United States, April - July 2009

PLoS Curr. 25 September 2009; 1: RRN1042
doi: 10.1371/currents.RRN1042. PMID: 20029614; PMCID: PMC2762775.

Abstract

Background

Accurate measures of the severity of pandemic (H1N1) 2009 influenza (pH1N1) are needed to assess the likely impact of an anticipated resurgence in the autumn in the Northern Hemisphere. Severity has been difficult to measure because jurisdictions with large numbers of deaths and other severe outcomes have had too many cases to assess the total number with confidence. Also, detection of severe cases may be more likely, resulting in overestimation of the severity of an average case. We sought to estimate the probabilities that symptomatic infection would lead to hospitalization, ICU admission, and death by combining data from multiple sources.

Methods and Findings

We used complementary data from two US cities: Milwaukee attempted to identify cases of medically attended infection whether or not they required hospitalization, while New York City focused on the identification of hospitalizations, intensive care admission or mechanical ventilation (hereafter, ICU), and deaths. New York data were used to estimate numerators for ICU and death, and two sources of data – medically attended cases in Milwaukee or self-reported influenza-like illness (ILI) in New York – were used to estimate ratios of symptomatic cases to hospitalizations. Combining these data with estimates of the fraction detected for each level of severity, we estimated the proportion of symptomatic patients who died (symptomatic case-fatality ratio, sCFR), required ICU (sCIR), and required hospitalization (sCHR), overall and by age category. Evidence, prior information, and associated uncertainty were analyzed in a Bayesian evidence synthesis framework. Using medically attended cases and estimates of the proportion of symptomatic cases medically attended, we estimated an sCFR of 0.048% (95% credible interval [CI] 0.026%–0.096%), sCIR of 0.239% (0.134%–0.458%), and sCHR of 1.44% (0.83%–2.64%). Using self-reported ILI, we obtained estimates approximately 7–9× lower. sCFR and sCIR appear to be highest in persons aged 18 y and older, and lowest in children aged 5–17 y. sCHR appears to be lowest in persons aged 5–17; our data were too sparse to allow us to determine the group in which it was the highest.

Conclusions

These estimates suggest that an autumn–winter pandemic wave of pH1N1 with comparable severity per case could lead to a number of deaths in the range from considerably below that associated with seasonal influenza to slightly higher, but with the greatest impact in children aged 0–4 and adults 18–64. These estimates of impact depend on assumptions about total incidence of infection and would be larger if incidence of symptomatic infection were higher or shifted toward adults, if viral virulence increased, or if suboptimal treatment resulted from stress on the health care system; numbers would decrease if the total proportion of the population symptomatically infected were lower than assumed.

Critics: Pandemic emergency bill tramples privacy rights

The Patriot Ledger, 26 September 2009, 12:01 AM ET.
https://www.patriotledger.com/story/lifestyle/health-fitness/2009/09/26/critics-pandemic-emergency-bill-tramples/40275122007/

Mandatory vaccinations, home searches without a warrant and forced quarantine for those who resist.

Critics of a pandemic preparedness bill pending in the Legislature say it would allow all those things and sets the stage for a medical police state where any response to an epidemic of flu or other illness has the potential to steamroll civil liberties.

The bill's supporters and its sponsor, Sen. Richard Moore, D-Uxbridge, have found themselves in recent weeks defending against attacks from talk show hosts and Internet critics with an anti-Big Government bent. In the category of unlikely bedfellows: the ACLU has joined the opposition.

Moore and other supporters say the bill is largely borrowed from public health laws and court rulings already on the books. They say that rumors and lies have led people to overreact to the legislation, and cite as an example the statement that the bill makes vaccinations mandatory. While he says his own bill doesn't mandate vaccination, Moore points to a 1905 U.S. Supreme Court ruling in a Massachusetts smallpox case that said states could require people to get vaccinated.

Critics responded that the bill's language is too broad and vague in many key areas, and that supporters were splitting hairs in defending it. No, vaccination is not mandatory, but people who do not get vaccinated after the governor declares a health emergency can be placed under quarantine, and failure to observe the quarantine can result in arrest.

Senate Bill No. 2028 – An Act Relative to Pandemic and Disaster Preparation and Response in the Commonwealth – passed the Senate by a unanimous vote on April 30 with almost no public notice. It is awaiting debate and vote on the House floor.

Christopher Ott, spokesman for the Massachusetts chapter of the ACLU, which opposes the bill, said, "We feel it's just a bad idea to legislate out of fear and in a hurry."

But the bill is not new and not a response to the H1N1 flu.

Moore first filed it about six years ago in response to the threat of anthrax attacks after Sept. 11, 2001. Rewritten versions have passed the Senate three times, but the bill has yet to make it through the legislative process.

The emergency measures outlined in the bill wouldn't be automatically activated even in a swine flu outbreak, said Jared Cain, a spokesman for Moore.

"The circumstances would have to be pretty grim," he said, before it became operative.

On Sept. 9, John Auerbach, the state's commission of public health, wrote a letter to legislators to clarify the matter.

"If the H1N1 pandemic develops ... there would be NO NEED (his capitals) for a declaration of the type of public health emergency as envisioned in Senate Bill 2028," he wrote.

The legislation, he said, is designed for situations on the level of the SARS outbreak or the aftermath of Hurricane Katrina in Louisiana.

But critics point out that the bill itself does not say it wouldn't be used for any type of flu outbreak regardless of how widespread or deadly it was.

State Sen. Robert Hedlund, R-Weymouth, voted for the bill in April but now says he has changed his mind. When it comes back to the Senate for a final vote, he said he plans to vote against it if no changes are made by the House or a joint conference committee.

"I think it needs to be defined what constitutes a public health threat. That's very vague," he said. "A lot of the definitions and criteria have to be firmed up."

The bill was initially based on the Model State Emergency Health Powers Act completed in December 2001 by the Centers for Law and Public's Health, a collaboration between Johns Hopkins and Georgetown universities.

According to the center, that model legislation has been introduced in whole or in part in 171 bills in 44 states.

Cain, Moore's spokesman, said the bill doesn't include anything not already on the books in Massachusetts. It consolidates many health laws and regulations into one act to outline how the state should deal with public health crises and what the state health commissioner would be empowered to do, he said.

Current laws, Cain said, are very broad on who would be in charge and what would take place.

"There are dozens of public health laws this bill borrows from," he said. "But it's all based on Massachusetts General Laws."

Senate Bill 2028 says that anyone who refuses to get a vaccination recommended by public health officials may be quarantined. It also allows arrest without a warrant or entry into any house or building without a warrant if an officer has probable cause to believe there is a violation of a quarantine.

The prospect of warrantless search and arrest riles critics, who call is an illegal expansion of the state's existing regulations for quarantine.

Moore's office says the bill applies to a public health situation the probable cause standard that already allows search and arrest without a warrant in other situations. While the Fourth Amendment of the U.S. Constitution guards against unwarranted searches and seizures, the concept of "exigent circumstances" has developed over time through case law. Emergency situations requiring swift action, the courts have held, may make a warrantless search constitutional if probable cause exists.

Under existing law, a quarantine order cannot be enforced unless the state health department or a local health board applies to a Superior Court judge for an judicial order empowering health authorities to take specific actions.

Ott, of the ACLU, said the organization believes "heavy-handed law enforcement is not the way to go."

The bill would also empower the state health commissioner to restrict or prohibit public assemblies.

Cain said Moore's intention was to require people to stay home from work or school, and give the health commissioner authority to close schools.

Critics, however, point out that the bill does specify those limits or intents.

When asked if it would apply to any public meeting, Cain said, "We're talking about an ebola-type situation. Nobody is going to think about having public meetings if this is the case."

LE MONDE *diplomatique*

Opération H1N1

Le Monde diplomatique, 28 Septembre 2009
https://web.archive.org/web/20100103025025/http://blog.mondediplo.net/2009-09-25-Operation-H1N1

«Centre opérationnel pandémie» (COP): des équipes se relaient dans cette structure de crise mise en place par le ministère de la Défense, en application du plan national de lutte contre du virus H1N1. La cellule «Opint» (opération intérieure) – déjà mobilisée lors de la prise d'otages du ferry Pascal Paoli, en 2005, ou lors de la tempête Klaus, en janvier 2009 – a été réactivée depuis début septembre, dans les sous-sols bunkerisés du boulevard Saint-Germain, dans le 6ème arrondisement, à Paris, au cœur du Centre de planification et de conduite des opérations (CPCO) – le «saint des saints» de la défense.

Objectif: vacciner au moins la moitié des 230 000 militaires engagés dans la préparation et l'emploi des forces armées, ainsi que les 100 000 gendarmes chargés de la sécurité au quotidien. Le «plan de continuité d'activité des armées» doit permettre, selon le ministre Hervé Morin, de préserver, quoiqu'il arrive, les missions jugées «impératives», comme la dissuasion nucléaire, la défense de l'espace aérien et des approches maritimes, ou les missions de sécurité intérieure.

Tous les militaires présents sur des théâtres d'opérations extérieures (Afghanistan, Balkans, Afrique) et dans les DOM-TOM (premières cibles françaises de la pandémie) ont reçu des réserves de masques et de vaccin Tamiflu qui leur garantissent soixante jours d'autonomie. Les unités désignées pour la relève (tous les quatre à six mois, selon les «opex»), sont également prioritaires: elles doivent être en mesure de poursuivre leurs entraînements, pour que Paris puisse tenir ses engagements internationaux.

Réserve de forces Retour à la table des matières

Par contrat, l'armée de terre tient par ailleurs en réserve dix mille militaires susceptibles de porter assistance aux autorités à l'intérieur du territoire, dont les 1600 personnels de l'opération Vigipirate. «Comme à chaque crise majeure (tempête, crash, pandémie...), la réserve des forces armées pourrait venir épauler les préfets en cas de besoin», précisait l'amiral Christophe Prazuck, porte-parole de l'état-major des forces armées: stockage et distribution des masques et doses de vaccins; acheminement d'urgence de vivres, etc.

La Pharmacie centrale des armées, seul établissement public habilité à produire l'équivalent de l'antiviral Tamiflu, a fabriqué près de 80 millions de comprimés, et se tient prête à reprendre la production à tout moment. Six hôpitaux d'instruction des armées – Metz, Marseille, Bordeaux, Brest, Val de Grâce à Paris, et Saint-Mandé – disposent de laboratoires agréés pour faire les diagnostics de la maladie. L'ensemble des établissements de santé des armées se sont préparés à accueillir les patients les plus gravement atteints, et à participer aux campagnes de vaccination de la population civile.

C'est le Secrétariat général de la défense nationale (SGDN) qui avait été chargé par le premier ministre d'actualiser dès le mois de février dernier le Plan national de prévention et de lutte «Pandémie grippale» de janvier 2007, suite aux nouvelles consignes de l'OMS, aux travaux réalisés sous l'égide du délégué interministériel à la lutte contre la gripe aviaire, aux enseignements tirés de l'exercice national réalisé le 24 janvier 2008, et aux recommandations du Livre blanc sur la défense et la sécurité nationale, publié en juin 2008.

Confinement et quarantaine Retour à la table des matières

Alors que le plan secret de la Chancellerie pour le maintien en activité de la justice, comportant de nombreuses limitations aux droits traditionnels, n'avait été dévoilé que début septembre, et par le

Syndicat de la Magistrature [1], le plan défense était connu des spécialistes. Dès le 30 avril 2009, la générale Anne Robert, médecin-chef des services, avait annoncé l'activation du réseau SMOG (Système militaire d'observation de la grippe) reposant sur trente «unités sentinelles», les soixante centres SMOP (Système militaire d'observation d'une pandémie) se préparant à une éventuelle activation.

«Les armées prendront part aux dispositifs de contrôle aux frontières, sur demande des autorités civiles, en fonction de leurs capacité du moment», mais seulement «en complément des forces de l'ordre dont c'est la mission», avait précisé la générale. En outre,

- des mesures de confinement (pour certains militaires et en fonction de leurs missions), ainsi que des mesures de restriction de mouvement (exercices, stages, entraînements) sont prévues, en cas de généralisation de la pandémie;
- le fonctionnement des unités pourra être réduit au minimum, et des mesures de maintien à domicile des militaires ou civils de la défense non indispensables seraient alors décidées;
- des mesures de quarantaine pourraient également être appliquées aux personnels de retour d'une zone suspecte;
- un contrôle sanitaire strict serait exercé sur les accès aux casernements abritant des moyens d'intervention,

THE FLU CASE

Top level army group activated in France to plan pandemic operations

The Flu Case, 11 November 2009

https://web.archive.org/web/20100102051438/http://theflucase.com/index.php?option=com_content&view=article&id=1736%3Atop-level-army-group-activated-in-france-to-plan-pandemic-operations&catid=41%3Ahighlighted-news&Itemid=105&lang=en

«The Operational Pandemic Center » (COP), set up by the Ministry of Defence in 2004, consists of 120 officers and 80 non commissioned officers who carry out strategic crisis planning. But the unit's activation will fuel fears that the government intends to implement martial law and also carry out forced vaccination and quarantines inspite of claims to the contrary.

The unit has been operating since September out of a bunker located beneath 231 boulevard St Germain in the center of Paris – where the army chief of staff has ist headquarters – and is reported to be involved in the construction of a new European Union Army.

Under the French national pandemic plan, special crisis committees work closely with and take orders from WHO.

The objective of the COP is to vaccinate at least half of the army's 230,000 soldiers as well as 100,000 Gendarmes with the swine flu jab.

In *April, the French army chief doctor General Anne Robert* announced a raft of measures to deal with the swine flu inside the army, including quarantine of units and the confinement of soldiers to barracks.

Emmanuel Hirsch, Director of the Departement of Research into Ethical Studies at the University of Paris-Sud XI has criticised the mobilisation of the army saying that it will be hard to impose restrictions on people if there has been no debate beforehand with people about why they are needed.

The mobilisation of the army to deal with a mild swine flu pandemic that has caused only a handful of deaths in France – while the far bigger problems of the economic crash and the theft of gigantic sums of tax money by the banks and industrialists are being ignored – will fuel fears that key elements in the state are acting as accomplices in a crime and are helping to wage biological warfare against the French people under the pretext of fighting a pandemic emergency.

CTV NEWS

Mutation not causing greater virulence in swine flu

CTV News // The Associated Press, 30 September 2009, 12:45 PM EDT
https://www.ctvnews.ca/mutation-not-causing-greater-virulence-in-swine-flu-1.439299?cache=klfcnyffis%3FclipId%3D104056%2F7.337730

Toronto – Dutch scientists have reported they have found what was thought to be a key mutation in some swine flu viruses from the Netherlands, a change many virologists feared would give the viruses the ability to cause more severe disease.

But so far the evidence seems to suggest this mutation does not make the new H1N1 virus more virulent, the researchers said Tuesday.

The change, at position 627 on the PB2 gene of the virus, is known to increase the ability of flu viruses to replicate; prolonged viral replication can lead to more serious illness. The mutation has been found in all known human flu viruses, including the three that caused the pandemics of the last century.

"Everybody predicted that this mutation is going to have a big impact on virus replication of the new H1N1," said Dr. Ron Fouchier, one of the authors of the report and a molecular virologist at Erasmus Medical Centre in Rotterdam.

"If you would have asked me three months ago, I would have bet my car on it. But nobody placed that bet because everybody was sure that it would increase (virulence)."

If they had, it seems they might have been able to claim the keys to Fouchier's SUV.

Three people either known or suspected of having been infected with the mutated H1N1 viruses suffered only mild disease. And ferrets infected with a laboratory synthesized H1N1 virus with this change also did not suffer more severe disease. Ferrets are the standard animal model for human flu.

"Given the information that we have at present, we have no indication for increased virulence," said Dr. Marion Koopmans, chief of virology in the infectious diseases laboratory of the National Institute of Public Health, The Netherlands.

"This is a mutation that is in the textbooks as something to look out for, but whether it really confers something to these (H1N1) viruses remains to be seen."

Koopmans, Fouchier and a number of colleagues disclosed the surprising findings through ProMed, a website and mailing list that serves as an early warning system for infectious diseases developments. It is closely scrutinized by scientists and public health officials in the infectious diseases sphere.

The Dutch scientists reported finding two viruses with this change that appear to have been transmitted between mid-July and mid-August in the West Frisian Islands in the north of The Netherlands. The area is a popular destination for Dutch and German campers.

One of the mutated viruses was recovered from a male who had been there and who started developing symptoms on Aug. 9. The second was found in a girl who hadn't been to the area, but

whose sister had been camping there at the time. The sister was also sick, but there was no specimen from her to test. Koopmans said the working assumption is that the sister who went camping was also infected with this virus.

The first virus was only discovered in mid-September, when it made its way to Koopmans' lab. An investigation at that point showed the male and the sister had been part of a group of 24 who shared two tents on the island. Most of the members of the camping party reported having been ill.

Koopmans said officials have looked at specimens from the area and from the regions from whence the campers came, but haven't found more viruses with this change.

"There's no evidence yet that this virus has spread any further in Holland," Fouchier said. "Of course we're currently still looking for it. Every virus we get our hands on we check (position) 627. But we haven't found any more."

Labs have been looking for this mutation from the moment the new H1N1 virus was fully analyzed and it was seen it didn't have the same amino acid at position 627 as other human viruses have.

Some scientists even suggested the virus might not be fully adapted to spread among humans because it didn't have this change, but instead had an amino acid at position 627 that is normally seen in avian flu viruses. The pandemic virus, which is a never-before-seen hybrid of swine, avian and human genes, has an avian PB2 gene.

Dr. Richard Webby, head of the World Health Organization's influenza collaborating centre at St. Jude Children's Research Hospital in Memphis, Tenn., said there is good evidence this mutation is associated with adaptation of avian influenza viruses to humans, but the proof that it is linked to severity of disease is less clear.

Viruses with this change show increased virulence in mice and sometimes in ferrets, but not always, he said, suggesting the ferret data probably are more reliable. "I think this is one instance where mice are probably lying a little bit," Webby said.

In some flu viruses this change is known to allow the virus to replicate at cooler temperatures, meaning they can infect the upper airways, rather than the warmer deep lung area preferred by avian flu viruses.

That might actually be a good thing with this H1N1, Webby said, noting autopsies have shown that in severe cases the pandemic virus wreaks havoc deep in the lungs.

Dr. Nancy Cox, who heads the influenza division at the U.S. Centers for Disease Control, warns people should not take too much comfort from the fact this change doesn't seem to make the virus more virulent at this point.

"We just know that influenza can change in unpredictable ways through mutation and reassortment," she said, referring to the process by which flu viruses swap genes with each other.

"The unexpected can arise, and arise very quickly. So we shouldn't write this off. It is causing hospitalization. It is causing fatalities. And in every single case that you hear about, it's a tragedy."

Big Pharma jumps back into Flu business

Reuters, 30 September 2009
https://www.reuters.com/article/us-flu-vaccines-analysis-idUSTRE58S6AP20090930

Chicago (Reuters) - A dearth of new products, new technologies and fresh commitments by governments scrambling to protect their populations from pandemic threats have lured U.S. drugmakers back into the flu vaccine business.

Three big U.S. pharmaceutical companies announced vaccine deals this week.

Johnson & Johnson, the world's largest healthcare company by market value, spent $444 million to buy a stake in Dutch biotech company Crucell as part of a new push into influenza vaccine and drug development.

Abbott Laboratories Inc spent $6.6 billion to buy the drugs unit of Belgium's Solvay, including Solvay's Dutch cell-based flu vaccine production facility, which can make both seasonal and pandemic influenza vaccines.

And Merck & Co, already a vaccines powerhouse with its shingles and cervical cancer vaccines, got back into the U.S. flu market with a deal to distribute seasonal flu vaccine made by Australia's CSL Ltd.

Although analysts say the deals are more strategic than game-changing, collectively they have infectious diseases experts heaving a sigh of relief.

"I am very pleased. For a while, a lot of vaccine manufactures simply disappeared," said Dr. Hildegund Ertl, who directs the vaccine centers at the Wistar Institute in Philadelphia.

"There was this attitude 20 years ago, 'Let's not worry about microbes. We've conquered them. Let's focus on cancer.' Then HIV came along. Then SARS came along. Then H5N1 (avian influenza) came along," she said.

Ertl said beginning with an outbreak of bird flu in Hong Kong in 1998, the United States and other governments started to offer grants to companies to develop new ways of making influenza vaccines.

That has continued with the current H1N1 swine flu pandemic that started in June. The U.S. government has committed $1.8 billion to companies to make a swine flu vaccine.

Out to Get Us

"I think it's finally sinking into politicians' minds that maybe viruses and pathogens are out to get us and that our infrastructure has really gone to hell," Ertl said in a telephone interview.

"We have very few vaccine manufacturers in this country," she said, noting that companies like Wyeth , which is being acquired by Pfizer, dropped out of the flu vaccine market in the United States in 2002 because of high manufacturing costs and commodity pricing.

Five companies make swine flu vaccine for the U.S. market, all ultimately owned outside the United States – Astra Zeneca's MedImmune unit, CSL, GlaxoSmithKline Plc, Novartis AG and Sanofi-Aventis SA.

"The government is now pitching in to try to get interest back, to have more manufacturers make vaccines," Ertl said.

Both Wyeth and Merck once made influenza vaccines in the United States using conventional egg-based technology.

"They decided it wasn't worth it," said Dr. Robert Belshe, director of Saint Louis University's Center for Vaccine Development. "But with new technologies and the rise in importance influenza vaccine, I think companies are revisiting that now."

For example, instead of chicken eggs, Solvay makes flu vaccine in cell culture, and Crucell is developing "flu-mAb," an antibody treatment meant to provide protection from all influenza A strains as well as to treat patients who are already infected.

Belshe said the United States is on the verge of recommending that all U.S. citizens get a flu shot. "We're at 270 million people who should get vaccinated. It's a big market. I think manufacturers are just now catching up."

John Sullivan, director of research and healthcare strategist at Leerink Swann, said all three deals reflect the fact that the pharmaceutical industry has too few products, but "lots of cash and lots of cash flow."

But he said the deals do suggest a change in direction.

"These deals indicate that infectious disease is perhaps moving up the list of what the managements of some big therapeutics companies care about," Sullivan said in a telephone interview.

He said the swine flu pandemic has made clear that governments are more willing to pay for products that protect their populations than before.

"If you look at some emerging countries – Brazil, India, China – governments are perceiving healthcare as a good that they can provide to their people, and they increasingly have enough money to do it."

ФЕДЕРАЛЬНАЯ СЛУЖБА ПО НАДЗОРУ В СФЕРЕ ЗАЩИТЫ ПРАВ ПОТРЕБИТЕЛЕЙ И БЛАГОПОЛУЧИЯ ЧЕЛОВЕКА

О Направлении Рекомендаций CDC США по Профилактике гриппа для родителей

Роспотребнадзор, Письмо, 1 октября 2009 г. N 01/14515-9-32
https://web.archive.org/web/20160623034546/http://www.hippocratic.ru/medtext2/medtext_26897.htm

Федеральная служба по надзору в сфере защиты прав потребителей и благополучия человека *направляет для сведения* рекомендации СДС США для родителей по профилактике гриппа в семьях.

Что следует предпринять родителям, чтобы уберечь своих детей и других членов семьи от гриппа в этом учебном году

Центры по контролю и предотвращению заболеваний (CDC) рекомендуют 4 наиболее эффективных способа защиты от гриппа в школе и дома:

1. Соблюдайте гигиену рук. Мойте руки водой с мылом как можно чаще, особенно после кашля или чихания. Также эффективными являются средства для обработки рук на основе спирта.

2. Прикрывайте рот и нос бумажной салфеткой во время кашля или чихания. Если у вас нет салфетки, при кашле или чихании прикрывайтесь локтем или плечом, а не руками.

3. Оставайтесь дома, если вы или ваш ребенок переболели, в течение, по крайней мере, 24 часов после того, как температура спала или исчезли ее симптомы (и больной при этом не принимал жаропонижающих средств). Для предотвращения распространения вируса заболевший школьник должен оставаться дома.

4. Все члены семьи должны сделать прививку от сезонного гриппа и гриппа H1N1 2009, как только поступит соответствующая вакцина. Если эпидемия гриппа примет более серьезные масштабы, родителям следует принять следующие меры:

- Продлите время пребывания заболевших детей дома, по крайней мере, на 7 дней - даже в том случае, если состояние больного улучшится раньше. Тем, кто болеет дольше 7 дней, следует оставаться дома в течение, по крайней мере, 24 часов после полного исчезновения симптомов.
- В случае заболевания одного из членов семьи все дети школьного возраста должны оставаться дома, по крайней мере, в течение 5 дней с момента заболевания родственника. Родители должны следить за состоянием своего здоровья и здоровья детей школьного возраста, регулярно измеряя температуру и обращая внимание на другие симптомы гриппа.

Чтобы подготовиться к сезонному гриппу 2009-2010 учебного года, следует принять следующие меры:

- Подумайте, как обеспечить уход за ребенком дома, в случае если он заболеет или если отменят занятия в школе.
- Будьте готовы следить за состоянием здоровья больного ребенка и других членов семьи: проверять температуру и наличие других симптомов гриппа.
- Определите, имеются ли в вашем доме дети, которые подвержены повышенному риску осложнений гриппа и обсудите со своим врачом, как вы можете уберечь своих детей от гриппа в предстоящем сезоне. В число детей, подверженных повышенному риску осложнений гриппа, входят дети в возрасте до 5 лет и дети, страдающие хроническими заболеваниями, такими как астма и диабет.
- На время лечения выделите отдельную комнату для заболевших членов семьи.
- Подготовьте новый список контактных лиц для связи в экстренных ситуациях.
- Подберите игры, книги, видеодиски и другие вещи, необходимые для развлечения в кругу семьи на случай, если отменят занятия в школе или если ваш ребенок заболеет и будет вынужден оставаться дома.
- Поговорите с представителями администрации школы об их планах на случай пандемии или экстренной ситуации.

Army's first swine flu death is soldier in SC

The San Diego Union-Tribune // The Associated Press, 1 October 2009, 10:52 AM PT
https://www.sandiegouniontribune.com/sdut-us-army-swine-flu-100109-2009oct01-story.html

Columbia, S.C. – A 23-year-old soldier from Florida who was in basic training is the Army's first death from complications of swine flu, officials said Thursday.

The death at Fort Jackson, the Army's largest training camp and just outside Columbia, may be the first such loss among the nation's 1.4 million men and women in uniform.

Pentagon officials said they were trying Thursday morning to confirm details of the case. But as of late last week, Department of Defense spokesmen said no military deaths had been recorded since the virus broke out last spring.

Spc. Christopher Hogg of Deltona, Fla., died Sept. 10th from "pneumonia due to H1N1 influenza," according to Fort Jackson commander Brig. Gen. Bradley May.

"His family had traveled to Columbia to be with him and was present when he passed away," May said in a statement Thursday.

An autopsy was conducted the following day and results received late Wednesday, May said.

Hogg was in the fifth week of basic. He had initially tested negative for the swine flu virus, but the autopsy later detected it, another defense official said on condition of anonymity because he was not authorized to speak on the record.

"Regrettably, this is the first H1N1-related death of a soldier for the U.S. Army," said Gary Tallman, a civilian spokesman for the service, the Pentagon's largest service branch with 552,425 soldiers.

Hogg reported to sick call with a fever on Sept. 1 and was treated at the Army's Moncrief Army Community Hospital. Two days later he was transferred to a local hospital, where he died, May said.

Fort Jackson spokeswoman Karen Soule said that as of Wednesday evening, 51 of Fort Jackson's 13,000 soldiers had flulike symptoms. More than 50,000 soldiers every year participate in either basic or advanced training on the installation.

Military recruits are always at higher risk for illness because of the stressful training environment, close quarters and rigorous physical work, military medical officials have said.

The Army has long had programs for preventing and treating illnesses. It stepped up efforts when swine flu surfaced in the spring, May said.

That includes mandatory vaccinations, frequent hand washing and use of hand sanitizer, coughing into the crook of the arm instead of the hands, and keeping hands away from the eyes, nose and mouth, the one-star general said.

Among many other steps, barracks have been rearranged so bunks are placed head-to-toe to keep soldiers as separate as possible. Living quarters are scrubbed daily with bleach, and soldiers turn in blankets, pillows and mattress covers for laundering every three weeks, the general said.

"We realize no matter how thorough our preventative measures are, soldiers will get sick, some will become seriously ill, and unfortunately some may die," the general said.

The military installation was one of many hit hard by the 1918 global flu pandemic.

During that pandemic, Camp Jackson, as it was known at the time, had more than 60,000 soldiers in training, according to Dale Smith, the historian for the military's medical school known as the Uniformed Services University of the Health Sciences in Bethesda, Md.

Exact numbers are hard to come by, but estimates are that about 25 percent of those at the installation got the flu, and of the afflicted about 18 to 20 percent died, Smith said.

Many who became ill recovered, "but it still killed a lot of people," Smith said.

Initial psychological responses to Influenza A, H1N1 ("Swine flu")

BMC Infect Diseases, 2009, 9, 166.
Received on 27 May 2009; Published on 6 October 2009
https://doi.org/10.1186/1471-2334-9-166

Background

The outbreak of the pandemic flu, Influenza A H1N1 (Swine Flu) in early 2009, provided a major challenge to health services around the world. Previous pandemics have led to stockpiling of goods, the victimisation of particular population groups, and the cancellation of travel and the boycotting of particular foods (e.g. pork). We examined initial behavioural and attitudinal responses towards Influenza A, H1N1 ("Swine flu") in the six days following the WHO pandemic alert level 5, and regional differences in these responses.

Methods

328 respondents completed a cross-sectional Internet or paper-based questionnaire study in Malaysia (N = 180) or Europe (N = 148). Measures assessed changes in transport usage, purchase of preparatory goods for a pandemic, perceived risk groups, indicators of anxiety, assessed estimated mortality rates for seasonal flu, effectiveness of seasonal flu vaccination, and changes in pork consumption

Results

26% of the respondents were 'very concerned' about being a flu victim (42% Malaysians, 5% Europeans, $p < .001$). 36% reported reduced public transport use (48% Malaysia, 22% Europe, $p < .001$), 39% flight cancellations (56% Malaysia, 17% Europe, $p < .001$). 8% had purchased preparatory materials (e.g. face masks: 8% Malaysia, 7% Europe), 41% Malaysia (15% Europe) intended to do so ($p < .001$). 63% of Europeans, 19% of Malaysians had discussed the pandemic with friends ($p < .001$). Groups seen as at 'high risk' of infection included the immune compromised (mentioned by 87% respondents), pig farmers (70%), elderly (57%), prostitutes/highly sexually active (53%), and the homeless (53%). In data collected only in Europe, 64% greatly underestimated the mortality rates of seasonal flu, 26% believed seasonal flu vaccination gave protection against swine flu. 7% had reduced/stopped eating pork. 3% had purchased anti-viral drugs for use at home, while 32% intended to do so if the pandemic worsened.

Conclusion

Initial responses to Influenza A show large regional differences in anxiety, with Malaysians more anxious and more likely to reduce travel and to buy masks and food. Discussions with family and friends may reinforce existing anxiety levels. Particular groups (homosexuals, prostitutes, the homeless) are perceived as at greater risk, potentially leading to increased prejudice during a pandemic. Europeans underestimated mortality of seasonal flu, and require more information about the protection given by seasonal flu inoculation.

Swine flu mild for now, but could worsen

Reuters, 7 October 2009, 5:21 AM GMT+8
https://www.reuters.com/article/us-flu-scenarios-sb/swine-flu-mild-for-now-but-could-worsen-idUSTRE59568W20091006/

Washington (Reuters) - The new pandemic of H1N1 swine flu is causing a strong second wave of disease in many Northern Hemisphere countries, according to the World Health Organization.

While the United States, China and Australia have begun vaccination, other countries have not and it is unlikely many people will be protected from the virus before November. Here are some possible ways the pandemic could play out:

Becoming Part of the Mix

The new H1N1 virus is a distant cousin of an H1N1 strain that has been part of the seasonal influenza mix for decades. Early surveillance suggests the new swine flu strain may supplant seasonal H1N1 and become part of the common circulating viruses. This could be good news as the seasonal H1N1 had developed resistance to the antiviral drug oseltamivir, Roche AG and Gilead Science's pill sold under the Tamiflu brand name. But most viruses eventually mutate and health experts would not be surprised to see swine flu acquire resistance. That is why companies are working to develop newer and better influenza drugs.

The U.N.'s senior technical expert on influenza, Dr. Julie Hall, said it takes two to three years for a new influenza virus to infect enough of a population to create broad immunity.

Adding a New Dimension

Because flu viruses mutate and recombine to form new strains, people remain vulnerable to flu all their lives. This is why the vaccine must be reformulated each year. H1N1 has been remarkably stable since it began infecting people widely in March and April this year. But experts predict once it has infected a certain proportion of the population -- no one knows exactly what proportion – it will start to change.

Right now the H1N1 vaccine is a good match against the virus, and most adults and older children will get good protection with a single dose. If the virus "drifts," the vaccine will have to be reformulated to match, just as with the seasonal flu vaccine. The process takes about six months.

Health officials will monitor closely for this to happen. In past pandemics, notably the one in 1918 that killed between 40 million and 100 million people globally, a first wave of relatively mild influenza was followed by a second wave of severe disease months later.

When Pigs Fly

It is also possible that the virus will recombine, swapping genetic material with other flu viruses, such as the seasonal H3N2 virus. A special concern is that someone could become infected with both the H1N1 virus and the H5N1 avian flu virus. They could then combine to create an especially

virulent new virus "that would have very unpleasant consequences for humanity," United Nations special pandemic coordinator Dr. David Nabarro told a World Bank briefing on Sunday.

Bird flu is still circulating and has infected 442 people, killing 262 of them, since 2003, the World Health Organization says. It is difficult for people to catch bird flu but when they do it is highly deadly. If a new virus had H1N1's infectivity and H5N1's deadliness, it could be devastating.

Many companies are working on H5N1 vaccines, which could give the world a head start on a new vaccine if any eventual new mutant closely matches the strain being used to make it.

Lacking Vaccines

Whatever the virus does, the world lacks the capacity to vaccinate most of the population against flu. The WHO estimates worldwide production capacity for pandemic vaccines at approximately 3 billion doses a year, which would be enough to cover fewer than half the world's 6.8 billion people. The WHO is pressing rich countries to buy and donate vaccine to poorer countries.

Hall told the World Bank gathering that the first wave of the swine flu pandemic affected wealthier nations like the United States, Australia and Japan, where it is still active.

"But what we are seeing now is that the virus is beginning to penetrate into some of the poorest communities in the world," she said. There it may cause "explosive outbreaks" among young and working-age adults – a particular problem for countries with younger populations.

Joy Phumaphi of the World Bank estimates that even a mild epidemic will reduce world gross domestic product or GDP by 0.7 percent. A more severe epidemic could reduce GDP by 3 percent, as it not only takes people out of the workforce for days or weeks, but requires them to seek expensive medical care.

PBSO NEWS HOUR

How Much Will the H1N1 Flu Cost the U.S.?

PBSO News Hour, 8 October 2009, 12:00 AM EST
https://www.pbs.org/newshour/health/health-july-dec09-flu-costs_10-08

As of Oct. 1, the Department of Health and Human Services reported 1,378,200 doses of the nasal-spray vaccine had been ordered in 46 states and the District of Columbia.

Here is a look at some of the predicted costs associated with fighting the outbreak:

Congress appropriated $7.65 billion in June to fight pandemic flu, including H1N1. Of that, $6.15 billion has been spent or is set aside, most of it for vaccine purchases and related supplies, including syringes, needles, antivirals and other support.

Federal officials and the White House warned last spring that closing schools might be an option to contain a peak outbreak, but the CDC and other agencies now say that's unlikely.

The Brookings Institute looked at the cost of closing schools in a recent report, finding it could cost between $35 and $157 per student.

If schools throughout the country closed for four consecutive weeks, the report predicts a loss of $10 to $47 billion in economic activity, or 0.1 to 0.3 percent of GDP.

With children out of school, parents would have to find ways to work from home or take time off. Some of those parents would be health care workers, further straining the health care system.

The United States could lose about 10 percent of all work-hours, based on the number of households with at least one child and no stay-at-home adults, 23 percent. Just over half of those workers will miss some work to care for children who would otherwise be at school.

"The CDC's viewpoint is that healthy kids need to be at school. Sick kids need to be at home," said CDC spokesman Joe Quimby.

Closing schools, he added, is ultimately a local decision.

In April, the Congressional Budget Office examined the possible price tag of a national, but "mild" pandemic that sickens 75 million and kills 100,000 people, akin to the 1957 and 1968 influenza outbreaks. The office predicted a 1 percent drop in GDP, relative to what it would have otherwise been.

In the case of a "more severe" scenario, something on a scale of the 1918-19 Spanish influenza that would infect 90 million and kill 2 million people, the CBO predicts real GDP would be 4 to 4.5 percent lower.

The Obama administration's advisory group on Science and Technology predicted in August that the H1N1 virus could cause between 30,000 and 90,000 deaths in the United States this flu season. A typical seasonal flu kills between 30,000 and 40,000 each year.

According to the CDC, more than one million Americans have been infected with H1N1, and around 20,000 have been hospitalized. At least 600 people in the U.S. have died from the disease this year.

The Guardian

Denis Campbell

Swine Flu fears grow as NHS staff shun Vaccine

The Guardian, 11 October 2009, 22.39 BST
http://www.guardian.co.uk/world/2009/oct/11/swine-flu-pandemic-vaccine-nhs

The Department of Health has ordered NHS bosses across England to ensure that frontline staff get immunised against swine flu amid growing signs that many doctors and nurses intend to shun the vaccine.

Chief executives and boards who run hospitals, primary care trusts and strategic health authorities have been told to urgently maximise the number of workers having the jab. Leading DH figures including Sir Liam Donaldson, the chief medical officer, have written to them six times in the last five weeks stressing the need for action before the second wave of the pandemic causes major problems.

Ian Dalton, the NHS's national director of flu resilience, last week warned that vaccination of nurses, doctors and other frontline staff was "absolutely critical" and that widespread take-up of the jabs "will help us to save lives".

The DH's letters stress that patients' health could be put at risk and the NHS left seriously short-staffed through virus-related absenteeism if senior managers do not overcome "perceived obstacles" to the vaccination of workers. Swine flu's threat is so great that the NHS must avoid only small numbers of personnel getting immunised, as usually happens with seasonal flu every winter, the letters add.

They stress that vulnerable patients could be endangered if staff decide not to heed repeated urgings from Donaldson and other senior figures to have the vaccine. There are growing signs that large numbers of workers will shun the jabs because they see them as unnecessary and potentially unsafe.

Dalton wrote to the chief executives of local NHS organisations in England on 10 September telling them: "We all know that uptake of the seasonal flu vaccine among NHS staff is traditionally low. It is an NHS board responsibility that we do not find ourselves in this position with the swine flu vaccine."

But hospital chief executives have told the Guardian that they expect as few as 10%-20% of their staff to get vaccinated and cannot fulfil the DH's demands because the jabs, which are due to begin within days, are entirely voluntary.

One chief executive of a busy urban hospital in one of the swine flu "hotspots" said: "At the moment in my hospital if nothing changes then it could be that 10%-20% of staff have the swine flu jab … Staff could have the virus and pass it on to patients, a proportion of whom will die, albeit a very small proportion."

He added: "The other consequence is that if loads of staff go off with swine flu that will leave us short-staffed, which is dangerous to patients. That's a bigger danger than transmission."

Another hospital chief executive said: "Ideally it should be 100% of frontline staff having the swine flu vaccine. But it obviously isn't going to be. I hope we'll get at least the 50% we usually get

for seasonal flu. This is important because although this strain of swine flu is mild in most people, if it's contracted by someone with an underlying health condition that can be serious."

One medical director at another hospital added: "The word on the street in NHS staff circles is that the vaccine is no good and you shouldn't bother with it. Nurses in particular worry that there may be side-effects, that corners have been cut in producing the vaccine and that the generally mild nature of the virus means they don't need to take it. As few as 10%-15% of doctors may have it because we doctors believe ourselves to be above such trivial things as infections."

A poll by Nursing Times magazine last week showed that the proportion of nurses who do not intend to get vaccinated has risen from 31% in August to 47%, while those who definitely will has fallen from 35% to 23%.

Dame Christine Beasley, the chief nursing officer for England, responded by stressing that the vaccine is "as safe as a vaccine can be" and adding: "Nothing in life is risk-free. I can well understand people being worried. I can well understand people thinking it's only a mild illness and why should I bother? I do understand all that, I think you wouldn't be human if you didn't think that." Beasley wants directors of nursing to act as role models to allay concerns among frontline nurses.

Hospital chief executives say privately that Donaldson's repeated reminders of the mild nature of swine flu's effects in those who contract it, and recent claim that the UK is "tantalisingly close" to beating the virus, may be leading staff to believe that vaccination is not important.

The health department said: "Frontline healthcare workers will be absolutely crucial in the height of a pandemic – without them, patient care will suffer, and the NHS will be stretched. Getting the swine flu vaccine will protect them and their patients."

It added: "All NHS organisations will be working hard to ensure that all eligible staff have the choice to protect themselves and their patients from swine flu by having the vaccine."

Department of Health
Information for a Healthy New York

Testimony by Guthrie Birkhead, M.D., M.P.H.
Deputy Commissioner New York State Department of Health

Department of Health, New York, 13 October 2009

Presented to
Assembly Standing Committee on Health
Assembly Standing Committee on Labor
Assembly Standing Committee on Education
Assembly Standing Committee on Higher Education
Assembly Standing Committee on Workplace Safety

Assemblyman Gottfried, Assemblywoman John, Assemblywoman Nolan, Assemblywoman Glick and Assemblyman Lancman: thank you for the opportunity to testify today and present the New York State Department of Health's response to the 2009 H1N1 influenza. I am Dr. Guthrie Birkhead, Deputy Commissioner for Public Health at the New York State Department of Health.

Our response to H1N1 influenza this fall has benefited from experience with this virus last spring and summer, three years of pandemic influenza planning from 2006 to 2008, as well as our experience with the 2004 flu vaccine shortage and our general state of preparedness to deal with all hazards from weather events, to disease outbreaks, to possible terrorist events. We have learned that our response to public health problems like H1N1 is very dependent on the cooperation and joint activities of the state health department, other state agencies, local health departments, and other partners throughout the health care system. This collaboration is one of the strengths of our public health system in New York.

Last April New York Governor David Paterson directed the state health department to activate its health emergency preparedness plan in response to cases of H1N1 in NYS. This plan was developed over a number of years of pandemic planning and involves the collaboration of programs across the health department, other state governmental agencies and local public health departments. Over the past months both Governor Paterson and Commissioner of Health Daines have been involved in the response with public appearances, multiple press conferences and meetings with providers and consumers.

The primary activities during the H1N1 response have included implementation of targeted surveillance and laboratory testing activities and multiple communication strategies including a toll-free hotline available 24/7, and ongoing communications with county health departments, hospitals, clinics, doctors' offices, schools and other partners. Governor Paterson directed his agencies to develop a coordinated response and supported conduct of a series of town hall style meetings at locations throughout the State to provide in-person briefings on clinical care, surveillance, community mitigation, vaccine and education and outreach.

We learned many lessons from the spring but we still have a lot to learn. We have learned that H1N1 is not a "1918" style pandemic in terms of clinical severity. The clinical spectrum of H1N1 is more similar to seasonal flu than the flu seen in 1918. We have also learned that there is little background immunity to H1N1 in the general population. As a result H1N1 spreads rapidly in children and young adults. Pregnant women have been identified as a population at increased risk of severe complications and as a result are a priority group for vaccination. Unlike the seasonal flu, we have seen relatively little infection in the elderly population suggesting that they may have some immunity possibly as a result of past exposures. With widespread transmission, it is inevitable that some people with underlying medical conditions will experience severe illness and risk death. It is important to note that seasonal flu kills on average 2000 New Yorkers each year; we can expect H1N1 to have a similar impact.

Current H1N1 flu activity

Nationally influenza activity attributed to 2009 H1N1 viruses increased during September 2009 beginning in the southern states where school starts in early August. H1N1 is expected to continue through the fall and winter influenza season. In New York State, our surveillance systems outside New York City indicate that flu activity is starting to increase. New York's flu activity is currently classified as widespread under the CDC's classification system indicating that more than 50 percent of reporting jurisdictions indicate the presence of flu. New York's flu status has gone from sporadic to localized to regional activity to now widespread activity over the last four weeks. To date this fall, the number of people hospitalized with flu remains low but may be starting to increase. Rates of visits for influenza-like-illness are also increasing in Emergency Departments and sentinel providers. So far this fall there have been three known H1N1 associated deaths. There is at least one school district upstate with significant disease and several college campuses have reported disease with one death in a college student.

We may now be at the beginning of our third influenza season this year, the seasonal flu season last February and March, the H1N1 outbreak in May and June, and now the return of H1N1. However, we don't know for sure how the fall and winter flu seasons will unfold. A telephone survey conducted in New York City last spring found that between 6 and 10 percent of all New Yorkers surveyed had experienced influenza-like-illness. The spring flu outbreak may have been truncated by the end of school and the beginning of the warm weather season. Had the flu season continued, as it now appears it may do over the coming fall and winter months, we could possibly see up to 35 to 40 percent of the population impacted by the new flu strain - two to three times that which we experienced in the spring. The experience with flu in states in the southern part of the country suggests a surge three to four weeks following the start of the school year. We are just entering that period in New York State

It should be noted that some cities are reporting near-normal levels of flu activity for this time of year. The cities, including New York, are those that were hardest hit at the outset of the 2009 H1N1 flu pandemic. New York, which had widespread school closures in the spring, is reporting normal attendance; the same holds true for Boston and Philadelphia. One theory to explain the relative lack of flu in these cities – as opposed to the rest of the country where activity is widespread – is that the earlier outbreaks conferred enough "herd immunity" to protect them now. This theory is plausible; only time would tell whether it's accurate.

New York State tracks and evaluates flu prevalence and severity using a multi-faceted reporting system. Five different reporting mechanisms are used to track the flu including an electronic clinical laboratory reporting system which feeds laboratory reports of H1N1 directly to the state; hospital reporting of emergency department visits for influenza-like-illness and hospitalized influenza cases; reports by physicians of patient visits for influenza like illness at selected offices around the state; deaths associated with influenza like illness; and prescriptions filled for antiviral medications. The results of this reporting system are on the Health Department website with statistics updated each week.

H1N1 Vaccine Efficacy and Safety

One of the remarkable aspects of the H1N1 influenza response has been the development of vaccines to prevent it. Influenza A (H1N1) 2009 monovalent vaccines have been developed by the five manufacturers of seasonal flu vaccine. The production and licensure of the H1N1 vaccines are being done by exactly the same methods as the seasonal vaccines. One hundred million Americans are vaccinated each year with seasonal flu vaccines, so the safety and efficacy of the process is well defined. FDA licensure has been on the basis of standards developed for vaccine strain changes for seasonal influenza vaccines, adherence to manufacturing processes, product quality testing, and lot release procedures developed for seasonal vaccines. The age groups, precautions, and contraindications approved for the influenza A (H1N1) 2009 monovalent vaccine are identical to those approved for seasonal vaccines. The only difference between the seasonal and 2009 H1N1 influenza vaccines is the viral antigens contained in the vaccine, which also do vary from year to year as the seasonal vaccine changes. The only other difference is that clinical trials have been done on the H1N1 vaccines to establish the dosing requirements. Clinical trials are not typically done for the seasonal vaccine. So we actually know more about the characteristics of the H1N1 vaccine than we do the seasonal vaccine from these trials.

Preliminary data from the clinical trials indicate that the immunogenicity and safety of these vaccines are similar to those of seasonal influenza vaccines. An immunogenicity study of an inactivated influenza A (H1N1) monovalent vaccine manufactured by CSL Limited demonstrated a safety profile consistent with results from studies of the seasonal influenza vaccine manufactured by CSL Limited. Studies of other seasonal inactivated

influenza vaccines found that rates of adverse events were not significantly different from placebo injections except for arm soreness and redness at the injection site. Vaccine safety data are reviewed by both the manufacturers' quality assurance staff and by the FDA. Only when all testing is completed and approved are the vaccines released for distribution.

Clinical trials in children coordinated by the National Institutes of Health reported preliminary results of a study among children aged 6 months--18 years which found safety results to be similar to those observed for seasonal influenza vaccine.

To assure that the safety of the H1N1 vaccine, New York is participating in expanded federal programs to monitor any possible adverse outcomes through a nationwide reporting system known as VAERS (vaccine adverse event reporting system) as well as through a program using managed care data on large populations to conduct follow up of vaccinated persons and a separate CDC-sponsored program to report Guillian-Barre Syndrome cases.

Availability of supplies and H1N1 vaccine distribution

There are currently 4 companies that are fully licensed by the FDA (the 5th is in process) to make the 2009 H1N1 vaccine, the same as for seasonal flu. Med Immune, which makes the inhaled live, attenuated influenza vaccine, Novartis, sanofi pasteur and CSL Limited, which make inactivated influenza vaccine, which is administered through an injection.

The CDC estimates that between now and the end of November there will be over 80 million doses of flu vaccine made available to states throughout the nation for redistribution to localities, health care providers and others as appropriate. The vaccine and supplies being made available by the Federal Government are being dispensed in weekly allotments that vary in size between 1.5 million and 4 million doses each week. States and cities were able to place their first orders for the 2009 H1N1 vaccine on Wednesday September 30th. By October 2nd, 2.4 million doses of live attenuated 2009 H1N1 vaccine were available for ordering with more vaccine becoming available for ordering in the coming days and weeks.

H1N1 Vaccine Distribution

Each week New York State (like all states) is provided a number of doses that are available to us to order. In general we expect to receive approximately 6 percent of the national allotment based on our population. To date we have placed orders requesting our full allotment and have provided direction to the CDC regarding where the vaccine is to be shipped. Our initial ship-to sites focused on hospitals, local health departments and federally qualified health centers – in an effort to assure that all persons in New York State who fit into one of the CDC's Advisory Committee on Immunization Practices (ACIP) defined priority groups have access to vaccine as quickly as possible.

The ACIP defined the following five populations as priority groups for vaccination against H1N1: pregnant women, persons who live with or provide care for infants aged <6 months (e.g., parents, siblings, and daycare providers), health-care and emergency medical services personnel, persons aged 6 months – 24 years, and persons aged 25--64 years who have medical conditions that put them at higher risk for influenza-related complications. Individuals in these groups are either at higher risk of complications associated with the flu or are more likely to come into contact, and possibly infect, persons at high risk of complications.

These five target groups comprise an estimated 159 million persons in the United States and 10 million people in New York State. Using season flu vaccination rates as a guide, which indicate that 20 to 40% of eligible persons actually present for vaccination, we estimated that we would need at least 4 million doses of H1N1 to reach all New Yorkers who fall into one of the priority groups.

To ensure distribution of vaccine in the most efficient and effective manner the Governor directed the New York State Department of Health to begin the process with initial shipments to all hospitals in the State, to all local health departments (outside of New York City) and to all Federally Qualified Health Centers outside of New York City. Following this initial push we will provide vaccine based on orders submitted by providers who have agreed to vaccinate individuals beginning with those in the defined priority groups.

The first orders, placed two weeks ago were delivered last week. Initial availability of vaccine was limited and included 91,000 doses of LAIV upstate. LAIV is used for 1) healthy kids 2-24 years old and 2) healthy adults 25-49 who are health care workers or who care for children under 6 months. Factors that we have and will continue to take into account when filling orders for H1N1 include: geographic distribution to ensure

statewide coverage; per capita allocation amounts (to be equitable in distribution); ability of providers to access target groups; input of local health departments and targeting based on the specific type of vaccine available and the most appropriate target audience.

Additional orders for 113,400 doses of vaccine were placed last week that are expected to arrive at designated sites this week – bringing the total number of H1N1 vaccine doses ordered to date to 204,000. This is only the beginning of what is expected to be available with substantial supplies of H1N1 vaccine being available starting this week and next. We anticipate that by early November, most providers who want to order vaccine will be able to do so. Additional vaccine will roll out through November, December and into January. One of the critical messages we need to convey is that as this vaccine is just now being produced, people and providers need to be patient as we do our best to ensure that vaccine is first delivered to those in the priority groups.

The State Department of Health developed a system to pre-register all providers in the state who are interested in receiving vaccine. This pre-registration process asks that the provider indicate how many people they anticipate vaccinating and how many of these individuals are in each of the targeted groups – information that will be critical in assuring that vaccine is properly targeted. Eventually we anticipate that all New Yorkers who wish to receive the vaccine will have an opportunity to do so.

To date 4000 providers have pre-registered representing a range of specialties and provider types including private practice physicians, hospitals, local health departments, federally qualified health centers, pharmacies, colleges and universities, public health clinics, substance abuse treatment clinics and Indian health providers. We anticipate that additional providers will register over the coming weeks. We are also aware that there are providers who continue to be concerned with the safety of the vaccine and as a result are reluctant to register and participate in our vaccination efforts. We will continue to work with our partners in the health care community including professional organizations to educate providers as to the safety of the vaccine and the importance of vaccine as a mechanism to assure public health.

Techniques to prevent the spread of the flu

Vaccination is the most effective way to prevent influenza. The next most effective measure is to avoid contact with other people and to stay home from work or school when you are sick. As we have noted throughout our printed materials and public outreach campaigns, it is best to stay home when you are ill to prevent further disease transmission. Health care settings are no different than any other setting where vaccination is the most effective method of preventing influenza. This forms the basis of our Health Care Worker mandate for flu vaccination.

The use and availability of N-95 face masks is a notable concern for many health care workers. It is particularly important for those workers who may be exposed to the flu virus during procedures when aerosols are produced. A recent study published in the Journal of the American Medical Association, the first randomized control trial of its kind to study the use of N95 masks compared with surgical masks by nurses for routine patient care, found no difference in influenza infection rates in health care workers during the 2008-2009 flu season, 22-23 percent in both groups. This suggests that N95 masks by themselves may not provide any additional protection in routine patient care settings. The most remarkable finding of this study was that only 30% of the nurses in either group were vaccinated.

How Health Care Settings, Schools and Workplaces Are Implementing These Steps

Under the direction of Governor Paterson the New York State Department of Health in collaboration with other state agencies, has developed numerous resources intended to assist health care providers, schools and businesses with the implementation of procedures to help prevent and reduce the spread of the flu. These resources include model polices regarding attendance and sick leave at places of employment; the preparation of contingency plans for operating during the flu season when many staff may be out either sick themselves or out caring for sick family members and how schools and businesses can communicate guidance on flu prevention and care provided by the CDC and by NYSDOH to their employees. The State Health Department has worked closely with the State Education department not only to provide guidance regarding best practices for assuring a healthy school environment and for minimizing transmission between students and staff but also by encouraging vaccination for students and employees. We have provided detailed guidance on how best to ensure proper facilities and supplies to ensure good hand hygiene and respiratory etiquette and to ensure that schools, health care facilities and workplaces are cleaned routinely.

Education, Outreach and Prevention - NYS Government Activities

NYSDOH has and continues to provide information about 2009 H1N1 flu through a variety of channels, intended to maximize our "reach" to target audiences. Last April Governor Paterson directed the State Health to establish an H1N1 call center; this call center has been available 24/7 to answer questions from concerned individuals. More recently we have established a vaccine call center for providers to place orders for vaccine over the coming weeks.

As the 2009 school year approached Governor Paterson asked that NYS agencies proactively reach out to communities and individuals throughout the State to provide education; to answer questions and to assure that all New Yorkers had access to the most comprehensive and up to date information available. Between July and September 38 briefings and educational sessions were conducted for groups throughout the State. There are an additional 14 trainings under development for October, and additional meetings, webinars and teleconferences are planned with agencies, unions, health care workers and others who express an interest in these sessions.

To date, approximately 2,100 planning and preparedness partners have participated in educational sessions and briefings including state agencies, hospitals, local health departments, long term care facilities, community health centers, home care and hospice staff, schools and universities and business groups.

To ensure ongoing access to updated information and to assure that local health departments are provided all the resources necessary to respond to 2009 H1N1 in their communities NYSDOH holds weekly teleconferences with representatives of Local Health Departments to provide informational updates, to answer questions and to solicit recommendations from the field. Weekly calls are also convened with hospitals and long-term care providers and we have reached out to health plans and to individual physicians. For example we have worked with the American College of Obstetricians and Gynecologists to identify the best ways to get crucial H1N1 information to pregnant women and their health care providers and to develop materials for dissemination.

Over the past several weeks we have refined and updated our comprehensive H1N1 website. This website which is continually evolving to reflect new and updated information and resources includes information for consumers and health care providers, along with information for the media. Many website materials are – or soon will be – available in English and Spanish as well as other languages.

Public education activities are ongoing. Working with the Governor and other state agencies the health department is engaging in a mass media campaign to educate people about ways to reduce their chances of getting or spreading the flu. A 2-week radio buy was timed to coincide with back-to-school. Messages stressed the importance of vaccination, hygiene, and staying home if you're sick. A television Public Service Announcement (PSA) with a similar message has been distributed statewide and is getting good airplay. A radio PSA featuring a pregnant woman explaining why she will get H1N1 vaccine is being taped this week and will begin to air shortly.

Later this month the Department will begin an advertising campaign posted on mass transit, in many parts of the state. Interior bus cards will encourage individuals in priority groups to "Go to the head of the line." The Department has and will continue to provide thousands of H1N1 informational materials free-of-charge to Local Health Departments, health care providers, employers and community groups.

As response efforts to the current pandemic intensify, education and training will shift from didactic, regional meetings, to a series of weekly phone calls and webinars. Presentations and informational sessions will continue to be updated weekly; materials will continue to be developed to meet identified needs and will be distributed through multiple channels and mechanisms. Similarly we will respond to outbreaks, to any identified trends in specific populations; to any reports of resistance to medication and to any adverse reactions to vaccine.

Governor Paterson has asked us to remain vigilant and flexible as this is an evolving situation. We have activated our emergency response system and have mechanisms, procedures and protocols ready to implement in the event of a surge requiring much more intensive activities and interventions on the part of the State. Throughout we will continue to communicate and coordinate with our partners throughout the State and the nation to ensure that our response is successful in reducing the number of persons ultimately infected and for those infected, a swift and easy recovery.

Thank you.

FINANCIAL TIMES

Human rights are the wrong basis for healthcare

Financial Times, 13 October 2009
https://www.ft.com/content/89bbbda2-b763-11de-9812-00144feab49a

The agonising US healthcare debate has taken on a new moral tone. President Barack Obama recently held a conference call with religious leaders in which he called healthcare "a core ethical and moral obligation". Even Sarah Palin felt obliged to concede: "Each of us knows that we have an obligation to care for the old, the young and the sick."

This moral turn echoes an international debate about the "right to health". Yet the global campaign to equalise access to healthcare has had a surprising result: it has made global healthcare more unequal.

The notion of a "right to health" has its origins in the United Nations' Universal Declaration of Human Rights in 1948. But in the decades that followed, foreign aid's most successful efforts in health – such as the World Health Organisation and Unicef campaigns on vaccines and antibiotics – were based on a more limited goal: obtaining the largest possible health benefits for the poor from finite foreign aid budgets.

The moral argument made a big comeback in the new millennium. One of its most eloquent advocates is Dr Paul Farmer, who earned fame with heroic efforts to give people access even to complex medical treatment amid extreme poverty in Haiti and Rwanda, saying that healthcare was "a fundamental human right, which should be available free". The WHO shifted from pragmatic improvement of health outcomes towards "the universal realisation of the right to health". Even Amnesty International, advocate of traditional human rights such as freedom from torture, added a new section to its human rights report in 2009 on the "right to health".

So what is the problem? It is impossible for everyone immediately to attain the "highest attainable standard" of health (as the health rights declaration puts it). So which "rights to health" are realised is a political battle. Political reality is that such a "right" is a trump card to get more resources – and it is rarely the poor who play it most effectively.

The biggest victory of the "right to health" movement has been the provision of aid-financed antiretroviral treatment for African Aids patients, who include the upper and middle classes. Aids treatment got funding from, among many others, the Bush and Obama administrations, the Clinton Foundation, the Gates Foundation and the UN Millennium Development Goals campaign. The WHO 2004 report that emphasised the "right to health" did so on behalf of only one specific effort – Aids treatment.

Saving lives in this way is a great cause – except to the extent that it takes resources away from other diseases. Alas, many observers fear that is exactly what it did.

An evaluation by the World Bank in 2009 faulted the bank for allowing Aids treatment to drive out many other programmes. Global deaths due to either tuberculosis or malaria stood at 2m in 2008,

around the same as those from Aids. Yet Aids accounted for 57 per cent of World Bank projects on communicable diseases from 1997 to 2006, compared with 3 per cent for malaria and 2 per cent for TB. Other big killers of the poor – such as pneumonia, measles and diarrhoeal diseases, which together accounted for more than 5m deaths in 2008 – received even less attention.

Rights advocacy also favours some aspects of health relative to others. Those who are HIV-positive advocate effectively for their right to treatment, while those who will get Aids in the future cannot organise a lobby for a "right to prevention". The results can be seen in the 2009 report of the President's Emergency Plan for Aids Relief (Pepfar), one of the largest foreign aid programmes in American history. Only 22 per cent of its budget goes towards prevention, compared with 48 per cent towards treatment.

The lesson is that, while we can never be certain, the "right to health" may have cost more lives than it saved. The pragmatic approach – directing public resources to where they have the most health benefits for a given cost – historically achieved far more than the moral approach.

In the US and other rich countries, a "right to health" is a claim on funds that has no natural limit, since any of us could get healthier with more care. We should learn from the international experience that this "right" skews public resources towards the most politically effective advocates, who will seldom be the neediest.

THE FLU CASE

WHO switches out seasonal flu virus strain

The Flu Case, 14 October 2009, 13:31
https://web.archive.org/web/20091018123203/http://www.theflucase.com/index.php?option=com_content&view=article&id=1071%3Awho-switches-out-seasonal-flu-virus-strain&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO has recommended the replacement of the current seasonal influenza vaccine strain with a virus that has components of the pandemic H1N1 virus, following a meeting of "experts" from the Global Influenza Surveillance Network.

The decision by WHO to alter components of the H3N2 virus in this years seasonal flu vaccine to make it more similar to a H1N1 pandemic virus will fuel fears that WHO is manipulating the H1N1 virus to increase the likelihood of a pandemic emerging when people take the "swine flu" vaccine soon after their seasonal flu shot.

A French scientist who works for WHO's Global Inflzenza Surveillance Network, Bruno Lina, carried out research this summer into making the "swine flu" more virulent.

In a report published in the French Lyonmag on July 16th, Professor Bruno Lina said he was leading a team at a laboratory located in the "Rockefeller House" in Lyon seeking to find a gene to make the swine flu more virulent.

" … *What types of research are being carried out by laboratory against the influenza virus*?"

"Bruno Lina: "We are seeking to understand the evolution of this virus. And among the scenarios that are possible, there are those concerning the factor of virulence. Work we are therefore carrying out in P4 today relates to the virus H1N 1, into which we are introducing a gene for virulence to see if the latter accepts it and if it becomes the same time more dangerous. At present, the virus has great difficulty to acquire the factor of virulence» ...

Professor Bruno Lina is the head of the WHO national reference lab in France housed in the Avenue Rockefeller in Lyon, according to Infomed. Direct links to WHO did not work.

The P4 laboratory, for which Professor Lina also works, plays a key role in a system of surveillance of infectious diseases run by WHO, according to the laboratory's own website.

"Unique en Europe, le P4 joue un rôle clé dans le système de surveillance et d'alerte épidémiologique mondial coordonné par l'OMS."

The biosecurity laboratory in Lyon is part of the government-funded science network, INSERM, and appears to be working on viruses that can be used for biological warfare such as ebola.

Bruno Lina: «**La vaccination est le pilier de la lutte contre la grippe A**»
=> https://www.lyonmag.com/article/10958/bruno-lina-la-vaccination-est-le-pilier-de-la-lutte-contre-la-grippe-a

Lyon Mag.com: Quels types de recherches sont menés au sein du laboratoire contre le virus de la Grippe A?

Bruno Lina: On essaye d'imaginer l'évolution de ce virus. Et parmi les scénarii qui sont possibles, il y a le facteur de virulence. Les travaux que l'on mène donc aujourd'hui dans le P4 concernent le virus H1N 1, et dans lequel on introduit un gène de virulence pour voir si celui-ci l'accepte et s'il devient du même coup plus dangereux. Pour l'instant, le virus a beaucoup de mal à acquérir le facteur de virulence. Mais notre objectif *est d'avoir un coup d'avance par rapport à ce qu'il pourrait se passer dans la nature* et d'anticiper l'apparition d'une mutation traitée en laboratoire. ...

REUTERS

New flu still raises questions among experts

Reuters, 15 October 2009, 8:55 PM
https://www.reuters.com/article/flu-questions-idINN1529221620091015

Washington, Oct 15 (Reuters) – How many people have been infected with the new swine flu? How many will it kill? How do you catch it?

Health authorities around the world are trying to persuade people to line up to be vaccinated against the pandemic H1N1 virus even as they struggle to answer these basic questions.

H1N1 swine flu was declared a pandemic in June and the World Health Organization says more than 375,000 people globally have been infected and 4,500 have died.

But these are just laboratory-confirmed cases and the WHO says they are the tip of the iceberg. Only a small fraction of people who get swine flu ever have it confirmed by a doctor.

Here is a rundown of what experts do and do not know about pandemic H1N1 influenza.

What They Know

* The virus spread around the world in the space of six weeks and is now virtually everywhere.

* It strongly resembles seasonal influenza in that it causes fever, sore throat, a dry cough, muscle aches and tiredness.

* Unlike seasonal influenza, worst among the elderly, this new influenza batters younger people.

* Many people escape without symptoms. Dr. Tim Uyeki, a flu expert at the U.S. Centers for Disease Control and Prevention, says studies show 12 percent of people do not have fever. "A lot of people might think they don't have influenza because they don't have classic influenza-like illness," Uyeki told a meeting of the Pan American Health Organization on Wednesday.

* H1N1 may cause symptoms not normally seen in seasonal flu. "We are seeing diarrhea and vomiting in children of all ages as well as adults," Uyeki said. It can also infect the heart, a condition called myocarditis, affect the brain in what is called encephalopathy and cause multiple organ failure.

* The incubation period – the time from infection to when symptoms begin – ranges from one to four days.

* People can spread virus for 24 hours after the fever stops.

* Adults over the age of 60 are less likely to be infected and to become seriously ill with H1N1, in part because they seem to have some immunity to it. The highest rates of hospitalization are among the youngest children -- aged up to 4 -- but the highest rates of death are in adults aged 50 to 64.

* The new vaccine should protect against H1N1 well and antiviral drugs can treat it if given soon enough.

What They Don't Know

* How many people have been infected. The World Health Organization and CDC stopped counting months ago. There are not enough diagnostic tests in the world to test everyone who gets sick, and not enough doctors, nurses or technicians to administer them. The tests that exist are not very good at detecting H1N1. All WHO or CDC will say is that "millions" have been infected.

* The fatality rate for H1N1. Uyeki says death rate estimates are all under 1 percent with a median range of 0.4 percent. Without knowing how many people in total have been infected, researchers cannot say what proportion have died. Seasonal influenza kills less than 0.1 percent of patients but this adds up to 250,000 to 500,000 people globally each year.

* How people catch it. "We don't actually have good data on understanding how this virus is transmitted," Uyeki said. The virus lives in little droplets of mucus and tests show it can be picked up on surfaces such as computer keyboards, passed in a sneeze or during close conversation, and perhaps transmitted in smaller particles that can float up to six feet (2 metres).

Uyeki said it is possible H1N1 may be passed in feces, as the virus affects the gastrointestinal tract, but no one knows.

* How long patients are contagious. "I think we don't really understand this well," said Uyeki. People with higher fevers and children appear to "shed" more virus.

* What makes a flu virus deadly. Genetic analysis has shown nothing special about the viruses infecting people who died, said Dr. Michael Shaw, assistant director of laboratory science at CDC's influenza division. "There is nothing that really stands out about these viruses that have been isolated from the severe or fatal cases," Shaw told the PAHO meeting.

* What other viruses are out there. Shaw said farmers rarely test swine herds, a known source of new flu viruses.

"When you go and pull the data that's available from GenBank you can find maybe 300 sequences from North American swine viruses," Shaw said. "There is essentially nothing from Africa or Central or South America. There obviously are some gaps that need to be plugged so that something (else) like this doesn't surprise us."

COUNCIL on FOREIGN RELATIONS

Pandemic Influenza: Science, Economics, and Foreign Policy

Council on Foreign Relations, 16 October 2009

https://web.archive.org/web/20091107200002/http://www.cfr.org/project/1442/cfr_symposium_on_pandemic_influenza.html

Session One: The Science: https://www.youtube.com/watch?v=f7RX0mxXxDY
Session Two: The Economics: https://www.youtube.com/watch?v=ijv-zwDiuPk
Session Three: Foreign Policy: https://www.youtube.com/watch?v=FE706NtQvi4

Laurie A. Garrett, Senior Fellow for Global Health

On August 24, 2009 the President's Council of Advisors on Science and Technology (PCAST) released its "Report to the President on U.S. Preparations for 2009-H1N1 Influenza," predicting, among other things, that the H1N1 (aka "swine flu") pandemic would resurge in North America in September, peaking by mid-October, causing infection and illness to up to half the U.S. population before the end of 2009. The PCAST assessment also suggested that H1N1 vaccines would not be available for the general public until well after the mid-October peak, and the epidemic would surge so rapidly that it could overwhelm hospitals, medical supplies and intensive care units, leading to as many as 90,000 deaths in the U.S. The predicted surge held special significance for schools, parents and employers, as sick-outs and school closures could impact productivity. Despite months of preparation, supplies of vaccines, medicines and protective gear were expected to be inadequate, and global competition for essential tools for pandemic control and treatment would be fierce. One billion doses of H1N1 vaccine were ordered from several pharmaceutical companies, and the bulk of that supply was prioritized for ten wealthy nations, particularly the U.S. Little, if any, vaccine, medicine or protective gear was expected to be ready, affordable and distributed for the bottom four billion poorest people on Earth.

The CFR meeting was convened at the predicted peak of the North American pandemic. Will the PCAST model have proven correct? Looking forward, what can be scientifically forecast regarding shifts in the virology and epidemiology of the H1N1 pandemic? What are the economic and financial impacts of the outbreak? What have been, and can be predicted to be, the foreign policy implications of the pandemic and related competition for medical and public health tools?

COUNCIL *on* FOREIGN RELATIONS

Pandemic Influenza: Science, Economics, and Foreign Policy
Session I

Council on Foreign Relations, 16 October 2009
https://www.cfr.org/event/pandemic-influenza-science-economics-and-foreign-policy

Laurie Garrett: Good morning, and good morning to all of you on the Internet. My name is Laurie Garrett, and you are here in the Council on Foreign Relations in New York on a grim, wet, chilly day. Thanks to all of you who managed to forge through the nasty weather. And I expect that we'll have stragglers coming in as a result of the weather problems.

I am the senior fellow for Global Health here at the Council on Foreign Relations, and I welcome everybody who is both here and in cyberspace with us.

In a few moments my colleague, Jon Cohen, will tell those of you out in the cyber world how you can actively participate all day today via Twitter. Jon is the outstanding, infamous, notorious, famous science correspondent for Science Magazine, which is our co-sponsor today. It's a first for the Council on Foreign Relations. We embrace it wholeheartedly and hope it will be the beginning of many more to come, for this symposium entitled "Pandemic Influenza: Science, Economics, and Foreign Policy."

On August 24th, the President's Council of Advisers on Science and Technology, some of whom are with us today, so-called PCAST, issued a remarkable analysis of what's in store with the H1N1 virus, the so-called swine flu, and the likely pandemic impact this fall on the United States of America.

The PCAST offered a scenario -- not a prediction, let me say -- a scenario that suggested the virus would indeed return, having already been here in the spring, for a second wave, and that we would see it appear sometime in September and be peaking right about today in the United States, and that sometime, by the end of the year, roughly half of the American population would have had H1N1 influenza.

The PCAST warned that this H1N1, despite being a not terribly dangerous virus in and of itself on a scale of influenza dangers, would overwhelm many of our hospitals and pose a great burden to our intensive-care-unit capacities across the country.

After circulating in the southern hemisphere for the last three or four months, H1N1 did indeed return as forecast, or shall we say scenario'd, by PCAST and has now been back in most of the United States for at least two weeks. It is indeed surging very rapidly around the country.

On Tuesday, Dr. Ann Schuchat from the Centers for Disease Control opened a press briefing with these remarks: "Unfortunately, we're seeing more illnesses, more hospitalizations and more deaths from it. Flu is widespread in 37 states. That's up from 27 states just last week. Unfortunately, 19 more pediatric deaths from influenza got reported to us this past week. We're now up to 76 children having died from the 2009 H1N1 virus." She means in the United States.

To put that in context, in the past three years the total pediatric influenza deaths ranged from 46 to 88. We've had 76 children dying from the 2009 H1N1 virus, and it's only the beginning of October.

There's a great deal of uncertainty about this flu pandemic. One thing is certain: It is a worldwide event, and it is occurring in the dawn of our age of globalization.

...

Palese: Maybe let me start this one out. So even though I mentioned that this 2009 novel influenza virus is really like a regular seasonal influenza virus in many of its characteristics, that doesn't mean that I underestimate influenza. Regular seasonal influenza is a very bad disease. And we all know that in the U.S. alone we have about 30,000 deaths and we have about 200,000 hospitalizations every year.

So regular flu is a very serious disease and therefore we should really use all the tools we have to combat and to fight the regular flu, and that includes vaccination. And by the same token I think it is really compelling that we should use the vaccines which are being produced and being distributed right now against the 2009 virus. So, by not taking the vaccine, by underestimating this disease, I think we are not helping us.

Cohen: Any dissent?

Simonsen: No. I mean, it's very clear that vaccination is the best defense we have against pandemic influenza. In fact, when you have a pandemic unfolding and really high transmission rates, it becomes very hard to mitigate with any other strategy than that.

So, from a personal point of view, I have the advantage of natural immunity at this point, I'm pretty sure.

...

Monto: ...

To back up to the issue of declaring pandemics, because having been on the WHO Emergency Committee, I had to deal with - over the telephone with some of these issues on telephone calls that went on for three to four hours. And basically the problem was that WHO, unlike the United States, had not got to the point of defining severity.

The U.S. came up with categories one though five, and we've learned that if you base this on case fatality, you can't very well figure out where you are in terms of the categories. So we had it set up but we've never really been able to implement the categorization the way we thought we would.

But WHO had never done that and there was concern that because there was so much focus on H5N1 in much of the world, especially in Asia where they had been seeing avian influenza, that declaring a pandemic would shut borders because of all sorts of things, and they needed a little time to figure this one out.

And that's why there was a delay between going from phase five to phase six. Interestingly, it took two days for each of the other increments but it took six weeks ...

...

Palese: So the issue is what is a pandemic? In the past, a pandemic was defined as a global epidemic - meaning an epidemic worldwide – plus - (inaudible) - its severity and a change of the subtype. So, in other words, if something was an H1 or an H3, we would not have called that a new pandemic.

So what happened with WHO now is that they've redefined or made a new definition of what a pandemic is, namely limiting it to the global epidemic too rather than severity and change of subtype.

So in a way we have now a new terminology for pandemics, namely just calling it something which goes around the world is a global epidemic, but not including severity and the change of subtypes.

...

Simonsen: Well, I think this is very interesting because, I mean, especially for the health-care worker example. I mean, there are many, many good reasons why health care workers should be considering immunization for their own safety but also to protect and, first, do no harm to the patients that they are treating. Having said that, does it work to mandate?

I think what would work better ***would be to say that there was a shortage*** *and people tend to buy more of something that's in demand. (Laughter.) We saw that – there was one season where, really, people lined up all night to get a flu shot.*

etc.

In Holland, the Public Face of Flu takes a Hit

Science, 16 October 2009, 326 (5951): 350-351;
DOI: 10.1126/science.326_350b // https://www.science.org/doi/full/10.1126/science.326_350b

Amsterdam – For the past 6 months, one could barely switch on the television here without seeing the face of famed virus hunter Albert Osterhaus talking about the swine flu pandemic. Or so it has seemed. Osterhaus, who runs an internationally renowned virus lab at Erasmus Medical Center in Rotterdam, has been Mr. Flu. But last week, his reputation took a nosedive after it was alleged that he had been stoking pandemic fears to promote his own business interests in vaccine development. As *Science* went to press, the Dutch House of Representatives had even slated an emergency debate about the matter.

So far, few incriminating facts have emerged, and Osterhaus has the backing of his employer as well as Dutch Health Minister Ab Klink, to whom he is an adviser. Yet the media frenzy has cast a pall on Osterhaus's public image that may be difficult to undo, and some say it undermines the already flagging confidence in the safety of flu vaccines and the motives of those promoting them.

It's no secret that Osterhaus, a workaholic with more than 700 scientific papers to his name, also loves cameras and microphones (*Science*, 23 May 2003, p. 1228). But recently, some fellow scientists have accused Osterhaus of fear-mongering. Luc Bonneux, an epidemiologist at the Netherlands Interdisciplinary Demographic Institute, says Osterhaus is part of a "flu mafia" and that he's hyping the threats of both avian and swine flu. Miquel Ekkelenkamp, a microbiologist at University Medical Center Utrecht, called Osterhaus a "panic virologist" in a recent op-ed, adding that he "should be banned from television permanently."

The current firestorm erupted when reports surfaced that Osterhaus is co-founder of, and owns a 9.9% share in, ViroClinics, a Rotterdam spinoff from his lab that is involved in vaccine development. Fleur Agema, a member of the House of Representatives for the Party of Freedom, has said that's irreconcilable with Osterhaus's role on a Health Council panel that advises the Dutch government on flu vaccination.

Osterhaus says ViroClinics isn't itself developing a vaccine against swine flu; it provides services–such as testing for antibodies in specimens—for a range of companies that do. His warnings about the pandemic peril don't affect ViroClinics' bottom line, says Osterhaus, because vaccine companies would have developed a vaccine against the new virus–and given his company business–no matter what. His company doesn't make more money if more vaccine is sold, he stresses.

Erasmus Medical Center agrees, but the Health Council sees it slightly differently. Osterhaus is "a little too close" to industry to be a voting member on the panel, says Executive Director Anneke Wijbenga; to avoid even the appearance of a conflict of interest, he has the status of an "adviser." Wijbenga stresses that there's nothing untoward about this situation, however, and that Osterhaus has been transparent about his financial interests. A Health Council statement also praises Osterhaus

as "the absolute world top" in his field and says "we are glad … to make use of his expertise." Health Minister Klink echoed that point of view in a letter to parliament. But Bonneux says that even as an adviser, "an alpha male like Osterhaus is going to dominate such a committee."

Bonneux has also taken aim at the European Scientific Working Group on Influenza (ESWI), an industry-supported group that Osterhaus has chaired since 2000. ESWI organizes meetings, promotes awareness about flu, and tries to raise vaccination levels. Bonneux says the group–which receives a €40,000 contribution from each of 10 companies annually–is little more than a lobby club that gives "trumped-up, sensational stories a scientific seal of approval." ESWI spokesperson Derek Smith, a flu scientist at the University of Cambridge in the United Kingdom and a close collaborator of Osterhaus's, dismisses the claim, pointing out that ESWI's independence is guaranteed by a Code of Practice.

Eelko Hak, a clinical epidemiologist at the University Medical Center Groningen who also sits on the Health Council panel, says that although the Dutch government encourages scientists to create spinoffs and ties with industry, popular opinion is still very uncomfortable with that idea. "It's typically Dutch to make such a fuss about this," he says. Hak worries about the fallout from the affair; the Netherlands has always had very high vaccination rates, but a recent campaign against the human papillomavirus, which causes cervical cancer, flopped because of public distrust of health authorities. The Osterhaus brouhaha is another blow, says Hak.

H1N1 flu causes unusual damage to lungs: studies

Reuters, 16 October 2009, 2:46 am
https://www.reuters.com/article/us-flu-clots-idINTRE59E5D220091015

Washington (Reuters) – The new pandemic H1N1 flu may cause blood clots and other unusual damage in the lungs and doctors need to be on the lookout, U.S. researchers reported on Thursday.

Two studies published in the American Journal of Roentgenology show the need to check X-rays and CT scans for unusual features, and also point out swine flu can be tricky to diagnose in some of the sickest patients.

H1N1 flu is causing a pandemic, and while it is not particularly deadly, it is sickening many younger adults and older children who usually escape the worst effects of seasonal flu.

"It is therefore essential that clinicians be able to recognize possible cases of pandemic H1N1 influenza in high-risk groups so that they order the appropriate diagnostic tests, begin specific antiviral therapy, and prepare to provide intensive supportive measures as needed," Dr. Daniel Mollura of the National Institutes of Health Clinical Center in Maryland and colleagues wrote.

One middle-aged man who died was not diagnosed until after death, but unusual findings on his X-rays may be able to help doctors save other, similar patients.

Mollura's team found irregularities called ground-glass opacities in the patient's lungs using a CT scan. Although the patient was severely ill and had a fever, he tested negative for flu and doctors did not treat him for it.

The man died five days after he went into the hospital and the autopsy confirmed he had swine flu. The lung lesions seen on his CT scan matched lung damage done by the virus, Mollura and colleagues said.

In another study in the same journal, CT scans of patients with severe cases of swine flu showed many had pulmonary emboli, which block the arteries in the lungs, a team at the University of Michigan found.

Anticoagulant drugs can break up these clots and save lives.

Dr. Prachi Agarwal and colleagues examined 66 patients diagnosed with H1N1, 14 of them who were in the intensive care unit. All 66 got standard X-rays, which can show if a patient has pneumonia.

They performed enhanced X-rays known as computed tomography or CT scans on 15 of the patients, 10 of them who were in the ICU on ventilators to help them breathe. Five of the ICU patients had the blood clots in the lungs, Agarwal reported

"Our study suggests that patients who are severely ill with H1N1 are also at risk for developing pulmonary emboli, which should be carefully sought for on contrast-enhanced CT scans," Agarwal said in a statement.

"The majority of patients undergoing chest X-rays with H1N1 have normal radiographs (X-rays)," she added. Pulmonary emboli are also not normally seen in flu, she said. "CT scans proved valuable in identifying those patients at risk of developing more serious complications as a possible result of the H1N1 virus, and for identifying a greater extent of disease than is appreciated on chest radiographs."

FDA warns against fake online H1N1 remedy claims

Reuters, 17 October 2009, 3:44 AM GMT+8
https://www.reuters.com/article/idUSN16359915/

Washington, Oct 16 (Reuters) - The U.S. government this week warned against the online marketing of unlicensed health remedies claiming to protect against H1N1 swine flu infection, including fake "Tamiflu" pills from India.

The Food and Drug Administration reported on Thursday that it had purchased and analyzed several products represented on the Internet as Tamiflu, Roche Holding AG's brand name [ROG.VX] version of the antiviral drug oseltamivir.

One order, which arrived in an unmarked envelope from India, consisted of unlabeled white pills that contained talc and the common pain reliever acetaminophen, the FDA said. Others contained various amounts of oseltamivir but were not approved for use in the United States.

In one action, the FDA and the Federal Trade Commission ordered well-known author and doctor Andrew Weil to stop marketing his Immune Support Formula to protect against the H1N1 flu virus.

"Claims that a dietary supplement can prevent, treat or cure human infection with the H1N1 virus must be supported by well-controlled human clinical studies," the regulatory agencies said in a warning letter to Weil.

Officials at Weil's Phoenix, Arizona-based headquarters were not immediately available for comment.

"Products that are offered for sale online with claims to diagnose, prevent, mitigate, treat or cure the 2009 H1N1 influenza virus must be carefully evaluated," FDA Commissioner Dr. Margaret Hamburg said in a statement.

Swine flu, which emerged in March, spread quickly around the world, and was declared a pandemic in June, poses a serious health threat because most people lack immunity to it.

But U.S. health officials say the most effective protection against infection is vaccination and the federal government hopes to offer as many as 250 million vaccine doses to the public by the end of the year.

The government has ordered vaccine from five companies – Sanofi-Aventis SA [SASY.PA], CSL Ltd [CSL.AX], Novartis AG [NOVN.VX], GlaxoSmithKline [GSK.L] and the AstraZeneca [AZN.L] unit MedImmune.

Once someone is already infected, oseltamivir and another antiviral drug called zanamivir - an inhaled medicine produced as Relenza by GlaxoSmithKline Plc can help relieve the severity of disease.

Widespread and unnecessary use threatens to make the H1N1 virus resistant to the antivirals, which would render them ineffective as medicine for people with severe flu cases.

Health officials have already reported H1N1 resistance to Tamiflu.

Grippe A, un virus qui fait débat

Le Blog TVNews, 20 Octobre 2009, 7h50
https://www.leblogtvnews.com/article-grippe-a-un-virus-qui-fait-debat-ce-mardi-soir-sur-arte-37841169.html

Grippe A, un virus qui fait débat. Documentaire allemand inédit proposé ce mardi à 20h50 sur Arte. Depuis que la grippe A (H1N1) a été déclarée pandémie mondiale par l'OMS, les gouvernements du monde entier se sont lancés dans des achats massifs de médicaments et de vaccins. Prévention ou hystérie?

Sur les 6,2 milliards d'individus que compte la planète, le virus de la grippe A (H1N1) en a tué jusqu'ici moins de 2 000; bien peu au regard des 100 000 personnes qui meurent de faim chaque jour dans le monde. Pourtant, avant même que les vaccins ne soient au point et que l'on soit certain de leur efficacité, des millions de doses ont été commandées par la plupart des pays. La dépense est-elle en rapport avec la menace réelle? Et comment l'Organisation mondiale de la santé (OMS) établit-elle ses seuils d'alerte? Le 29 avril dernier, elle a en effet décidé de passer au niveau 5 d'alerte pandémique, stade qui permet de débloquer des crédits pour développer des vaccins. Puis, en juin, elle a déclenché le niveau 6, en déclarant la grippe A (H1N1) pandémie mondiale. Quelle est l'influence de l'industrie pharmaceutique sur ces décisions?

Rejoignant la position de Jean Ziegler, membre du Conseil des droits de l'homme à l'ONU, Wolfgang Becker-Brüser, l'ancien directeur du service chargé de la circulation des médicaments à l'Office pour la santé de la République fédérale d'Allemagne, soulève la question des intérêts commerciaux en jeu. D'autres critiques s'inquiètent de l'efficacité du Tamiflu et des vaccins. Certains s'interrogent même sur leur nocivité. D'autres se demandent enfin si, sur fond de crise financière et économique, le phénomène de la grippe A ne viendrait pas à point nommé pour les hommes politiques de tous les continents.

THE FLU CASE

Arte video on the swine flu scam

The Flu Case, 5 November 2009, 12:44
https://web.archive.org/web/20100102041056/http://theflucase.com/index.php?option=com_content&view=article&id=1622%3Aarte-video-on-the-swine-flu-scam&catid=1%3Alatest-news&Itemid=64&lang=en

Résumé: Depuis que la grippe A a été déclarée pandémie mondiale par l'OMS, les gouvernements du monde entier se sont lancés dans des achats massifs de médicaments et de vaccins. La dépense est-elle en rapport avec la menace réelle? Wolfgang Becker-Büser, ancien directeur du service chargé de la circulation des médicaments à l'Office pour la santé de la République fédérale d'Allemagne, soulève la question des intérêts commerciaux en jeu. Si des critiques s'inquiètent de l'efficacité du Tamiflu et des vaccins, d'autres s'interrogent sur leur nocivité. Plus généralement, certains estiment que le virus H1N1 vient à point nommé pour les hommes politiques de tous les continents. Un reportage à ne pas manquer

Et l'incontournable: Silence on Vaccine.
L'ONF a permis la sortie du documentaire de Lina B. Moreco sous condition qu'aucune personne, aucun commerce, ne puisse acquérir le film pour la revente. De plus aucune publicité ne sera faite pour faire connaître la sortie du DVD. Conséquemment la population ne sera pas informée de la sortie du documentaire.

Vive La Liberté D'expression Canadienne Et Québécoise! Qu'il fait bon vivre désinformé et ignorant au CULBEC of CANADA!

Par la présente, j'invite toutes les personnes travaillant dans les médias à visionner un reportage d'enquête français exceptionnel et combien nécessaire. Il est télédiffusé sur la chaîne ARTE en EUROPE depuis le 20 octobre.

Canadians protest draconian Bill C6

The Flu Case, 19 October 2009

https://web.archive.org/web/20091025145657/http://www.theflucase.com/index.php?option=com_content&view=article&id=1166%3Acanadians-protest-draconian-bill-c6&catid=1%3Alatest-news&Itemid=64&lang=en

CAP Policy Opposes Bill C6

The Canadian Action Party recently became the only federal political party to vehemently oppose bill C6, an act representing the safety of consumer products, by passing urgent policy to protect Canadians against this unconstitutional bill.

Bill C6 is a regurgitation of last years failed bills C51 and C52, and if passed in the next few days will be the ultimate blow to the constitutional rights of Canadians.

Canadian Action Party, Policy Committee Chair Tim McCormick states, "Bill C6 is a sham. Canadians should wonder why the only thing the Liberals and Conservatives can agree on is to extinguish the flame of our civil rights. Bill C6 negates the law of trespass, denies due process and steps on the Constitutional rights of Canadians. All in all this Orwellian Bill is bad news for Canadians."

The Canadian Action Party feels that along with many clearly identified problems with the bill, such as expanding Health Canada's powers to search private property without a warrant and seize private property without Court supervision, that the ultimate betrayal of Canadians lies in the bills ability to deprive citizens of due process in any area arbitrarily added to the schedules by the ministers without taking it to parliament.

If C6 passes, Canadians will be subject to the whim of the government without legal recourse.

Dee Nicholson, National Communication Director of Freedom in Canadian Health Care, a member organization of Canadians for Health Freedom and frequent contributor to http://www.falseflagflu.com voiced her concerns as follows, "What people don't realize is that the clauses of bills, once enacted into law, are considered to have been voted on by Parliament, and thus may be moved by the Minister involved to be incorporated into other legislation by a simple regulatory change. That means, in terms of Bill C6, that whatever rights are removed from those who would import "hazardous" products may also be removed from others; what is taken from one may be taken from all, and under C6, "offenders" are guilty because the ministry says so, and have no recourse to a court of law. This Bill has the potential to, and in fact does, destroy the rule of law in Canada, and it must not be passed."

Bill C-6 has been fast-tracked in the Senate by removing administrative rules that would have added months to the time required for readings and passage of this legislation. Why would the Canadian government rush through such a controversial bill, if it was truly in Canadians best interests, and why suspend the right of due process?

Melissa Brade, Interim Leader of the Canadian Action Party, states, " Bill C-6 is an egregious act by our government against the Canadian people. Canadians must understand the ramifications of this bill which has the ability to severely limit their health options, their access to natural health products, and nutrient rich foods by moving individual clauses into other legislation. What is even more un-

nerving is the timing of this bill, which will be passed just as the engineered Swine-Flu ‘Pandemic’ may be upgraded to a level 6 threat by the World Health Organization (WHO). The W.H.O. under such conditions has the ability to collapse governments, authorize mandatory vaccinations, declare martial law, and force compliance. It appears that C-6 could go hand in hand with completely absolving our constitutional rights under a orchestrated event being used to create a police-state and amassed profits for the pharmaceutical giants."

Mrs. Brade is concerned about bill C-6's connections to the Codex Alimentarius, a for-profit World Trade Organization agreement. Codex (among other things) will put Natural health products under risk assessment, keeping doses 100x weaker than needed to be effective, thereby eliminating adequate dose nutritional supplements.

All countries must be Codex compliant by Dec, 31st, 2009, or risk losing international trade disagreements in a world court. Mrs. Brade sees C-6 as Canada’s primer for full Codex Compliance and a crippling blow to effective and safe natural health options which compete for profits with our government's supporters in big-Parma.

The Canadian Action Party is urging Canadians to contact the Senate and their MPs adding their voices to the multitudes opposition to this unconstitutional and extremely questionable bill.

Swine flu mass vaccination programme launched
11m priority patients and frontline health workers offered jab in first phase

The Guardian, 21 October 2009, 14:52 BST
https://www.theguardian.com/world/2009/oct/21/swine-flu-mass-vaccination

The UK's mass vaccination programme against swine flu was launched today, targeting 11 million priority patients and frontline health workers in its initial phase.

Amid fears that there would be a low take-up among NHS staff, the prime minister, Gordon Brown, told the Commons that the country was "ahead of the world" in its fight against the potentially fatal infection.

Doses of the drug Pandemrix are being offered in hospitals from today and supplies are being delivered to GPs' surgeries from the beginning of next week. Medical officials fear that a post office strike could delay letters being sent out to patients calling them in for immunisation.

The health secretary, Andy Burnham, was at University College Hospital in London for the first vaccinations. He said: "The people today who are volunteering are showing real leadership, they are sending a clear message out to people working in the health service that it is the right thing to do."

"We are one of the first countries in the world to launch a vaccination programme and we are looking ahead to a very difficult winter in the NHS, there is still seasonal flu around and we have the added challenge of H1N1 swine flu."

Sir Liam Donaldson, the chief medical officer for England, said: "This is the first pandemic for which we have had vaccine to protect people. I urge everyone in the priority groups to have the vaccine - it will help prevent people in clinical risk groups from getting swine flu and the complications that may arise from it. It's important for frontline health and social care workers to have the vaccine.

"It will help prevent them and their families getting the virus from patients, it will stop them passing the virus on to their patients, it will potentially protect them from mutated strains and it will reduce the disruption to NHS services caused by people being absent due to illness."

NHS staff have traditionally been reluctant to participate in mass immunisations. Only around 20% normally receive the seasonal flu vaccination. In a bid to overcome suspicions, professional health organisations urged their members to be innoculated.

A joint statement was issued by the British Medical Association, the Royal College of GPs, Royal College of Midwives, Royal College of Nursing, Royal College of Psychiatrists, Royal College of Obstetricians and Gynaecologists and Royal Pharmaceutical Society of Great Britain, as well as the union Unison which represnets many health workers.

It declared: "By the nature of their work, many NHS staff come into close contact with patients and the public and have a higher risk of exposure to the virus."

"The vaccine has been thoroughly tested. All NHS organisations will be working hard to ensure that eligible staff are given access to the vaccination to protect themselves, their families and their patients from swine flu. We encourage staff to protect themselves with the swine flu vaccine, in addition to the seasonal flu immunisation."

The UK death toll from the H1N1 virus has risen to 108 so far, with more than 70 people being treated in intensive care wards around the country. The age profile of those succumbing to serious infections is different to normal seasonal flu. As many as 370,000 people are estimated to have contracted the virus so far in the UK.

Victims of swine flu have tended to be far younger. Pregnant women are recognised as being particularly at risk; six of the UK deaths have been of women in the later stages of pregnancy.

In west Wales, a primary school was closed following high levels of staff sickness. Pontyberem community primary school in Carmarthenshire is due to reopen after the half-term holiday.

It is no longer routine policy to close schools if individuals catch the virus. At the last weekly briefing, the chief medical officer, Sir Liam Donaldson, revealed that almost 150 schools had recorded outbreaks.

Swine Flu Cases Overestimated?
CBS News Exclusive: Study Of State Results Finds H1N1 Not As Prevalent As Feared

CBS News, 21 October 2009

https://web.archive.org/web/20091022182003/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

(CBS) If you've been diagnosed "probable" or "presumed" 2009 H1N1 or "swine flu" in recent months, you may be surprised to know this: odds are you didn't have H1N1 flu.

In fact, you probably didn't have flu at all. That's according to state-by-state test results obtained in a three-month-long CBS News investigation.

The ramifications of this finding are important. According to the Centers for Disease Control and Prevention (CDC) and Britain's National Health Service, once you have H1N1 flu, you're immune from future outbreaks of the same virus. Those who think they've had H1N1 flu – but haven't – might mistakenly presume they're immune. As a result, they might skip taking a vaccine that could help them, and expose themselves to others with H1N1 flu under the mistaken belief they won't catch it. Parents might not keep sick children home from school, mistakenly believing they've already had H1N1 flu.

Why the uncertainty about who has and who hasn't had H1N1 flu?

In late July, the CDC abruptly advised states to stop testing for H1N1 flu, and stopped counting individual cases. The rationale given for the CDC guidance to forego testing and tracking individual cases was: why waste resources testing for H1N1 flu when the government has already confirmed there's an epidemic?

Some public health officials privately disagreed with the decision to stop testing and counting, telling CBS News that continued tracking of this new and possibly changing virus was important because H1N1 has a different epidemiology, affects younger people more than seasonal flu and has been shown to have a higher case fatality rate than other flu virus strains.

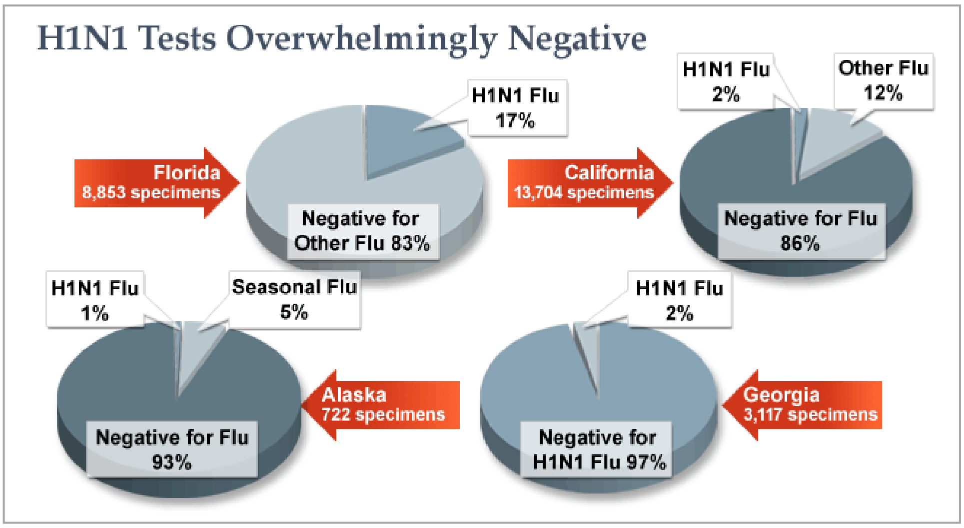
CBS News learned that the decision to stop counting H1N1 flu cases was made so hastily that states weren't given the opportunity to provide input. Instead, on July 24, the Council for State and Territorial Epidemiologists, CSTE, issued the following notice to state public health officials on behalf of the CDC:

"**Attached are the Q&As**; that will be posted on the CDC website tomorrow explaining why CDC is no longer reporting case counts for novel H1N1. CDC would have liked to have run these by you for input but unfortunately there was not enough time before these needed to be posted

When CDC did not provide us with the material, we filed a Freedom of Information request with the Department of Health and Human Services (HHS). More than two months later, the request has not been fulfilled. We also asked CDC for state-by-state test results prior to halting of testing and tracking, but CDC was again, initially, unresponsive.

Watch CBS News Videos Online –
Video above: A CBS News producer asks the director of the CDC, Dr. Thomas Frieden, for this information at a press conference on Sept. 19.

While we waited for CDC to provide the data, which it eventually did, we asked all 50 states for their statistics on state lab-confirmed H1N1 prior to the halt of individual testing and counting in July. The results reveal a pattern that surprised a number of health care professionals we consulted. The vast majority of cases were negative for H1N1 as well as seasonal flu, despite the fact that many states were specifically testing patients deemed to be most likely to have H1N1 flu, based on symptoms and risk factors, such as travel to Mexico.



It's unknown what patients who tested negative for flu were actually afflicted with since the illness was not otherwise determined. Health experts say it's assumed the patients had some sort of cold or upper respiratory infection that is just not influenza.

With most cases diagnosed solely on symptoms and risk factors, the H1N1 flu epidemic may seem worse than it is. For example, on Sept. 22, this alarming headline came from Georgetown University in Washington D.C.: "H1N1 Flu Infects Over 250 Georgetown Students."

H1N1 flu can be deadly and an outbreak of 250 students would be an especially troubling cluster. However, the number of sick students came not from lab-confirmed tests but from "estimates" made by counting "students who went to the Student Health Center with flu symptoms, students who called the H1N1 hotline or the Health Center's doctor-on-call, and students who went to the hospital's emergency room."

Without lab testing, it's impossible to know how many of the students actually had H1N1 flu. But the statistical trend indicates it was likely much fewer than 250.

CDC continues to monitor flu in general and H1N1 through "sentinels," which basically act as spot-checks to detect trends around the nation. But at least one state, California, has found value in tracking H1N1 flu in greater detail.

"What we are doing is much more detailed and expensive than what CDC wants," said Dr. Bela Matyas, California's Acting Chief of Emergency Preparedness and Response. "We're gathering data better to answer how severe is the illness. With CDC's fallback position, there are so many uncertainties with who's being counted, it's hard to know how much we're seeing is due to H1N1 flu rather than a mix of influenza diseases generally. We can tell that apart but they can't."

After our conversation with Dr. Matyas, public affairs officials with the California Department of Public Health emphasized to CBS News that they support CDC policy to stop counting individual cases, maintaining that the state has the resources to gather more specific testing data than the CDC.

Because of the uncertainties, the CDC advises even those who were told they had H1N1 to get vaccinated unless they had lab confirmation. "Persons who are uncertain about how they were diagnosed should get the 2009 H1N1 vaccine."

That's unwelcome news for a Marietta, Georgia mom whose two children were diagnosed with "probable" H1N1 flu over the summer. She hoped that would mean they wouldn't need the hastily developed H1N1 flu vaccine. However, since their cases were never confirmed with lab tests, the CDC advises they get the vaccine. "I wish they had tested and that I knew for sure whether they had it. I'm not anxious to give them an experimental vaccine if they don't need it."

Speaking to CBS' "60 Minutes," CDC Director Dr. Frieden said he has confidence that the vaccine will be safe and effective: "We're confident it will be effective we have every reason to believe that it will be safe."

However, the CDC recommendation for those who had "probable" or "presumed" H1N1 flu to go ahead and get vaccinated anyway means the relatively small proportion of those who actually did have H1N1 flu will be getting the vaccine unnecessarily. This exposes them to rare but significant side effects, such as paralysis from Guillain-Barre syndrome.

It also uses up vaccine, which is said to be in short supply. The CDC was hoping to have shipped 40 million doses by the end of October, but only about 30 million doses will be available this month.

FDA U.S. Food and Drug Administration

Fraudulent 2009 H1N1 Influenza Products List

FDA US, 21 October 2009

https://web.archive.org/web/20091021235245/http://www.accessdata.fda.gov/scripts/h1n1flu/

Information current as of noon October 20, 2009, 139 entries in list

Purpose of the Fraudulent Products List

This list is intended to alert consumers about Web sites that are or were illegally marketing unapproved, uncleared, or unauthorized products in relation to the 2009 H1N1 Flu Virus (sometimes referred to as the "swine flu" virus). Note that until evidence to the contrary is presented to FDA, the owner of the listed Web site is considered responsible for promoting the unapproved, uncleared, or unauthorized products. The uses related to the 2009 H1N1 Flu Virus are not necessarily being promoted by the manufacturers of the products.

Consumer Considerations about the Products List

- This list does not include every Web site that is marketing products related to the 2009 H1N1 Flu Virus without FDA approval, clearance, or authorization, only those Web sites to which FDA has issued a warning letter.
- Even if a Web site is not included in this list, consumers should exercise caution before purchasing over the Internet any product purporting to diagnose, mitigate, prevent, treat, or cure the 2009 H1N1 Flu Virus.
- Please note that some of these products may be approved or cleared by FDA for other medical uses. The fact that a product is listed on this page indicates ONLY that the products are not cleared, approved, or authorized for the diagnosis, mitigation, prevention, treatment, or cure of the 2009 H1N1 flu virus.

Once included, all Web sites and products will remain listed. After FDA has verified that the products or the objectionable claims related to the 2009 H1N1 Flu Virus have been removed from the Web site, this information will be added to the list.

The information is current as of the date indicated. If we learn that any information is not accurate, we will revise the list as soon as possible.

View Products List

Important note: Consumers are advised that FDA has not determined whether these Web sites include products promoted for uses not related to the 2009 H1N1 Flu Virus that are also illegally marketed because they are not approved, cleared, or authorized by FDA for those other uses.

Peter Michael Lingens

Ich riskiere die Schweinegrippe

Profil, 22 October 2009
https://www.profil.at/meinung/peter-michael-lingens-ich-schweinegrippe-253927

Seit Wochen löchern mich E-Mails mit Hinweisen auf die düsteren Machenschaften eines Gangstersyndikats, das mithilfe der Schweinegrippe-Impfung zuerst einen Massenmord begehen und dann die Weltherrschaft an sich reißen will. Man legt dergleichen nach 50 Jahren Berufserfahrung zur raschen Entsorgung ab und fühlt sich darin nach kurzem Googeln bestätigt: Letztlich gehen die Warnungen auf eine in Österreich ansässige Journalistin namens Jane Bürgermeister zurück, die einen Zwischenfall in einem Labor des Pharmakonzerns Baxter in Orth an der Donau zum Anlass genommen hat, bei der Staatsanwaltschaft Strafanzeige gegen eine kriminelle Organisation zu erstatten, die die obigen Verbrechen im Zusammenwirken begehen wolle.

Unter den von ihr Verdächtigten auch profil-Herausgeber Christian Rainer, weil profil den Vorfall in Orth als bloße Panne dargestellt habe, und profil-Gründer Oscar Bronner, weil er als Teilnehmer von Bilderberg-Treffen offenbar zu den Drahtziehern zählt. So weit ein durchaus vertrautes Muster. Ich hätte das Material zur Gänze in den Papierkorb geworfen, wäre ich mittendrin nicht auf die Beantwortung einer parlamentarischen Anfrage durch Gesundheitsminister Alois Stöger gestoßen, die den Vorfall in Orth zum Gegenstand hatte: Es wurden dort, so räumt er ein, tatsächlich 72 Kilo einer Substanz hergestellt, die mit Vogel- und Schweinegrippe-Viren angereichert war und versehentlich an 16 europäische Labors versendet wurde, ehe in Tschechien auffiel, dass damit gefütterte Frettchen starben.

Frau Bürgermeister schloss daraus, die 72 Kilo sollten dazu dienen, einen Haufen Grippetote zu produzieren, die die WHO dann zum Anlass nehmen würde, aufgrund der Ausnahmebestimmungen zur Bekämpfung einer Pandemie die Weltherrschaft zu erringen.

Ich schließe daraus, dass bei der Forschung nach Impfstoffen offenbar Fehler vorkommen, die eigentlich ausgeschlossen sein sollten, und die Anfragebeantwortung Dr. Stögers, dass das Labor in der Folge behördlich überprüft worden sei, hat mein Vertrauen in Impfstoffe nicht unbedingt gestärkt. Wenn Vogelgrippe- und Schweinegrippe-Viren so unglaublich gefährlich sind, dass man die ganze Welt dagegen impfen muss, dann scheint mir der offenbar nicht ausreichend sorgfältige Umgang damit doch ein Problem zu sein, das mit einer parlamentarischen Anfragebeantwortung unter Ausklammerung aller Details nicht aus der Welt geschafft ist.

Mein eigentliches Interesse gilt freilich der Frage, ob diese Massenimpfungen wirklich gerechtfertigt sind, und es hat mittlerweile doch auf relativ gewichtige Medien übergegriffen: Arte hat dazu eine TV-Diskussion abgehalten, im ZDF hat ein Impfsachverständiger gemeint, er sehe keinen Grund, sich zur Impfung zu drängen; man könne durchaus auch in Ruhe zuwarten, wie sich die Dinge entwickeln und wie sich die Impfstoffe bewähren.

Dem von Österreich bestellten Baxter-Fabrikat bescheinigt er dabei die relativ größte Sicherheit: Dieser Impfstoff basiere ausschließlich auf der Wirkung von Antigenen und sei nicht, wie die

anderen, mit Verstärkern versehen, deren Nebenwirkungen man noch ungenügend kenne. Ein paar Tage später erklärte ein anderer Sachverständiger am selben Sender das Gegenteil: Der Baxter-Impfstoff sei der altmodischere, weniger gut dokumentierte. Mir war das insofern egal, als mich etwas anderes sehr viel mehr interessiert: Ich möchte doch zuerst etwas mehr Datenmaterial darüber, dass die Schweinegrippe derart gefährlich ist. Denn vorerst gab es nur eine eindrucksvolle Meldung aus Mexiko, wonach sie 350 Tote gefordert habe, die freilich -wenig später auf sieben Tote (ARD) reduziert werden mussten.

An sonstigen Grippen sterben in Deutschland 15.000 Menschen im Jahr. Soweit die Schweinegrippe in Europa beobachtet wurde, ist sie keineswegs besonders kritisch verlaufen. Der Hinweis, dass sich der Virus verändern und sehr viel gefährlicher werden könnte, beeindruckt mich auch nicht ausreichend: Erstens gilt das für jeden Virus, und zweitens ist fraglich, ob der Impfstoff auch gegen den veränderten Virus nützt.

Normalerweise richtet man sich in Fragen wie diesen freilich nach der WHO, und die empfiehlt die Impfung dringend. Allerdings hat sie die Kriterien für die Gefahreiner Pandemie verändert: Ursprünglich war eine dramatische Sterblichkeitsrate erforderlich jetzt genügt es, dass die Schweinegrippe in zwei Ländern gleichzeitig auftritt, sich also offenbar verbreitet. Das genügt mir, wenn sie nicht wirklich so gefährlich sein sollte, nicht ganz. In den Gremien der WHO, die über das Ausmaß der Gefahr urteilen, sitzen zwangsläufig Experten, die engen Kontakt mit der Pharmaindustrie pflegen müssen.

Erhard Busek hat mir anlässlich des AKH-Skandals mit auf den Weg gegeben, dass man bei öffentlichen Aufträgen im Allgemeinen mit einer Korruptionsrate von fünf Prozent rechnen sollte, die sich bei Rüstungsaufträgen verdreifacht. Nun versuche ich mir auszurechnen, welche Summen der Pharmaindustrie zur Verfügung stehen, wenn sie sicher sein kann, Milliarden Menschen gegen Schweinegrippe zu impfen. Selbst wenn sie jedem WHO-Beauftragten, der zur Gefahr der Schweinegrippe Stellung nimmt, zehn Millionen Euro in die Hand drückte, hätte sie noch längst nicht die 5-Prozent-Marke erreicht. Natürlich liegt es mir fern, für wahrscheinlich zu halten, dass dergleichen wirklich passiert. Aber schon die bloß theoretische Möglichkeit lässt mich die Haltung der Hälfte aller britischen Ärzte einnehmen: Sie lassen sich selbst nicht impfen und warten ab.

THE FLU CASE

Jane Burgermeister

Austrian news Magazine writes hit piece about my charges against Baxter

The Flu Case, 25 October 2009, 18:55
https://web.archive.org/web/20091028231438/http://www.theflucase.com/index.php?option=com_content&view=article&id=1366:austrian-news-magazine-writes-hit-piece-about-my-charges-against-baxter&catid=1:latest-news&Itemid=64&lang=en

The Austrian news magazine Profil has run a hit piece against me, saying that my criminal charges against Baxter for contaminating 72 kilos of vaccine material with live bird flu virus belong in the waste paper basket.

Peter Michael Lingens from Profil fails to mention the fact that the live bird flu virus has to be handled under biosafety level 3 regulations (separate lab, double doors, electronic codes, special clothing, negative pressure etc), which makes an accidental contamination virtually impossible even though I make this point repeatedly in my charges.

Also, he fails to mention that there was no need for Baxter to have the artificial and deadly virus (supplied by WHO) in its labs in Orth an der Donau in the first place.

The existence of the biosafetly regulations make accidentally manufacturing and distributing 72 kilos of pandemic material in a biosafetly level 3 lab about as likely as accidently getting 72 tonnes of gold out of Fort Knox.

Ignoring these facts, Lingens blissfully concludes Baxter "didn't take enough care."

If only!

Also, Lingens fails to mention that the police have actually opened a case and are investigating these ridiculous charges worthy only of being tossed into his wastepaper basket.

However, what can anyone expect from Profil?

Their reporter Emil Bobi distorted the facts on the Baxter case in a piece in April using exactly the same tactic of omitting mention of the the existence of biosafety level 3 regulations and claiming a minute quantity had been contaminated because a single little tube hadn't been changed when we know, in the meantime, it was 72 kilos in an apparent bid to to whitewash the company even though I sent them a copy of my criminal charges where the biosafety level 3 regulatinns indicating criminal intent are mentioned in detail.

Interestingly, the founder of Profil Oscar Bronner visited Bilderberg meetings where he hob nobbed with the Rockefellers.

Obviously, the campaign to alert people to the dangers of the vaccine is going so well even in Austria that Bronner and Profil have decided to try to discredit it.

I will be filing charges for defamation againt Lingens and Profil. I will post them up on the website after they have been deposited in court.

Here is Lingens' piece: (*see above*)

Marilynn Marchione

FDA warns: Swine flu scams lurk on the Internet

Associated Press, 22 October 2009

https://web.archive.org/web/20091103181236/http://www.google.com/hostednews/ap/article/ALeqM5hGsk8HldTZc5s-iF50VTpZktrkHwD9BGBGJG1

Air "sterilizers." A photon machine. Supplement pills to boost the immune system. Protective shampoos and face masks. Even fake Tamiflu.

These and other products making bogus claims to prevent or treat swine flu are flooding the Internet as scam artists prey on the public's fears while the vaccine is delayed and real Tamiflu – made by Switzerland's Roche Group – is rationed.

Every problem, it would seem, is a sales opportunity. Some of the products appear to have been pitched for other emergencies, such as one called "Quake Kare" and masks and purifiers sold during the SARS scare.

Federal officials have sent warning letters to promoters of more than 140 swine flu-related products, including well-known alternative medicine advocate Dr. Andrew Weil for his "Immune Support Formula."

Consumer Reports also has warned subscribers to be wary

"It's harmful, disappointing, frustrating to see folks take advantage of the public like this," said Dr. John Santa, who evaluates health claims for Consumer Reports.

Fraudulent products emerged shortly after swine flu did last spring – about 10 a day, said Alyson Saben, head of a swine flu consumer fraud team formed by the Food and Drug Administration. The pace slowed over the summer as the flu abated, but "it's picked up" in recent weeks, she said. "We are seeing new sites pop up."

Most worrisome: sites that claim to sell Tamiflu without a prescription. The FDA bought and tested five such products. One contained powdered talc and generic Tylenol – no Tamiflu. Several others contained some Tamiflu but were not approved for sale in the U.S.

"We have no idea of the conditions under which they were manufactured. They could contain contaminated, counterfeit, impure or subpotent or superpotent ingredients," Saben said.

Tamiflu and GlaxoSmithKline's Relenza are the only drugs recommended for treating swine flu.

Rogue Web sites are not the only ones trying to cash in on flu fears. Makers of some well-established products are making claims that may be close to the line, the FDA says.

This week, the makers of Dial Soap, Kleenex, Clorox and other big brands launched a joint promotional campaign costing up to $1 million. The FDA is reviewing the campaign, which includes a video that says:

"Germs are tiny organisms that can cause disease. According to the CDC, up to 80 percent of infectious diseases, like the flu, are spread by your hands. That's why frequent, proper handwashing is so important in preventing spread of the flu, other viruses and germs. An antibacterial soap like Dial Complete foaming hand wash kills 99.9 percent of germs."

Flu is caused by a virus, so killing bacteria is of uncertain benefit

The campaign is "not being specific down to swine flu," said Scott Moffitt, an official with Dial Corp.'s parent company, Germany-based Henkel AG. He also contends the video is not misleading, even though the germ-killing claim follows a sentence about flu and other viruses.

One product that drew a warning letter from the FDA is the Photon Genie, a gadget that delivers "energy waves." Its Web site claimed it "helps strengthen the immune system, and a strong immune system is KEY to preventing swine flu symptoms and KEY to treating swine flu."

The site has since removed the swine flu claim but "other claims remain," Saben said.

The group behind the Web site, the Skilling Institute of Phoenix, "is not marketing, and will not market in the future, any product that is intended to diagnose, mitigate, prevent, treat or cure the H1N1 flu virus," its director, Warren Starnes, wrote in an e-mail.

Some products the FDA warned about contain silver, such as "Swine Flu...Gone," made by *Secrets of Eden*. "Spray 'Swine Flu... Gone' with ionic silver on your hands and on any surface where these germs may exist and kill the virus," its site had claimed.

Secrets of Eden sells supplements and oils with a biblical flair, said its general manager, Rick Strawcutter, a former pastor in Adrian, Mich. The staff "got a little carried away" on marketing for one product and "drew the ire of the FDA," he said.

"It was not worth contesting," so he ordered a stop to it, Strawcutter said.

The federal Agency for Toxic Substances and Disease Registry says silver "may cause harmful health effects," depending on the amount and type of exposure.

Dr. Andrew Weil's site had this problem language, the FDA's warning letter said: "...during the flu season, I suggest taking a daily antioxidant, multivitamin-mineral supplement, as well as astragalus, a well-known immune-boosting herb that can help ward off colds and flu. You might also consider ... the Weil Immune Support Formula which contains both astragalus and immune-supportive polypore mushrooms."

Weil issued a statement saying the content "was primarily educational" about how to avoid the flu, and that he had directed his Web site team to remove and review it for compliance with federal rules.

Doctors, too, are being warned not to prescribe unproven remedies, such as drugs not shown to be safe and effective for swine flu. In this week's New England Journal of Medicine, three FDA doctors caution against use of ribavirin, a drug approved in the U.S. for treating hepatitis C and respiratory syncytial virus, or RSV, a childhood illness.

There have been reports of doctors wanting to try it for seriously ill flu patients, but it can cause a dangerous type of anemia and cannot be used in pregnant women because of the risk of birth defects, said the FDA's Dr. Debra Birnkrant.

"It shouldn't be used lightly" and needs to be tested in a clinical trial for flu, she said.

Los Angeles Times

Thomas H. Maugh II

One in five kids had swine flu? No, not really, CDC now says

Los Angeles Times, 22 October 2009, 2:31 PM PT
https://www.latimes.com/archives/blogs/booster-shots/story/2009-10-22/one-in-five-kids-had-swine-flu-this-month-cdc-says

One in five U.S. children had an influenza-like illness during the first 11 days of October, and most of those cases were probably pandemic H1N1 influenza, according to the Centers for Disease Control and Prevention. About 7% of adults said they had suffered the illness during the same time period, according to a telephone survey of more than 14,000 households, agency officials announced today at a medical meeting in Atlanta. There was no confirmation of the infections.

[Update, 12:02 p.m. Oct. 23: Dr. Thomas R. Frieden, director of the CDC, said Friday in a news conference that the data was misinterpreted by news media and that it is highly unlikely that most of the cases were swine flu. In a few communities having peak infections, one in five kids did have swine flu, but in this survey, it is far more likely that most of them had colds and other infections. 'The data simply show that kids get a lot of infections,' he said.]

Lyn Finelli, a CDC surveillance expert, said the so-called swine flu virus is causing more illness now than at any time since the first outbreak in April. She added that the number of swine flu deaths in children since the beginning of September is equal to the number that occurred in the four months of the outbreak this spring.

Some experts have warned that the pandemic is peaking now and that the swine flu vaccine, which has been delayed, will arrive too late to have much effect. But health authorities have emphasized that even if half of the population has contracted the virus, that still leaves substantial numbers vulnerable to it.

In other news:

- The American Medical Assn. has created a new website to help patients and physicians communicate and to improve care coordination for swine flu. The site will help patients assess their own potential flu symptoms or those of a child or other loved one, and provide guidance on whether to seek medical care.

- The Food and Drug Administration is warning again that alleged flu scams abound on the Internet, according to the Associated Press. The agency has sent warning letters to more than 140 promoters of swine-flu-related products, including well-known alternative medicine advocate Dr. Andrew Weil for his 'Immune Support Formula.' 'It's harmful, disappointing, frustrating to see folks take advantage of the public like this,' Dr. John Santa of Consumer Reports told AP. The agency also cautioned doctors against prescribing products like the antiviral agent ribavirin that have not been shown to be effective against influenza. A list of the allegedly fraudulent products is available here and you can report fraud here.
https://web.archive.org/web/20091029132643/http://www.accessdata.fda.gov/scripts/h1n1flu/

- Many people refuse to get vaccinated for swine flu, but there are still large numbers who want it. More than 1,700 people showed up for a vaccination campaign Wednesday at a public health clinic in Rockville, Md., but most had to be turned away because the clinic had only 249 doses, according to Reuters. Vaccine distribution has been delayed because the virus does not grow as rapidly in the laboratory as producers had hoped.

Thomas H. Maugh II

One in five kids had swine flu? No, not really, CDC now says

Los Angeles Times, 23 October 2009, 12:33 PM PT
https://www.latimes.com/archives/blogs/booster-shots/story/2009-10-23/one-in-five-kids-had-swine-flu-no-not-really-cdc-now-says

Media reports Thursday that one in five kids had the pandemic H1N1 influenza virus during the first 11 days of October were a misinterpretation, Dr. Thomas Frieden, director of the Centers for Disease Control and Prevention, said at a news conference this morning. What researchers actually found was that one in five kids had an influenza-like illness during that period, but only a minority of those cases were likely to be swine flu.

The results came from a telephone survey of 14,000 randomly selected households, who were asked if they had suffered influenza-like symptoms from Oct. 1 to Oct. 11. The responses indicated that one in five kids had suffered such symptoms and about 7% of adults. No effort was made to confirm that the illnesses were, in fact, swine flu.

Frieden said that at the peak of the epidemic, in some localities, as many as one in five kids were indeed infected by the virus. In this survey, however, it is more likely that most of the the children simply had colds or sniffles. "The data simply show that kids get a lot of infections," he said.

SPIEGEL Wissenschaft

Nähe zu Pharmaindustrie

Pandemie-Beauftragter der Regierung hat umstrittenen Beraterjob

Spiegel, 24 Oktober 2009, 14:30 Uhr

http://www.spiegel.de/wissenschaft/medizin/0,1518,657146,00.html

Der Influenza-Koordinator am staatlichen Robert-Koch-Institut berät nach SPIEGEL-Informationen eine von der Pharmaindustrie finanzierte Vereinigung. Korruptionswächter beklagen die Verquickung - ein Amtsträger dürfe nicht so eng mit einem Lobbyverein verbandelt sein.

Berlin - Walter Haas, Koordinator der Influenza-Expertengruppe am staatlichen Robert-Koch-Institut (RKI), ist wissenschaftlicher Berater einer ausschließlich von der Pharmaindustrie finanzierten Vereinigung. Nach SPIEGEL-Informationen unterstützen zehn Arzneikonzerne die European Scientific Working Group on Influenza (ESWI), für die er tätig ist.

Unter ihnen befinden sich GlaxoSmithKline, Hersteller des deutschen Schweinegrippe-Impfstoffs, sowie der Schweizer Roche-Konzern, der das antivirale Mittel Tamiflu produziert. Nach eigenem Bekunden ist ESWI ein unabhängiger Forscherverbund. Er organisiert regelmäßig Grippe-Konferenzen mit vielen hundert Teilnehmern.

Im Statut steht, der Verband kläre Politiker und Gesundheitsbehörden über "die Vorteile und die Sicherheit von Influenza-Impfstoffen und antiviralen Medikamenten" auf. Man befördere "eine Politik für die antivirale Bevorratung" und biete dazu wissenschaftliche Argumente.

Tatsächlich taucht auf den ESWI-Web-Seiten unter anderem ein Werbefilm von Tamiflu-Produzent Roche auf. Ein ESWI-Sprecher sagte dem SPIEGEL, man sei stolz, eine "hochkarätige Institution" wie das RKI und Walter Haas als unentgeltlichen Berater gewonnen zu haben.

Angela Spelsberg von der Anti-Korruptions-Organisation Transparency International beklagt, das RKI bewege sich hier sowohl ethisch als auch rechtlich in einer Grauzone: "Es kann nicht sein, dass ein Amtsträger, der allein dem Wohl der Bevölkerung dienen soll, so eng mit einem Lobbyverein verbandelt ist", sagte sie dem SPIEGEL.

THE FLU CASE

Flashback:
Spiegel report highlights links between big pharma and German government

The Flu Case, 17 November 2009, 12:00
https://web.archive.org/web/20100102040132/http://theflucase.com/index.php?option=com_content&view=article&id=1844%3Aflashback-spiegel-report-highlights-links-between-big-pharma-and-german-government-&catid=1%3Alatest-news&Itemid=64&lang=en

The German news magazine Der Spiegel reported end of October that the government coordinatior for pandemic emergencies at the Robert-Koch-Institute Walter Haas is also a member of the European Scientific Working Group on Influenza (EWSWI), which is financed exclusively by pharmaceutical companies. According to an EWSWI press release from 2005, a worldwide pandemic was "just a question of time."

Pharmaceutical company Baxter contaminated 72 kilos of seasonal flu with the live bird flu virus in its Austrian facilities in Orth an der Donau and so nearly sparked a global bird flu pandemic in February. Because Baxter is obliged to follow biosafety level 3 standards when handling the virus – supplied by WHO – an accident can be ruled out.

Also, the EWSWI allegedly met in January to discuss loosening the criteria for WHO to declare a pandemic level 6 emergency. In the event of WHO declaring a pandemic level 6 emergency, WHO acquires sweeping powers over national governments, and can order forced vaccination and quarantine.

The pharmaceutical companies supplying the vaccines sit on WHO's vaccine advisory committee as observers.

"*Issued at the end of a four-day conference on influenza organized by the European Scientific Working group on Influenza (ESWI) in Malta, the warning reflects a consensus that a worldwide outbreak of influenza is just a question of time. Only by placing this issue at the top of Europe's health agenda now, will member states take the necessary steps towards preparing infrastructure, citizens and the community at large for the threat*. (p. 1)
"*Pandemics appear to occur with some regularity every thirty to forty years – most recently in 1957 and 1968 – reinforcing concerns that a new pandemic may be imminent*."(p. 2)

The Second European Influenza Conference. MALTA, 11-14 September 2005, EWSWI.

the WHITE HOUSE
PRESIDENT BARACK OBAMA

Barack Obama
President of the United States of America

Declaration of a National Emergency with Respect to the 2009 H1N1 Influenza Pandemic

The White House, Office of the Press Secretary, 24 October 2009
https://obamawhitehouse.archives.gov/the-press-office/declaration-a-national-emergency-with-respect-2009-h1n1-influenza-pandemic-0

On April 26, 2009, the Secretary of Health and Human Services (the "Secretary") first declared a public health emergency under section 319 of the Public Health Service Act,42 U.S.C. 247d, in response to the 2009 H1N1 influenza virus. The Secretary has renewed that declaration twice, on July 24,2009, and October 1, 2009. In addition, by rapidly identifying the virus, implementing public health measures, providing guidance for health professionals and the general public, and developing an effective vaccine, we have taken proactive steps to reduce the impact of the pandemic and protect the health of our citizens. As a Nation, we have prepared at all levels of government, and as individuals and communities, taking unprecedented steps to counter the emerging pandemic. Nevertheless, the 2009 H1N1 pandemic continues to evolve. The rates of illness continue to rise rapidly within many communities across the Nation, and the potential exists for the pandemic to overburden health care resources in some localities.Thus, in recognition of the continuing progression of the pandemic, and in further preparation as a Nation, we are taking additional steps to facilitate our response.

NOW, THEREFORE, I, BARACK OBAMA, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States,including sections 201 and 301 of the National Emergencies Act (50 U.S.C. 1601 et seq.) and consistent with section 1135 of the Social Security Act (SSA), as amended (42 U.S.C. 1320b-5), do hereby find and proclaim that, given that the rapid increase in illness across the Nation may overburden health care resources and that the temporary waiver of certain standard Federal requirements may be warranted in order to enable U.S. health care facilities to implement emergency operations plans, the 2009 H1N1 influenza pandemic in the United States constitutes a national emergency. Accordingly, I hereby declare that the Secretary may exercise the authority under section 1135 of the SSA to temporarily waive or modify certain requirements of the Medicare, Medicaid, and State Children's Health Insurance programs and of the Health Insurance Portability and Accountability Act Privacy Rule throughout the duration of the public health emergency declared in response to the 2009 H1N1 influenza pandemic. In exercising this authority, the Secretary shall provide certification and advance written notice to the Congress as required by section 1135(d) of the SSA (42 U.S.C. 1320b-5(d)).

IN WITNESS WHEREOF, I have hereunto set my hand this twenty-third day of October, in the year of our Lord two thousand nine, and of the Independence of the United States of America the two hundred and thirty-fourth.

BARACK OBAMA

Patricia Zengerle

Obama declares swine flu a national emergency

Reuters, 24 October 2009
https://web.archive.org/web/20111104221853/http://www.reuters.com/article/2009/10/24/us-flu-usa-obama-idUSTRE59N19E20091024

(Reuters) – **President Barack Obama** has declared 2009 H1N1 swine flu a national emergency, the White House said on Saturday.

The declaration will make it easier for U.S. medical facilities to handle a surge in flu patients by allowing the waiver of some requirements of Medicare, Medicaid and other federal health insurance programs as needed, the White House said in a statement.

The U.S. Centers for Disease Control and Prevention said on Friday that swine flu has become widespread in 46 of the 50 U.S. states, a level comparable to the peak of ordinary flu seasons but far earlier and with more waves of infection expected.

Obama signed the statement on Friday night.

The White House statement said the declaration was intended to prepare the country in case of "a rapid increase in illness that may overburden health care resources." It was similar to disaster declarations issued before hurricanes hit coastal areas.

"It's important to note that this is a proactive measure -- not a response to a new development," an administration official said.

"H1N1 is moving rapidly, as expected. By the time regions or healthcare systems recognize they are becoming overburdened, they need to implement disaster plans quickly," he said.

Seasonal flu normally peaks sometime between late November and early March and kills about 36,000 Americans in an average year. Swine flu has hit young adults and children the hardest, while seasonal flu normally is more dangerous for people over age 65.

H1N1, declared a public health emergency earlier in the year, has killed more than 1,000 people in the United States and put more than 20,000 in the hospital since it emerged earlier this year, the CDC said. But health officials are quick to note that the actual number of cases cannot be measured. The new declaration clears the way for waivers of federal requirements that, for example, could prevent hospitals from establishing off-site, alternate care facilities that could help them deal with emergency department demands, the White House said.

The Health and Human Services Department is trying to deliver vaccines against H1N1 but says production is falling short of projections because companies are having trouble making them. HHS has also moved to make available stockpiles of antiviral drugs oseltamivir, made by Roche AG under the brand name Tamiflu, and zanamivir, an inhaled drug made by GlaxoSmithKline under the brand name Relenza.

On Friday the U.S. Food and Drug Administration issued an emergency use authorization for an experimental new drug called peramivir, made by Biocryst Pharmaceuticals Inc and licensed to Shionogi & Co Ltd. The authorization allows the intravenous drug to be used in hospitalized patients who cannot take pills or inhale Relenza or when Tamiflu or Relenza do not seem to be helping.

President Obama declares national emergency over swine flu pandemic, but why?

Natural News, 24 October 2009
https://www.naturalnews.com/027323_flu_national_emergency_swine.html

According to the CDC, swine flu infections have already peaked, and the pandemic is on its way out. Peak infection time was the middle of October, where one in five U.S. children experienced the flu, says the CDC. Out of nearly 14,000 suspected flu cases tested during the week ending on October 10, 2009, 99.6% of those were influenza A, and the vast majority of those were confirmed as H1N1 swine flu infections.

Even though the H1N1 pandemic appears to have peaked out, U.S. President Barack Obama has now declared a national emergency over swine flu infections. The reasoning behind such a declaration? According to the White House, it's designed to "allow hospitals to better handle the surge in patients" by allowing them to bypass certain federal laws.

Emergency powers trump the Bill of Rights

That's the public explanation for this, but the real agenda behind this declaration may be far more sinister. Declaring a national emergency immediately gives federal authorities dangerous new powers that can now be enforced at gunpoint, including:

- The power to force mandatory swine flu vaccinations on the entire population.
- The power to arrest, quarantine or "involuntarily transport" anyone who refuses a swine flu vaccination.
- The power to quarantine an entire city and halt all travel in or out of that city.
- The power to enter any home or office without a search warrant and order the destruction of any belongings or structures deemed to be a threat to public health.
- The effective nullification of the Bill of Rights. Your right to due process, to being safe from government search and seizure, and to remain silent to avoid self-incrimination are all null and void under a Presidential declaration of a national emergency.

None of this means that federal agents are going to march door to door arresting people at gunpoint if they refuse the vaccine, *but they could if they wanted to*. Your rights as an American are no longer recognized under this national emergency declaration.

What emergency?

The declaration of this national emergency seems suspicious from the start. Where's the emergency? The number of people killed by swine flu in the United States is far smaller than the number of people killed each year from *seasonal flu*, according to CDC statistics. People obviously aren't dropping dead by the millions from H1N1 influenza. Most people are just getting mild flu symptoms and a few days later they're fine.

So where's the emergency? The only emergency I can see is the emergency fabricated by Big Pharma to sell more vaccines. By declaring a national emergency over the H1N1 pandemic, Obama is playing right into their hands. I find the timing of all this curious. Two days ago, New York gave up on its efforts to require mandatory vaccinations of health care workers. This was designed to defuse a large number of planned protests from health freedom-conscious people who don't want government-mandated chemicals pumped into their veins.

The planned protests in New York would have fueled yet more resistance among health care workers across the country, and had it been allowed to continue, it could have resulted in a huge nationwide backlash against swine flu vaccines. By backing off the vaccine mandate and blaming it on a vaccine shortage, and then having Obama declare a national emergency, our state and national leaders have halted the protests and put in place a pro-vaccine Big Brother mandate that can be enforced at gunpoint.

Big Pharma must be pleased with all this. With these emergency powers in place, all that's necessary to force vaccinations upon the entire population is a larger supply of the vaccines – and that's coming in November.

Obama's H1N1 Emergency Declaration: Is Martial Law Unfolding?

Info Wars, 24 October 2009
https://web.archive.org/web/20091027010722/http:/www.infowars.com/obamas-h1n1-emergency-declaration-is-martial-law-unfolding/

Obama has declared a 2009 H1N1 swine flu a national emergency.

It is not clear if this declaration falls under the National Emergencies Act (50 U.S.C. 1601–1651). The act is not mentioned in media reports.

The National Emergencies Act was passed in 1976. It has been extended six times. In 2007, the declaration was strengthened with the issuance of National Security Presidential Directive 51 (NSPD-51) which gave the president the authority to do whatever he deems necessary in a vaguely defined "catastrophic emergency" including everything from canceling elections to suspending the Constitution.

NSPD-51 (National Security and Homeland Security Presidential Directive) is unconstitutional. It was created on May 4, 2007, as a "presidential directive" (bypassing Congress) and signed by George W. Bush. It claims the power to execute procedures for continuity of the federal government in the event of a "catastrophic emergency." Such an emergency is construed as "any incident, regardless of location, that results in extraordinary levels of mass casualties, damage, or disruption severely affecting the U.S. population, infrastructure, environment, economy, or government functions."

In other words, it is a martial law directive. On May 10, 2007, The Washington Post characterized NSPD-51 is a "shadow government" directive [see: Spencer S. Hsu, Bush Changes Continuity Plan: Administration, Not DHS, Would Run Shadow Government. – Washington Post, 10 May 2007]
=> https://web.archive.org/web/20110513055449/https://www.washingtonpost.com/wp-dyn/content/article/2007/05/09/AR2007050902719.html

The John Warner National Defense Authorization Act (NDAA) for Fiscal Year 2007 states that the military may be used during a "national emergency." Sec 1076 is extremely explicit, notes Michel Chossudovsky, and "virtually creates a Pinochet style environment for the mass arrest of political dissidents without trial, the storming of public rallies, etc."

NDAA specifically mentions "epidemic" as an excuse to declare martial law.

Prior to Warner and NSPD-51, legislation passed by the Clinton administration allowed the military to intervene in judicial and civilian law enforcement activities. In 1996, legislation was passed which allowed the military to intervene in the case of a national emergency. In 1999, Clinton's Defense Authorization Act (DAA) extended those powers (under the 1996 legislation) by creating an "exception" to the Posse Comitatus Act, which permits the military to be involved in civilian affairs "regardless of whether there is an emergency," according to Chossudovsky.

In 2005, a month after Hurricane Rita, a so-called bird flu "crisis" was hyped by the government and the corporate media. "I am concerned about avian flu. I'm concerned about what an avian flu outbreak could mean for the United States and the world… I have thought through the scenarios of what an avian flu outbreak could mean," Bush declared at the time. "*One option is the use of a military that's able to plan and move.* So that's why I put it on the table. I think it's an important debate for Congress to have" (emphasis added).

Bush's directive, signed two years later, did not bother to involve Congress in the "debate."

Obama's declaration of a national emergency sets the stage for forced vaccination and internment of people who refuse to be vaccinated.

In January, the National Emergency Centers Establishment Act (HR 645) was introduced in Congress. It calls for the establishment of six national emergency centers in major regions in the US to be located on existing military installations to be used to quarantine people in the case of a public health emergency or forced vaccination program. HR 645 remains in committee.

The H1N1 "crisis" is a manufactured crisis. As noted earlier today, a CBS investigative report reveals that H1N1 flu cases are not as prevalent as we are told by the government, the CDC, WHO, and the corporate media. The so-called epidemic is bogus.

Millions of people are refusing to take the H1N1 vaccine. In the weeks ahead – if Obama's emergency declaration falls under the above directives – we may witness a move toward martial law, forced vaccination, and internment of those who refuse.

At best, Obama's declaration is a flimsy attempt to scare people into taking the toxic soft kill vaccination. Let's hope this is the case.

Swine-flu emergency! What does that mean?
Is president's proclamation formality, or institution of Obama martial law?

World Net Daily, 24 October 2009, 7 pm Eeastern
https://web.archive.org/web/20091027012132/http://www.wnd.com/index.php?fa=PAGE.view&pageId=113964

President Obama announced today that he has declared a "national emergency" over the H1N1 virus, a phrase with an ominous sound, but with little explanation offered by most of the news media.

The Associated Press, for example, merely stated that the declaration removes "bureaucratic roadblocks" and enables officials to "bypass federal rules." Other news outlets were even vaguer, saying the declaration waived federal requirements, but not saying what those requirements govern.

In the void of information, Internet rumors were quick to flame, centering on concerns over how the Obama administration might use the declared emergency to suddenly expand government power.

"Obama just declared H1N1 a national emergency," wrote a WND reader in an e-mail, "Here we go with martial law."

An article by Kurt Nimmo of InfoWars took the worry a step further, wondering if the White House's declaration engaged certain measures of the National Emergencies Act: "In the weeks ahead," Nimmo writes, "we may witness a move toward martial law, forced vaccination and internment of those who refuse."

But even if there really is a plot to manipulate the H1N1 virus scare into enforcing a sweeping expansion of federal power, today's "national emergency" falls far short of martial law. In fact, the laws enacted by the president's proclamation do little more than clear administrative hurdles for quicker processing of Medicare payments, and the very provisions of the National Emergencies Act that the president cited in his proclamation actually limit the power his administration can take.

The proclamation signed by the president states:
https://obamawhitehouse.archives.gov/the-press-office/declaration-a-national-emergency-with-respect-2009-h1n1-influenza-pandemic-0

I, Barack Obama, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, including sections 201 and 301 of the National Emergencies Act … do hereby find and proclaim that, given that the rapid increase in illness across the nation may overburden health care resources and that the temporary waiver of certain standard federal requirements may be warranted in order to enable U.S. health care facilities to implement emergency operations plans, the 2009 H1N1 influenza pandemic in the United States constitutes a national emergency.

Section 201 of the National Emergencies Act, however, simply requires the president to inform Congress in writing when a national emergency is declared – which he did today, after signing the declaration last night.

Section 301 forbids the president from taking up any powers of the National Emergencies Act save those he lists in the proclamation of emergency, requiring him to "specify the provisions of law under which he proposes that he, or other officers will act."

And what powers did Obama specify?

"I hereby declare," the proclamation states, "that the secretary [of Health and Human Services] may exercise the authority under section 1135 of the [Social Security Act]."

Section 1135, in turn, allows the Centers for Medicare & Medicaid Services, or CMS, to review on a case-by-case basis applications from health care providers who wish certain restrictions be waived.

According to an explanation prepared by the Association of State and Territorial Health Officials, those restrictions that can be waived include:

- Certification requirements for some doctors to be paid by Medicare, Medicaid and SCHIP programs
- Pre-approval requirements for some services
- Requirements that doctors be licensed in the same state they're practicing in order to get federal payments
- Sanctions against moving patients to alternate facilities
- A handful of other requirements governing how medical providers are paid.

In fact, the most ominous provision of a Section 1135 waiver may be alterations to HIPAA privacy regulations.

The U.S. Department of Health & Human Services explains that under a declared emergency, facilities granted a Section 1135 waiver no longer need to obtain a patient's agreement to speak with family members or friends involved in the patient's care, no longer need to distribute a notice of their privacy practices and no longer need to honor the patient's right to request privacy restrictions or confidential communications.

"For example," an HHS document on HIPAA explains, "an individual may request that her health care provider call her at her office, rather than her home. A health care provider must accommodate an individual's reasonable request for such confidential communications."

With a Section 1135 waiver granted by the CMS in a declared emergency, however, the provider need not accommodate the request in the example of calling the patient at her office.

President Obama justified the national emergency proclamation with the following words:

By rapidly identifying the virus, implementing public health measures, providing guidance for health professionals and the general public, and developing an effective vaccine, we have taken proactive steps to reduce the impact of the pandemic and protect the health of our citizens. As a nation, we have prepared at all levels of government, and as individuals and communities, taking unprecedented steps to counter the emerging pandemic.

Nevertheless, the 2009 H1N1 pandemic continues to evolve. The rates of illness continue to rise rapidly within many communities across the nation, and the potential exists for the pandemic to overburden health care resources in some localities.

Thus, in recognition of the continuing progression of the pandemic, and in further preparation as a nation, we are taking additional steps to facilitate our response.

Obama Declares Swine Flu a National Emergency

The Los Angeles Times, 25 October 2009, 12 AM PT
https://www.latimes.com/archives/la-xpm-2009-oct-25-na-national-flu-emergency25-story.html

Washington – President Obama on Saturday declared the swine flu outbreak a national emergency, a procedural step designed to allow healthcare providers to speed treatment and slow the spread of the disease.

The action gives Secretary of Health and Human Services Kathleen Sebelius temporary authority to grant waivers that would expedite steps such as setting up off-site emergency rooms to treat potential flu victims apart from other patients.

Administration officials said the move was not made as a result of any particular development, but as a preemptive measure to ensure that the tools for a quick response were in place.

"The potential exists for the pandemic to overburden healthcare resources in some localities," the White House announcement said. "Thus, in recognition of the continuing progression of the pandemic, and in further preparation as a nation, we are taking additional steps to facilitate our response."

According to the Centers for Disease Control and Prevention, 46 states have reported widespread incidence of the swine flu, also known as H1N1. Since the outbreak of the pandemic in April, there have been more than 20,000 hospitalizations from laboratory-confirmed infections and more than 1,000 deaths.

The declaration is the second step in the government's response effort. In late April, HHS declared a public health emergency, which allowed the government to release antiviral medications from federal stockpiles to states that might need them.

The national emergency declaration allows Sebelius, on a case-by-case basis, to waive federal rules governing routine medical operations if requested by doctors or hospitals.

For example, to isolate infected patients, some hospitals are planning to establish separate treatment locations in off-site tents or community centers. But without a waiver of current rules, the hospital may not get federal reimbursement if the facility is too far from its property. Hospitals could also ask for a waiver of paperwork procedures if they are besieged by flu patients.

"If there's a surge in patients, you want to be able to put in place more efficient methods of triaging and treating people," said Reid Cherlin, a White House spokesman. "It's a priority for providers not to have to waste time on the phone with federal managers."

Obama declares swine flu national emergency

MS NBC, 25 October 2009
https://web.archive.org/web/20091026045602/http://www.msnbc.msn.com/id/33459423/

Washington – President Barack Obama has declared the swine flu outbreak a national emergency, giving his health chief the power to let hospitals move emergency rooms offsite to speed treatment and protect noninfected patients.

The declaration, signed Friday night and announced Saturday, comes with the disease more prevalent than ever in the country and production delays undercutting the government's initial, optimistic estimates that as many as 120 million doses of the vaccine could be available by mid-October.

Health authorities say more than 1,000 people in the United States, including almost 100 children, have died from the strain of flu known as H1N1, and 46 states have widespread flu activity. So far only 11 million doses of the vaccine have gone out to health departments, doctor's offices and other providers, according to the Centers for Disease Control and Prevention officials.

On Sunday, the leader of the Senate's Republican minority pledged to give the Obama administration any more help it may need to fight the outbreak. Sen. Mitch McConnell of Kentucky told ABC television's "This Week" that Congress would be willing to provide any additional resources needed on a bipartisan basis.

Administration officials said the emergency declaration was a pre-emptive move designed to make decisions easier when they need to be made. Officials said the move was not in response to any single development.

Health and Human Services Secretary Kathleen Sebelius now has authority to bypass federal rules when opening alternative care sites, such as offsite hospital centers at schools or community centers if hospitals seek permission.

Some hospitals have opened drive-thrus and drive-up tent clinics to screen and treat swine flu patients. The idea is to keep infectious people out of regular emergency rooms and away from other sick patients.

Quicken access to treatment

Hospitals could modify patient rules – for example, requiring them to give less information during a hectic time – to quicken access to treatment, with government approval, under the declaration.

It also addresses a financial question for hospitals – reimbursement for treating people at sites not typically approved. For instance, federal rules do not allow hospitals to put up treatment tents more than 250 yards (230 meters) away from the doors; if the tents are 300 yards (275 meters) or more away, typically federal dollars won't go to pay for treatment.

Administration officials said those rules might not make sense while fighting the swine flu, especially if the best piece of pavement is in the middle of a parking lot and some medical centers already are putting in place parts of their emergency plans.

"I think the term emergency declaration sounds more dramatic than it really is," said Dr. Peter Hotez, a research professor and chairman of the Department of Microbiology, Immunology and Tropical Medicine at George Washington University. "It's largely an administrative move that's more preemptive ..." He said such a step would give emergency rooms and hospitals the flexibility they need.

The national emergency declaration was the second of two steps needed to give Sebelius extraordinary powers during a crisis.

On April 26, the administration declared swine flu a public health emergency, allowing the shipment of roughly 12 million doses of flu-fighting medications from a federal stockpile to states in case they eventually needed them. At the time, there were 20 confirmed cases in the U.S. of people recovering easily. There was no vaccine against swine flu, but the CDC had taken the initial step necessary for producing one.

"As a nation, we have prepared at all levels of government, and as individuals and communities, taking unprecedented steps to counter the emerging pandemic," Obama wrote in Saturday's declaration.

He said the pandemic keeps evolving, the rates of illness are rising rapidly in many areas and there's a potential "to overburden health care resources."

The government now hopes to have about 50 million doses of swine flu vaccine out by mid-November and 150 million in December. The flu virus has to be grown in chicken eggs, and the yield hasn't been as high as was initially hoped, officials have said.

"Many millions" of Americans have had swine flu so far, according to an estimate that CDC Director Dr. Thomas Frieden gave Friday. The government doesn't test everyone to confirm swine flu so it doesn't have an exact count. He also said there have been more than 20,000 hospitalizations.

Obama's H1N1 national emergency declaration could invoke FEMA response to pandemic

Info Wars, 26 October 2009
https://web.archive.org/web/20101204204308/http://www.infowars.com/obamas-h1n1-national-emergency-declaration-could-invoke-fema-response-to-pandemic/

President Obama's declaration of a national pandemic emergency is "no cause for alarm," reported the mainstream media throughout the weekend. The declaration is nothing more than a "precaution," they say. "It's really more a continuation of our preparedness steps," said Anne Schuchat, director of the Centers for Disease Control and Prevention's National Center for Immunization and Respiratory Diseases, in a USA Today story.

In other words, there's not really any emergency at all. So why declare a national emergency in the first place? The media reports this was done to allow hospitals to bypass federal regulations concerning the setting up of large-scale triage sites – emergency medical camps quickly constructed to deal with large numbers of sick people.

But at the same time, H1N1 isn't causing large-scale sickness. As USA Today reported, an expert on infectious disease, P.J. Brennan (the chief medical officer for the Penn Health System at the University of Pennsylvania in Philadelphia) said, "The public ought to take some solace, some relief in this. It's not a suggestion that things have deteriorated in any way. In no way is the virus more severe or more difficult to manage."

So let me get this straight. The H1N1 virus remains mild. The CDC reports that swine flu infections already peaked out in mid-October. There have been no new developments in swine flu that would be cause for alarm and no reason to suspect huge numbers of sick people flooding into the hospitals. And yet, for some reason, the Obama administration has declared a national pandemic emergency specifically for the purpose of speeding the ability of hospitals to process large masses of sick people through emergency medical triage tents?

What are these people not telling us?

Something doesn't add up here. Why would the U.S. government need to declare a national emergency to enable hospitals to handle a flood of sick people when there is no flood of sick people (and the pandemic seems to be fizzling out)?

This is more like the kind of preparation you might expect in advance of a *biological terrorism attack*, not for a flu that appears no more dangerous than the seasonal sniffles.

The National Emergencies Act and FEMA

Meanwhile, the media ignores the rest of the story about what dangerous powers a declaration of a national emergency puts into play. As reported here on NaturalNews, this declaration effectively ends many civil liberties in America and, at least on paper, puts the U.S. government in the position of having the legal authority to force vaccinations on the entire population at gunpoint (if they wanted to).

The National Emergencies Act passed in 1976 has some peculiar realities attached to it. In particular, as Wikipedia reports:

A federal emergency declaration allows the United States Federal Emergency Management Agency (FEMA) to exercise its power to deal with emergency situations ... Typically, a state of emergency empowers the executive to name coordinating officials to deal with the emergency and to override normal administrative processes regarding the passage of administrative rules.

Got that yet? By declaring a national emergency, Obama invokes a set of laws that not only override important sections of the U.S. Constitution, but that also activate FEMA to take charge of "responding" to the emergency.

Now we know why they need all those emergency medical tent camps near the hospitals. FEMA's in charge! And if FEMA handles the swine flu pandemic in the same way the agency handled the Hurricane Katrina disaster, we may indeed need all those emergency triage tents after all.

Those of you who have been following the ongoing march to destroy the freedoms of the American People already know about FEMA camps. These aren't Boy Scout field trip camps; they're detention centers designed to hold large numbers of people for "emergency" purposes. Many theories abound on what these FEMA camps might be used for (www.campFEMA.com)

They could conceivably be used to quarantine people who are infected with a dangerous pandemic virus. On the other hand, they might also be used to isolated and detain people who refuse to be vaccinated against any declared pandemic. Under the National Emergencies Act and related U.S. law, FEMA would have *two years of near-total control over the civilian population*, during which people could be subjected to forced vaccinations, mandatory searches of their homes, gunpoint detainment and "involuntary transportation" to a FEMA detainment facility, and so on.

I'm not saying they're going to do all this, *but they could if they wanted to!* And that's not freedom. Real freedom means you have the guaranteed right to be safe from being detained, or arrested without cause, or injected with a government-mandated chemical. Under a declaration of a national emergency, your "freedom" is at the whim of those who maintain police state powers over you. You're only "free" if they decide to refrain from exercising the power they have over you. It's the same kind of freedom you might get as a peasant in some Medieval kingdom where the king says, "You're free to go."

Now, some of these freedom-restricting actions *might conceivably* be justifiable if a truly dangerous pandemic virus were sweeping through the population killing millions, causing huge disruptions in the national infrastructure and threatening the nation with a partial or total shutdown of essential services. But that is not happening here. H1N1 is a mild virus that rates astonishingly low on the severity scale. If H1N1 were a hurricane, it would be little more than a "tropical depression." It is not a category five hurricane, nor a phase six pandemic. Virtually everyone who is exposed to H1N1 generates their own antibodies and cures themselves naturally. According to hospital reports, those who have died from the H1N1 virus are almost exclusively people who were already suffering from preexisting conditions that compromised their health such as asthma or extreme obesity.

By any measure, H1N1 as currently configured appears to present *no extraordinary threat to the health of the population*. So once again, we must ask: Why declare a national emergency and initiate a FEMA response to something that's not really an emergency?

Why I'm concerned

For the first time in this whole pandemic situation, I'm concerned. Not due to the virus itself, because that's a mild virus that presents no real threat to the population at large. I'm concerned about *what we don't know* might be going on behind the scenes here.

These preparations for large-scale medical triage tents and the emergency activation of FEMA have me worried that **the American people aren't being told the whole story.** Perhaps a terrorist organization is planning on releasing a wildly dangerous mutation of H1N1 in some major U.S. city. Or perhaps some vaccine maker is, in fact, that terrorist organization. (The best way to sell more vaccines would be to release a mutated form of H1N1 into the population and scare up some more sales…)

Or maybe, as some creative thinkers have suggested, the vaccine itself IS a bioweapon, and the U.S. government is preparation for large-scale fatalities it expects to see soon.

Or maybe these are just fleeting, dark visions from crazy people, and the U.S. government is a benevolent organization with all our best interests in mind, and they're jumping through these bureaucratic hoops to make sure there are plenty of hospital beds to go 'round just in case more people get really sick.

But even that explanation doesn't hold water. A "national emergency declaration" isn't necessary to waive hospital tent rules. Obama could have easily accomplished the same thing with an *Executive Order*, without having to invoke the National Emergencies Act or put FEMA in charge at all.

He chose the emergency declaration for a specific reason. I guess we'll all have to wait and see what that real reason turns out to be.

Kurt Nimmo

Obama's "National Emergency" Violates the Constitution

Prison Planet / Info Wars, 26 October 2009

https://web.archive.org/web/20091029072222/http://www.infowars.com/obamas-national-emergency-violates-the-constitution/

Drew Zahn, writing for WorldNetDaily, takes issue with Infowars declaring Obama's "national emergency" amounts to martial law. "An article by Kurt Nimmo of InfoWars took the worry a step further, wondering if the White House's declaration engaged certain measures of the National Emergencies Act," writes Zahn. "But even if there really is a plot to manipulate the H1N1 virus scare into enforcing a sweeping expansion of federal power, today's 'national emergency' falls far short of martial law."

Zahn writes that the laws enacted by the president's proclamation merely clear administrative hurdles for processing of Medicare payments and that the provisions of the National Emergencies Act cited by Obama in his proclamation limit the power his administration can take. He then cites Section 301 that forbids the president from taking up any powers of the National Emergencies Act except those listed in the proclamation of emergency. The list deals with Medicare, Medicaid, HIPAA privacy regulations, and other bureaucratic functions of the department of Health and Human Services.

Infowars noted that Obama's "national emergency" is likely a scare tactic designed to stampede people into getting the vaccine. The National Emergencies Act, however, is part of a larger framework designed specifically for the implementation of martial law. The law allows the president to revoke the right of habeas corpus under Article 1, Section 9. It also grants special powers to the executive in times of national emergency and underscores the threat the executive poses to the civil liberties of Americans, regardless of the stipulations in Section 301.

Revoking the right of habeas corpus is unconstitutional. So is declaring a national emergency without congressional approval. The Constitution declares, "The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it."

It may be argued that Obama is invoking the Constitution for the sake of "public safety," that is until you look at the facts – the H1N1 "pandemic" does not threaten the safety of most Americans. It is far less deadly than seasonal flu. When was the last time a president declared a national emergency over seasonal flu?

A state of emergency (regardless of the pretext) allows Obama to do a number of things. As Dr. Harold C. Relyea, a specialist in national government with the Congressional Research Service (CRS) of the Library of Congress, has written, "when the President formally declares a national emergency, he may seize property, organize and control the means of production, seize commodities, assign military forces abroad, institute martial law, seize and control all transportation and communication, regulate the operation of private enterprise, restrict travel, and, in a variety of ways, control the lives of United States citizens."

Obama's declaration, however, is incidental because the United States has been under a state of emergency since September 14, 2001. Bush extended this "emergency" (against a bogus terrorist threat) on August 28, 2008.

"Will President Obama allow the state of national emergency, first declared by President George W. Bush on 9/14/01 and re-declared seven times, to remain in effect?" asked Peter Dale Scott and Dan Hamburg on February 10, 2009.

On September 10 of this year, Obama reinstituted the national State of Emergency.

As Infowars noted on the weekend, once a National Emergency is declared the president has full authority to supersede Congress and the Constitution under the John Warner Act of 2007, passed by Congress and signed into law Oct 17, 2006. Warner expands the power of the president during national emergencies, specifically section 1076.

Paul Joseph Watson

Swine Flu Scam Reaches New Heights With Obama's Emergency Declaration

Prison Planet, 26 October 2009
https://web.archive.org/web/20091028231511/http://www.infowars.com/swine-flu-scam-reaches-new-heights-with-obamas-emergency-declaration/

President Obama's declaration that the H1N1 outbreak represents a "national emergency" seems to be little more than a public relations stunt aimed at intimidating reticent Americans into taking a vaccine that is becoming increasingly unpopular and unnecessary.

Despite the fact that swine flu cases have seemingly peaked, allied to the fact that seasonal flu has proven far deadlier, on Friday night Obama declared a national emergency in order to "allow hospitals to better handle the surge in patients" by allowing them to bypass certain federal laws.

What "surge in patients"? Swine flu has killed just 0.2 people per thousand who have caught the virus, a far lower potency than the annual flu virus which kills one patient per thousand, meaning swine flu has proven to be around 400% less deadly than the regular flu.

Either the government is preparing for an engineered pandemic of which they have prior knowledge, or Obama's announcement is a flagrant abuse of executive power and a ruse to coerce more people into taking the vaccine.

As we have exhaustively documented, polls out of the U.S., as well as globally, show that a rapidly growing number of health professionals and the general public are refusing to take the vaccine because they either think it is unnecessary or they are concerned about potential side-effects.

Despite a desperate $16 million media propaganda campaign on behalf of the federal government that is trying to brainwash Americans into rolling up their sleeves and taking the shot, a majority of people aren't buying the hype.

The purpose of Obama's declaration is to heighten fears surrounding swine flu and create the artificial impression that the vaccine is in demand, when the opposite is the true. The government hopes this will create a herd-like rush to take the shot amongst the general public.

Early indications are that the ruse may be working.

"I've already gotten a couple of calls from people today asking, 'Where can I get the vaccine?' whereas yesterday it was, 'I don't want that vaccine,' " said Arthur Caplan, a University of Pennsylvania bioethicist. "I'm worried about people getting panicky and the vaccine being diverted away from those who need it most."

Dr. Peter Hotez, a research professor and chairman of the Department of Microbiology, Immunology and Tropical Medicine at George Washington University, admitted that the term, "emergency declaration sounds more dramatic than it really is."

The government has already emphasized the notion that the vaccine is now in short supply, despite the fact that they previously assured the public there would be enough batches to cover the entire population by September. By combining this artificial scarcity with the scary notion that the situation now represents an "emergency," more of the sheeple will be intimidated into lining up and taking the toxic shot so as to soothe the underlying fear that a pandemic is around the corner and they might not be protected against it. That way the pharmaceutical giants get to inflate their already record profits to new levels of greed and the government gets to inject its otherwise worthless stockpile of vaccines into the idiot public.

Additionally, as Mike Adams and others have pointed out, classifying the situation as a national emergency triggers all kinds of tyrannical provisions that the feds have been waiting to unleash, while also empowering FEMA to lock down American cities under a state of medical martial law. Mandatory vaccinations, quarantines, curfews, involuntary kidnap, and warrantless searches and seizures are now just a heartbeat away because Obama's order has in effect nullified the bill of rights.

We can only hope that this is not a precursor to a major biological attack or pandemic outbreak, but it would hardly be a surprise if it was. The government has been preparing to unleash full-scale martial law upon the American public for years but whether swine flu will be enough to realize that agenda remains to be seen.

At best, Obama's Friday night declaration was a crude propaganda stunt designed to whip up fervor behind the H1N1 vaccine and corral millions of reluctant Americans into allowing their bodies to become a dumping ground for mercury, squalene, cancerous animal cells and God knows what other additives are in the shot, while the elite rest easy in the knowledge that they have privileged access to a clean version of the vaccine that contains none of these dangerous adjuvants.

Америка заметает следы!

Infocorn, 9 марта 2009;
https://web.archive.org/web/20090312080439/http://infocorn.org.ua/2009/03/09/ameryka_zametaet_sledy

Новости из-под электронного микроскопа.

На международной конференции вирусов гриппа было принято решение об окончательной элиминации человечества на Европейском континенте. «Мы признательны американской компании «Бакстер Интернешнл» за неоценимый вклад в развитие межвидового сотрудничества. Только объединившись, мы сможем решить все проблемы с людьми», – заявил Авиан Флю, представитель штамма H5N1, австрийский специалист по хорькам и хомячкам.

Суетливые телодвижения вокруг скандала с американской компанией «Бакстер Интернешнл» (Baxter International, Inc, NYSE:BAX), о котором я писал в своей предыдущей статье, равно как и очевидные попытки замять ситуацию, приводят к противоположным результатам. Все больше специалистов пытаются выяснить, что же на самом деле происходило в австрийской лаборатории этой компании, все больше журналистов обращаются к этой теме.

Скандал вокруг рассылки по почте потенциальных компонентов биологического оружия, широко освещается в немецких и чешских СМИ, лаборатории которых получали смертоносные бандерольки с возбудителями птичьего гриппа. Очень серьезное внимание уделяет этой теме канадская пресса. В то же время в СМИ самых демократических стран мира, в частности, Соединенных Штатов и Российской Федерации, по-прежнему царит гробовая тишина: здесь можно найти разве что единичные публикации на эту тему. Также мертвое молчание по поводу данного инцидента продолжает хранить и Всемирная организация здравоохранения (ВОЗ). Отдельные выступления её представителей лишь дублируют официальные заявления представителей «Бакстер» и напускают всё больше тумана в эту, и без того двусмысленную, ситуацию.

Восемь лет назад рассылка по почте конвертов с «белым порошком» (который на поверку оказывался тальком или гипсом) привела к военному вторжению в Афганистан. Одно только подозрение о том, что Садам Хуссейн разрабатывает биологическое оружие, стало поводом для войны в Ираке. Зато недавно выявленная рассылка по почте немаркированных бандеролей со смертельно опасным вирусом американской компанией в другие страны, то есть – бесспорное подтверждение как минимум факта проведения экспериментов с нарушением правил и норм безопасности, не рассматривается как повод для каких-либо санкций и вообще не считается событием, достойным внимания. Особую пикантность ситуации придает очевидная «зачистка» информационного пространства: в англоязычном сегменте Интернета наиболее острые публикации исчезают буквально на глазах, и от них остаются лишь «пустые» ссылки в других сообщениях и в поисковых системах.

Заявления официальных представителей Baxter International напоминают фразу из рекламы о том, что «иногда лучше жевать, чем говорить». Так, они настаивают, что заражение рассылаемого вещества опасным вирусом произошло вследствие ошибки, а в целом австрийская

лаборатория этой компании соответствует высочайшим критериям безопасности BSL-3. Если внимательно изучить эти критерии, можно придти к неутешительным выводам: в данной лаборатории, по всей видимости, осуществлялись незаконные эксперименты со смертоносными штаммами, которые проводились в «нейтральной», то есть безопасной, зоне, видимо, чтобы не привлекать излишнего внимания австрийских властей. Какие это были эксперименты, нам сейчас остается только догадываться. А тот факт, что во главе совета директоров фармацевтической кампании Baxter International стоит бывший первый заместитель командующего Корпуса морской пехоты США, четырехзвездный генерал Уолтер Бумер (Walter E. Boomer), дает широкий простор для фантазии.

Еще одна «линия защиты» компании Baxter International заключается в упорном и многократном отрицании того, что разосланные образцы являются вакциной. Компания называет их «экспериментальным вирусным материалом» на основе «человеческого» штамма H3N2. Однако, как сообщило недавно авторитетное издание Bloomberg News со ссылкой на представителей австрийских властей, в чешской лаборатории присланный материала в начале месяца была использован для приготовления вакцины, которую и вводили подопытным животным. Маловероятно, чтобы это производилось самовольно, без прямого на то указания заказчика – фирмы «Бакстер». Что характерно, американское ведомство CDC, которое не только следит за соблюдением требований безопасности в американских компаниях, но и регулярно рассылает фармацевтическим кампаниям образцы вирусов гриппа для производства вакцин, не видит повода для беспокойства, не проводит расследований и консультаций по данному инциденту.

По информации ВОЗ, на данный момент разработку вакцин против птичьего гриппа ведут более двадцати фармацевтических компаний. Это значит, что более двадцати компаний в сотнях лабораторий по всему миру проводят эксперименты с опаснейшими живыми возбудителями. Как показали события в Австрии, ни высочайший авторитет разработчиков, ни соблюдение самых строгих требований безопасности, ни жесткий контроль со стороны государственных органов не гарантируют, что смертоносный вирус не выйдет за пределы лаборатории.

Во многих публикациях события, произошедшие месяц назад в Европе, сравнивают со сценарием американского блокбастера. И в лучших традициях Голливуда, как только была обнаружена утечка, прошла спецоперация «зачистка». Как рассказал в телефонном интервью Bloomberg News официальный представитель «Бакстера» Кристофер Бона (Christopher Bona), сотрудники этой компании очень быстро уничтожили все разосланные образцы во всех странах, провели двукратную дезинфекцию лабораторий. Все сотрудники, контактировавшие с подозрительным веществом, были немедленно изолированы, помещены в карантин и пролечены мощнейшим антивирусным препаратом. Это, конечно, замечательно, но по правилам ВОЗ в таких случаях обязательно должны отбираться образцы материалов для обеспечения возможности дальнейшего расследования. В нынешней ситуации, когда правду установить уже невозможно, нам остается только верить скудным официальным заявлениям. Или – строить собственные предположения.

На сегодняшний день я знаю две фармацевтические компании, которые занимались разработкой вакцины против птичьего гриппа по договоренности с ВОЗ. Одна из них – американская, Baxter International Inc. Вторая – Serum Institute of India, Ltd. Как сейчас стало известно, работы в этом направлении были начаты в Индии еще в 2006 году. Два месяца назад было объявлено об успешном завершении исследований и начале клинических испытаний индийской вакцины.

Serum Institute – это та самая индийская фирма, которая изготовила печально известную вакцину против кори и краснухи, более известную как «КаКа». После того, как весной прош-

лого года была предпринята попытка провести незаконную и необоснованную кампанию, в ходе которой предполагалось ввести незарегистрированный препарат восьми миллионам молодых украинцев, осталось множество неясностей и вопросов, ответов на которые нет и по сей день. Например, до сих пор неизвестно, что находится в прилагаемом к вакцине растворителе. Это странное вещество, заявленное как «вода для инъекций», при ввозе в Украину не проверялось. При этом оно вызывает странное изменение цвета раствора, а температурный режим хранения его в точности соответствует режиму хранения вакцины против гриппа. Что характерно, инструкция к вакцине гласит, что прилагаемая к вакцине «вода для инъекций» якобы «специально разработана» для этой вакцины. Изготовитель категорически запрещает применение любого другого растворителя, а также обычной воды для инъекций, равно как и использование прилагаемого к препарату растворителя в любых других целях.

Напомню, что та внеплановая вакцинация планировалась и проводилась с полным игнорированием украинского законодательства и медицинских соображений, под жестким прессингом ВОЗ, который можно было наблюдать до самого недавнего времени. Также стоит вспомнить, что после приостановки этой весьма сомнительной акции все усилия украинского Минздрава и представителей международных организаций были направлены на обеспечение неприкосновенности «застрявшей» в Украине вакцины с растворителем и недопущения независимого исследования их содержимого.

Надеюсь, ответы хотя бы на некоторые вопросы, касающиеся «КаКи», мы сможем получить в ходе судебного разбирательства по иску Александра Славского, которое начнется 12 марта 2009 года в 11 часов 40 минут в Окружном административном суде г. Киева.

Многие задаются вопросом: не была ли Украина в списке тех 18 стран, куда были направлены «загрязненные образцы»? Не поступали ли в последние месяцы в украинские лаборатории биоматериалы от американской компании Baxter International?

Печальная судьба польских бездомных, которых за гроши привлекали к незаконным испытаниям вакцины против птичьего гриппа, заставляет задуматься и о судьбе наших сограждан.

Scene I, Act II – See: http://www.rense.com/general85/dsd2.htm

Pandemic Vaccine Training Exercise

I thought it very strange that a rather obscure Texas county would see fit to conduct such a "training exercise" involving Texas National Guard Troops and "drive-thru vaccination clinics". I also thought it exceedingly strange that these rather obscure county officials would make the public declarations that emergency "pandemic vaccination programs would mean a line of cars 41 miles long" in Guadalupe County, but that San Antonio's drive-thru vaccine's line would stretch from "San Antonio to Calgary, Alberta Canada" – strange, because this just happens to be the planned route of the Amero Freeway – connecting the late-great U.S.A. with Mexico and Canada. Could this, too, be a coded message to insiders?

Just as Norad was conducting "mock" terrorist drills on the morning of September 11, 2001 - could this May 2 event be Timed to announce the release of the planned pandemic and the eventual advent of martial law in North America? Today, Friday, April 24, 2009 - according to USA Today, the BBC, and the Associated Press, the World Health Organization (WHO) is "very, very concerned" about a very strange "swine flu" outbreak in Mexico City. http://www.usatoday.com/news/health/2009-04-23-swine-flu_N.htm?csp=34

The WHO is so concerned, in fact, that it has ordered all WHO officers to man the "Pandemic Control Room" 24/7 for the 1st time.

Attention America! This is highly significant.

LIVEJOURNAL

Сергей Стиллавин

Свиной грипп: геноцид от коммерческой науки

Live Journal, 28 апреля 2009, 07:41 am
https://stillavin.livejournal.com/191854.html?cut_expand=1&page=5

Уже все уши прожужжали про новую гадость – «свиной грипп из Мексики»: руководство повыше отдаёт команды не допустить её в Россию, начальство пониже боязливо отчитывается, что жертв не избежать и у нас. Обсуждать тут было бы нечего, если бы не получил письмо от[info]vladmradio:

«…Добрый день, коллега. Не знаю, входит ли данная тема в круг интересных для Вас, но ввиду последних вирусных мировых событий, возможно, что материалы, о которых я напомню, сегодня достойны внимания. Прошу прощения, если зря отнял время.

В начале марта публицист Сергей Дибров выступил с материалом "Америка заметает следы!" *Коротко*: Компания Бакстер была замечена в подозрительных экспериментах по скрещиванию штаммов вируса гриппа человеческого и животного происхождения, что может быть особо опасно в общегуманитарных масштабах. Экспериментальные образцы были разосланы в партнёрские лаборатории восемнадцати стран, причём, без каких-либо необходимых в таких случаях примечаний. На момент выявления данного факта образцы были изъяты, а лабораторные сотрудники получили жёсткий карантин и были привиты противовирусными препаратами. В европейской либеральной прессе шума не получилось – сообщения на эту тему стали попросту изымать.

Теперь мы наблюдаем некий "свиной" грипп и компанию Бакстер, которая героически с ним борется на переднем крае вирусной войны - в Мексике. Не хочется фантазировать на тему разработки бактериологического оружия. Просто, всё это очень похоже на ещё один способ хорошо заработать на искусственно созданной болезни. Филиалы компании Бакстер представлены на территории России и Украины - вот, именно это и вызывает тревогу…»

Поскольку появились сообщения о гибели людей в европейских странах, нам осталось ждать всего несколько дней, когда смерть примется косить и наши ряды. Об опытах коммерческих учёных, которые обслуживают не Науку и Человечество, а интересы конкретных корпораций, снято множество фильмов в тех же Штатах, и, можно сказать, население тщательно приготовили к раскрытию «страшной тайны», если секреты придадут огласке. Штамм вырвался из пробирки, и тайну пока что успешно заминают, но сценарий по её раскрытию уже, конечно, готов: придумают басню про зарвавшегося завлаба, который, подобно московскому майору, повздорил с женой и решил насолить всем людишкам, оставшимся равнодушными к его личной трагедии. Ну или типа того. Понятно, что завлаба найдут уже объеденным червями или язвами – в качестве справедливого возмездия.

А если серьёзно, то, например, версии о появлении того же ВИЧ аналогично восходят к американским медицинским опытам: тренировались на обезьянах – может, хотели сделать такую фигню, которая торкала бы исключительно любителей коммунизма (как версия), а фигня оказалась всеядной и быстренько побежала колошматить обычных граждан, начав, понятно дело, с «продвинутых» – с гомосексуалистов.

Вопрос стоит много шире, нежели просто очередной смертельный вирус – вопрос стоит о том, чтобы запретить коммерческим лабораториям заниматься исследованиями в тех областях, которые касаются искусственного создания болезней. Ведь что сделали в упомянутой конторе: там болезнь человека соединили с болезнью свиньи, и таким образом только свиные, грубо говоря, антибиотики на неё не действуют – равно как и только человеческие. Получился универсальный убийца, справятся с которым нескоро, потому что автор никогда открыто не скажет, что он и создал эту мерзость.

Фактически речь идёт о том, что фармацевтические гиганты могут создавать новый виток глобальной «наркомании»: чтобы вы купили таблетки или ампулы с обычной наркотой, в вашем окружении должен нарисоваться дилер, а в вашей жизни – наступить «чёрная полоса». Обычный дилер может подождать такого стечения обстоятельств, а вот корпорации – нет: им нужен тот, кому жизненно необходимы «наркотики» прямо сейчас! Идеальный вариант – сделать человека зависимым при помощи вируса, болезни, которая уничтожается тем эксклюзивным, запатентованным средством, что есть только у этой корпорации. Конечно, для создания ажиотажа в аптеках нескольким тысячам придётся сдохнуть, но разве велика эта цена за миллионные партии лекарства от искусственной болезни?!

Удивляться такому цинизму уже не приходится – жизнь ничего не стоит, потому что у типового потребителя она и смысла особого не имеет. Если ты живёшь для того, чтобы работать, а работаешь, чтобы жить, то смешна цена такому прозябанию. Впрочем, и у таких животных есть право на жизнь: власти обязаны серьёзно разобраться с коммерческим научным миром и с коммерческими лабораториями, чтобы отобрать у них саму возможность креативить новую заразу.

Конечно, если только коммерческие лаборатории не являются просто неким «научным оффшором», местом, свободным для любых опытов, где спецслужбы занимаются антигуманными исследованиями, прикрываясь брендом. Этакие доктора Менгеле 21-го века. Думаю, как вариант – вполне жизнеспособная версия.

LIVEJOURNAL

Теракт "Калифорния-04/2009"

Live Journal, 28 апреля 2009, 6:31 PM
https://malchish-org.livejournal.com/64998.html

Вирусный теракт?

ВОЗ объявила чрезвычайную ситуацию мирового масштаба из-за вспышки "свиного гриппа" в Мексике. Последний раз подобное происходило в 2003 году из-за угрозы атипичной пневмонии.

В Мексике, где по официальным данным на 27 апреля от "свиного гриппа" погибли уже 103 человека, а более 1,6 тысяч человек являются носителями вируса, эпидемия может перерасти в пандемию. Если принять во внимание данные официальных властей, оглашаемые ежедневно, то в Мексике "свиного гриппа" за сутки умирает около 20 и заражается более 200 человек. Вот почему по темпам заражения, стремительности распространения очага заболевания эпидемия "свиного гриппа" напомнила врачам свой аналог, знаменитую "испанку", которая в начале 20-го века унесла жизни более 20 миллионов человек в Европе.

Последний момент не удивляет - новый вирус имеет тот же тип, что и знаменитая "испанка" - A/H1N1, который по мнению учёных представляет собой "адскую смесь" из генетического материала вирусов гриппа свиней, птиц и человека. Как это вообще стало известно? Как современные медики определили тип вируса "испанки", эпидемия которой закончилась в 1920 году? В 1997 году американские учёные эксгумировали тело одной из погибших от «испанки», сохранившееся в вечной мерзлоте штата Аляска, извлекли образцы тканей заражённых лёгких и восстановили код вируса. Исследователи пришли к выводу, что штамм, вызвавший пандемию в 1918 году, впервые появился у птиц, но в результате мутаций стал смертелен и для людей, приобретя к тому же способность передаваться от человека к человеку. Таким образом можно сказать, что к нам вернулась смертоносная "испанка". Может быть только с небольшими изменениями. Именно поэтому опасения ВОЗ можно считать полностью оправданными – тогда, в 1918 году этим вирусом переболело около 500 млн человек, каждый пятый житель планеты. И по некоторым оценкам каждый десятый из заболевших (то есть 50 млн человек) умер.

В этой информации не было бы ничего удивительного, если бы не одно совпадение. В 1997 году американские учёные из секретной лаборатории US Centre for Disease Control откапывают тело умершей от "испанки", в августе 2005 года полностью восстанавливают вирус и проводят над ним опыты, а уже в апреле 2009 году этот вирус начинает свой новый сбор "урожая" в Мексике. Видимо опыты над вирусом успешно завершились? Такая возникает мысль.

Информация по этому поводу подтверждается и из другого источника, который утверждает, что в опытах участвовала и некая канадская лаборатория. Там опыты проводились на макаках. Первые симптомы заболевания возникли уже в течение первых суток после инфицирования, а *следующее разрушение лёгочных тканей было так масштабным, что если бы обезьян через несколько дней не усыпили, они практически захлебнулись бы в собственной своей крови*. Животных убивал не сам вирус, а иммунная система организма, наносящая вред повреждённым тканям. Вирус умеет отключать ген RIG-1, регулирующий ответ иммунной системы на инфекцию, в итоге организм убивает сам себя. *"Эта способность влиять на иммунную реакцию организма не уникальна: ею владеют и последний по времени кандидат на мутацию в потенциально пандемический штамм, вирус птичьего гриппа H5N1"*.

Вызывает интерес реакция научного сообщества на восстановление смертельного вируса:
=> https://web.archive.org/web/20090503234723/http://www.5fc.ru/?p=506

***Ёсихиро Каваока**, руководивший анализом в институте Висконсина произнёс: “То, что мы смотрим при заражении обезьян вирусом 1918 года, - это фактически то же самое, что мы смотрим с вирусом H5N1. Определённые процессы могут происходить на ранней стадии заражения, но мы, возможно, сумеем вмешаться и прекратить эту реакцию”.*

*Доктор **Рональд Катлер**, спец по инфекционным заболеваниям из института восточного Лондона, ведает: “Зная, каким образом происходит эта чрезмерная стимуляция, мы можем далее продвинуться на пути сотворения новейших способов исцеления этих болезней и таковым образом лучше приготовиться к вероятным пандемиям”.*

*Доктор **Джим Робертсон** из английского Государственного института биостандартов и контроля также считает, что решение воссоздать ужасный вирус было полностью оправдано: “Почти Все вирусологи, изучающие грипп, нервничают по поводу сотворения и проведения экспериментов с реконструированным вирусом “испанки” 1918 года, очень опасным вирусом, который давно исчез с лица земли. Но нельзя отрицать, что информация, приобретённая в ходе этого опыта, очень увлекательна и представляет собой важную веху в понимании смертоносности этих очень патогенных типов вирусов инфлюэнцы”.*

В копилку анализируемых фактов можно, наверное, внести и статью из АИФ, где некий "политтехнолог" Сергей Маркелов берёт интервью у анонимного эксперта, "побывавшего в секретных лабораториях Латинской Америки". Совершенно очевидно, что данное интервью политтехнолог высосал из собственного пальца, но... Высасывал он это достаточно вдумчиво. Всё-таки "политтехнолог". Все детали про деревянные избы на пятиметровых сваях с современным биологическим оборудованием можно выкинуть и забыть. Очевидная чушь. Даже не стоит её разбирать. Однако в выдуманном интервью промелькнули две очень важных мысли.

Мысль первая:
"Может ли распространение информации о вирусе использоваться как отвлекающий от мирового кризиса фактор?
- С точки зрения информационной войны, безусловно. Сейчас идёт главный информационный поток, связанный с кризисом, а также аналогичный по значимости контринформационный поток, связанный со свиным гриппом. Второй как бы перетягивает на себя внимание. Я могу допустить, что информационный повод разжигается, чтобы отойти от «жевания» темы кризиса."

Мысль вторая:
"Я бы всё-таки посмотрел на эту историю с пандемией с точки зрения репетиций других, более конструктивных мер, отработки сценариев для борьбы с такими заболеваниями в планетарном масштабе. Это более полезно для всех, в том числе и для разработчиков биооружия."

Насчёт конструктивности и полезности пандемии смертельного гриппа можно, конечно, поспорить. Более сотни человек уже умерли как-то слишком уж "конструктивно". А вот насчёт "отработки сценариев" - да, вполне могу согласиться. Но более всего привлекает внимание первая мысль, связанная с темой кризиса.

Ещё четыре года назад я высказывал предположение о подобной связи теракта "911" с кризисом. По моим представлениям теракт тогда отодвинул кризис на семь лет. Отметить тут надо было следующее - теракт был направлен против собственного народа, но для сохранения финансовой и экономической системы страны. Сейчас, если предположить такой же смысл уже биологического теракта, он тоже должен быть направлен против самих американцев и тоже ради сохранения существующей системы. Если взглянуть на карту распространения вируса "свиного" гриппа, то заметим, что США практически находятся в клещах инфекции:

Почему предполагаемый теракт не нанесён сразу внутри страны? Очевидно из соображений конспирации – вирус должен придти извне, тогда не будет и мыслей о *внутренней* операции спецслужб. Кроме того, очевидно есть польза и от международного характера операции - проверяется реакция санитарных служб разных стран, реакция правительств и т.д. Ведь и сам теракт может служить репетицией большой биологической войны. Кризис чреват новой мировой войной, и его первым актом может быть биологическая война. Реальность её подтверждают и российский спецслужбы, запретившие в 2007 году вывоз за пределы страны медицинских биологических образцов человека - от волос до образцов крови. Предполагалось, что они могут быть использованы для создания биологического оружия против русских. "Грани" Березовского на счёт этого пытались посмеяться, но не слишком убедительно. Фактом является то, что ФСБ считает такую угрозу достаточно серьёзной. И у них есть свои специалисты, делающие подобные выводы.

Опасные пандемии в преддверии крупной войны могут замаскировать реальный теракт против будущего противника. При этом сами США после своей же "репетиции" внутри собственной страны будут обладать развитой системой мер биологической защиты. Включая наличие вакцины. Это вполне серьёзный аргумент в пользу версии "вирусного теракта". Ну а другие аргументы включают набор антикризисных последствий:

1. Отвлекается внимание СМИ и общественности от темы кризиса. Снижаются его "информационные" последствия. Биржевики меньше паникуют, население меньше экономит, бизнес меньше осторожничает. Тем самым кризис меньше влияет сам на себя.

2. Многие последствия кризиса будут списаны за счёт последствия пандемии. Упал ВВП на 30%. "Это результат пандемии гриппа. Система тут не при чём. Она вполне эффективна."

3. Возможные гражданские волнения будут ликвидированы мерами "карантина". Выставят военное оцепление вокруг гудящих толп безработных Детройта. Прорвавшихся будут расстреливать под предлогом биологической безопасности. СМИ не будут допускаться к месту волнений. Опять же в целях карантина.

4. Погибшие в волнениях от рук военных будут списываться как умершие в результате пандемии гриппа. А кто докажет? Медицинскую экспертизу никто проводить не позволит!

5. Кризис образует множество "ненужных экономике" людей. Социально опасная ситуация. Если убить этих людей гриппом, то социального взрыва может и не случиться. Такой социальный геноцид может послужить для стабильности системы. И я не капли не сомневаюсь, что власти США могут на такое пойти. Теория "золотого миллиарда" имеет и обратный отсчёт.

Текст, который вы прочитали, не имеет характер абсолютно достоверной информации. Это гипотеза. Её верность могут доказать только ближайшие события. Если гипотеза верна, то скоро мы будем наблюдать вспышки инфекции внутри США. Чтобы теракт произвёл эффект должны умереть миллионы американцев. В ближайшие полгода. Следим за событиями.

The August Forecast

Patrick Wood and Dr. Russell Blaylock, MD

Pandemic Nonsense: Flying Pig Flu
Are globalist fear-mongers driving the media to panic the public into universal healthcare solutions?
Or federally-mandated vaccinations?

The August Forecast, 28 April 2009
https://web.archive.org/web/20090710180814/http://www.augustreview.com/news_commentary/general/pandemic_nonsense:_flying_pig_flu_20090428118/

By definition, a "pandemic" is an epidemic that is geographically widespread. Fear-mongers are always careful to add the innuendo that millions of people could and probably will die, as in the Spanish Flu pandemic of 1918 that killed between 20 and 100 million people worldwide.

Excuse me, but how does the death of even a few hundred equate to 20 million?

Mexico, not the usual Southeast Asia, is the origin of the latest flu outbreak. It has spread in limited numbers to several continents. Almost all of the deaths, limited as they are, are in Mexico. The ratio of deaths to infections is very small.

Again, how does this outbreak even remotely qualify as a pandemic?
Answer: It does not!

Scientists and virus researchers are baffled because the genetic makeup of the virus contains elements of human, swine and bird flu from three geographic regions: North America, Europe and Asia. Until now, this has been unknown in nature, but not theoretically impossible.
see: New flu combines pig, bird, human virus
https://web.archive.org/web/20090731105917/http://www.globalresearch.ca/index.php?context=va&aid=14550
see: Mexico Seeks to Stop Spread of Deadly Flu
https://web.archive.org/web/20090429114232/http://www.npr.org/templates/story/story.php?storyId=103459566

Because of its unique genetic makeup, this writer proposes calling it the "flying pig flu", or FPF, instead.

This writer is hardly qualified to write with authority about the scientific side of viruses. However, after reading several authoritative papers on swine and avian flu, several observations can be made.
In the world of virus experts, there are two types of researchers: *Observers* and *Experimenters*.

Observers
Most researchers are highly trained scientific observers. These "Sherlock Holmes" scientists examine the pathology of virus development. Where did it originate? What animals or human were involved? Did the infected humans handle animals? Are certain strains limited to geography? You get the idea.

Without good observers, we would know little about the source or spread of different viral strains.

There are several good Internet resources where the findings of research observers are published. (For instance, see H5N1 - Ultimate News on mutation)

We should be thankful for astute observers who can untangle mysteries that would otherwise not be understood.

Experimenters

A minority of researchers are experimenters. This group is worrisome.

Experimenters establish their playground in trying to create different types of viruses in order to measure their effect on test animals.

Such was the case at Baxter AG, when such an experiment was "accidentally" released as a live virus in a vaccine distributed to 18 countries. (See Baxter: Product contained live bird flu virus). In this case, the live H5N1 virus (avian flu) was combined with the much more contagious (human) H3N2 virus.

Experts say that it is almost impossible for Baxter to make such a grievous error by accident. Czech newspapers, where the story was originally broken, suggest it was a rogue employee or a mole that purposely mixed the virus' together, but nothing has been proven as yet. Baxter is now under great suspicion that it is attempting to foment a pandemic that would bring hundreds of millions of dollars in revenue to supply its normal H5N1 vaccine.

Another example is the Center for Disease Control in Atlanta, Georgia. In a 2004 report, CDC to mix avian, human flu viruses in pandemic study, it was noted that,

"*The Centers for Disease Control and Prevention (CDC) will soon launch experiments designed to combine the H5N1 virus and human flu viruses and then see how the resulting hybrids affect animals. The goal is to assess the chances that such a "reassortant" virus will emerge and how dangerous it might be.*"

Critics worried that such a "franken-virus" could itself cause a pandemic if it escaped from its creators. The CDC's only response is that their facilities were more secure than others who had experienced breaches of some sort in years past.

Why would the CDC risk world exposure to an artificially created virus? According to the above report, it was done in the name of preparedness.

As mentioned above, experimenters are a worrisome lot. Real world experience indicates that they are generally overconfident in their scientific prowess and in their abilities to contain the unpredictable fruit of their experiments.

Conclusion

There are some big problems with the current outbreak of flying pig flu. If there has been foul play, it may never be brought to light. Still, tough questions need to be asked:

- While it is not unknown for pigs to become infected with the H5N1 virus, the result has *always* been a less-lethal and less-contagious virus than avian flu by itself. Why is this epidemic so obviously contagious?
- How would genetic code from three continents find its way into a single strain in Mexico City?
- Is this virus an escaped experiment from a project gone awry?
- If man-made and not accidentally released, then who released it, and why?

As we contemplate these questions, watch the stock prices of major pharma companies skyrocket as they gear up to sell billions in vaccines. Watch governments as they declare mandatory vaccination programs. Watch the Obama administration as it railroads universal healthcare through Congress.

Indeed, *flying pig flu* may be just the right name for whatever is responsible for this particular flu outbreak.

In the meantime, we can reopen this case when pigs fly or when 10 million or so people have died, whichever comes first.

Special Guest Opinion from Dr. Russell Blaylock

[Editor's note: My friend, Dr. Russell Blaylock, is a board certified neurosurgeon, author and lecturer. An expert on nutrition and vaccines, he is also editor of the widely distributed Blaylock Wellness Report. Dr. Blaylock graciously submitted the following comments for August Review readers. I highly recommend his newsletter] =>
https://infiniteunknown.net/2009/04/30/dr-russell-blaylock-on-1976-swine-flu-and-current-outbreak/#more-11674

I was in the military during the first swine flu scare in 1976.

At the time it became policy that all soldiers would be vaccinated for swine flu. As a medical officer I refused and almost faced a court martial, but the military didn't want the bad publicity. Despite the assurance by all the experts in virology, including Dr. Sabin, the epidemic never materialized.

What did materialize were 500 cases of Gullian-Barre paralysis, including 25 deaths – not due to the swine flu itself, but as a direct result of the vaccine. At the time President Gerald Ford, on advice from the CDC, called for vaccination of the entire population of the United States.

Today, some 33 years later, we are hearing the same cries of alarm from a similar lineup of virology experts.

The pharmaceutical companies are busy designing a vaccine for the swine flu in hope that this administration will make the vaccine mandatory before another vaccine-related disaster can ruin their party.

And as before, a number of equally qualified experts are calling for calm, based on a number of carefully conducted studies. To no one's surprise, they too are being ignored by the media and government planners.

According to science reports, this current strain of flu is H1N1. It can be forcibly inoculated into pigs, but it has been shown not to spread among the pig population. This means that the danger of a swine-based epidemic is small.

There are several strains of this flu virus however, including H1N1, H1N2, H3N1, H3N2 and H2N3. What the science has shown is that when the virus passes through the pig, it becomes less virulent – that is, it is less likely to cause serious disease in people. With each passage, it becomes even weaker.

Since this is not the answer that the pseudo-scientists wanted, they next announced that it is "possible" that the pigs could be infected with both the bird flu (strain H5N1) and the swine flu (strain H1N1), resulting in a mutant, highly virulent strain that could lead to a pandemic.

Note this is pure speculation and that no scientist has ever performed this trick. It is purely hypothetical – like global warming. CDC virologists claim that in the past they performed a similar virological trick, but they never published their results and thus have kept the data close to the vest.

In science, especially medical science, speculation is taboo. But, politicized scientists perform this bit of smoke and mirrors all the time.

So, you may ask, "What about all the people dying in Mexico?"

Overcrowding, poor nutrition and overall poor immunity, all of which are indigenous to Mexico, are a certain prescription for death from almost any infection. [Note that despite 46 cases of this very same flu in the United States there have been no deaths. This is because Americans, comparatively, have better nutrition and medical care.]

Like SARS and bird flu before it, this swine flu scare is a lot of nonsense.

Just take your high dose vitamin D3 (5000 IU a day), eat a healthy diet and take a few immune boosting supplements (such as beta-1, 3/1, 6 glucan) and you will not have to worry about this flu.

Swine flu? A panic stoked in order to posture and spend

The Guardian, 29 April 2009
https://web.archive.org/web/20090827001405/http://www.guardian.co.uk/commentisfree/2009/apr/29/swine-flu-mexico-uk-media1

Despite the hysteria, the risk to Britons' health is tiny - but that news won't sell papers or drugs, or justify the WHO's budget.

We have gone demented. Two Britons are or were (not very) ill from flu. "This could really explode," intones a reporter for BBC News. "London warned: it's here," cries the Evening Standard. Fear is said to be spreading "like a Mexican wave". It "could affect" three-quarters of a million Britons. It "could cost" three trillion dollars. The "danger", according to the radio, is that workers who are not ill will be "worried" (perhaps by the reporter) and fail to turn up at power stations and hospitals.

Appropriately panicked, on Monday ministers plunged into their Cobra bunker beneath Whitehall to prepare for the worst. Had Tony Blair been about they would have worn germ warfare suits. British government is barking mad.

What is swine flu? It is flu, a mutation of the H1N1 virus of the sort that often occurs. It is not a pandemic, despite the media prefix, not yet. The BBC calls it a "potentially terrible virus", but any viral infection is potentially terrible. Flu makes you feel ill. You should take medicine and rest. You will then get well again, unless you are very unlucky or have some complicating condition. It is best to avoid close contact with other people, as applies to a common cold.

In Mexico, 2,000 people have been diagnosed as suffering swine flu. Some 150 of them have died, though there is said to be no pathological indication of all these deaths being linked to the new flu strain. People die all the time after catching flu, especially if not medicated.

Nobody anywhere else in the world has died from this infection and only a handful have the new strain confirmed, most in America and almost all after returning from Mexico. A couple from Airdrie who caught the flu on holiday in Cancun are getting better. That tends to happen to people who get flu, however much it may disappoint editors.

We appear to have lost all ability to judge risk. The cause may lie in the national curriculum, the decline of "news" or the rise of blogs and concomitant, unmediated hysteria, but people seem helpless in navigating the gulf that separates public information from their daily round. They cannot set a statistic in context. They cannot relate bad news from Mexico to the risk that inevitably surrounds their lives. The risk of catching swine flu must be millions to one.

Health scares are like terrorist ones. Someone somewhere has an interest in it. We depend on others with specialist knowledge to advise and warn us and assume they offer advice on a dispassionate basis, using their expertise to assess danger and communicating it in measured English. Words such as possibly, potentially, could or might should be avoided. They are unspecific qualifiers and open to exaggeration.

The World Health Organisation, always eager to push itself into the spotlight, loves to talk of the world being "ready" for a flu pandemic, apparently on the grounds that none has occurred for some time. There is no obvious justification for this scaremongering. I suppose the world is "ready" for another atomic explosion or another 9/11.

Professional expertise is now overwhelmed by professional log-rolling. Risk aversion has trounced risk judgment. An obligation on public officials not to scare people or lead them to needless expense is overridden by the yearning for a higher budget or more profit. Health scares enable media-hungry doctors, public health officials and drugs companies to benefit by manipulating fright.

On Monday the EU health commissioner, Androulla Vassiliou, advised travellers not to go to north or central America "unless it's very urgent". The British Foreign Office warned against "all but essential" travel to Mexico because of the danger of catching flu. This was outrageous. It would make more sense to proffer such a warning against the American crime rate. Yet such health-and-safety hysteria wiped millions from travel company shares.

During the BSE scare of 1995-7, grown men with medical degrees predicted doom, terrifying ministers into mad politician disease. The scientists' hysteria, that BSE "has the potential to infect up to 10 million Britons", led to tens of thousands of cattle being fed into power stations and £5bn spent on farmers' compensation. A year later, the scientists tried to maintain that BSE "might" spread to sheep because, according to one government scientist, "the absence of evidence is not evidence of absence". The meat industry was wrecked and an absurd ongoing cost was imposed on stock farmers with the closure and concentration of abattoirs.

This science-based insanity was repeated during the SARS outbreak of 2003, asserted by Dr Patrick Dixon, formerly of the London Business School, to have "a 25% chance of killing tens of millions". The press duly headlined a plague "worse than Aids". Not one Briton died.

The same lunacy occurred in 2006 with avian flu, erupting after a scientist named John Oxford declared that "it will be the first pandemic of the 21st century". The WHO issued a statement that "one in four Britons could die".

Epidemiologists love the word "could" because it can always assure them of a headline. During the avian flu mania, Canada geese were treated like Goering's bombers. RSPB workers were issued with protective headgear.The media went berserk, with interviewers asking why the government did not close all schools "to prevent up to 50,000 deaths". The Today programme's John Humphrys became frantic when a dead goose flopped down on an isolated Scottish beach and a hapless local official refused to confirm the BBC's hysteria. The bird might pose no threat to Scotland, but how dare he deny London journalists a good panic?

Meanwhile a real pestilence, MRSA and C difficile, was taking hold in hospitals. It was suppressed by the medical profession because it appeared that they themselves might be to blame. These diseases have played a role in thousands of deaths in British hospitals - the former a reported 1,652 and the latter 8,324 in 2007 alone. Like deaths from alcoholism, we have come to regard hospital-induced infection as an accident of life, a hazard to which we have subconsciously adjusted.

MRSA and C difficile are not like swine flu, an opportunity for public figures to scare and posture and spend money. They are diseases for which the government is to blame. They claim no headlines and no Cobra priority. Their sufferers must crawl away and die in silence.

LIVEJOURNAL

Теракт "Калифорния-04/2009" – III

Live Journal, 2 мая 2009, 6:48 PM
https://malchish-org.livejournal.com/65581.html

Кто подложил свинью?

Я уже хотел было отойти от темы свиного гриппа до прояснения ситуации. Однако тема сама меня не отпускает. Читатели подкидывают новые факты. Дело "Калифорния-04/2009" разрастается как снежный ком и уже напоминает настоящее расследование. Выясняется, например, что препарат Тамифлю разработала американская фирма Gilead Sciences. Она продала лицензию на производство этого препарата фармацевтическому гиганту Roche, о котором я писал в прошлый раз. Согласно условиям контракта, концерн Roche продолжает выплачивать Gilead Sciences определенный процент от реализации Тамифлю в США и других странах. По некоторым данным 20%. Но самое интересное в том, что в состав совета директоров Gilead Sciences входил Дональд Рамсфельд, глава Пентагона при Буше. Он был одним из директоров Gilead Sciences с 1988 года, а с 1997 года возглавлял его.

В 2001 году, получив предложение войти в администрацию Джорджа Буша, Рамсфельд отошёл от руководства Gilead Sciences, однако продолжал оставаться одним из крупнейших акционеров компании. Только по официальным данным паника по поводу птичьего гриппа принесла ему 5 млн. долларов. Дональд Рамсфельд выгодно продал часть принадлежавших ему акций GileadSciences в 2004 году, в момент, когда цена на акции компании достигла очередного пика. Согласно финансовому отчёту министра обороны США за 2004 год, ему тогда удалось заработать только на этой сделке более $ 5 млн. Однако и после этой сделки Рамсфельд продолжает располагать 25-миллионным пакетом акций Gilead Sciences. Кроме того, после падения цены на акции, Рамсфельд мог вернуть и проданную часть, заработав на колебании курса акций как обычный биржевой спекулянт.

Известно, что в США работы по проектам "Геном человека" и "Геном ради жизни" финансируются преимущественно по линии Минобороны США. Именно этому министерству Конгресс выделяет миллиарды долларов якобы на защитные мероприятия от "птичьего гриппа". На финансирование гражданских исследований в 2004 г. было выделено 40,2 млрд. долл., из них на биологические и медицинские науки – 25,7 млрд. долл. Для сравнения: на машиностроение – 8,2; физические науки – 4,7; охрану окружающей среды – 3,5; математику и компьютерные исследования – 2,6; другие точные и естественные науки - 1,4; социальные науки – 1,4 и психологию – 0,86 млрд. долл. =>
https://web.archive.org/web/20090531174333/http://www.vpk-news.ru/print.asp?pr_sign=archive.2006.131.articles.rostrum_01

Итак, что мы обнаружили? Бывший глава Пентагона США оказывается "материально заинтересован" в пандемии гриппа! Не более и не менее. И долгое время у него в подчинении были секретные лаборатории из Института патологии Вооружённых сил США и центра по контролю за инфекционными заболеваниями, то есть те, что занимались восстановлением и изучением вируса "испанки". Есть мотив и есть оружие. Суд присяжных уже бы приговорил Рамсфельда к длительному тюремному заключению. Правда и у защиты ещё есть шансы - на оружии нет отпечатков пальцев обвиняемого. Достать мог, выстрелить мог, отпечатков нет. Однако и "отпечатки" есть!

Случай с Baxter International, в вакцине которого обнаружили настоящий птичий вирус H5N1 в комбинации с человеческим H3N2 уже можно считать таким отпечатком. Baxter пару лет назад получил штамм вируса птичьего гриппа из Индонезии с обязательством сделать для него вакцину, но "случайная ошибка" производителя вакцин могла вместо этого привести к пандемии смертельного для человека гриппа. Мало того, что Baxter International придерживается системы BSL3 (Уровень Биологической безопасности 3), по которому путаница просто невозможна, так и комбинация обнаруженных в "вакцине" вирусов имеет совершенно не случайный характер.

The New York Times

Elisabeth Rosenthal.

Swine Flu: First, Sow No Panic

The New York Times, 2 May 2009 (3 May 2009, p. WK 3)
https://www.nytimes.com/2009/05/03/weekinreview/03rosenthal.html

Wash your hands.

I know this sounds silly, but *it is far more effective* at preventing flu than having a dose-pack of Tamiflu in the medicine chest. Take it from a doctor, mother and reporter who covered SARS as well as bird flu where they were most virulent.

In 2003, as SARS was spreading across Asia, I was posted in Beijing. Many families fled. My children's school – the International School of Beijing – was one of the very few in the city to stay open, although my daughter's class of 25 dwindled below 10. For the children who remained, the school instituted strict policies – the ones that schools promote all the time but never really enforce. For parents, the first was: Don't send your child to school sick. For students, it was: Wash your hands frequently and thoroughly during the day – before meals, after recess. No one got SARS. But more than that, the stomach bugs and common colds that are the bane of elementary schools all over the world disappeared as well.

If hand-washing is the first lesson of the SARS epidemic to apply to today's swine flu outbreak, the others are: Masks, the symbol of protection, are only rarely useful. And enjoy being outside; it's not where you will get the flu.

I hate seeing pictures of people in Mexico riding bicycles and walking down the street in masks. Infectious diseases are not transmitted well outside and in sunlight. As a doctor and as a reporter, my cardinal rule is to interview sick people with infectious respiratory diseases – from garden-variety flu to tuberculosis to bird flu — in open spaces. That sometimes means an open-air hospital ward. So yes, avoid crowded, closed spaces in places where there may be danger.

Also, avoid touching things that lots of other people touch – door knobs and escalator handrails, for example – and then touching your nose or mouth. Having worked in an emergency room, I got into the habit.

Masks are for when you can't avoid a closed space during a serious outbreak – when, say, you need to travel by a crowded bus or plane or subway. In 2003 I had a mask in my bag as I traveled to severely affected cities across Asia, but wore it only rarely. When transmitting an infectious disease through the air, a patient is generally sneezing or coughing. During the height of the SARS outbreak in China, if a nearby passenger exhibited symptoms, I moved to another part of the subway or plane.

I can tell you from my experience in Beijing that having an **entire city of masked people** is devastating to the social fabric. It is hard to have conversation through a mask – you can't see smiles or frowns. Also, not all masks are equal. A good mask, well fitted and worn properly, is uncomfortable and hard to breathe through. And wearing a mask casually draped over your ears is more of a totem against disease than a scientifically valid form of protection.

In a normal season in the United States, tens of thousands of people die of complications of influenza. A baby's death in Texas or the 200 people who have succumbed in Mexico are tragic cases, but not by themselves worrisome totals. They could even suggest that this strain of swine influenza is quite mild. We have no idea how many people came down with lesser infections – presumably a huge number – that went unrecorded by the public health system. More data is needed to sort this out.

Which is why public health officials are frantically performing contact tracing and surveillance to track where the outbreak is going. It is the best way to head off something worse and help society prepare. But watching them perform this important business should be reassuring, not a reason to panic.

Even with SARS, which had a high death rate (1,000 people died and about 8,000 fell ill), you could argue that the most profound consequences were economic. Panicked people canceled conferences and trips throughout the region for months afterward, devastating local economies.

Too little information as well as too much can be dangerous.

In 2003, China created panic by trying to cover up the SARS outbreak, denying at first that it had hit Beijing. The vacuum of good information led to wild rumors. The danger was everywhere and nowhere. People left Beijing and stayed away for months because they didn't know if the risk was huge or small. I remember villages in the countryside setting up SARS screening programs. Villagers would stop cars and stick a thermometer in your mouth or behind your ear to gauge whether you were infected.

It was a great way to spread whatever was out there.

With swine flu, rightly and thankfully, we're in full-disclosure mode. We get nearly minute-by-minute statistics. But people should understand exactly what information they are receiving. Potential pandemics make good headlines; hardworking scientists do not. People wearing masks make for great pictures; a school in Queens where children are returning to their classrooms does not.

As a physician, as a student of public health and even as a journalist, I cringe when I see the swine flu, or H1N1, called "the deadly virus." Evidence to date does not suggest that it is any more deadly than the average flu. And there is this sentence that I have so often seen: The World Health Organization has not declared a pandemic yet. The sentence would be fine – and impart just as much known information without presuming what the future holds – if it dropped the final word, "yet."

SFGATE

Joe Garofoli

Some see media flu coverage as overblown

SFGATE, 3 May 2009.
https://www.sfgate.com/health/article/Some-see-media-flu-coverage-as-overblown-3162409.php

After a few days of breathless H1N1 flu coverage - some of it on his own network - CNN commentator Jack Cafferty noted that 13,000 people have died from the "regular ol' flu" this year in the United States, compared with just one confirmed H1N1 flu death. Cafferty then asked his audience to respond to his online poll asking "if swine flu coverage was overblown."

He waited a moment, then said, "Hint: Yes." Sounding somewhat sheepish, "Situation Room" host Wolf Blitzer said, "OK, good hint. Thanks, Jack."

For a week, the flu story has whet cable TV's bloodlust with what the 24-hour cable news vacuum craves: mystery, death and great visuals that inspire fear. No detail about the flu - often delivered without context - has been too tiny to go unreported, which means that cable TV viewers are getting coverage that is moment-to-moment but often not terribly useful.

Since most Americans still get their news from television, analysts say they have a growing concern: Will viewers actually trust media reports if there is a more serious and imminent health scare?

"Or will viewers think that the media is over-blowing it again. Will they say, 'Oh, it's just like bird flu.' Or, 'It's just like SARS,' " said Mark Jurkowitz, associate director of the Project for Excellence in Journalism.

Print coverage, which has fewer opportunities a day to deliver information and analysis, has been decidedly more measured, analysts said. And there has been insightful coverage from CNN's doctor-turned-broadcaster Sanjay Gupta, who reported on the flu's genesis in Mexico; and from NPR, which has a new blog "Flu Shots" (www.npr.org/blogs/health) to handle breaking developments while more contextual stories go on the air. Online, the Centers for Disease Control and Prevention has steered viewers to its own bulletins and videos, created by medical professionals working directly on the crisis.

Other outlets haven't been as reasoned.
Conservative talk radio hosts have used fear about the flu to segue to anti-immigrant remarks and calls to close the U.S.-Mexico border.

"How do you protect yourself? What can you do?" syndicated talk radio host Michael Savage told his audience last week. "I'll tell you what I'm going to do, and I don't give a damn if you don't like what I'm going to say. I'm going to have no contact anywhere with an illegal alien, and that starts in the restaurants."

By Friday, even "Today" show co-host Meredith Vieira seemed overwhelmed.
"I think part of the problem is that we're getting so much information that it's hard to know what to do," Vieira told her audience. Co-host Matt Lauer agreed, saying when people get nervous, "It makes them go in an emotional way."

But isn't filtering conflicting information and adding perspective the job of a journalist?

In that way, analysts say the flu reportage has shown the downside of the 24-hour news cycle. The past several days have presented viewers with a blur of numbers - of schools closed, of children out of school, of states where a confirmed flu case has appeared.

The by-product of this accelerated media environment "is that there is a rush of numbers and statistics that makes context hard to grasp," Jurkowitz said.

"Frankly, I've been a little horrified by how sensationalist and scare-mongering it is," said Vivian Schiller, chief executive officer of National Public Radio.

"It's kind of the perfect cable news story," she added. "It's scary. It threatens you. You don't know where it's going to strike next. It's like the (story of) killer bees (coming to the United States) - amplified by Twitter. You have all these little bits of information spewing out all over the place without context."

Just when the coverage appeared to be calming a bit Thursday, Vice President Joe Biden helped rekindle fears by saying on the "Today'" show that he "would tell members of my family - and I have - I wouldn't go anywhere in confined places now."

On cable network MSNBC, anchors put Biden's comments in the context of his history of gaffes, not just of how the flu can spread. MSNBC anchor Contessa Brewer urged viewers to go to MSNBC.com to answer this poll question:

"Vice President Biden told 'Today' he would advise family members to stay away from confined places, including planes and subways. Do you agree with this advice?"

Health stories always attract huge audiences, said Andrew Kohut, president of the Pew Research Center. But viewers shouldn't expect as much breathless coverage when Congress begins debating an overhaul of the U.S. health care system over the next few months.

"Because the policy debate is a tougher one to cover for many outlets," Kohut said. "They're more complicated. They require more nuance and discussion."

And there aren't as many opportunities to show people wearing masks.

Rebelión

Michel Chossudovsky

Mentiras políticas y desinformación mediática en relación a la pandemia de gripe porcina
Political lies and media misinformation in relation to the swine flu pandemic

Rebelion, 4 May 2009
https://rebelion.org/mentiras-politicas-y-desinformacion-mediatica-en-relacion-a-la-pandemia-de-gripe-porcina/

¿Qué es la gripe?

Es una grave enfermedad respiratoria contagiosa causada por los virus de la gripe. Millones de personas en Estados Unidos padecen gripe cada año. La mayoría suele estar enferma una semana aproximadamente. Algunas personas (especialmente los niños pequeños, las mujeres embarazadas, los ancianos y las personas con problemas crónicos de salud) pueden ponerse muy enfermas y muchos mueren por la gripe.

Centro para el Control y Prevención de la Enfermedad [1]

La Organización Mundial de la Salud (OMS) aumentó su nivel de alerta de pandemia a un nivel 5 en una escala de 6. La fase 5 de la OMS significa que «hay una propagación continua entre humanos del virus en al menos dos países y que es inminente un brote de la enfermedad a nivel global… Indica también un aumento de los esfuerzos para producir una vacuna … Se han confirmado casos humanos en México, Estados Unidos, Canadá, Gran Bretaña, Israel, Nueva Zelanda y España» (la negrita es nuestra).

Según los informes, la OMS tomó la decisión después de que «un bebé de 23 meses muriera [de gripe porcina] en Texas tras haber viajado desde México para recibir tratamiento médico». Según los informes, la gripe porcina se ha confirmado en 11 de los estados de Estados Unidos. Se han citado las palabras de altos cargos sanitarios de la OMS en Ginebra y Washington afirmando que «es poco probable que se detenga la propagación del virus». Los medios de comunicación se han puesto a pleno rendimiento con muy pocos análisis y revisión de las pruebas, y han centrado la atención en los más de 2.400 casos de gripe no específica en México.

Al día siguiente de que la OMS decretara la fase 5 de la alerta, un científico vinculado con el Centro para el Control y Prevención de la Enfermedad de la Unión Europea insinuó, sin pruebas, que la pandemia podía afectar «de manera benigna» a entre un 40% y 50% de la población de la UE (véase europeanvoice.com, 30 de abril de 2009). El profesor Neil Ferguson, un miembro del grupo de trabajo de la OMS sobre la gripe porcina, afirmó que «el 40% de las personas en Reino Unido podrían infectarse en los próximos seis meses si el país se viera afectado por la pandemia».

«No sabemos qué dimensiones tendrá la epidemia en los próximos dos meses … Es casi seguro que aunque desaparezca en las próximas semanas (lo que puede ocurrir) tendremos una epidemia estacional en otoño» .

«Podemos esperar que hasta entre un 30% a un 40% de la población enferme en los próximos seis meses si verdaderamente se convierte en pandemia. Puede que tengamos una cantidad importante de personas infectadas, pero, si a mí me gustara apostar, diría que durará poco porque avanzamos hacia el verano». El profesor Ferguson afirmó que los 152 muertos en México probablemente suponen una proporción relativamente pequeña del número total de infectados que podría llegar a decenas o cientos de miles» (Daily Express, 1 mayo de 2009).

Los reportajes de los medios de comunicación están distorsionados. Se transforman las realidades. Las declaraciones de los políticos no están respaldadas por pruebas médicas y científicas. Las declaraciones del profesor Ferguson carecen de fundamento. No se ha molestado en confirmar el número de casos de gripe porcina en México «confirmados por el laboratorio». ¿Entre el 30% y el 40% de la población de Gran Bretaña? ¿Hasta el 50% de los 500 millones de habitantes de la Unión Europea? ¿En qué se basan estas afirmaciones? Según los reportajes, el 27 de abril sólo había un caso de gripe porcina en toda la UE: «El primer caso confirmado en Europa de gripe porcina se diagnosticó en España. La ministra de Salud del país lo confirmó el lunes por la mañana, después de que se le hicieran pruebas a un hombre que había vuelto recientemente de México» BBC, 27 de abril de 2009 [2]). ...

Elizabeth Cohen

When a pandemic isn't a pandemic

CNN, Health, 4 May 2009 // 22:42 GMT (06:42 HKT)
https://edition.cnn.com/2009/HEALTH/05/04/swine.flu.pandemic/index.html

Atlanta, Georgia (CNN) – When the World Health Organization raised its influenza pandemic alert from a Phase 4 to a Phase 5 last week, there was a bit of a gasp heard round the world.

News about the pandemic sent people to line up at a mobile health clinic in Mexico City.
After all, Phase 5 "is a strong signal that a pandemic is imminent," according to WHO.

"All countries should immediately activate their pandemic preparedness plans," the organization's director-general, Dr. Margaret Chan, said Wednesday. "After all, it really is all of humanity that is under threat during a pandemic."

But the word "pandemic" isn't quite as scary as it sounds, explained **David Ozonoff**, professor of environmental health at the Boston University School of Public Health.

"When people hear the words 'pandemic' and 'flu,' the first thing that comes to mind is 1918, which was a real horror show," Ozonoff said, referring to the flu pandemic that killed some 50 million people 91 years ago. But you can have a pandemic without a large number of deaths, he said. "The word pandemic refers to how widely dispersed a disease is, not to how severe the disease is," he said.
Confusion about the meaning of "pandemic" is understandable, Ozonoff said, considering the definition of the word is "not set in stone."

Until Monday morning, the WHO *had a definition on its Web site saying* that a pandemic flu causes "enormous numbers of deaths and illness." After a CNN reporter pointed this out, WHO spokeswoman *Natalie Boudou*[1] called back to say the definition was in error and had been pulled from the WHO Web site.

"It was a mistake, and we apologize for the confusion," she said. "(That definition) was put up a while ago and paints a rather bleak picture and could be very scary."
The correct definition is that "pandemic" indicates outbreaks in at least two of the regions into which WHO divides the world, but has nothing to do with the severity of the illnesses or the number of deaths.

Based on lessons from the past, "influenza may cause mild disease in affluent countries, but more severe disease, with higher mortality, in developing countries," Chan said at Wednesday's news conference.

There have been three influenza pandemics in this century, said Andrew Pekosz, associate professor of microbiology and immunology at Johns Hopkins University's Bloomberg School of Public Health. The other two, in 1957 and 1968, also were caused by new viruses to which no one had immunity, but didn't cause nearly the number of deaths as the one in 1918.

"I think people need to be reminded that this current H1N1 outbreak is going to resemble much more the pandemics in 1957 and 1968, where there was an increase in deaths from other years, but nothing like the millions of deaths we saw in 1918," Pekosz said.

Россельхознадзор / Грипп A/H1N1/Калифорния/04/2009
федеральная служба по ветеринарному и фитосанитарному надзору

Интервью Руководителя Роспотребнадзора
Геннадия Григорьевича Онищенко

«Грипп А, H1N1, Калифорния/04/2009»

«Эхо Москвы», программа «В круге СВЕТА», 5 мая 2009
(стенограмма – https://46cge.rospotrebnadzor.ru/txt/4588)

Гость: Руководитель Федеральной службы по надзору в сфере защиты прав потребителей и благополучия человека. Геннадий Григорьевич Онищенко
Ведущая: *Светлана Сорокина*

С. Сорокина: Здравствуйте, здравствуйте. Это программа «В круге СВЕТА». Сегодня в студии работаю я, Светлана Сорокина. И я сразу представлю вам моего собеседника. Это Геннадий Онищенко. Здравствуйте, Геннадий Григорьевич.
Г. Онищенко: Здравствуйте.

С. Сорокина: Это главный государственный санитарный врач РФ и руководитель Федеральной службы по надзору в сфере защиты прав потребителей и благополучия человека. Какое длинное название. Сами придумывали?
Г. Онищенко: За нас.

С. Сорокина: За вас придумали. Ну как-то звучит очень многообещающе. Но об этом еще поговорим. Итак, несмотря на то, что Всемирная организация здравоохранения (ВОЗ) настаивает на высоком уровне опасности, мы то ли устали уже бояться, то ли привыкли уже к сообщениям об этом самом т.н. «свином гриппе», как его первоначально называли, потом калифорнийский, потом H1N1. Ну вот. Но, тем не менее, он продолжает распространяться, и первым делом – все-таки действительно он такой страшный, как казалось первоначально, или ничего особенного?
Г. Онищенко: Ну, на самом деле, его истинное название изначальное было – грипп А, H1N1, Калифорния, 04 2009. Это самое исконное, самое правильное его название. Потому что гриппов H1N1 по меньшей мере несколько тысяч уже было. За всю нашу совместную и неоднозначную историю сосуществования гриппа H1N1…

С. Сорокина: Этого вируса и нас.
Г. Онищенко: И нас, человечества, да. На самом деле, действительно, ситуация состоит в том, что человечество по меньше мере десять лет уже ждет появления нового штамма, так называемого нового пандемического штамма гриппа.

С. Сорокина: То есть того, который пронесется и будет страшным?
Г. Онищенко: Нет. Тот, который действительно резко изменит свой генетический код, произойдет резкий генетический дрейф, и человечество будет снова после этого революционного всплеска последовательно накапливать коллективный иммунитет против нового гриппа. Если вы помните, в 2005 году наша страна столкнулась с H5N1, тогда тоже было

много шума. Этот шум был небескорыстный, я бы так сказал, хотя, в общем-то, угроза была реальная. Потому что с H5N1 человечество еще не встречалось. И если говорить об этой статистике, то где-то с 2003 года в 14 странах мира зарегистрировано порядка 470 случаев, 250 из которых завершились смертельно. То есть два к одному – два заболевают, один умирает при H5N1. И все тогда говорили, что это не последний. После H5N1 был H7N7.

С. Сорокина: А который называли птичьим гриппом?

Г. Онищенко: Вот тот H5N1. На самом деле, свиной и птичий – это неверные названия. Скажу позже, почему. Потом был H7N7, потом был H9. И вот сейчас вновь пришел H1N1.

С. Сорокина: То есть это не новенький грипп?

Г. Онищенко: В данном случае не новенький. То есть естественный ход событий нарушен. Раньше было как? Дикая популяция водоплавающей птицы, переход на домашнюю птицу, с домашней птицы, как правило, на свинью домашнюю, свинья очень близка нам по своей физиологии, является почти идеальной биологической моделью человека, на ней очень легко испытывать лекарства…

С. Сорокина: Нифига не льстит.

Г. Онищенко: Ну надо просто знать себе цену. Чего ж вы так-то о себе так хорошо размечтались? В данном случае природа указывает нам на наше место в эволюции. Итак, со свиньи уже переходило на человека. В данном случае произошло другое. Вот где-то 50 лет как минимум точно, гипотетически с «испанки» H1N1, человечество сталкивалось с этим гриппом.

С. Сорокина: То есть у нас близкий к «испанке»?

Г. Онищенко: Если говорить изначально, H1N1 рядом. Но мы с ним уже живем почти век. Потом он уходит снова к свинье, то есть опускается на эволюционную ступень ниже, там приобретает новые совершенно свойства, происходит реасортация с тремя штаммами, и вот уже, приобретя новые силы, он возвращается к человеку. Судя по всему, он чего-то не досчитал. Ему надо было все-таки побольше побыть на свинье. У него не хватает трансмиссибельности. Он от человека к человеку передается, но не так, как нужно было бы настоящему пандемическому штамму. Где-то он не сработал. Сказать, когда это произойдет, тоже нельзя, потому что слишком малый период наблюдений. Если бы мы, допустим, его понаблюдали несколько лет – допустим, он первый появился, потом через год еще раз мутировал, потом еще раз, и тогда мы бы поняли, насколько скорость его мутации и приобретение этих свойств быть пандемическим штаммом заложено к его генетическом коде. Пока этого сказать нельзя. Но что показывает объективная реальность? Ну вспомните, две недели назад впервые официальные власти Мексики и медицинские власти США объявляют о появлении нового штамма. Тогда говорили о трех тысячах…

С. Сорокина: Но потом не подтвердилось.

Г. Онищенко: Нет, а потом, когда научились типировать, когда научились лабораторно подтверждать, сейчас все вернулось на круги своя – где-то тысяча с небольшим подтвержденных случаев, двадцать с небольшим случаев смертельных. Прежде всего, в Мексике и в 32 штатах Америки регистрируют сейчас этот штамм. Ну, если мы с вами в наш обычный эпидемический подъем в городе Москве в день, когда мы говорим «наступил эпидпорог, начался эпидемический подъем», в день регистрируем больше десяти тысяч. В десятимиллионной Москве. То здесь практически за полтора месяца, потому что с момента объявления прошло две недели, а с момента первых регистраций, а это было 18 марта…

С. Сорокина: То есть за полтора месяца.

Г. Онищенко: За полтора месяца всего лишь какие-то тысяча с лишним. То есть контактность у него не такая уж большая. Еще один аргумент. США, люди предельно прагматичные, с высоким уровнем здравоохранения – они даже не госпитализируют этих больных.

С. Сорокина: Просто лечат на месте?
Г. Онищенко: Просто лечат дома.

С. Сорокина: Вирус и вирус.
Г. Онищенко: Да, лечат дома, лечат амбулаторно. И лишь единиц – только с жизненным показанием для человека, а не с точки зрения его контактности, - они госпитализируют. Вот эти факторы говорят о том, что все-таки мы пока имеем дело с кандидатом, но еще недостаточно сильным кандидатом на пандемический штамм.

С. Сорокина: Извините, перебью, Геннадий Григорьевич, то есть практически получается, что весь этот шум и наши опасения вызваны именно ожиданием какого-то нового страшного прорывного штамма?
Г. Онищенко: Есть ожидание. И вы понимаете, я вам это говорю не потому что мы, медики, расслабились и ждем. Мы действительно ждем нового штамма. Но контент, логистика должна быть другой. Ну дайте слово врачам. Пусть они спокойно…

С. Сорокина: Спокойно. ВОЗ сколько там, пятерку поставила опасности?..
Г. Онищенко: Я о ВОЗ, если позволите, отдельно скажу. Спокойно. Будут рассказывать о том, как нужно бороться. Вот сегодня американцы дали великолепный почти комикс с точки зрения восприятия. «Я подозреваю, что я болен: раз, два, три».

С. Сорокина: Делай раз, делай два, делай три.
Г. Онищенко: Да. Я болен – раз, два, три. У меня в окружении, в моей семье заболели – абсолютно понятно. Человек это прочтет – он только от прочтения успокоится, что да, в принципе, наверное, что-то страшное, но не такое, что…

С. Сорокина: А почему нам такое не сделать?
Г. Онищенко: А мы сделали. У нас, во-первых, нет этих случаев, слава богу. И мы взяли американские данные, их перевели и на нашем сайте разместили. И просим вашу радиостанцию периодически делать какие-то такие вставочки. Вот это был бы нормальный ход истории. Что же происходит? Я сейчас не буду про это говорить вариант, я скажу про 2005 год в нашей стране. Сцены ужаса, горящие огни, бегающие в скафандрах молодые защитники человеческой популяции от этого невидимого, но страшного врага, тревожные голоса ваших коллег…

С. Сорокина: Ну а что, правда, страшно. Вдруг это был бы действительно тот самый новый прорывной?
Г. Онищенко: **Это была хорошо спланированная тогда информационная диверсия**.

С. Сорокина: Да я вас умоляю. А может, это большой интерес фармакологических компаний?
Г. Онищенко: И был не большой интерес фармакологических компаний. Тогда люди не болели, некому было эту фармакологию скармливать. А тогда был большой интерес в смысле передела рынков белого мяса.

С. Сорокина: А, вот в чем дело!
Г. Онищенко: Это было.

С. Сорокина: А сейчас свинину, значит, переделывают.
Г. Онищенко: Нет, а свинина сейчас играет третьестепенную роль. Вот сейчас – я вот тут высказывался по поведению нашей доблестной Всемирной Организации Здравоохранения, и я считаю, что я имею на это право… Вот мы получили штамм. В Мексике получили, не в США. Если бы еще мы получили в США, я бы еще мог поверить этим данным. Нам говорят: «Этот вирус не чувствителен ни к чему, только к одному тамифлю». И все. И наша любимая

ВОЗ, которая является средоточием всего положительного, что есть у здравоохранения на этой планете, выступает в роли маркетингового отдела фирмы «Ля Рош», которая совершенно случайно оказалась в той же Швейцарии, в том же городе Женева. Ну разве так можно?

С. Сорокина: Ну, может, оно действительно помогает, это лекарство?

Г. Онищенко: Оно действительно помогает. И, может быть, лучше всех помогает. Но они забыли о чем? Что есть, во-первых, международная панель применяемых противовирусных препаратов. Ну хорошо, ну дайте всем странам штамм, вот нам, например, и мы проверим его чувствительность и скажем – да, вот этот препарат не работает, вот этот работает хуже, вот этот нормально работает, а вот этот ну идеально работает. И вот тогда, составив эту панель, мы скажем и начнем уже свои стандарты лечения.

С. Сорокина: Так а что, не дают?

Г. Онищенко: Ну, они могут дать, они должны были дать. Дать сегодня могут только американцы. Американцы нам дают. Но опять – сегодня я вот ехал к вам на передачу, из Атланты они опять нам его не выслали, потому что они ему присвоили категорию А, а категория А – это другие перевозчики. Ну, то есть начинаются эти бюрократические заморочки. Ну получим мы его в конце концов, это, как говорится, сейчас не самое страшное. Вот вам частичный ответ на ваш вопрос. Теперь – меня это беспокоит еще и с другой стороны. Мы не можем еще сказать, что все, отбой. Напряжение остается. Но пусть оно будет у нас, профессионалов. Мы сейчас контролируем прилет самолетов. Мы занимаемся расчетом необходимых медикментов, раз уж пятый уровень угрозы. Следующий шестой, и все.

С. Сорокина: Пандемия?

Г. Онищенко: Да. Мы расчеты делаем, мы врачей готовим. Мы смотрим наши материальные ресурсы, нашей лечебной сети, страновые. Вот я вчера утром провел селекторное совещание со всеми субъектами Российской Федерации, где руководители на уроне замов губернаторов рассказывали, что у них решено, что не решено, что нужно решать. То есть шел нормальный разговор всех причастных структур. И дай бог. Но, вот вы правильно сказали, когда и россияне, и другие страны мира, и, прежде всего, мексиканцы исчерпали ресурс адреналина, который они потратили на эту психопатическую кампанию, которая была развернута в СМИ, я понимаю правила игры журналистов – им надо подать весомо, ярко зримо эту информацию, но где-то ж нужно и не перебирать это. Поэтому, конечно же, как всегда, в этой информационной кампании неправильно расставлены акценты. Со скидкой на правила жанра.

С. Сорокина: Ну, знаете ли, а вдруг это действительно оказался бы тот самый революционный штамм, и нужно действительно, чтобы опасения были у всех, чтобы люди были настороже и принимали меры.

Г. Онищенко: Да, я согласен, но давайте будем сотрудничать.

С. Сорокина: Сотрудничаем. Вы к нам пришли и говорите.

Г. Онищенко: С вами мы сейчас сотрудничаем.

С. Сорокина: Геннадий Григорьевич, дайте спрошу. А вот скажите, пожалуйста, а вот эта «испанка» знаменитая, которую все вспоминают, кому не лень, 18-й год, 50 миллионов, по-моему…

Г. Онищенко: Это как бы.

С. Сорокина: Ну примерно. Там трудно считать было. Огромные жертвы. Еще и Первая Мировая, и прочее. Но все-таки миллионы жертв были.

Г. Онищенко: Согласен.

С. Сорокина: Очень страшно. Это что, действительно была какая-то новая мутация, это был новый штамм?

Г. Онищенко: Это как раз была классическая пандемия, которая произошла в результате появления нового пандемического штамма, против которого у человечества, которое жило в тот период на планете, не было ни индивидуального, ни коллективного иммунитета. Произошел резкий дрейф. Мы как человечество оказались не готовы. И тогда и возможности здравоохранения были другие. Не было антиретровирусных препаратов, не было такого уровня здравоохранения, который есть сейчас и в Европе, и у нас в России, в развитых странах. Это играло свою роль, и очень серьезную роль играло. И за прошлый, 20-й век, в который мы с вами родились, произошло три таких полноценных и еще две абортивных пандемии, когда появлялись новые штаммы. Срок примерно 30 лет, потом 10 лет, потом…

С. Сорокина: А со времени последней сколько прошло?

Г. Онищенко: Уже много, больше 30 лет.

С. Сорокина: То есть поэтому и ждем?

Г. Онищенко: Поэтому мы и ждем. И особенность этой пандемии состоит в том, что у нас как минимум три штамма циркулирует. Вот при еще не закончившемся подъеме заболеваемости эпидемическом у нас с вами циркулировал A H1N1, A H3N2 и B. Вот три штамма у нас были такой классической триадой, и против всех трех у нас была актуальная вакцина.

С. Сорокина: То есть прививаться все-таки есть смысл против этих гуляющих гриппов?

Г. Онищенко: Одним из главных пунктов, являющихся результатом коллективного труда всех врачей на планете является вакцинация. И вот смотрите, что сейчас происходит. Мы уровень тревоги не снимаем, он остается пятым. Мы проводим меры сейчас и в нашей стране, и в других странах. Но если вы меня спросите, где наиболее уязвимо сегодня, вот по всем законам эпидемиологии сегодня уязвимо южное полушарие. Почему? Потому что там наступает зима. И вот на фоне тех заболеваний, которые туда, несомненно, придут из тех штаммов, если туда присоединиться еще этот новый, он может за период этого полугодия мутировать, приобрести дополнительные свойства, и уже к нам на северное полушарие прийти во всей своей зловещей красе. Вот это может произойти.

С. Сорокина: Но сейчас пандемии не будет, на ваш взгляд?

Г. Онищенко: Я не могу, как говорится, отступать от корпоративных вещей. Тем более, что априори у всемирной организации больше данных сегодня удерживать этот пятый уровень, но я говорю, что сегодня в России у нас с вами заболеваемость обычными штаммами гриппа сохранена в Магадане, немножко в Санкт-Петербурге идет превышение, немножко в Кемеровской области. Вот и, пожалуй, все те регионы, где у нас идет превышение обычными штаммами.

С. Сорокина: А этого пока, по счастью, не появилось?

Г. Онищенко: Этого, по счастью, мы за прошедшие сутки посмотрели 78 рейсов международных, там где-то около 6 000 пассажиров, температуру замерили, и трех сняли.

С. Сорокина: Но не подтвердилось?

Г. Онищенко: Они сейчас у нас в инфекции. Причем два из них монгола, которые летели и не выходили в Шереметьево-2 из этой пограничной зоны. Они прилетели к нам, переждали ночь и должны были лететь на Улан-Батор нашим рейсом, но утром обратились в медпункт в пограничной зоне. Обратились, им померили температуру и тут же госпитализировали, потому что они прибыли из Мексики. И сейчас они у нас в инфекции находятся. Два гражданина Монголии. И еще один гражданин, который вернулся из США, которого мы сняли с борта и тоже госпитализировали. Это уже, считайте, девятый случай за весь период, когда мы начали мониторинг бортов, когда мы начали снимать с бортов людей с температурой, прибывших из неблагополучных стран.

С. Сорокина: А скажите, пожалуйста, а вообще вот эти карантинные меры как-то дают заграждение или все-таки это все не очень эффективно?

Г. Онищенко: А какие карантинные меры? Карантина пока нет.

С. Сорокина: Нет, я имею в виду это вот отслеживание.

Г. Онищенко: Это дает

С. Сорокина: Дает, да? Потому что все равно же распространяется, все равно вон сколько стран подтверждает наличие этого вируса.

Г. Онищенко: Я вам одну принципиальную вещь скажу. Когда мы были очень закрытой страной, и за рубеж у нас ездили только…

С. Сорокина: Дипломаты и избранные.

Г. Онищенко: Члены райкомов партии, дипломаты, передовики производства и очень ограниченный круг, вот для нас, для эпидемиологов, был рай.

С. Сорокина: Ну наверное.

Г. Онищенко: Рай был в том плане, что вот появилась в 67-м году холера – взяли, закрыли город Одессу, весь город окружили войсками, никто оттуда не выходил. В Астрахани появилась – та же самая ситуация. То есть это были, в общем-то, эффектные меры. Не эффективные, а эффектные меры.

С. Сорокина: То есть я так понимаю, что эпидемиологи – сторонники тоталитарного режима.

Г. Онищенко: Ни в коем случае. Но тогда было неинтересно. А сейчас главная и первая задача – сделать все, чтобы минимизировать последствия. А для этого нужно иметь очень эффективную, с очень низким порогом чувствительности систему здравоохранения, чтобы врач мог быстро поставить диагноз, отдифференцировать его, изолировать больного, если в этом есть необходимость, и не дать распространиться. Вы на меня так подозрительно смотрите.

С. Сорокина: Я смотрю, потому что подошло время новостей середины часа. Нам нужно буквально на пару минут прерваться, а потом продолжим разговор. Очень много вопросов пришло. Мы еще по вопросам пройдемся. А сейчас – время новостей середины часа. Это программа «В круге СВЕТА».

...

С. Сорокина: И еще раз здравствуйте. Это программа «В круге СВЕТА». Мы говорим о гриппе, говорим с главным санитарным врачом Геннадием Онищенко. Мы уже выяснили, что, собственно, не так страшен грипп, как его малюют. Видимо, это все-таки не тот штамм, который представляет такую гигантскую угрозу. Не знаем, как он мутируется за следующие полгода, но пока вроде…

Г. Онищенко: Давайте назовем его пока кандидатом.

С. Сорокина: Кандидат в страшные, но пока не очень страшно. Ну и надеюсь, что вы получите образцы этого самого вируса.

Г. Онищенко: Не сомневаюсь.

С. Сорокина: Я тут слышала даже какую-то информацию о том, что наши ученые, не дожидаясь этого самого штамма, уже нашли что-то, что явно может влиять на этот вирус.

Г. Онищенко: Нет, наши ученые что сделали – когда наши коллеги из Атланты опубликовали в интернете всю библиотеку генетической последовательности штамма, мы ее воспроизвели у себя, сварили праймеры и из этих праймеров изготовили чувствительные именно к этому штамму диагностику…

С. Сорокина: То есть какие-то заготовки есть?

Г. Онищенко: Такие возможности сегодня есть. Когда опубликована вся последовательность, ее можно воспроизвести в искусственных условиях, но это будет не живой штамм, но…

С. Сорокина: Но близко к нему. Вопросы. Вот пишут о том, что где взять этот самый тамифлю, и еще реленса какой-то упоминают. Где это взять в аптеках?

Г. Онищенко: Так, первое – брать нигде не надо. Я вам просто настоятельно рекомендую – не обогащайте на этом этапе наш фармацевтический бизнес.

С. Сорокина: То есть пока нет этой угрозы, не нужно ниоткуда брать.

Г. Онищенко: Ну, во-первых, что касается Москвы, я доподлинно знаю, я буквально заслушивал сегодня утром отчет Москвы о готовности. У них есть определенный запас, причем достаточно солидный. Если, паче чаяний, появятся больные, то у Москвы есть чем лечить. А вот покупать, вернее, сметать – это даже не покупка, это сметание с полок – этого делать сейчас не нужно. Вот второе – это более близко к теме, и вообще я относительно марлевых повязок скажу. Есть ли этот H1N1 Калифорния, нет ли его, но как только придет сентябрь, пожалуйста, на всех членов семьи заготовьте, и как только вы услышите первые наши тревожные сообщения о том, что начинается подъем, наденьте и покажите, что Россия – цивилизованная страна.

С. Сорокина: Где взять? В аптеках нет.

Г. Онищенко: А сейчас, наверное, просто не сезон.

С. Сорокина: Ну вот все пишут – нет в аптеках. Обежали все в округе – нет в аптеках этих марлевых повязок.

Г. Онищенко: Ну, я думаю, что в Москве они есть. А сейчас просто наш фармбизнес просто не ожидал, что появится это, и они их, кстати, заготавливали, но в основном их закупали медицинские учреждения, но граждане как-то не очень любят это. Посмотрите на наших соседей – китайцев, японцев. Им не надо напоминать. Как только похолодало, они все надели марлевые повязки и ходят везде.

С. Сорокина: В общем, надо проследить, чтобы они были в аптеках.

Г. Онищенко: Среди наших граждан вы вообще где-нибудь видели в общественном месте человека в маске?

С. Сорокина: Видела.

Г. Онищенко: Где?

С. Сорокина: Здесь в Москве уже видела, вот в поликлинике многие ходят в марлевых повязках.

Г. Онищенко: О, так в поликлинике они ходят в повязках, потому что мы штрафуем. Работников торговли, которые стоят за прилавком, мы тоже штрафуем. Любовь к маске из-под палки. А вот такую искреннюю любовь…

С. Сорокина: Ничего-ничего, привыкнем. Мы тоже мутируем, поэтому привыкнем потихонечку. Скажите мне, пожалуйста, то, что касается мяса, ввоз которого в некоторых странах ограничен уже – свинины из Мексики и так далее, через мясо может что-то передаваться?

Г. Онищенко: Первое. Что касается нашего российского мяса, в тех сложившихся семейных, этнических, региональных традициях, в которых вы его употребляете, пожалуйста, употребляйте. Если у вас есть на это финансовая возможность. Что касается завоза. Гипотетически если даже это мясо будет от заболевшей свиньи, которую соответствующим образом направили на восполнение белкового дефицита в человечестве, если оно будет заведомо заражено,

то после термической обработки в 70 градусов, а вы знаете, что в гораздо более высоких температурах приготавливаем, это будет не опасно. Существует единственная реальная опасность заражения – во время разделки. И все. Ну, здесь – перчатки, и никаких проблем не будет.

С. Сорокина: Скажите, пожалуйста, можно ли в обычной поликлинике, не дай бог у нас появится этот вид гриппа, провести диагностику – тот ли это опасный вирус или все-таки нет?

Г. Онищенко: Я вам так скажу. Это, в общем-то, недешевое удовольствие. В обычной поликлинике, конечно, этого не сделаешь. Сегодня в Москве на Графском переулке мы делаем эту диагностику, и вот с первой инфекции мы везем на Графский переулок. Мы делаем на Шоссе Энтузиастов в Центральном институте эпидемиологии.

С. Сорокина: Ну то есть врач, к которому вы обратились, сам должен направить на исследование в необходимое учреждение, да?

Г. Онищенко: Если врач, к которому вы обратились, заподозрит у вас заболевание, тогда он, не спрашивая у вас, он просто обязан это сделать, поставить диагноз под вопросом, провести соответствующий отбор и направить на исследование. Такие нормативные требования уже сформированы, и они уже реально реализуются.

С. Сорокина: Геннадий Григорьевич, вот пишут нам еще: «Не пора ли обязать авиакомпании устанавливать системы дезинфекции воздуха в самолетах?» Потому что если летишь в самолете, можно подхватить что угодно, особенно если то долгий полет. Мы дышим одним и тем же воздухом.

Г. Онищенко: На самом деле, в разных системах самолетов существуют разные системы очистки, но они, как правило, идентичны, и все они направлены на то, что очистка воздуха с помощью разного типа фильтров осуществляется, потому что, как вы понимаете, на большой высоте идет рециркуляция воздуха с небольшой подпиткой извне. Это происходит. Другое дело, и сегодня я не могу сказать, что самолеты у нас являются этим вот разносчиком заразы…

С. Сорокина: Я сколько раз сталкивалась. Все-таки легко там подхватить что-то.

Г. Онищенко: Скорее в самолетах бывает другое, особенно в старых типах самолетов. Там несовершенная система кондиционирования, которая создает неадекватные ситуации температуры, и люди просто простужаются или у них начинает срабатывать аллергическая реакция. Вот есть, знаете, холодовая аллергия и так далее. Но чтобы самолеты были разносчиками заразы, я такого сказать не могу. Другое дело – если там заведомо появится больной с каким-то опасным контагиозным заболеванием, вот тогда весь самолет мы, естественно, возьмем на обсервацию, больных мы карантинизируем и будем лечить. Это есть. Но вопрос имеет под собой вполне реальную почву. И вот, допустим, в старом типе боинга, я уж не говорю о наших самолетах, поставим задачу дополнительно еще дезинфицировать воздух, то технологии их циркуляции воздуха не позволяют этого делать.

С. Сорокина: В общем, вопрос уже об обновлении парка авиалайнеров.

Г. Онищенко: Да, модернизации.

С. Сорокина: Совершенно в сторону сейчас вопрос по смс-сообщению: «В Екатеринбурге половина школ во вшах, а вы о какой-то Мексике». На самом деле, как я понимаю, педикулез – это страшная проблема для многих детских учреждений не только в Екатеринбурге. Это насколько серьезно сейчас?

Г. Онищенко: На самом деле, я бы педикулез отнес, за редким изъятием, к элементам просто санитарной культуры.

С. Сорокина: Но есть такая проблема в России сейчас?

Г. Онищенко: Конечно, есть.

С. Сорокина: Серьезная? Это хуже, чем в прошлые годы?

Г. Онищенко: Я бы так сказал – что динамика идет не в лучшую сторону. Просто регистрация педикулеза. Мы даже лет 15 назад вновь ввели регистрацию педикулеза. Было время, когда мы просто от нее отказались. В общем-то, это быль – в начале моей производственной деятельности ходила такая байка: что настойкой вшей можно лечить некоторые заболевания. Ну, это была, конечно, глупость. Но, тем не менее, тогда в цыганских таборах вшу можно было купить за 3-5 советских рублей. А это были большие деньги в то время. А сейчас, к сожалению, и это не потому что это асоциальные люди, низкий социальный статус семьи, а даже во вполне нормальных семьях люди не знают, что такое вша, и когда говорят, что у вашей девочки или у вашего мальчика головная вошь, я уж не говорю о платяной и еще об одной форме вши, люди просто оскорбляются. Хотя на самом деле это так. Поэтому здесь вошь сама по себе, в общем-то, не является какой-то страшной опасностью, кроме эстетической неприятности. Но вошь, если вы помните, это был сыпной тиф в свое время…

С. Сорокина: Переносчики, конечно.

Г. Онищенко: Да, они являются природным резервуаром такого страшного заболевания, как сыпной тиф.

С. Сорокина: Скажите, пожалуйста, вот здесь Наталья из Москвы пишет – если возвратиться к гриппу, ведь главное не сам грипп, а его осложнения.

Г. Онищенко: Конечно. Молодец.

С. Сорокина: И раньше, во время «испанки», не было антибиотиков. А антибиотики – это как раз лечение осложнений. Ну действительно, есть две стадии. Потому что когда сам грипп, надо антивирусные применять, а когда осложнения, антибиотики.

Г. Онищенко: Поддерживая позицию Натальи, я скажу, что после эпидемии гриппа идет эпидемия сердечнососудистых осложнений. Особенно в старшей возрастной группе. Поэтому мы в национальных календарях прививаем кого? Детей, у которых еще нет достаточного уровня иммунной системы, и пожилых людей, у которых уже иммунная система имеет достаточно серьезные изъяны. Поэтому защита с помощью вакцинации – это да. Потом – есть еще одна проблема. Ну вот, например, американцы что говорят? Они во время каждого сезонного подъема самого обычного гриппа регистрируют до 32 000 смертей, где диагноз – грипп. У нас идет немножко другой счет, но это изъяны статистики, это вовсе не значит, что мы более устойчивы. Ну у нас серьезные подъемы – это где-то до 1000 доходило, когда ставилась причина смерти грипп. В основном это все у нас уходит в осложнения – сердечно-сосудистые, сердечные заболевания и так далее. Как бы вторичная идет постановка диагноза. Но, тем не менее, грипп сам по себе, даже самый простой, самый привычный для нас, это серьезный урон здоровью как каждого человека, так и здоровью популяции.

С. Сорокина: «А не лучше ли ввести запрет на въезд из этих стран, чтобы не получить вирус?» Ну, во-первых, стран уже слишком много, из которых надо запрет вводить.

Г. Онищенко: На самом деле, реальную опасность сегодня представляют все-таки две страны… даже нет, не две. США, Мексика и Канада. Потому что в Канаде уже тоже идет распространение.

С. Сорокина: Но есть ведь страны, въезд которые закрыли. Куба, Перу, по-моему.

Г. Онищенко: И Китай закрыл. Я считаю, это чрезмерная мера. Вот представьте себе – по нашим оценкам, по оценкам МИДа, сегодня на территории Мексики 3 000 россиян. Вот люди поехали в командировку, им нужно оттуда вернуться – что мы, их не пустим в нашу страну?

С. Сорокина: Да нет, ну это несерьезно, конечно. Смотрите, в панике Юлия пишет: «Нечаянно дотронулась сегодня губами до сырой свинины на рынке. Что делать?»

Г. Онищенко: Юлечка, во-первых, не надо паниковать. Вся та свинина, до которой вы дотронулись губами, никакой опасности с точки зрения гриппа H1N1 Калифорния 042009 не представляет. Но – как любое сырое мясо, может быть причиной и кишечного заболевания…

С. Сорокина: Да, вот за этим лучше последить, конечно.

Г. Онищенко: И просто в следующий раз не делайте этого. Я думаю, это очень легко сделать.

С. Сорокина: Геннадий Григорьевич, вот Александр пишет: «Когда будет закуплена вакцина против гепатита В?»

Г. Онищенко: Молодец Александр.

С. Сорокина: «Задержка есть уже три месяца. Что будет со страной?» Видимо, проблема есть.

Г. Онищенко: Скорее всего, это мой коллега. На самом деле, в 2006 году, в 2007 году, благодаря национальному проекту, наша страна сделала беспрецедентный шаг – привила 25 миллионов человек. И когда мы в этом году докладывали это на…

С. Сорокина: Детям почти обязательная прививка.

Г. Онищенко: Детям – это в национальном календаре. Это уже, слава богу, обязательная прививка. Причем первую аппликацию делать в первые 24 часа с момента рождения.

С. Сорокина: Так а что сейчас-то с этим?

Г. Онищенко: Сейчас у нас закупается на 6 000 000 человек 18 000 000 доз впервые отечественной, изготовленной нашими производителями. Причем что для меня особенно приятно – что наш бизнес, не государство, а бизнес создал вакцину. Это говорит о том, что он начинает немножко приобретать…

С. Сорокина: А хорошая вакцина-то?

Г. Онищенко: Очень хорошая с точки зрения того, что она сделана из актуального штамма.

С. Сорокина: А почему такая задержка? Вот говорят, три месяца уже нет.

Г. Онищенко: Нет, такого нет. Детская вакцина у нас есть. Что касается взрослой, вот на 6 000 000 человек мы будем покупать на взрослое население, мы еще не завершили вакцинацию прошлого года, и вот где-то в июне мы будем подводить итоги. В прошлом году мы прививали 12,4 миллиона человека в возрасте от 18 до 35 лет. В этом году зачистка будет проходить – еще 6 000 000 человек. И если удастся нам и сэкономить деньги на вот этих вот торгах, то мы еще закупим, может быть, на несколько миллионов, потому что наша с вами задача как любой цивилизованной страны – ставить перед собой вопрос о ликвидации гепатита С. Сорокина:

С. Сорокина: А есть динамика? Положительная?

Г. Онищенко: Очень большая положительная динамика. Вот за эти три года мы с 10 на 100 000 свели на 4 на 100 000. Из 100 000 только 4 – острого гепатита. А половина субъектов РФ – это менее 3 на 100 000.

...

С. Сорокина: «Собираюсь в командировку в Мексику, - пишет нам Евгения. – Какие лекарства нужно взять и какие меры профилактики?»

Г. Онищенко: Первое. Евгения…

С. Сорокина: Отложите командировку.

Г. Онищенко: Отложите командировку – это просто почти обязательная вам рекомендация. Пока мы окончательно не разберемся… Отложите ее. А мы потом вам скажем, когда это можно будет сделать.

С. Сорокина: Да. И самое последнее спрашивают – а чеснок поможет?
Г. Онищенко: Помогает.

С. Сорокина: От гриппа в любом случае? От любого штамма?
Г. Онищенко: Нормально и от любого штамма, и не только от гриппа. Так что если отбросить эстетику…

С. Сорокина: То потребляйте, потом надевайте маску, и не так будет пахнуть этим чесноком.
Г. Онищенко: Нет, просто накормите своего близкого этим чесноком, и все. И будет баланс.

С. Сорокина: И все будет отлично. Все. Мы заканчиваем программу. Сегодня мы говорили о гриппе и не только о гриппе – о некоторых проблемах, в которых так или иначе разбирается Геннадий Онищенко, главный государственный санитарный врач РФ.
Г. Онищенко: Спасибо, это высокая оценка моего труда.

С. Сорокина: Да-да-да, спасибо вам. Спасибо большое. Это была программа «В круге СВЕТА». Встретимся через неделю. До свидания, всего доброго. Не болейте.

Интервью Г.Г.Онищенко радио "Эхо Москвы"

6 May 2009 — **Интервью Руководителя Роспотребнадзора Геннадия Григорьевича Онищенко** радио «Эхо Москвы», программа «В круге СВЕТА» на тему: «Грипп A, H1N1,

НОВАЯ ГАЗЕТА

Елена Рачева

Пандемия лоббизма:
На чем основаны обвинения Геннадия Онищенко в адрес Всемирной ассоциации здравоохранения и при чем тут бывший министр обороны США

Новая Газета, 8 мая 2009, 08:00
https://novayagazeta.ru/articles/2009/05/08/42921-pandemiya-lobbizma

Глобальный кризис забыт, рост цены на нефть не замечен: новости о распространении «свиного гриппа», для реабилитации свинины срочно переименованном в вирус H1N1, вышли на первые полосы газет. Всемирная ассоциация здравоохранения (ВОЗ) присвоила ему пятую (из шести) стадию угрозы, следующая – признание пандемии. Первой на угрозу пандемии откликнулась швейцарская компания F.Hoffman-La Roche.

Фирма передала Всемирной организации здравоохранения (ВОЗ) три миллиона упаковок антивирусного препарата «Тамифлю», который ВОЗ называет основным (а производитель – единственным) средством лечения «свиного гриппа». По сообщению компании La Roche, запасы препарата сделаны правительствами уже 85 стран мира и рассчитаны на 25–50% населения. Мир вздохнул облегченно, а котировки акций компании La Roche начали расти, явно опережая распространение самого гриппа.

И тут свое слово сказал главный санитарный врач России Геннадий Онищенко. Он заявил, что официальные представители ВОЗ не предоставили медицинским властям мира информацию о свойствах вируса H1N1, без которой нельзя создать вакцину против него, а вместо этого порекомендовали использовать препарат «Тамифлю», что, по словам Онищенко, «некорректно и противоречит уставу ВОЗ».

«Наша любимая Всемирная организация здравоохранения, которая является средоточием всего положительного, что есть у здравоохранения на этой планете, выступает в роли маркетингового отдела фирмы La Roche, которая совершенно случайно оказалась в той же стране – Швейцарии, в том же городе – Женеве. Разве так можно?» – заявил он в прямом эфире радио «Эхо Москвы» и добавил, что «Тамифлю», конечно, помогает, но кроме него существует «международная панель применяемых антиретровирусных препаратов».

Нельзя сказать, что мнению непримиримого борца с соседскими шпротами, боржоми и вином можно слепо доверять. Но, к сожалению, Онищенко не единственный, выдвигающий подобные упреки. Он просто пошел дальше, связав лоббистские усилия La Roche с деятельностью Всемирной ассоциации здравоохранения.

Вспомним историю препарата «Тамифлю». Это название стало широко известно в 2004 году, когда лекарство объявили эффективным против «птичьего гриппа». Заказы на него пришли из шестидесяти стран, в 2004-м доходы от продажи препарата увеличились почти в четыре раза и составили 44,6 млн долларов, а в 2005-м – 161,6 млн долларов. При этом информация, что вызвавший эпидемию неизвестный вирус аналогичен вирусу птиц, впервые прозвучала на пресс-конференции La Roche. Китайское «Бюро по контролю за оборотом

лекарственных средств» даже начало расследование ситуации, но ничего не добилось. Врачи подвергали сомнению действенность препарата, утверждая, что его принимали 70% умерших от «птичьего гриппа». Зато стоимость акций компании La Roche, продающей препарат, и его разработчика Gilead Sciences (получающего пятую часть средств от каждой проданной таблетки) резко выросла. А вот ценная информация для патриотов-сторонников теории заговоров: одним из акционеров Gilead Sciences был Дональд Рамсфелд, бывший министр обороны США. На пике угрозы эпидемии «птичьего гриппа» он, по данным налоговой декларации Рамсфелда за 2004 год, продал часть своих акций за 5 млн долларов и остался владельцем пакета еще на 25 млн.

Конечно, лоббизм «Тамифлю» – это скандальная версия. Понятно, ВОЗ важнее справиться с болезнью, чем оглядываться на предсказуемые обвинения в ангажированности, а фармацевтическая компания не может не воспользоваться угрозой пандемии для продвижения своего лекарства. И сделает это успешно: как сообщили «Новой» в сети аптек «36,6», препарат «Тамифлю» до недавнего времени не пользовался популярностью у покупателей, но за последние дни был полностью раскуплен.

В компании «Протек» (дистрибьюторе «Тамифлю») говорят об увеличении спроса на препарат со стороны аптек. Несмотря на цену в две тысячи рублей за 10 капсул, практически все запасы «Тамифлю» раскуплены. Как рассказывают в администрации сети аптек «Итек», паникующие люди скупают и другие противовирусные и профилактические средства, к примеру, арбидол и амиксин, а также марлевые маски для лица и дезинфицирующие средства для рук.

По словам Давида Мелик-Гусейнова, директора по маркетинговым исследованиям отраслевого агентства «Фармэксперт», до сих пор «Тамифлю» не считался ключевым продуктом компании, специализирующейся на дорогостоящих онкологических лекарствах. Но продажи антивирусного препарата выросли настолько, что он скоро может войти в пятерку самых продаваемых препаратов La Roche. «Проблема лоббизма фармацевтических средств встречается. Доказать его в случае La Roche сложно, но предсказать повышение прибыли компании можно уже сейчас», – говорит Давид Мелик-Гусейнов.

Мир уже болел свиным гриппом
Недолго и дорого

Комсомольская Правда, 7 мая 2009, 6:00
https://www.kp.ru/daily/24290.3/484465/

Паника по поводу новой болячки напрасна?

Страшный «аттракцион»

Сводки ВОЗ тревожны: свиной грипп наступает. У людей, по словам медиков, отсутствует иммунитет к этому вирусу. И это может грозить возникновением эпидемии планетарного масштаба. Новое словосочетание «свиной грипп» уже внедрилось в мозг наряду со СПИДом, атипичной пневмонией, птичьим гриппом. Правда, по их поводу мы уже отпаниковали. Так что происходит сейчас? Кто-то устраивает новый «аттракцион»? Или в самом деле беда? С этими вопросами я обратилась к одному специалисту по информационным технологиям, который в свое время помог мне разоблачить миф об атипичной пневмонии («КП» от 25 апреля 2003-го, «Опасность «новой чумы XXI века» сильно преувеличена»). Он пожелал остаться неизвестным, но свой взгляд на ситуацию изложил.

- В 1976 году дирекция Центра контроля и профилактики заболеваний США (CDC) заявила, что появился новый вирус - свиной грипп, который скоро начнет косить американцев направо и налево, - рассказал мне Н. Н. - Поводом для подобного заявления послужил случай, произошедший среди новобранцев. Тогда на военной базе Форт-Дикс в Нью-Джерси заболели 14 солдат и один умер. Это и была вспышка свиного гриппа, вызванного вирусом A/H1N1. А центр в то время испытывал большие финансовые затруднения. И дирекция решила немного подзаработать, объявив о появлении нового, невероятно опасного вируса. Напугано общество. Напугано правительство. И президент Джеральд Форд выделил центру на создание и производство вакцины 135 млн. долларов. Начинается тотальная вакцинация. Но вдруг выясняется, что никакого вируса нет. А вот вакцина обладает мощным побочным эффектом, от которой тысячи людей получили тяжелые нервные расстройства и паралич...

Апокалипсис три раза

Позже свиным гриппом пугали аж целых три раза. В 1999 году медики предрекали не менее 35 млн. жертв! А последний раз сообщения об этой заразе приходили в августе 2005 года из Китая, где скончались 38 человек.

Сейчас специалисты штамм свиного гриппа H1N1 упоминают в качестве причины пандемии гриппа 1918 - 1919 годов - «испанки», унесшей жизни 50 млн. человек. Однако ученые до сих пор не могут с точностью утверждать, что пандемия «испанки» вызвана именно свиным, а не человеческим вирусом. По их словам, свиньи могли заражаться от людей, а вирус А (H1N1) был выделен гораздо позже - в 1931 году.

Пандемии нам больше не грозят?

На прощание мой информатор дал почитать статью 2002 года «Прошлое, настоящее и будущее пандемий гриппа. Взгляд эпидемиолога». Один из авторов - Павел Иванович

ОГАРКОВ - полковник медицинской службы, главный эпидемиолог Министерства обороны РФ, доктор медицинских наук, профессор. Вот что он пишет: «Многочисленные прогнозы грядущих пандемий гриппа, в том числе зоонозных (животного происхождения), так и не сбылись... Известно, что суммарная заболеваемость гриппом и ОРЗ за последние 15 лет имеет стойкую тенденцию к снижению, хотя доля гриппа А и В в ней, как и раньше, относительно стабильна (около 30%). При этом грипп А окончательно утратил пандемический характер распространения в человеческой популяции...»

«И далее до бесконечности...»

Кто-то из ученых, с которым мы обсуждали тему мифа о СПИДе, обронил: «За 20 лет рядовой гражданин смог убедиться, что, находясь в эпицентре «эпидемии», он не наблюдает той заболеваемости, которую ему обещали. Нет последствий, которыми запугивали. То же самое происходит и с другими «страшилками», забытыми и сошедшими на нет: птичий грипп, атипичная пневмония, холестерин, сальмонеллез, озоновая дыра, конец света, проблема 2000-го и далее до бесконечности».

Лишь бы эта игра не закончилась, как в старой байке про мальчика, который так часто кричал: «Волки съели стадо!» - что, когда действительно хищники напали на овец, никто не откликнулся на эти крики.

Цифры

Во время эпидемии гриппом только в России заболевали до 90 000 человек в сутки! А от свиного гриппа заболели за неделю меньше 2000 человек. С точки зрения эпидемиологии новая болезнь - это очень вялая инфекция

Мнение Специалиста

«Гриппозная истерия закончится через месяц»

Доцент кафедры общей и военной эпидемиологии Военно-медицинской академии им. Кирова, кандидат медицинских наук Александр БЕЛОВ:

- Истерия со свиным гриппом создана искусственно. Видимо, Центру контроля и профилактики заболеваний США вновь потребовались деньги. Гриппом H1N1 болеют каждый год. Поэтому иммунитет к этому виду гриппа у людей есть. Свиной грипп похож на человеческий. В числе сегодняшних больных есть часть тех, кто заразился от свиньи, а другая часть болеет обычным человеческим гриппом. Произошла путаница. Или специально людей запутали, чтобы вызвать панику и заставить правительство дать денег. Свиной грипп потерпит фиаско, думаю, уже через месяц, максимум два.

Мировая экономика подхватила вирус

В первые дни эпидемии рынки просели, подешевела нефть. Появились пессимистические прогнозы, вплоть до краха экономики. Но уже на этой неделе нефть снова подорожала и фондовые рынки воспряли духом.

- Биржи уже отыграли эту новость и забыли, - комментирует Ксения АНОШИНА, аналитик компании «АТОН». - Спад на рынке был краткосрочной эмоциональной реакцией и игрой спекулянтов. Для сравнения: от птичьего гриппа наша экономика пострадала гораздо сильнее, чем от свиного. Ведь наши компании, производящие куриное мясо, несли тогда большие потери. Но в то время не было кризиса и люди могли отказаться от куриного мяса в пользу той же свинины. Сейчас же доходы сокращаются и люди и так вынуждены переходить от мяса красного к белому.

- Российские производители свинины пока не несут никакого ущерба, - комментирует Сергей ЮШИН, руководитель исполнительного комитета исполкома Национальной мясной ассоциации. - На потребление мяса негативная новость тоже никак не повлияла.

Ограничения по ввозу свинины пока тоже никак не влияют на стоимость мяса. Потому что из Мексики мы свинину не завозим. Были приостановлены поставки из некоторых регионов, импорт которых и так был незначителен.

Кое-кто на этой лихорадке заработал. Акции фармацевтических компаний взлетели. В аптеках на 15% увеличились продажи. И это несмотря на то, что вакцин от свиного гриппа пока еще не существует.

«Пандемия страха» опаснее самого заболевания

Вот, например, американцам вообще очень нравится бояться. В истории со свиным гриппом все усугубилось территориальной близостью очага заразы от границ Соединенных Штатов. Американский сектор Всемирной паутины был переполнен апокалиптическими воплями: «Надо спасать нацию! Мы на пороге самой страшной эпидемии в истории!» Сетевая паника распространяется гораздо быстрее самого заболевания.

На днях РИА «Новости» сообщало, что нью-йоркские больницы под завязку забиты мнимыми больными, которые, проснувшись утром с небольшим насморком, в ужасе бросились за медицинской помощью. Врачи сбились с ног, приводя в чувство сотни ипохондриков. В это время государство щедрой рукой «отсыпало» 1,5 млрд. баксов на борьбу с новой напастью, сам президент Обама рассказал электорату о том, как важно мыть руки, а производители свинины уже на грани самоубийства (по прогнозам Wall Street Journal, их убытки в ближайший месяц составят порядка 270 млн. долларов).

Но и в США находятся граждане, которых вся эта ситуация порядком достала. Эксперт-вирусолог Марк СИГЕЛ на страницах своего блога так откомментировал происходящее: «Нынешние страхи по поводу свиного гриппа изображают его смертельную опасность гораздо более преувеличенно в сравнении с реальностью».

Нас каким-то гриппом, пусть даже и свиным, так просто не напугаешь. Видали мы заразу и посерьезней (ГКЧП и дефолт, например). Рунет изощряется в остроумии: «Люди должны объединиться и скрепиться, чтобы отвести нависшее над ними свиное копыто. Свинья не пройдет!», «Возник термин «новый грипп». Я предлагаю также термины «новое сало» и «новое мясо» или просто - «новина» вместо «свинина». Для политкорректности...»

Тем временем в Египте убоявшиеся гриппа депутаты местного Народного собрания требуют закрыть все свинофермы в стране. То ли еще будет? Ждем-с...

Кому выгодна новая болезнь?

Самые популярные версии происхождения A/H1N1:

- заговор фармацевтических компаний: в коммерческих лабораториях якобы синтезировали нынешний штамм вируса путем скрещивания свиного и человеческого гриппа, а теперь фармкорпорации получат сверхприбыли за разработку и продажу противовирусных препаратов;

- заговор высоких государственных чиновников с целью отвлечь население от экономического кризиса;

- воровство и коррупция во власти: под борьбу с гриппом списываются миллиарды, оседая затем в карманах высокопоставленных негодяев;

- передел «мясного» рынка: борьба производителей между собой с применением жестких информационных технологий.

The New York Times

Andrew Pollack

Fear of a Swine Flu Epidemic in 1976 Offers Some Lessons, and Concerns, Today

The New York Times, 8 May 2009.
http://www.nytimes.com/2009/05/09/health/09vaccine.html?_r=1&partner=rss&emc=rss
https://web.archive.org/web/20150319212539/http://www.nytimes.com/2009/05/09/health/09vaccine.html?_r=1&partner=rss&emc=rss

With fears of swine flu engulfing the nation in 1976, Janet Kinney got vaccinated to make sure she would be able to take care of her children. Instead, her children ended up taking care of her.

About a week after getting the swine flu shot, she recalled, “I was so weak I couldn’t push down the toaster button.” She spent a month in the hospital, paralyzed from the neck down, before gradually recovering.

With health authorities now gearing up for what could be a huge vaccination campaign against a new strain of swine flu, the experience of 1976 is raising a note of caution.

The feared swine flu epidemic of 1976 never materialized. And several hundred people, including Ms. Kinney, who is now 68 and lives in Gig Harbor, Wash., developed Guillain-Barré syndrome, a rare neurological condition that causes temporary muscle weakness or paralysis. More than 30 of those people died.

Many experts say they do not think a vaccine for the new flu strain, called H1N1, would raise a similar risk for Guillain-Barré. But answering that question is difficult because to this day, no one has figured out why the 1976 vaccine caused the disease, in which the body’s immune system mistakenly attacks the nerves.

Indeed, some researchers still question whether the vaccine did cause Guillain-Barré, particularly since flu vaccines in other years have been linked to little or no risk of the disease.

“It doesn’t make sense that one flu strain would cause Guillain-Barré syndrome where none of the others have,” said Dr. Paul A. Offit, a vaccine expert at Children’s Hospital of Philadelphia.

Still, many experts consider the matter settled. The Institute of Medicine of the National Academy of Sciences concluded after an extensive review in 2003 that the “evidence favored acceptance of a causal relationship” between the 1976 vaccine and the syndrome. It stopped short, however, of saying the evidence “established” a causal relationship.

“It’s really not all that controversial anymore,” said Dr. Lawrence B. Schonberger, who as a young epidemiologist at the Centers for Disease Control and Prevention in 1976 gathered the initial evidence that led to the vaccination program being halted that December. Dr. Schonberger, who is still with the agency, found that for people who got vaccinated, the rate of getting a diagnosis of Guillain-Barré in the next six weeks was more than seven times as high as for those who did not get the vaccine.

In all, the vaccination resulted in nearly one extra case of Guillain-Barré for every 100,000 people immunized, which would translate into roughly 450 cases for the 45 million people who got the shot.

Some critics challenged the findings, arguing that some diagnoses were mistaken and that vaccinated people were more likely to self-report having Guillain-Barré than others because it was in the news.

But some studies canvassed health records for all diagnosed cases and had the diagnoses confirmed by experts. One of the leading critics worked on his own study, which confirmed the magnitude of the increased risk.

The more intriguing question is how the vaccine triggered the syndrome. One hypothesis was that the vaccine, rushed into production, was contaminated with Campylobacter, a type of bacterium that does cause Guillain-Barré. The Institute of Medicine said this was unlikely but could not be totally excluded.

A more likely explanation is that something in the vaccine resembled something in the nerve cells. When the body's immune system mounted an attack on that component of the vaccine, it also then attacked the lookalike in the nerves.

Irving Nachamkin, a professor of pathology and laboratory medicine at the University of Pennsylvania, examined some 1976 vaccine that had been saved by a scientist in Texas. In a paper published last year in The Journal of Infectious Diseases, he and colleagues reported that mice given the vaccine made antibodies that reacted with gangliosides, which are components of nerve cells. An antibody attack on gangliosides is part of the disease mechanism of Guillain-Barré.

But when Dr. Nachamkin tested two flu vaccines from other years which were not linked to the syndrome, the mice also made those antibodies. So the mystery remains about what was unique, if anything, about the 1976 vaccine.

In particular, the most important question now would be whether the unique factor was that it was a vaccine against a swine flu rather than a human flu. If so, that could raise concern about a vaccine for the new flu strain, which is made mostly of swine virus.

Dr. Nachamkin plays down such worries. "There's no evidence to suggest it's a swine-derived-virus problem," he said.

Others say there are lessons to be learned even without solving the mystery. One is that any medicine or vaccine given to tens of millions of people is likely to have side effects, so surveillance systems need to be in place.

Another is that risks have to be weighed against benefits. Had there been a swine flu epidemic in 1976, the number of lives saved by a vaccine would have dwarfed the small number of cases of Guillain-Barré. But in 1976, the vaccine was given even though the epidemic did not materialize.

"The math is overwhelmingly in favor of vaccine if there's an epidemic," said Dr. Harvey V. Fineberg, the president of the Institute of Medicine and co-author of "The Epidemic That Never Was," a book about the 1976 episode. "It's in the absence of disease that this rare effect looms large."

This time, officials say the decision to make the vaccine will be divorced from the decision to use it. The manufacturing decision is likely in the next couple of weeks and will probably be yes. But the decision on using the vaccine will probably not be made until the fall.

For her part, Ms. Kinney, who says the syndrome left her unable to run down stairs, said she would not take the vaccine if offered. "I'm just not willing to take that chance," she said.

Would she even need to? One intriguing idea is that if the new flu strain is similar to the 1976 strain, people who got vaccinated then might, possibly, have some protection now.

The C.D.C. says it will eventually study that question. Peter Palese, a flu expert at Mount Sinai School of Medicine, said he doubted that would be the case because the two viruses appear quite different.

Still, if it were the case, the oft-maligned 1976 vaccination campaign might end up having done some good after all.

КОМСОМОЛЬСКАЯ ПРАВДА

Евгений Черных

Нас будут кошмарить свиным гриппом до 2016 года
Обозреватель Евгений Черных пытается выяснить, кому выгодна вселенская паника

Комсомольская Правда, 4 июня 2009, 6:00
https://www.kp.ru/daily/24305.3/498468/

Каюсь, только сейчас я по достоинству оценил актуальность и гениальность фразы булгаковского профессора Преображенского: «Разруха в головах!» Еще недавно ее употребляли применительно к мировому финансовому кризису. Свинячья напасть задвинула кризис на задворки. В мозгах раздрай от бурного потока ежедневных кошмарных новостей. Поневоле голова заболит. А это первый признак новой опаснейшей хвори H1N1...

«Граждане с яйцами, срочно сдайте их в милицию!»

Запуганный Всемирной организацией здравоохранения (ВОЗ), грозящей пандемией типа печально знаменитой «испанки», унесшей 90 лет назад СТО миллионов жизней, главным санврачом Москвы Филатовым, стращавшим СЕМЬЮ миллионами инфицированных в мае, я кинулся за рецептом к авторитетному профессору. Тот прописал... «Роковые яйца». Все того же Булгакова.

...В заштатном городке Стекловске у гражданки Дроздовой все хохлатки откинули лапки. И пошла писать губерния! Дроздова попала в местную газету «Красный боец» в статью под заголовком «Неужели куриная чума?». Весть понеслась в Москву.

И вот уже в столице невероятнейшей величины заголовок через всю страницу центральной газеты - «Куриный мор в республике»!

«В сквере против Большого театра, где бил ночью разноцветный фонтан, толкалась и гудела толпа. А над Большим театром гигантский рупор завывал: «Антикуриные прививки в Лефортовском ветеринарном институте дали блестящие результаты. Количество куриных смертей за сегодняшнее число уменьшилось вдвое». Затем рупор менял тембр и жаловался басом: «Образована чрезвычайная комиссия по борьбе с куриной чумой в составе наркомздрава, наркомзема, заведующего животноводством Птахи-Поросюка (ну и фамилия, создатель! - Е. Ч.) и товарища Рабиновича!»

Толпы народа теснились у больших объявлений: «Под угрозой тягчайшей ответственности воспрещается населению употреблять в пищу куриное мясо и яйца. Частные торговцы при попытке продажи их на рынках подвергаются уголовной ответственности с конфискацией всего имущества. Все граждане, владеющие яйцами, должны в срочном порядке сдать их в районные отделения милиции».

На киноэкране грудой до самого неба лежали куры, и зеленоватые пожарные, дробясь и искрясь, из шлангов поливали их керосином».

Фантастическая повесть о яйцах написана в 1924-м. Действие происходит в 1928-м.

Ужас мчится на поросячьих рылах

Залежавшиеся с 1924 года «Роковые яйца» до боли напоминают свежую панику с куриным гриппом, охватившим в XXI веке всю планету. (Эпидемиология и клиническая картина вирусного заболевания птиц подана у врача Булгакова профессионально, объяснил мне профессор.) Радио, ТВ, прессу заполонили тогда кошмарные новости. На голубых экранах показывали массовое сжигание домашней птицы. Врезался в память заголовок «Ужас, летящий на крыльях кур!» Куры не летают. Разве что иногда низенько-низенько, на несколько метров, спасаясь от сексуальных домоганий петуха. Нелепый заголовок четко отражал ситуацию: ужас, как в повести Булгакова!

А дальше - еще ужаснее: «Птичий грипп загоняет человечество в тупик!», «Пандемия птичьего гриппа убьет треть человечества!» Кранты! Обжалованию не подлежит.

Журналисты не фантазировали, а лишь старательно выдавали на-гора сообщения ВОЗ и местных санитарно-эпидемиологических органов.

И где же та ужасная пандемия? По данным ВОЗ, с 2003 по 06.04.2009 гг. зафиксировано 256 летальных исходов. Это даже не эпидемия. (Булгаков в «Роковых яйцах» и то нафантазировал около тысячи людских смертей от куриного мора в одной советской республике.) Только в Штатах за сезон обычный грипп убивает 36 тысяч человек. По миру - 500 тысяч. И никакой тревоги со стороны ВОЗ, ООН...

Вновь летит ужас, но уже на рылах свиней. Хроника всепланетного кошмара повторяется, как под копирку. Точно так же каждый день фиксируется каждая новая страна, жертва. Помощник гендиректора ВОЗ Кеджи Фукуда заявил, что треть населения Земли может заразиться гриппом H1N1...

Пламенный привет от Птахи-Поросюка

Когда ужас первых недель улегся, обнаружилось: число жертв вируса-убийцы в Мексике, откуда и началась вселенская паника, было завышено раз в 5. Но и без того стало очевидно - объявленный мировой мор буксует. «Мы видим обнадеживающие признаки того, что пока этот вирус не выглядит более опасным, чем обычный штамм во время сезонной вспышки гриппа», - заявил глава федерального Центра по контролю и профилактике заболеваний США Ричард Бессер. И в Москве на конец мая вместо обещанных СЕМИ миллионов санитары зафиксировали лишь трех больных, да и те быстро пошли на поправку. Как выразился наш Главный санврач Онищенко, H1N1 рыльцем не вышел, чтобы вызвать пандемию. Пронесло.

Однако успокаиваться рано, это могла быть лишь первая волна грядущей пандемии свиного гриппа, намекнула глава ВОЗ М. Чен: «Возможно, вирус дает нам передышку, однако мы не знаем, как долго это продлится. Никто не знает, не является ли это затишьем перед бурей». И напугала второй, смертельной, волной. По аналогии с печально знаменитой «испанкой», у которой первая волна тоже была легкой.

Помню, точно так же госпожа Чен пугала пандемией птичьего гриппа! И с «испанкой» путаницы много. Прежде писали, что ее жертвами стали 20 миллионов. Потом повысили до 40 миллионов. Теперь фигурирует 100! Чему верить?

Ох, чует мое сердце, не случайно Булгаков обозвал члена чрезвычайки Птахой-Поросюком. Странная фамилия, символическая. Мистический привет нам в XXI век от автора «Мастера и Маргариты». Пташий H5N1 и поросючий H1N1 гриппы словно близнецы-братья, вылупившиеся из одного рокового яйца. Слишком многое их объединяет. Даже порядок пандемий, которыми нас пугают, повторяет фамилию члена чрезвычайки. Вернемся на минутку к «Роковым яйцам».

«Театр покойного Всеволода Мейерхольда, погибшего, как известно, в 1927 году при постановке пушкинского «Бориса Годунова», когда обрушились трапеции с голыми боярами, выбросил движущуюся разных цветов электрическую вывеску, возвещавшую пьесу писателя Эрендорга «Курий дох» в постановке ученика Мейерхольда, заслуженного режиссера республики Кухтермана».

Создается ощущение, что очередной гениальный ученик раздавленного голыми боярами Мейерхольда разыгрывает уже всепланетный спектакль под названием «Курий дох, пардон, свиний удох». И мы с вами не просто зрители, а статисты. Так и хочется крикнуть: «Браво! Режиссера на сцену!» Но кто он, этот новый Кухтерман-Свинерман?

Ищите женщину! (=> *Маргарет Чен*)

Таинственный режиссер никогда по своей воле не выйдет на сцену за цветами и аплодисментами. Ему публичность не нужна. Попробуем вычислить сами постановщика(ов) спектакля. Поставим вопрос ребром: кому выгодно подкладывать свинью всему человечеству, кошмарить нас до поросячьего визга старой напастью в новом обличье?

Первое, что приходит на ум в «разрушенную голову»: фармацевты воду мутят. Они, креста на них нет, наживаются на страхах, получая сверхприбыли от продажи лекарств. Главный государственный санитарный врач РФ Г. Онищенко даже конкретный адресок подсказал прямо в прямом эфире «Эха Москвы» (5 мая 2009: «Нам говорят: «Этот вирус не чувствителен ни к чему, только к одному тамифлю»). И наша любимая ВОЗ, которая является средоточием всего положительного, что есть у здравоохранения на этой планете, выступает в роли маркетингового отдела фирмы «Ля Рош», которая совершенно случайно оказалась в той же Швейцарии, в том же городе Женева. Ну разве так можно?»

Действительно, нельзя. Есть и другие препараты. В Мексике, принявшей первый удар поросячьей напасти, использовали 4 (четыре!) лекарства. И Онищенко назвал три отечественных.

Разговоры о том, что ВОЗ неровно дышит к «ля рошевскому» лекарству, пошли еще в дни «куриной паники». Известен и главный маркетолог – Маргарет Чен. В ту пору представитель гендиректора ВОЗ по пандемии гриппа, а ныне уже сама – глава уважаемой организации. На международных форумах по борьбе с *грядущей* птичьей пандемией она пропагандировала тамифлю и «Ля Рош».

Ноябрь 2005 г. В Женеве обсуждали вселенский план действий по борьбе с птичьим гриппом. Журналисты допытывались у Чен: почему ставка сделана именно на этот препарат? Ведь среди умерших от H5N1 были пациенты, принимавшие тамифлю. Чен ответила дипломатично. Дескать, в некоторых случаях, судя по всему, лечение началось поздно.

В январе 2006 года на очередной международной конференции по H5N1 в Пекине Чен призвала мировое сообщество увеличить бюджет на борьбу с грядущей пандемией. Запланированных $1,5 миллиарда может не хватить. Опять напомнила про запасы тамифлю. На форуме не обошлось без критики. Увеличивая расходы на птичий грипп, ВОЗ сокращала финансирование лечения ВИЧ, полиомиелита, туберкулеза. Чен отвергла эти инсинуации. «Я уверена, что наши усилия стоят того!» (В 2006-м, констатировала позже ВОЗ, на планете заболели чахоткой 9,2 миллиона человек. Умерли 1,5 миллиона «простых» туберкулезников и 200 тысяч, страдавших вдобавок СПИДом.)

В Пекине тогда на борьбу с птичьим гриппом собрали $1,9 млрд. $40 млн. выделила Россия.

Посмотрим же результат маркетинга ВОЗ (обратите внимание, слово «маркетинг» первым произнес официальный чин - товарищ Онищенко! Безответственный журналист лишь повторяет его).

По данным Datamonitor, в 2004 году, когда заварушка с птичьим гриппом начиналась, тамифлю продали на $266 млн. 2005 год - $1,3 млрд., 2006 г. - разгар паники и призывов ВОЗ - $2,1 млрд., 2007 г. - $1,7 млрд.

Спасаем просроченное лекарство!

По маркетологам плачет Нобелевская премия. Они придумали гениальную стратегию продвижения (Воланд нервно курит в углу, а Птаха-Поросюк просто выпал в осадок!). Ставка не на рядового потребителя, который дорогому лекарству может предпочесть дешевый аналог. Закупать препарат должны государства!

Хитроумный ход сработал. Почему? Ответ дает реклама тех птичьих времен. «По мнению экспертов ВОЗ, заблаговременное создание резервов противовирусных препаратов является единственным способом замедлить распространение инфекции на уровне стран и в международном масштабе, а также снизить заболеваемость, смертность и социальную нестабильность. Срок годности тамифлю - 5 лет, что позволяет сделать значительный запас препарата. На сегодняшний день более 80 государств создали запасы тамифлю. Уровень запасов в Европе достаточен для лечения 25% населения, США планирует закупить к 2008 году 81 млн. упаковок. За дополнительной информацией обращайтесь...»

Кстати, о сроке годности. В 2000 году он составлял 2 года. Строгая надпись предупреждала: «Препарат не следует использовать по истечении срока годности, указанного на упаковке». Вскоре добавили еще годок. Когда началась паника курячья, продлили еще на пару лет. Странно получается. Те же санитары стращают нас опасными для здоровья и жизни продуктами с просроченным сроком хранения, на которые нечистоплотные продавцы клеят новые этикетки. А новому лекарству, отпускаемому по рецепту, увеличивают срок годности в 2,5 раза. У детского тамифлю он по- прежнему 2 года.

Так вы поняли наконец, в чем ужас? В этом году заканчивается срок годности первых запасов, сделанных на случай обещанной ВОЗ пандемии. А может, уже и закончился. Это ж настоящая катастрофа! Угрохали миллиарды на лекарство, его хранение, а пандемия птичья показала кукиш. Теперь еще утилизировать просроченное надо. Тоже небесплатно. Ситуация, как говорится, курам на смех. Но 80 государствам не до смеха (России в списке нет!). Впору на ВОЗ в суд подавать.

Имела баба заботы, да выручил порося

И фирме «Ля Рош» несладко. Мощности раскрутили, лекарства навыпускали, а спрос падает. В 2008 году всего $564 млн. выручили. И перспективы нерадостные. ...

Но тут по весне мексиканцев начал валить новый грипп, свиной. ВОЗ оперативно забила тревогу - на пороге пандемия! Единственным средством от смертельной напасти, судя по словам информированного Геннадия Онищенко, ВОЗ вновь объявила тамифлю. Швейцарский сосед мгновенно отреагировал. «Недавняя вспышка гриппа A (H1N1) показывает, что опасный вирус может появиться совершенно неожиданно и быстро распространиться по всему миру, - заявил представитель компании Уильям М. Бернс. - Это подчеркивает важность пополнения Всемирной организацией здравоохранения и «Рош» запасов быстрого реагирования, а также необходимость пополнения правительственных запасов тамифлю; только так мы можем с готовностью встретить новые вспышки этого гриппа или гриппа, вызванного другими вновь появившимися штаммами вируса». Миру пообещали за 5 ближайших месяцев значительно нарастить выпуск лекарства. А в случае необходимости быстро достичь максимально возможного уровня производства - 400 миллионов курсовых доз (4 миллиарда капсул) в год.

На этом оптимистичном фоне незаметно промелькнуло сообщение: «В свете вспышки заболеваемости гриппом A (H1N1) Европейское агентство по лекарственным средствам рекомендовало, чтобы срок годности для тамифлю был увеличен с 5 до 7 лет». Это относится и к лекарству, у которого уже истекает пятилетний срок.

Получается осетрина даже не второй, а третьей свежести, вспомнил я незабвенного Булгакова. Впрочем, когда речь идет о спасении человечества, утвердят и 10, и 15 лет годности. И этикетки переклеят.

Все возвращается на круги своя!

Кто там сказал, что гусь, пардон, курица свинье не товарищ? Тамифлю накрепко связал их одной цепью, извиняюсь, капсулой. И не надо иронизировать, что новый вирус рыльцем не вышел. Маховик запущен. Первая волна схлынула? Так мы получим вторую волну и третью... Девятый свинячий вал. Или гусиный, крольчиный грипп.

Но я попросил бы вас не метать громы и молнии в адрес «Ля Рош». Компания делает благородное дело. Выполняет решения ВОЗ, пытается спасти человечество от грядущей пандемии! Сверхприбыли? Их не может быть по определению.

Вы что думаете, смогла бы ВОЗ так запросто стать маркетинговым отделом фармацевтических компаний, чтобы сообща пугать нас пандемией? Да кто просто так пустил бы их со свиным, извиняюсь, гриппом да в калашный ряд большой мировой политики?

Открою маленький секрет. От 10 до 20 процентов денежек за каждую проданную в мире капсулу тамифлю уходит за океан (точная цифра - коммерческая тайна). Кому? Компании «Гилеад». Не слыхали про такую? А вам это и ни к чему. «Гилеад» - владелец патента на тамифлю. До 2016 года. Вот закончится срок, тогда и другие смогут выпускать «дженерики» тамифлю - дешевые аналоги. Но к тому сроку нам выдадут новые пандемии и новые лекарства от них.

... Извините, я забыл сообщить, чем закончился куриный дох у Булгакова. Через две недели в смысле кур в Союзе республик было совершенно чисто. И тогда объявился загадочный человек Рокк с маузером на боку и секретной бумагой из самого Кремля от Птахи-Поросюка.

Продолжение расследования читайте в следующем номере еженедельника.
«Свиного гриппа нет! Мы его придумали, господин президент». (=> 10.06.09)

Улетная [игра] на злобу дня - боремся с эпидемией

Евгений Черных

«Свиного гриппа нет! Мы его придумали, господин президент!»

Комсомольская Правда, 11 июня 2009, 6:00
https://www.kp.ru/daily/24309.3/502296/

Мы уже разобрали популярную версию, кто пугает мир – заговор фармацевтов (см. «Нас будут кошмарить свиным гриппом до 2016 года» от 4 июня с. г.). Испугавшись птичьего гриппа, около сотни стран закупили лекарство тамифлю на миллиарды долларов на случай пандемии. России в том списке нет. Но пандемии не случилось. А у лекарства заканчивается срок годности. Катастрофа! Но тут появляется свиной грипп. ВОЗ вновь пугает нас смертоносной пандемией и объявляет тамифлю единственным средством от новой напасти. Рекомендовано продлить срок его годности с 5 до 7 лет, т. е. реанимировать просроченные запасы. Выяснилось, что за швейцарской фирмой, выпускающей панацею, стоит хозяин лекарства - заокеанский «Гилеад» (входит в первые 50 фармкомпаний мира). У него патент до 2016 года.

«Ястреб» заработал на курах миллионы

Знакомьтесь, Дональд Рамсфелд. Официально вошел в историю США как дважды хозяин Пентагона. В перерыве между делами военными занимался лекарствами. Возглавляемый им «Гилеад» и создал принципиально новый противогриппозный препарат из группы так называемых «ингибиторов нейраминидазы».

Вообще-то первооткрыватели - австралийские ученые. Они выдвинули теорию блокирования нейраминидазы - поверхностного белка вируса гриппа, отвечающего за способность вирусной частицы проникать в клетку человека и выходить из нее после размножения. Воплотить идею в конкретное лекарство взялась местная фирма «Биота». Подключив к работе английский «Глаксо Веллком» (входит в первую тройку мировых гигантов фармацевтики). В «Гилеаде» прослышали про идею и срочно занялись разработкой своего препарата. Началась гонка! Англо-австралийский тандем создал релензу в виде спрея. Американцы – аналогичную тамифлю в капсулах и тут же продали права швейцарской «Ля Рош». На рынке лекарства появились в 1999 году. Производством занимаются гиганты фармацевтики, а держатели патентов «Биота» и «Гилеад» получают проценты с продаж. ВОЗ считает оба препарата эффективными от гриппа, но пропагандирует тамифлю.

В 2001 году глава «Гилеада» вновь возглавил Пентагон. Но остался крупнейшим держателем акций фирмы. Когда началась мировая «птичья» паника и спрос на тамифлю рванул вверх, возник небольшой скандальчик. Вроде бы Рамсфелд продал акции на $5 млн., оставив у себя ценных бумаг еще на $25 млн. А крупному государственному мужу негоже зарабатывать на панике! Рамсфелд оправдывался, дескать, он советовался в высоких инстанциях, даже с президентом, криминала нет. Но осадочек остался.

Тогда же черная кошка пробежала между «Гилеадом» и «Ля Рош». Американцы собрались забрать назад лицензию на золотое яичко. Якобы швейцарцы слабо занимаются продвижением. Как утверждали злые языки, такие претензии обычно предъявляют, чтобы слупить с партнера большую долю с продаж. Грех не воспользоваться паникой! Поскольку все утряслось, похоже, «Гилеад» добился своего. По слухам, отчисления поднялись до 20%. Доходы Рамсфелда выросли. Да и с акций оставшихся капает.

Почему молчит Кудрин

Спасибо Геннадию Онищенко! Его заявление, что Всемирная организация здравоохранения (ВОЗ) стала отделом маркетинга одного лишь противогриппозного лекарства, хотя есть и другие, дало толчок расследованию. Я быстро вычислил, что следы ведут за океан. На этом все застопорилось. Ясно же, Рамсфелд не мог публично повлиять на раскрутку своего золотого яичка. Из-за акций и то скандал вспыхнул! Единственное, что смог шеф Пентагона, - купить тамифлю на $70 млн. для своей армии. Но ежу понятно: ВОЗ в одиночку не могла принудить глав государств делать стратегические закупки. Не тот масштаб!

Главный маркетолог М. Чен тогда была лишь помощником гендиректора ВОЗ. Требовалось орудие более мощного калибра! Я долго рылся в Интернете, ища недостающее звено. И вот, в который раз просматривая «поросячью» хронику, обратил внимание: Всемирный банк (ВБ) выделил Мексике на борьбу с болезнью свыше $200 млн. кредита, в том числе на закупку лекарств. «Так вот же оно, главное звено», – сверкнуло в голове. Вернулся в эпоху «птичью». Так и есть, рядом с ВОЗ на всех пандемийных мировых форумах фигурировал ВБ. Как, извиняюсь, шерочка с машерочкой. Госпожа Чен с главой ВБ Вулфовицем в унисон пугали планету. Китаянка – миллионами смертей, американец – миллиардами, триллионами убытков. Он настойчиво призывал собирать деньги на борьбу с грядущей заразой, минимум $1,2 млрд: «Пандемия птичьего гриппа опасна не только для здоровья и жизни людей, но и для глобальной экономики! Инвестируя в борьбу с птичьим гриппом, мы инвестируем в более безопасное будущее!»

Вулфовиц - действительно авторитет для президентов и премьеров. И сам, и его банк.

Деньги в нынешнем мире решают все! Как и банки. Жаль, Кудрин не последовал примеру Онищенко, не намекнул на отраслевое мировое ведомство. Он же лично обсуждал с Вулфовицем «птичью проблему», выделил от России свыше $40 млн. на общее дело борьбы за спасение человечества. Из-за молчания Кудрина мое расследование и затянулось.

Операция «Дырявый носок»

Рамсфелда, друзья, вы знать не обязаны. Разве что генералы. Но Вулфовица, я уверен, знают все.

Не напрягайте память! Это бедолага в дырявых носках из турецкой мечети. Вспомнили? Его конфуз освещало ТВ по всему миру! Наша пресса призывала олигархов и чиновников, прожигающих состояния в куршевелях, брать пример с этого скромного человека. Миллиардами ворочает, а на носках экономит! Капиталистический аналог ленинского наркома Цюрупы, который падал в голодный обморок, имея под рукой все продовольствие республики.

Представляю, как смеялись авторы пиар-акции «Дырявый носок» над околпаченной публикой. Над головой Вулфовица тогда сгустились тучи. Недруги прознали, что он положил своей любовнице в госдепе США очень большое жалованье за счет конторы. $193 тысячи в год. У самой главы госдепа К. Райс на $7 тысяч меньше. Дырявые носки, однако, не помогли щедрому любовнику. Пришлось уйти в отставку.

Нас в этой любовной истории интересует другое. До прихода во Всемирный банк Вулфовиц был замом министра обороны Рамсфелда.

Если уж он любовнице порадел, то как не подсобить начальнику, наставнику?!

С первых дней командования Всемирным банком в 2005 году борьба с птичьим гриппом стала одной из главных задач Вулфовица. Даже президента Буша подключил к операции. Тот трагично объявил, что надвигается страшнейшая угроза, пообещал $3 миллиарда, в том числе на лекарства. После такой грандиозной пиар-атаки не могли не дрогнуть сердца и души глав государств и правительств. Все кинулись закупать тамифлю.

Спросите: зачем Бушу это надо? Главными спонсорами обеих его президентских выборных кампаний были нефтяники и фармацевты. С первыми он рассчитался захватом Ирака, где расположены богатейшие запасы «черного золота» (сам Буш, К. Райс, вице-президент Р. Чейни и ряд других членов его команды пришли в Белый дом из нефтяного бизнеса, где командовали крупными компаниями). А с фармацевтами расплатился нагнетанием «птичьей паники». Тем более что вояки Рамсфелд с Вулфовицем и захватили для него Ирак.

Все вроде встало на свои места. Нас стращают пандемиями, чтобы дать заработать хорошим ребятам. Бизнес есть бизнес. Чего обижаться? Правда, за это полощут ВОЗ с «Ля Рош», оставив за кадром американских парней. Тоже понятно. Отвлекающий маневр, как дырявые носки экс-главы Всемирного банка. Можно ставить точку. Расследование закончено. Сколько ни возмущайтесь, друзья, ситуацию не изменить. Пока у «Гилеада» не закончится срок патента в 2016 году, нас будут кошмарить гриппозными пандемиями. Надо же куда-то сплавлять стратегические запасы. И создавать новые. Производство-то налажено! Курс лечения тамифлю (10 капсул) стоил 50 – 60 баксов. Теперь, говорят, к 80 приближается. Одна азиатская страна попыталась было выпустить дешевый аналог. Но министр здравоохранения США популярно объяснил, что Америка уважает интеллектуальную собственность. Попробуй возрази, когда за патентом на лекарство стоит Пентагон!

У орлов денег - куры не клюют!

Популярная версия - «заговор фармацевтов» - стопроцентно подходит для... обывателя с разрухой в голове. Подумайте, не слишком ли бросается в глаза, что рыльце в пушку у производителей лекарства. Думаю, на это и рассчитывали организаторы операции «Курий дох, свиной удох».

Но не зря в «Роковых яйцах» Булгакова после аналогичного куриного мора в Советской республике появляется странный персонаж с маузером и секретной бумагой из Кремля от загадочного Птахи-Поросюка.

Слишком высокого полета эти две птицы, Рамсфелд с Вулфовицем! Даже не ястребы, как их обзывают политические противники, – орлы! Подобные тому, что увековечен на гербе США. В одной лапе – стрелы для непокорных, в другой – ветвь оливы для покоренных!

Именно «фармацевт» Рамсфелд со своими воспитанниками Чейни, Вулфовицем еще в начале 90-х, после завершения «холодной войны», создал новую доктрину национальной безопасности США, утверждающую мировую гегемонию единственной сверхдержавы. Глава «Гилеада» разработал и программу реанимации «Звездных войн» (опасные для России планы размещения американских ПРО в Чехии и Польше родились в голове мирного фармацевта). Когда Буш-младший пришел в Белый дом, он сразу мобилизовал группу для претворения в жизнь их доктрины. Чейни стал вице-президентом, Рамсфелд - министром обороны, Вулфовиц - его замом. Эти ястребы развязали войну в Афганистане, Ираке. Кстати, министр Рамсфелд провел самые глубокие реформы в американской армии. В первый свой срок перевел ее на профессиональную основу, отказавшись от призыва. Во второй срок «архитектор» борьбы с мировым терроризмом сделал ее более мобильной. Под стать новым задачам мирового жандарма.

И после этого вы поверите, что такие орлы отдадут массу сил, энергии, времени для международной операции «Тамифлю» только ради того, чтобы заработать несколько лишних миллионов? У этих ребят и так, думаю, денег куры не клюют. Продал тот же Рамсфелд соседке по ранчо красотке Джулии Робертс лишнюю землицу – и положил в карман $3,5 миллиона.

Продвинутое биологическое оружие – в массы?

Так для чего же все затевалось? Подсказку поищем в организации «Проект нового американского века» (PNAC). Среди отцов-основателей - все та же троица ястребов. PNAC разработала документ «Восстановление американской обороноспособности». Там есть очень

любопытный пункт про использование биологического оружия массового поражения для целей политической сообразности. Вам страшно? Не пугайтесь, все сформулировано очень изящно. Оказывается, «продвинутые виды биологического оружия, способные воздействовать на конкретный генотип, могут перевести биооружие из сферы террора в область полезного политического инструментария».

Уж не являются ли курячье-поросячьи пандемии тем самым продвинутым биологическим оружием? Очень и очень похоже.

Вернемся, однако, к нашим свиньям.

... Белый дом. Старый президент сдает дела преемнику. В самом конце раскрывает самую главную тайну. «Помните программу прививок от свиного гриппа?» Новый президент медленно кивнул. «Как вы, видимо, понимаете, никакого свиного гриппа не существует. Мы придумали его специально, как предлог, чтобы привить всей стране вакцину от смертоносного яда».

Это не Буш с Обамой. Цитата из повести «Последний порог» У. Мэрфи и Р. Сэпира. Любители детективов знают этих авторов по знаменитой серии «Дестроер» о сверхсекретной организации при президенте США. По сюжету в Штатах умерли люди от неизвестной отравы. Чтобы спасти Америку, решили сделать прививки. Но чтоб не напугать народ, запустили байку про свиной грипп.

Повесть написана еще в 1977-м. По горячим следам реальной трагедии. В 1976-м на военной базе Форт-Дикс заболели 14 новобранцев, один умер. Официально объявили, что свирепствует свиной грипп. (Тот самый H1N1, которым нас вновь пугают сегодня.) Мол, он уничтожит полстраны. Паника! Президент Форд срочно выделил на создание вакцины $135 млн. Правда, эпидемия заглохла сама, так и не начавшись, но 40 миллионов американцев привили от свиного гриппа. Тысячи получили от побочных действий вакцины нервные расстройства, кого-то парализовало. 32 человека умерли. Авторы детектива намекнули на странности вакцинации и самого гриппа.

Меня больше в этой истории заинтересовала фамилия реального министра обороны, у которого заболели новобранцы. Рамсфелд.

Форд вскоре проиграл выборы Картеру. Передал дела (точь-в-точь как в детективе). Вместе с ним ушел и Рамсфелд. В фармацевты.

Уж не была ли то репетиция второго пришествия свиного гриппа в 2009-м, но уже в мировом масштабе? Только вместо поголовной вакцинации нам всем навязывают одно-единственное лекарство, разработанное фирмой Рамсфелда.

А знаете ли вы, как называется по науке нынешний свиной (он же мексиканский) грипп? «Калифорния 04/2009»! По месту, где его определили лабораторно.

В Калифорнии находится и штаб-квартира рамсфелдовского «Гилеада».

Продолжение расследования - в следующем номере еженедельника (18.06.23)

Los Angeles Times

Michael Fumento

WHO's flu

Los Angeles Times, 14 June 2009, 12 AM // 9, p. 21.
https://www.latimes.com/archives/la-xpm-2009-jun-14-oe-fumento14-story.html

How bizarre! The World Health Organization has declared swine flu a “pandemic,” signaling governments worldwide to launch emergency response plans.

The mildest pandemics of the 20th century killed at least a million people worldwide, according to the WHO’s data, while old-fashioned seasonal flu strikes every nation yearly and kills an estimated 250,000 to 500,000. As of Thursday, when the pandemic was declared, H1N1 swine flu had killed only 144 people total – fewer than succumb daily to seasonal flu annually. And in Mexico, where the outbreak began and where it has been the most severe, cases peaked quickly, in just four weeks.

A pandemic declaration will be costly when we can least afford it and could prompt severe restrictions on human activities (think China). Perhaps most important, such a declaration could render the term “flu pandemic” essentially meaningless – risking lethal public complacency if a bona fide one hits.

So how can the WHO say swine flu qualifies as a pandemic? And why?

The WHO definition for “influenza pandemic” once required “several, simultaneous epidemics worldwide with enormous numbers of deaths and illness.” But in 2005, it promulgated a definition that virtually ignores the number of cases and completely ignores deaths. Now it requires “sustained chains of human-to-human transmission leading to community-wide outbreaks” in two parts of the world, with this addition: The cause must be an animal or human-animal flu virus; the latter is known as genetic reassortment.

Thus, under this definition, “community-wide outbreaks” of swine flu in two South American countries and somewhere in China could qualify as a pandemic. No deaths required. And a pure human flu that killed 20 million people would not qualify.

The obvious presumption is that viruses with animal genes pose a greater threat. But that’s “a matter of faith more than science,” says James Chin, a UC Berkeley epidemiologist who was in charge of surveillance and control of communicable diseases at the WHO in the late 1980s.

Indeed, the science indicates the presumption is false. The WHO first warned of an H5N1 avian flu pandemic in 2004, projecting up to 150 million deaths. Yet a 2007 study found H5N1 – though detected in 1959 – was many mutations away from the ability to become readily transmissible among humans.

We’re also repeatedly warned that if H5N1 reassorted with human flu, it would produce a combination with the alleged severity of the bird virus and the infectiousness of the human one. Yet a 2006 Centers for Disease Control and Prevention study found the opposite: that a genetically engineered reassortment given to ferrets – the best animal models for human flu – produced milder and less infectious flu than did pure H5N1. Reassortment didn’t create a “super flu” but rather a 98-pound weakling.

As to human-pig hybrids, a 1976 New Jersey swine flu outbreak in the dead of winter, when flu is most contagious, infected just 230 soldiers, killing one, on a crowded Army base.

At some level, the WHO knows its definition is faulty. The online "WHO Handbook for Journalists" still states: "A pandemic virus can emerge" by adapting "during human infections." And the WHO has warned that one way avian flu could become pandemic is through a purely human mutation.

But it's also true that the worst influenza pandemic in history, the Spanish flu of 1918-19, did involve an animal-human hybrid virus; that episode has become a popular obsession. Never mind that "each subsequent novel flu that sweeps through the world has been milder," Chin observes. "The public health community keeps waiting for the second coming" of Spanish flu, he says.

So, in 2005, the WHO apparently redefined "flu pandemic" to reflect the popular angst as well as its own.

A less generous observation is that the WHO's "when, not if" avian flu pandemic failed to materialize, and it has now put swine flu in its stead. In her pandemic announcement Thursday, WHO's director-general, Margaret Chan, declared: "The world can now reap the benefits of investments over the last five years in pandemic preparedness." Not really. Swine flu, being no more contagious and far milder than seasonal flu, calls for absolutely no actions that wouldn't apply to seasonal varieties.

"I think they're going to have to go back to the drawing board," says Chin of the WHO definition. For now, we'll pay in told and untold ways because the WHO has cried "havoc" and let slip the dogs of pandemic.

КОМСОМОЛЬСКАЯ ПРАВДА

Евгений Черных

Свинский грипп расчистит планету только для избранных?

Комсомольская Правда, 25 июня 2009, 6:00
https://www.kp.ru/daily/24316.3/508884/

Птичий грипп должен был отвлечь мир от войны в Ираке. А свиной - от кризиса. Обозреватель Евгений Черных ищет организаторов вселенской паники.

Что-то слишком часто в последние годы нас пугают смертоносными болезнями, грозящими выкосить планету. Коровье бешенство, атипичная пневмония, птичий грипп. Теперь вот свиной нагрянул. (Начало расследования см. в еженедельниках «КП» от 4, 11 и 18 июня с. г.).

- Каждая страшилка выполняет свою тактическую задачу, - считает профессор Сергей Кара-Мурза.

- Свежий свиной грипп явно отвлекает от мирового финансового кризиса, да и фармацевтам дает заработать. Но это цветочки! У «паникеров» наверняка имеется стратегическая цель. Так что ягодка впереди. И очень горькая.

Вспомнить не могу без слез нитраты и сальмонеллез

- Что же нам уготовано, Сергей Георгиевич? - спрашиваю известного философа.

- Помните в перестройку панику с сальмонеллезом?

- Конечно! Народ боялся есть сырые, вареные яйца. Даже яичницу жарили с двух сторон, изничтожая неведомую бактерию.

- А нитраты? - продолжает допытываться профессор.

- Ну как же! Сам покупал у кооператоров полоски, чтоб в свекле и морковке выявить азотный яд. Вся страна с ума сходила.

- Нитратную страшилку запустил в «Огоньке» поэт Вознесенский. Вся пресса ее подхватила. Мол, абсурдная плановая экономика заставляет колхозников заваливать поля удобрениями. Из удобрений в овощи переходят опаснейшие нитраты. Студенты в столовых едят нитратные винегреты. Советская власть их травит! Это при том, что в самом лучшем, 1988 году в СССР вносили 122 кг удобрений на 1 гектар, а в Голландии, которую нам выдавали за сельхозидеал, - 808 кг. Вот и считайте, в чьих овощах было больше нитратов. Но поток абсурда было не остановить. С овощебаз повезли на свалку лук, морковь. Пьяницы тот лук собирали и отвозили на рынок - хоть кто-то в народе не потерял здравый смысл.

Даже сероводородную страшилку запустили. Дескать, Черное море может вспыхнуть в любой момент. Сам Горбачев на международном экологическом форуме пугал мировое сообщество черноморским пожаром. Море по-прежнему мокрое, а где теперь Горбачев?

- Теперь-то ясно, Сергей Георгиевич, как ловко нас тогда облапошили. Из-за боязни сальмонеллеза в СССР перестали есть курятину. Птицепром рухнул! До сих пор обидно за Томилинскую фабрику, крупнейшую в Подмосковье. Там вместо выращивания кур стали разливать китайское вино. До сих пор льют. А страну завалили заокеанскими «ножками Буша». Когда появился птичий грипп, я сразу раскусил, что это очередной «сальмонеллез» уже мирового масштаба, передел куриных рынков!

- Вот и вам «ножки Буша» напрочь затуманили глаза, - вздохнул мудрый профессор. - Слона-то и не заметили!

- Какого еще слона?

- Однажды поутру все мы проснулись другим народом - неведомыми россиянами в другой, значительно уменьшившейся стране «РФ», с родным спивающимся президентом и чужими «зелеными» деньгами. А главное - с противоположным общественным строем.

Череда тех экологических страшилок преследовала одну цель - «искусственную шизофренизацию сознания». Такой термин ввели психологи, изучавшие эпоху перестройки.

«Шизофренизация» немало поспособствовала тому, что СССР рухнул без единого выстрела со стороны НАТО. Теперь эти опробованные технологии используют уже против всей планеты.

- Кто?

- Победители в «холодной войне».

- А конкретнее?

- Они себя не афишируют. Ходят разговоры про мировое правительство, влиятельные элитные общества банкиров и политиков типа «Бильдербергского клуба». Но разговоры к делу не пришьешь.

- И какая же у них главная цель, если социализм порушили?

- Сами организаторы никогда не скажут. Ну а исполнители - тем более. Потому что не знают. Как не догадывалось про грядущий развал СССР абсолютное большинство советских «зеленых», искренне воевавших за экологию. Кстати, не задумывались, куда после победы демократии подевались все наши «зеленые»? Сельское хозяйство разрушено, овощи, фрукты, прочие продукты везут из-за границы. И никто не меряет нитраты, ядохимикаты, не бьет тревогу, не сражается против превращения Сибири в могильник для мировых ядерных отходов. Разом исчезли «экологи», как ветром их сдуло. Свою задачу выполнили и больше не нужны.

Не буди лихо, пока оно тихо

Вот и замаячила она, тайная мировая закулиса! На душе кошки заскребли. Каюсь, я был бы даже рад, когда б всю свинскую шумиху затеяли для того, чтобы только отвлечь внимание от мирового кризиса, финансистов Уолл-стрит и самого Обамы. (Кстати, официально вирус, который в горячке едва не обозвали мексиканским, именуется «Калифорния 04.2009».) Новая зараза выпала аккурат к славной дате - исходу первых ста президентских дней, затмила провал Обамы. Уж лучше бы фармацевты воду мутили, зарабатывали на своих антивирусных лекарствах... Но, возможно, за ними стоит кто-то помогущественней...

В дни птичьей паники миллионы заработал подлинный хозяин тамифлю Д. Рамсфелд, главный американский ястреб, создатель новой оборонной доктрины США, - я про него уже писал в предыдущих материалах. Но рядом с ним в списочке обогатившихся на курином гриппе акционеров фирмы «Гилеад» - Э. Давиньон, почетный председатель «Бильдербергского клуба». Этот закрытый клуб многие на Западе считают теневым мировым правительством. Вот и Кара-Мурза на этот клуб намекал. Правда, сам господин Давиньон в редких интервью скромно просит не преувеличивать роль «Бильдерберга». Выходит, тайная закулиса открыла свое личико! Значит, жди событий.

Нынешняя тактика весьма схожа с экологической «шизофренизацией сознания» советского народа нитратами, сальмонеллезом, сероводородом и т. д. Союз развалили - принялись за планету. Сначала коровьим бешенством шандарахнули. Затем атипичной пневмонией грохнули по мозгам. Следом птичий грипп в атаку послали. Теперь свинючий громко хрюкает. Кошмарят без передышки.

И добровольные помощники-медики вовсю стараются, забыв про профессиональную этику.

Я присмотрелся внимательно к трем пандемиям XX века.

- 1918 год: «испанка» - 20 миллионов жертв.
- 1957-й: «азиатский грипп» - 2 млн.
- 1968-й: «гонконгский грипп» - 1 млн.

Ага, смертность-то постоянно сокращалась. И значительно. Достижения медицины повлияли, новые лекарства, изобретение антибиотиков, улучшение работы санитарных служб, повышение качества жизни.

От оспы вообще избавились. Радоваться надо успехам медиков, эпидемиологов. В XXI веке, согласно установившейся тенденции, и вовсе должны свести потери до минимума.

Не тут-то было! В 1998-м ВОЗ официально пересматривает масштабы «испанки» - действительно, прежде в число пострадавших от нее записывали и погибших от тифа, и от других болезней. Логично было бы эту цифру уменьшить. Но... по новым данным, число жертв повысилось вдвое, до 40 млн.! И с того момента нас начинают массированно стращать новой гриппозной пандемией покруче 1918 года. От 5 до 150 миллионов возможных жертв, потом вообще до трети человечества! Хотя к моменту перерасчета старых жертв на рынок уже запускали антивирусные лекарства нового поколения - тамифлю и релензу. Появились другие эффективные препараты. Не странно ли, почему ВОЗ вдруг расписывается в полной беспомощности? К чему бы такое целенаправленное запугивание?

Если хилый, сразу в гроб!

Терзаемый сомнениями, я пришел к профессору Владимиру Жданову.

- Владимир Георгиевич, что-то слишком часто нас стали пугать рецидивом «испанки». Уж не готовят ли к третьей мировой войне, неизбежности новых жертв? Два первых мировых кризиса заканчивались войнами.

- Это навряд ли. В третьей мировой победителей не будет, если вести ее обычными средствами. Скорее готовятся претворить в жизнь доктрину золотого миллиарда. Слышали про такую?

- Нет.

- Природные ресурсы, увы, ограничены. Для комфортного американского стандарта проживания в третьем тысячелетии на всех землян их не хватит. Только для 1 миллиарда избранных. Его и назвали золотым. Сюда входят США, Канада, Япония, Израиль, часть Западной Европы. А остальных если и сохранят, то лишь на положении рабов - обслуживать избранных. Вот и вся доктрина. В России оставят несколько миллионов для обслуживания Транссибирской железнодорожной магистрали, кратчайшего пути из Юго-Восточной Азии в Европу. Для работы на самых грязных химических, металлургических производствах. И мировых ядерных могильниках, в которые превратят позже Россию. Им нужны наши природные богатства и просторы, а не люди.

- А не слишком ли это круто? В голове не укладывается! Новая мировая война - понятно. А золотой миллиард?!

- Действительно, люди удивляются: такого быть не может! Почему не может? Кто бы мог представить еще лет 80 назад, что культурная немецкая нация породит фашизм? Этот зверь стал захватывать жизненное пространство, уничтожая «неполноценные народы», пока не сломал шею в России. А чем отличается от фашизма доктрина золотого миллиарда? То же самое, только в более изощренной форме. А кто бы мог представить, что США сбросят атомные бомбы на Хиросиму и Нагасаки?!

Советую всем посмотреть старенький фильм «Мертвый сезон». Там есть документальная хроника из нацистских концлагерей, где использовали биооружие, вакцины. Не только для убийства людей, но и чтобы превратить их в рабов с минимальными потребностями. Поучительный фильм. И нынешняя гриппозная паника может служить прикрытием не только для миллионов смертей. Но и изменения сознания путем навязываемых лекарств. Ведь мы не знаем, что в них на самом деле может входить.

- Что делать?

- Разумные люди страшилок бояться не должны. В основном умирают не от самого гриппа, а от осложнений, обострения уже имевшихся болячек. Значит, прежде всего надо укреплять свое здоровье. Физическое и психическое. Рецепт дан в популярной песне Высоцкого:

Очень вырос в целом мире
гриппа вирус, три-четыре!
Ширится, растет заболевание.
Если хилый - сразу в гроб!
Сохранить здоровье чтоб,
Применяйте, люди...

И дальше список мер: утренняя гимнастика, водные процедуры, приседания, вместо коньяка и кофе - спортпрофилактика.

Если бы Высоцкий сам придерживался этого рецепта, то до сих пор радовал бы нас своими песнями. И про свиной грипп непременно написал бы, как тогда про «гонконгский». Пьянство сгубило талантливого певца.

Мне 60. Я 26 лет назад бросил пить под воздействием лекций академика Федора Углова, занялся всерьез своим здоровьем. Зарядка ежедневная, обливания, правильное питание, никакого алкоголя, никотина. И все, забыл про болезни, врачей, лекарства. Хотя много мотаюсь по стране, миру. Собираю соратников, учу обретать здоровье. Здоровым, крепким людям легче построить в родной стране здоровую экономику, обустроить Россию. И не дать себя сломать пресловутому золотому миллиарду.

Не страшны дурные вести!

Право, не знаю, есть ли на самом деле такая тайная доктрина или золотым миллиардом называют группу богатых стран? Правит ли нами мировая закулиса или известные всем и каждому президенты, премьеры? Главное, что это лишь часть конспирологических версий появления свиного гриппа и связанных с ним загадок. Эти версии будут и дальше множиться, обрастать всякими подробностями. А все потому, что реальные размеры бедствия никак не соответствуют масштабам раздуваемой вокруг него паники. Скорее надуваемого пузыря. А все потому, что время на дворе такое. Время пузырей. Финансовых, рекламных, политических, эстрадных и т. д. Что далеко за примером ходить. Мировой кризис с чего начался? Стали лопаться ипотечные пузыри. А чем медики хуже других граждан? Вот и раздувают панику вокруг странных болезней. Бороться с обычным туберкулезом - работа неблагодарная. Бомжи, заключенные... Совсем другое дело - выявлять специальной аппаратурой на международных авиарейсах пассажиров с повышенной температурой. Публика вся солидная, интеллигентная. И денег на такую борьбу дают немерено. И позиция беспроигрышная. Не случилось птичьей пандемии - заслуга ВОЗ, подчиненных ей эпидемиологических, санитарных служб. Начнет грипп поросячий косить народ - ВОЗ предупреждала, пандемию объявляла. Много жертв, говорите? Мало денег выделили на создание вакцины. Есть еще вопросы?

А то, что находятся люди со стороны, желающие подзаработать на том же гриппе – свиноводы, птицеводы, политики, - ничего странного. Вокруг пузырей в других сферах тоже масса желающих срубить деньжат по-легкому. Время такое. Недаром и кризис возник. Долго еще он будет грохать пузыри.

А нам остается одно: следовать совету Высоцкого из песни про все тот же злополучный грипп:

Не страшны дурные вести,
Мы в ответ бежим на месте.
В выигрыше даже начинающий...
Так побежали за здоровьем!

The Bovine

Mass-murder-attempt charges filed against UN and WHO re A/H1N1 virus

The Bovine, 2 July 2009, 1:38 PM.
https://thebovine.wordpress.com/2009/07/02/mass-murder-attempt-charges-filed-against-un-and-who-re-ah1n1-virus/

Here's a story of the utmost consequence excerpted from Natural News.com. =>
https://web.archive.org/web/20090627093227/http://www.naturalnews.com/026503_pandemic_swine_flu_bioterrorism.html

But first, here's a corroborating report from Benjamin Fulford wondering whether the world's mass media are going to make themselves accessories to the crime by failing to report this threat to the future of humanity:

Benjamin Fulford: "A warning to the media barons about H1N1 and other bio-weapons – How can it be that when a well trained science journalist presents 173 pages of evidence of planned genocide and lays criminal charges against the UN, the WHO, major drug companies and world leaders the corporate media refuses to report it and instead reports things like "Obama interrupted by phone that quacks?"

Jane Burgermeister, who has written for Nature and other publications has proved that, for example, Baxter AG sent 72 kilograms of bird flu virus to 16 laboratories. She is not alone; the evidence is for planned genocide by use of bio-weapons is overwhelming. If the corporate media does not report this ASAP the owners of the major media corporations, including Rupert Murdoch, will be labeled as enemies of humanity."

And now an excerpt from the Natural News story on this case:

As the anticipated July release date for Baxter's A/H1N1 flu pandemic vaccine approaches, an Austrian investigative journalist is warning the world that the greatest crime in the history of humanity is underway. Jane Burgermeister has recently filed criminal charges with the FBI against the World Health Organization (WHO), the United Nations (UN), and several of the highest ranking government and corporate officials concerning bioterrorism and attempts to commit mass murder. She has also prepared an injunction against forced vaccination which is being filed in America. These actions follow her charges filed in April against Baxter AG and Avir Green Hills Biotechnology of Austria for producing contaminated bird flu vaccine, alleging this was a deliberate act to cause and profit from a pandemic.Summary of claims and allegations filed with FBI in Austria on June 10, 2009

In her charges, Burgermeister presents evidence of acts of bioterrorism that is in violation of U.S. law by a group operating within the U.S. under the direction of international bankers who control the Federal Reserve, as well as WHO, UN and NATO. This bioterrorism is for the purpose of carrying out a mass genocide against the U.S. population by use of a genetically engineered flu pandemic virus with the intent of causing death. This group has annexed high government offices in the U.S.

Specifically, evidence is presented that the defendants, Barack Obama, President of the U.S, David Nabarro, UN System Coordinator for Influenza, Margaret Chan, Director-General of WHO, Kathleen Sibelius, Secretary of Department of Health and Human Services, Janet Napolitano, Secretary of Department of Homeland Security, David de Rotschild, banker, David Rockefeller, banker, George Soros, banker, Werner Faymann, Chancellor of Austria, and Alois Stoger, Austrian Health Minister, among others, are part of this international corporate criminal syndicate which has developed,

produced, stockpiled and employed biological weapons to eliminate the population of the U.S. and other countries for financial and political gain.

The charges contend that these defendants conspired with each other and others to devise, fund and participate in the final phase of the implementation of a covert international bioweapons program involving the pharmaceutical companies Baxter and Novartis. They did this by bioengineering and then releasing lethal biological agents, specifically the "bird flu" virus and the "swine flu virus" in order to have a pretext to implement a forced mass vaccination program which would be the means of administering a toxic biological agent to cause death and injury to the people of the U.S. This action is in direct violation of the Biological Weapons Anti-terrorism Act.

Burgermeister's charges include evidence that Baxter AG, Austrian subsidiary of Baxter International, deliberately sent out 72 kilos of live bird flu virus, supplied by the WHO in the winter of 2009 to 16 laboratories in four counties. She claims this evidence offers clear proof that the pharmaceutical companies and international government agenciesthemselves are actively engaged in producing, developing, manufacturing and distributing biological agents classified as the most deadly bioweapons on earth in order to trigger a pandemic and cause mass death.

In her April charges, she noted that Baxter's lab in Austria, one of the supposedly most secure biosecurity labs in the world, did not adhere to the most basic and essential steps to keep 72 kilos of a pathogen classified as a bioweapon secure and separate from all other substances under stringent biosecurity level regulations, but it allowed it to be mixed with the ordinary human flu virus and sent from its facilities in Orth in the Donau.

In February, when a staff member at BioTest in the Czech Republic tested the material meant for candidate vaccines on ferrets, the ferrets died. This incident was not followed up by any investigation from the WHO, EU, or Austrian healthauthorities. There was no investigation of the content of the virus material, and there is no data on the genetic sequence of the virus released.

In answer to parliamentary questions on May 20th, the Austrian Health Minister, Alois Stoger, revealed that the incident had been handled not as a biosecurity lapse, as it should have been, but as an offence against the veterinary code. A veterinary doctor was sent to the lab for a brief inspection.

Burgermeister's dossier reveals that the release of the virus was to be an essential step for triggering a pandemic that would allow the WHO to declare a Level 6 Pandemic. She lists the laws and decrees that would allow the UN and WHO to take over the United States in the event of pandemic. In addition, legislation requiring compliance with mandatoryvaccinations would be put into force in the U.S. under conditions of pandemic declaration.

She charges that the entire "swine flu" pandemic business is premised on a massive lie that there is no natural virus out there that poses a threat to the population. She presents evidence leading to the belief that the bird flu and swine flu viruses have, in fact, been bioengineered in laboratories using funding supplied by the WHO and other government agencies, among others. This "swine flu" is a hybrid of part swine flu, part human flu and part bird flu, something that can only come from laboratories according to many experts.

WHO's claim that this "swine flu" is spreading and a pandemic must be declared ignores the fundamental causes. The viruses that were released were created and released with the help of WHO, and WHO is overwhelmingly responsible for the pandemic in the first place. In addition, the symptoms of the supposed "swine flu" are indistinguishable from regular flu or from the common cold. The "swine flu" does not cause death anymore often than the regular flu causes death.

Burgermeister notes that the figures for deaths reported for the "swine flu" are inconsistent and there is no clarity as to how the number of "deaths" has been documented.

There is no pandemic potential unless mass vaccinations are carried out to weaponize the flu under the guise of protecting the population. There are reasonable grounds for believing that the mandatory vaccines will be purposely contaminated with diseases that are specifically designed to cause death.

Reference is made to a licensed Novartis bird flu vaccine that killed 21 homeless people in Poland in the summer of 2008 and had as its “primary outcome measure” an “adverse events rate”, thereby meeting the U.S. government’s own definition of a bioweapon (a biological agent designed to cause an adverse events rate, i.e death or injury) with a delivery system (injection).

She alleges that the same complex of international pharmaceutical companies and international government agencies that have developed and released pandemic material have positioned themselves to profit from triggering the pandemic with contracts to supply vaccines. Media controlled by the group that is engineering the “swine flu” agenda is spreading misinformation to lull the people of the U.S. into taking the dangerous vaccine.

The people of the U.S. will suffer substantial and irreparable harm and injury if they are forced to take this unproven vaccine without their consent in accordance with the Model State Emergency Health Powers Act, National Emergency Act, National Security Presidential Directive/NSPD 51, Homeland Security Presidential Directive/HSPD-20, and the International Partnership on Avian and Pandemic Influenza.

In the U.S. since 2008, Burgermeister charges that those named in her allegations have implemented new and/or accelerated the implementation of laws and regulations designed to strip the citizens of the U.S. of their lawful constitutional rights to refuse an injection. These people have created or allowed provisions to remain in place that make it a criminal act to refuse to take an injection against pandemic viruses. They have imposed other excessive and cruel penalties such as imprisonment and/or quarantine in FEMA camps while barring the citizens of the U.S. from claiming compensation from injury or death from the forced injections. This is in violation of the laws governing federal corruption and the abuse of office as well as of the Constitution and Bill of Rights. Through these actions, the named defendants have laid the groundwork for mass genocide.

Using the “swine flu” as a pretext, the defendants have preplanned the mass murder of the U.S. population by means of forced vaccination. They have installed an extensive network of FEMA concentration camps and identified mass grave sites, and they have been involved in devising and implementing a scheme to hand power over the U.S. to an international crime syndicate that uses the UN and WHO as a front for illegal racketeering influenced organized crime activities, in violation of the laws that govern treason.

She further charges that the complex of pharmaceutical companies consisting of Baxter, Novartis and Sanofi Aventis are part of a foreign-based dual purpose bioweapons program, financed by this international criminal syndicate and designed to implement mass murder to reduce the world’s population by more than 5 billion people in the next ten years. Their plan is to spread terror to justify forcing people to give up their rights, and to force mass quarantine in FEMA camps. The houses, companies and farms and lands of those who are killed will be up for grabs by this syndicate.

By eliminating the population of North America, the international elite gain access to the region’s natural resources such as water and undeveloped oil lands. And by eliminating the U.S. and its democratic constitution by subsuming it under a North American Union, the international crime group will have total control over North America….”

ОГОНЁК

Владимир Тихомиров, Светлана Скарлош

Бизнес на пандемии.
Паника, вызванная вирусом свиного гриппа A/H1N1, обернулась колоссальными доходами для транснациональных фармацевтических гигантов

Огонек, 6-12 июля 2009, № 8, с. 44-46
Коммерсантъ, 6 июля 2009
https://magzdb.org/file/187766/dl // https://www.kommersant.ru/doc/1194576

С момента обнаружения в Мексике вируса свиного гриппа A/H1N1 прошло чуть больше двух месяцев, но вирус вместе с паникой распространились уже по всем странам и континентам. Всемирная организация здравоохранения (ВОЗ) объявила о высшей шестой степени угрозы пандемии, эпидемиологи пугают, что настоящий апокалипсис наступит осенью, когда ослабленное простудой человечество накроет третья волна пандемии гриппа ... Но чем больше пугают тем больше возникает вопросам. «Огонек» решил разобраться.

Болезнь, которой не было

... Все это уже было ровно 33 года назад. Весной 1976 года мир впервые узнал словосочетание «свиной грипп » (или «грипп A/H1N1 », когда американские газеты сообщили о вспышке нового заболевания среди солдат военной базы Форт Дюсс в Нью-Джерси. Когда трое пехотинцев скончалось, тогдашний глава Центра контроля и профилактики заболеваний (американская аббревиатура – CDC) Дэвид Сэнсэр заявил что над страной нависла смертельная угроза пандемии. Панику мигом подхватило телевидение, и уже через несколько дней было принято решение о поголовной вакцинации американцев новой вакциной которая содержала только штамм H1N1. Когда было сделано более 50 млн прививок, выяснилось два неприятных факта. Во-первых вся «угроза эпидемии с самого начала была пропагандистским трюком CDC. Во-вторых, новая вакцина имела крайне неприятные побочные эффекты, которые стали причиной смерти 30 человек. Еще несколько тысяч американцев стали инвалидами, получив тяжёлые нервные расстройства и паралич. Государство по судебным искам выплатило около 100 млн долларов, но это не о беспокоило руководителей CDC, ведь фармацевтические компании заработали на свином гриппе куда больше.

– Сегодня события вокруг пандемии свиного гриппа развиваются по похожему сценарию, уверен профессор Карви Файнберг директор Колумбийского института медицины и автор книги «Эпидемия, которой никогда не было».

– Правда, сейчас пропаганда ведется с куда большей изощренностью. Задействованы все возможности телевидения, интернета и даже электронных блогов, чтобы создать у людей ощущение паники и безысходности.

Разумеется, вирусологи возразят: дескать, да, мы немного сгущаем краски, но мы хотим проинформировать и предупредить. Директор одного из медицинских институтов, непосредственно занятых изучением гриппа, в интервью «Огоньку» так и заявил:

– Да, с шестой степенью угрозы пандемии действительно немного переборщили. Но лучше уж заранее трубить о возможности пандемии, чем оказаться к ней неготовыми.

Но в благие намерения верится с трудом. И не только потому что показатель смертности от пандемии свиного гриппа не превышает уровня смертности средней сезонной эпидемии гриппа. Но и по той причине, что за всякой эпидемией стоят огромные деньги и интересы фармацевтических корпораций.

«Лучшие пилюли»

И первая в этом списке – швейцарская фармацевтическая компания Roche Holding AG, производящая Tamiflu, препарат из группы ингибиторов, блокирующих размножение вируса гриппа и распространение его в организме. Препарат появился на рынке в 1999 году, и с этого времени Roche активно сотрудничает с ВОЗ, передавая капсулы Tamiflu в специальный фонд «Запасы быстрого реагирования). К примеру, еще в начале мая, когда из Мексики пришли первые новости об обнаружении вируса A/H1N1, компания безвозмездно передала в распоряжение ВОЗ более 3 млн упаковок Tamiflu. Потом – еще 2 млн упаковок. И тоже безвозмездно. Другое дело, что в результате своего сотрудничества с ВОЗ, компания, как заявил Дэвид Редди, руководитель группы Roche по подготовке к пандемии, получила заказы от правительств различных стран на 35 млн упаковок. Но и это еще не предел, согласно рекомендациям ВОЗ, правительства 85 стран мира должны создать стратегические запасы Tamiflu, чтобы обеспечить препаратом до 25-50 процентов население мира. Для выполнения этой программы компания даже сообщила, что готова предоставлять развивающимся странам препараты по сниженным ценам и в кредит на несколько лет. Согласитесь, конкурентам Roche, например британской компании G1axoSmithKline, производящей ингибитор Relenza, о таких оборотах остается лишь только мечтать (впрочем, справедливости ради стоит отметить, что и Relenza одобрена ВОЗ, но вот о необходимости создания статистических запасов этого препарата речь не идет).

Сотрудничество с ВОЗ дает фармацевтам не только самую эффективную рекламу, но и помощь в различных щекотливых ситуациях. Например, некоторое время назад (тогда еще мир боялся птичьего гриппа H5N1) вспыхнул скандал в Японии: врачи из японского Министерства здравоохранения утверждали, что применение Tamiflu, выпущенного компанией Chugai Pharmaceutical, дочерним предприятием Roche, якобы вызвали побочные эффекты в виде психических расстройств и галлюцинаций, из-за которых 54 подростка покончили жизнь самоубийством. Расследование, проведенное под контролем ВОЗ, погасило этот скандал, и уже в прошлом году президент Chugai Pharmaceutical Осаму Нагаяма заявил, что объемы продаж препарата выросли до 3,4 млрд долларов, что стало абсолютным рекордом за всю историю компании. В этом году ожидался 7-процентный рост продаж, но с учетом паники от свиного гриппа прибыль может вырасти до астрономических величин.

ВОЗ вступилась за Roche и после сообщения из Дании, где на прошлой неделе был зафиксирован первый случай устойчивости вируса H1N1 к Tamiflu. Датские врачи заявили, что вирус, похоже, мутировал и стал невосприимчивым к ингибитору, но эксперты ВОЗ утешили публику: дескать, все дело в индивидуальной невосприимчивости человека к лекарству.

Гонка за вакциной

Второй способ заработка фармацевтических компаний – это бурные мерприятия по созданию вакцины. Здесь в гонке лидируют компании из США – конгресс уже распорядился выделить более миллиарда долларов на разработку новой моновакцины с агентом A/H1N1. Скорее всего эта сумма будет поделена между гигантами фармацевтического рынка – корпорациями MedImmune Inc., DynPort Vaccine Co., Amgen, Wyeth, Abbot Laboratories. И конечно же Baxter Pharmaceuticals Inc., связанная с Минобороны США, которая пару лет назад уже разрабатывала вакцину против птичьего гриппа, в связи с чем получила эксклюзивное право на распространение вакцины в 18 странах мира, включая Европу. Результатом же опытов стал грандиозный скандал, когда в Австрию и Чехию для клинических испытаний пришли образцы вакцин от обычного гриппа, зараженные птичьим штаммом H5N1. Комбинация этих двух вирусов могла

бы привести к появлению нового "птичьего вируса, который мог бы передаваться от человека к человеку. И снова расследование этого инцидента было замято при помощи ВОЗ, а ответственность за загрязнение вакцины возложили на лабораторных техников, мол, они там что-то случайно напутали.

Разумеется, подобные факты рождают множество конспирологических теорий и о появлении нынешней эпидемии свиного гриппа. К примеру, профессор Ребекка Гартен из CDC опубликовала доклад, в котором утверждается, что комбинация 8 сегментов генома вируса H1N1 прежде никогда не встречалась ни среди свиных, ни человеческих вирусов, что может свидетельствовать о его лабораторном происхождении. Другие ученые вспомнили и про то, что впервые свиной грипп появился на базе Форт Дикс, вокруг которой расположены крупнейшие химико-фармацевтические лаборатории страны, включая научные центры Технологического института Нью-Джерси, Принстонского университета и Университета медицины. А в те годы биологи часто использовали новобранцев для испытаний новых препаратов.

Впрочем, медиков всего мира куда больше интересует не происхождение вируса, а возможность заработка на прививках. В гонку за вакциной включилась уже канадцы – на днях ученые из Национальной микробиологической лаборатории Канады заявили, что они первыми в мире завершили работу над определением генома вируса и готовы работать над вакциной.

О создании моновакцины заявил и швейцарский фармацевтический гигант Novartis, которому правительство США выделило 289 млн долларов на клинические испытания первой партии препарата. Свой образец вакцины для испытаний представила и французская компания Sanofi-Pasteur, а Национальный институт инфекционных болезней Японии пообещал выдать рецепт вакцины буквально уже на следующей неделе. А в конце июля начать ее производство в объемах, достаточных для вакцинации 20 млн человек.

Вместе с тем далеко не все фармацевты бросились изобретать моновакцину. По словам директора французской компании Sanofi-Aventis SA Криса Виебахера, паника вокруг свиного гриппа уже и так привела к тому, что доходы производителей обычных вакцин от сезонного гриппа выросли на 16 процентов за первый квартал текущего года. Но переход на производство моновакцины означал бы полную остановку и перезапуск конвейера, что чревато коммерческими убытками.

– Это очень трудный вопрос, поскольку многие производители вакцин не в состоянии производить средства против различных типов гриппа одновременно. И если мы перейдем на производство новой вакцины, то миллионы людей могут лишиться вакцины от сезонного гриппа.

Наш продукт

Своя политика и у России, где реализуется концепция фармацевтической импортонезависимости. Правительство уже выделило более 3 млрд рублей на изготовление вакцины против гриппа A/H1N1, правда, большая часть этих денег ушла на покупку образцов штамма вируса – ни одна фармацевтическая компания мира не хочет дешево отдавать биоматериал в руки конкурентов. Образцы штамма получили сразу три российских медицинских учреждения: Государственный научный центр вирусологии и биотехнологии «Вектор», Институт вирусологии РАМН и Институт гриппа РАМН. Пока обещано изготовить опытные образцы для вакцины к 2010 году, но нужны еще деньги. И можно не сомневаться, что средства будут выделены, ибо кто посмеет усомниться в благородной миссии медиков? «Но вы же понимаете, что в случае какой-либо эпидемии, например, французская вакцина пойдет в первую очередь к французам, – объясняют эпидемиологи. – И нам вакцины просто не хватит. Поэтому надо начинать производство своей вакцины, а это дело затратное... »

Потом потребуются деньги и для производства 30 млн доз вакцины, запланированных Минздравом.

– Конечно, пандемия открывает новые финансовые возможности для фармацевтов, но вы не забывайте, что каждая пандемия – это соцзаказ для науки и медицины, – говорит академик Феликс Ершов, руководителя отдела НИИ эпидемиологии и микробиологии им. Н. Ф Гамалеи. – Это стимул к совершенствованию методов, изобретению новых средств. Мы обречены изобретать новые и новые противовирусные препараты, ведь так же, как в случае с антибиотиками, противовирусные препараты со временем становятся неэффективными.

Но тут и возникает интересный вопрос: в чем же состоят эти принципиальные отличия новой моновакцины от старых, от тех, что были созданы для предупреждения сезонного гриппа?

– Принципиально нового ничего нет, по своему типу это такая же вакцина, – заявила в интервью «Огоньку» Людмила Цыбалова, заместитель директора по науке Института гриппа РАМН, где сейчас и работают над созданием вакцины. – Правда, в сезонную вакцину входит сразу три компонента против трех видов вируса гриппа, а это моновакцина, ее действие направлено непосредственно против нового штамма.

– Тогда какой же вакциной пользоваться? Вытеснит ли пандемический грипп сезонный или мы будем болеть сразу двумя видами гриппа?

– Раньше считалось, что новый штамм вытесняет предыдущий, но есть предположение, что в этот раз все будет иначе. Пока трудно прогнозировать, увидим, как будет развиваться ситуация.

А вот директор НИИ вирусологии РАМН академик Дмитрий Львов и вовсе посоветовал не поддаваться панике и массовому психозу по поводу нового вируса гриппа:

– Мой вам совет: сделайте прививку уже существующими вакцинами против гриппа. В том числе и импортными коммерческими прививками. Может быть, эти вакцины и не совсем адекватны, но в них тоже есть компонент H1N1, к которому чувствительны штаммы свиного гриппа. Возможно, обычные вакцины и не уберегут вас от заболевания и температуры, но вот от тяжелых осложнений и летального исхода вы точно застрахуетесь.

Charges for Conspiracy Against Mankind

NWO Observer, 16 July 2009
https://nwoobserver.wordpress.com/2009/07/16/the-austrian-reporter-claims-the-swine-flu-was-created-in-order-to-eliminate-huge-numbers-of-the-population-and-attain-global-control/

The Austrian reporter claims: the swine flu was created in order to eliminate huge numbers of the population and attain global control!

"I have filed criminal charges in Austria against Baxter and Avir Green Hills Biotechnology for producing and distributing contaminated bird flu vaccine material this winter, alleging that this was a deliberate act to cause a pandemic, and also to profit from that pandemic" – this is the beginning of the charges raised by Austrian reporter Jane Burgermeister on April 8 at the Vienna State Attorney`s Office.

...

Biggest crime in the history of mankind

Jane Burgermeister went a step further: warning that the biggest crime in history of mankind was on the verge, she has decided to file criminal charges at the American FBI against the World Health Organization (WHO), the United Nations and several high government and pharmaceutical responsible for vaccines, with charges of planning mass murder.

Furthermore, the reporter will request a court ban of mandatory vaccination against the swine flu.

According to Burgermeister, bioterrorism is promoted by a group of U.S. bankers who control Federal reserves, as well as WHO, UN and NATO. The group of conspirators has also infiltrated the very pinnacle of the American state.

WHO delivered bird flu to laboratories, which unleashed it

According to the reporter, the group has unleashed artificially created viruses – bird flu and swine flu in order to eliminate huge numbers of the population and subsequently profit from selling vaccine through Baxter and other companies, along with using mandatory vaccination in certain countries. Of course, with the goal of controlling the pandemic.

Her latest lawsuit refers to the one filed in April. At the time, Burgermeister submitted evidence that Baxter laboratories in Austria intentionally unleashed 72 kilos of active bird flu virus. The virus was supposedly delivered by the WHO to 16 laboratories in four countries. Even though security is tight with dangerous matters, especially those classified as bio weapons, the procedure was not honoured this time.

According to Burgemeister, the release of these viruses serves the WHO so that it can stat distributing vaccine once enough time passes for an epidemic to occur. Various lethal diseases would also be injected along with the vaccination, thus eliminating huge numbers of the population.

USA would be the first "cleansed" country

The reporter claims that the American government has systematically been introducing measures since 2008, intended for cutting back constitutional freedoms so that when the time comes, they can conduct mandatory vaccination. The media play a part as well, convincing people of the seriousness of the swine flu, announcing the vaccination.

Finally, what the group which has spurred a food of conspiracies, is trying to achieve, is control over North America in order to exploit its natural resources without any obstacles. Later on, the similar process will take place all over the world, according to prognosis.

Are statements of some of the accused men a month after Burgermeister`s initiative hints of her claims being true?

– The swine flu virus is now unstoppable. The world is moving into the early days of its first influenza pandemic in the 21st century – Margaret Chan, Director-General of WHO said on June 11.

With this statement, the media write, the WHO has given pharmaceutical companies the green light of finding a vaccine. What is more, "every country will need to vaccinate citizens against the A/flu virus and must choose who else would get priority after nurses, doctors and technicians", said Dr. Marie-Paule Kieny, WHO director of the Initiative for Vaccine Research.

– The committee recognized that the H1N1 pandemic … is unstoppable and therefore that all countries need access to vaccine – Kieny concluded. The British cabinet has now announced that it will vaccinate all of its citizens, due to the increasing number of persons who have contracted the virus and died of the swine flu.

SPIEGEL International

Interview conducted by Johann Grolle and Veronika Hackenbroch

A Whole Industry is Waiting for a Pandemic

Spiegel International, 21 July 2009
http://www.spiegel.de/international/world/0,1518,637119,00.html

SPIEGEL: Mr. Jefferson, the world is living in fear of swine flu. And some predict that, by next winter, one-third of the world's population might be infected. Are you personally worried? Are you and your family taking any precautions?

Tom Jefferson: I wash my hands very often -- and it's not all because of swine flu. That's probably the most effective precaution there is against all respiratory viruses, and the majority of gastrointestinal viruses and germs as well.

SPIEGEL: Do you consider the swine flu to be particularly worrisome?

Jefferson : It's true that influenza viruses are unpredictable, so it does call for a certain degree of caution. But one of the extraordinary features of this influenza – and the whole influenza saga – is that there are some people who make predictions year after year, and they get worse and worse. None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all? Nothing. But that doesn't stop these people from always making their predictions. Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur.

SPIEGEL: Who do you mean? The World Health Organization (WHO)?

Jefferson: The WHO and public health officials, virologists and the pharmaceutical companies. They've built this machine around the impending pandemic. And there's a lot of money involved, and influence, and careers, and entire institutions! And all it took was one of these influenza viruses to mutate to start the machine grinding.

SPIEGEL: On your Italian homepage, there is a "pandemic countdown" that expires on April 1. Don't you think the situation calls for just a bit more seriousness?

Jefferson: I'm just using it ironically to expose the false certainty that we are fed. Will one-third of the world's population get swine flu? Nobody can say for sure right now. For now, at least, I don't really see any fundamental difference, no difference in the definition between this and a normal flu epidemic. Swine flu could have even stayed unnoticed if it had been caused by some unknown virus rather than an influenza virus.

SPIEGEL: Do you think the WHO declared a pandemic prematurely?

Jefferson: Don't you think there's something noteworthy about the fact that the WHO has changed its definition of pandemic? The old definition was a new virus, which went around quickly, for which you didn't have immunity, and which created a high morbidity and mortality rate. Now the last two have been dropped, and that's how swine flu has been categorized as a pandemic.

SPIEGEL: But, year after year, 10,000-30,000 people in Germany alone die from influenza. In the Western world, influenza is the most deadly infectious disease there is.

Jefferson: Hold on! These figures are nothing more than estimates. More than anything, you have to distinguish between an influenza-like illness and a genuine flu, the real influenza. Both of them have the same symptoms: a sudden high fever, a sore throat, coughing, rheumatic pain in the back and legs, possible bronchitis and pneumonia. But real flues, real influenzas are only caused by influenza viruses, while there are more than 200 different viruses that cause influenza-like illness. When it comes to figures related to so-called flu deaths, you always get other causes of death caused by other viruses mixed in. Now, in the case of elderly people who die of pneumonia, nobody would do a postmortem to figure out if it was really an influenza virus that killed them. Approximately 7 percent of influenza-like illness cases are caused by influenza viruses. It's a very small percentage. What I know is that real influenza is systematically overestimated.

SPIEGEL: And what about the 200 other kinds of viruses?

Jefferson: They're not as popular as influenza. Researchers are just not as interested in that. Take rhinovirus, a horse-derived virus. It's the most commonly isolated agent in common colds. There are a hundred different types of these rhinoviruses. They usually only cause a normal runny nose, but they can be deadly, too. Or so-called RSV, the human respiratory syncytial virus, that is highly dangerous to infants and small children.

SPIEGEL: So why aren't researchers interested in it?

Jefferson: It's easy: They can't make money with it. With rhinoviruses, RSV and the majority of the other viruses, it's hard to make a lot of money or a career out of it. Against influenza, though, there are vaccines, and there are drugs you can sell. And that's where the big money from the pharmaceuticals industry is. It makes sure that research on influenza is published in the good journals. And that's why you have more attention being paid there, and the entire research field becomes interesting for ambitious scientists.

SPIEGEL: But is there any scientific reason to be interested in influenza viruses?

Jefferson: The strict focus on influenza is not only misguided; it's also dangerous. Do you remember something called SARS? That was a truly dangerous epidemic. It was like a meteor: It came and it went quickly, and it killed a lot of people. SARS took us by surprise because it was caused by a completely unknown coronavirus. Where did it come from? Where did it go? Or is it still here? We still don't know. There are lots of other strange things like that coming out. Every year, a new agent is identified. For example, there's something called bocavirus, which can cause bronchitis and pneumonia in small children. And there's something called metapneumovirus, which studies say is responsible for more than 5 percent of all flu-related illnesses. So, we should keep our eyes open in all directions!

SPIEGEL: But the great pandemic of 1918/1919 was caused by an influenza virus, and it killed up to 50 million people around the world. Or do scientists contest that?

Jefferson : It's very well possible that it was, but there are many aspects about the 1918/1919 pandemic that still puzzle us. It was only 12 years ago that we learned that the H1N1 virus caused it. But there was also a lot of bacterial activity going on at the time. And it's particularly unclear why the mortality rate for the flu dropped so dramatically after World War II. Today, you only get a fraction of what was standard before the war. When it comes to the later pandemics, such as the "Asian flu" of 1957 or the "Hong Kong flu" of 1968/69, you can barely detect them as exceptional figures when it comes to death statistics as a whole.

Contradictions between Scientific Findings and Practice

SPIEGEL: So why should we even speak of pandemics at all?

Jefferson: That's something you should ask the World Health Organization!

SPIEGEL: In your opinion, what do you think it takes to make a virus like the swine flu a global threat?

Jefferson: Unfortunately, we can only say that we don't know. I suspect that the whole issue is much more complex than we are even able to imagine it today. Given all the viruses that produce flu-like symptoms, perhaps Robert Koch's postulate that one particular pathogen causes one particular disease doesn't go far enough. Why, for example, do we not get influenza in the summertime? In the end, the pathogen is there all year long! Already in the 19th century, the German chemist and hygienist Max von Pettenkofer had developed a theory about how the pathogen's contact with the environment can alter the disease. I think that research in this direction would be worthwhile. Perhaps it would allow us to understand the pandemic of 1918/1919 better or to be able to assess the dangers of swine flu.

SPIEGEL: Humans have better defenses today than they did in 1918, and it probably won't be long before we have a swine flu vaccine. Last week, Germany's federal government announced that it wanted to buy enough for 30 percent of the population. How much do you think that will protect us?

Jefferson: When it comes to pandemic vaccination, as we say in English, the proof is in the pudding. The proof is in using it. We'll see. It does generate an antibody response, but will it really guard against the disease?

SPIEGEL: Are you pessimistic about that?

Jefferson: No, I'm just saying I think we're about to find out *(laughter)*. Let's have this conversation again in about a year's time, shall we?

SPIEGEL: For a number of years, as part of the Cochrane Collaboration, you have been systematically evaluating all the studies on immunization against seasonal influenza. How good does it work?

Jefferson: Not particularly good. An influenza vaccine is not working for the majority of influenza-like illnesses because it is only designed to combat influenza viruses. For that reason, the vaccine changes nothing when it comes to the heightened mortality rate during the winter months. And, even in the best of cases, the vaccine only works against influenza viruses to a limited degree. Among other things, there is always the danger that the flu virus in circulation will have changed by the time that the vaccine product is finished with the result that, in the worst case, the vaccine will be totally ineffectual. In the best of cases, the few decent studies that exist show that the vaccine mainly works with healthy young adults. With children and the elderly, it only helps a little, if at all.

SPIEGEL: But aren't those the exact groups that influenza immunization is recommended for?

Jefferson: Indeed. That's one of the contradictions between scientific findings and practice, between evidence and policy.

SPIEGEL: So, what's behind this contradiction?

Jefferson: Of course, that has something to do with the influence of the pharmaceutical industry. But it also has to do with the fact that the importance of influenza is completely overestimated. It has to do with research funds, power, influence and scientific reputations!

SPIEGEL: So, at the moment is it reasonable to keep vaccinating against seasonal influenza?

Jefferson: I can't see any reason for it, but I'm not a decision maker.

SPIEGEL: And what about Tamiflu and Relenza, two of the anti-flu medications that are being deployed against swine flu? How well do they really work?

Jefferson : If taken at the right time, on average, Tamiflu reduces the duration of a real influenza by one day. One study also found that it diminishes the risk of pneumonia.

SPIEGEL: Could these medications lower mortality rates associated with the flu?

Jefferson : That's possible, but it has yet to be scientifically proven.

SPIEGEL: And what about side effects?

Jefferson: Tamiflu can cause nausea. And there are things that point toward psychiatric side effects. There are reports coming out of Japan that young people who have taken Tamiflu have had acute psychotic reactions similar to those found in schizophrenics.

SPIEGEL: So, is it sensible to use such medications at all?

Jefferson : When it comes to severe disease, yes. But under no circumstances should Tamiflu be handed out to whole schools, as is currently sometimes being done. With that being the case, it doesn't surprise me at all that we're already hearing reports about resistant strains of swine flu.

SPIEGEL: In Germany, the government is supposed to stockpile flu medications for 20 percent of the population. Do you see that as being sensible?

Jefferson: Well, at least there are much cheaper ways to accomplish a lot more. For example, school children should be taught to wash their hands regularly -- preferrably after every class! And every airport should install a couple hundred wash basins. Whoever gets off a plane and doesn't wash their hands should be stopped by the border police. You could tell for example by putting an invisible, neutral dye in the water. And wearing masks can be sensible, as well.

SPIEGEL: Has it really been shown that these measures work?

Jefferson : There are several good studies on this that were done during the SARS epidemic. They are so-called case-control studies that examined individuals that had had close contact with the SARS virus. They compared the characteristics of those who had been infected with the virus through this contact with those of people who had not been infected. These studies resulted in very clear results.

SPIEGEL: You sound pretty impressed.

Jefferson: I am. What's great about these measures is not only that they are inexpensive, but also that they can help against more than just influenza viruses. This method can fight against the 200 pathogens that bring about flu symptoms as well as against gastrointestinal viruses and completely unknown germs. One study done in Pakistan has shown that hand washing can even save children's lives. Someone should get a Nobel Prize for that!

SPIEGEL: Mr. Jefferson, we thank you for this interview.

PAKISTAN OBSERVER

Khalid Saleem

Of swine flu!

Pakistan Observer, 23 July 2009, Rajab 28, 1430
https://web.archive.org/web/20091003172931/http://pakobserver.net/200907/23/Articles01.asp

Ominous reports emanating from the West are spreading quite a scare about the spreading of what has been called ‘swine flu’. The epidemic reportedly originated from Mexico and then permeated north into the United States where a dozen fatal cases have been reported. One of the hazards of the emergence of the ‘global village’ is that there is very little to prevent the spreading of such epidemics. It may be pertinent to point out that this is by no means the first scare, though one must record that this may be the first in which the accusing finger cannot be pointed at Asia or Africa.

The swine flu, let it be said is basically a Western phenomenon. Not so very long ago, two news items concerning public health had appeared in the media. One related to what was then termed as ‘bird flu’. It quoted an international vaccine expert as warning that it was only a matter of time before a “deadly flu pandemic” struck. The world, he warned, was ill prepared to cope with such a major outbreak of the disease. “We are talking about a killer influenza that would kill probably tens of millions of people,” stated Mr. John Clemens, director of the International Vaccine institute. “We are not talking about if, we are talking about when”, he ominously added.

Another earlier item was about AIDS and its devastating impact on health in the continent of Africa. The Kenyan lady minister, winner of the Nobel peace prize 2004, was quoted as having expressed the conviction that the AIDS virus was not a natural phenomenon but happened to be man-made. She went on to imply that the spreading of the AIDS virus over vast areas of the African continent, too, was a deliberate act (accident/conspiracy?). The powers that be and their spin doctors ensured that this point of view was instantly ‘killed’. The aforementioned news items provide serious food for thought. For one thing, they serve to shake one’s confidence in the role of the modern medical research establishment.

For another, they serve to add fuel to the already boiling conspiracy theory cauldron as regards the AIDS epidemic. Together they should be enough to spread panic in an already jittery world community. Some pertinent questions, thereby, crop up, begging for answers. Among them are:

a) Have our overall priorities undergone a drastic change to the detriment of the interests of mankind?

b) Is it logical to assume that the dedication and hard work that once characterized medical research is now a thing of the past? and

c) Is modern medical research today controlled by expediency rather than ethics and is, thus, in conflict with nature?

The history of medical research, one finds though, tells a different and touching story. The perspicacious reader may be interested in the following item reproduced by the International Herald Tribune from its pages, circa June 1899: “The Liverpool School for Tropical Diseases has decided to dispatch to the West Coast of Africa a special expedition for the purpose of investigating the

causes of malaria. The expedition will be headed by Major Ross and will start for Sierra-Leone early in August, when the malaria season is at its height and the conditions are most favorable for research. Major Ross hopes to prove his theory that malaria is caused by the bites of a mosquito."

The reader will undoubtedly have noted the profoundly touching sense of dedication of researchers of the likes of the said Major Ross. These pioneers surmounted fearful odds in their endeavors to discover the healing touch for humanity's ailments. Humanity benefited enormously from the hard work put in by such dedicated individuals. Regrettably, today the world has acquired a mercenary hue. In the days gone by, such research was carried out with extremely scarce resources and with what can only be described as 'missionary zeal'. Today it is pelf that rules the roost. The expedition of the aforementioned Major Ross and his dedicated team is a case in point. Over the years, medical research took enormous strides. Several ailments, many of them theretofore considered incurable, were successfully treated thanks to the selfless efforts of countless researchers who dedicated their lives to their work in the interest of humanity. Public memory is proverbially short. How many people even recall the time when such deadly diseases as pneumonia were considered incurable and fatal? And yet today hardly anyone gives a second thought to such ailments. Nonetheless, it would be imprudent to ignore the fact that it is nature that guides man's efforts. Cures to all man's ailments are to be found in nature. They are just waiting to be discovered. It is no coincidence that that all medicines were originally discovered in natural form usually in the flora and fauna. It was only after discovery in nature that various drugs were synthesized for mass production.

Nature, incidentally, has prescribed a certain regime for each species to be safe from disease. Out of all species, it is man alone who violates the regime prescribed by nature. As a result, humankind pays a terrible price. Each succeeding generation is prone to newer and newer ailments, not a few of them man-made. Nature does not take kindly to mankind's indiscretions.

While on this subject, one must take note of the rather intriguing fact that, despite the giant strides taken by the medical profession in the field of curative medicine, the cure for common cold still continues to elude them. It would appear that common cold is the symbol of the resolve of nature to stay a step ahead of man. This may well be nature's way of putting humankind in its place.

Пандемия жадности: кому выгоден свиной грипп?

AIF.ru, 7 августа 2009, 17:03
https://aif.ru/society/law/12798

Фармкомпании и... политики

Естественно, больше всего прибыли от новой пандемии хлынуло на фармрынок. Услышав про новый грипп, люди побежали в аптеки, чтобы защититься заодно и от всех старых, причём сметать стали как микстуры, порошки и простые витамины, так и специальные вакцины против гриппа.

В результате одна из крупнейших мировых фармкомпаний «Рош» к концу года заработает около 2 миллиардов долларов всего на одном наименовании противогриппозных таблеток. А ведь «Рош» – лишь дистрибьютор препарата, тогда как разработчик – фирма «Галаад» – будет получать отчисления с каждой проданной упаковки. Что интересно, раньше совет директоров «Галаада» возглавлял бывший министр обороны США Дональд Рамсфельд. Не стоит пояснять, между какими лицами распределены акции этой компании.

Другой фарм-гигант, успевший подсуетиться к началу «гриппного» сезона, – вторая по величине в мире здравоохраниетльная компания «ГлаксоСмитКляйн» (GSK). Она не только разработала альтернативные противовирусные средства для беременных и детей, но и заполучила огромные заказы на поставки марлевых повязок в Европе и Америке.

– Свиной грипп определённо пойдёт нам на пользу, – открыто заявил исполнительный директор GSK Эндрю Уитти. Хотя потом рассудительно добавил: – Но прибыль нам обеспечена только потому, что мы сами потрудились ради этого. Долгое время мы сильно рисковали, инвестируя огромные деньги в исследования, которые никто больше не решался проводить (GSK действительно внесла огромный вклад в разработку противовирусных вакцин. – Прим. авт.), и теперь не собираемся извиняться за то, что компания получит свой заработок.

Не секрет, что продажа товара кормит не столько его производителя, сколько продавца. В России, например, торговые наценки в некоторых аптеках могут достигать и 70, и 150, и даже 200%! В последнее время, правда, аптекарей всё собираются утихомирить: в частности, скоро заработает закон, согласно которому максимальный размер наценки будет установлен государством. Однако, безусловно, полностью своей доли прибыли продавцы не лишатся.

Кстати, как ни странно, наряду с противогриппозными препаратами одним из самых популярных товаров в последнее время стали термометры. По данным The Times, их продажи в среднем выросли в 7 раз, так что даже при уменьшенных наценках аптекари возьмут своё на возросшем спросе. Впрочем, есть у их работы и обратная сторона: продавцы потенциально чаще общаются с больными людьми, а следовательно имеют больший риск заразиться. Хотя это, конечно, касается самих служащих, а не управляющих ими топ-менеджеров.

«Мыльные короли»

Начало XXI века можно условно назвать эпохой стерильности: с каждого угла нам кричат, что мир кишит бактериями, пугают смертельно-опасными грибками, которые выживают в

самых экстремальных условиях, и... с радостью предлагают избавиться от этих напастей с помощью антисептических средств. Тут вам и супер-мыло, и очень удобный гель в компактных бутылочках, и даже обеззараживающие салфетки, пригодные для ежедневного использования. За последние два месяца продажи подобных товаров по миру выросли на 16-20%, и тенденция, предрекают эксперты, будет продолжаться. Некоторые сообразительные фирмы уже позаботились о расширении продуктовой линейки специально под предстоящую эпидемию, выпустив «противовирусные» салфетки, маски и даже мази.

Правда, врачи, в свою очередь, такой пропаганде гигиены не очень-то рады. Конечно, мыть руки надо и как можно чаще, однако обилие антибактериальных средств совсем не обязательно. Как правило, с опасностью может справиться обычное мыло, зато регулярные «салфеточные» атаки на вирусы заставляют их мутировать и делают заразу устойчивой к лекарственным средствам. Возможно, уже через 5-10 лет чрезмерная осторожность приведёт человечество к реальной пандемии.

«Горячие линии»

Беременные и дети считаются двумя самыми рисковыми группами во время эпидемий гриппа. Не удивительно, что к началу гриппозных сезонов многие коммерческие клиники открывают «горячие линии» или онлайн-консультации для обеспокоенных родителей или тех, кто готовится ими стать.

Естественно, услуги советчиков далеко не бесплатные. Средняя цена такой консультации в Европе – 80 долларов. Предполагается, что именно столько человек готов заплатить за возможность получить рекомендацию специалиста, при этом не выходя из дома и не подвергая себя лишнему риску заражения. Другая набирающая популярность услуга – онлайн-скрининг, то есть буквально «слежка» за вашим здоровьем по Интернету. Регулярно пациент отправляет врачу сведения о своём самочувствии, температуре тела и т. п., а тот определяет у него риск заражения и советует лекарственные средства.

– Там где есть паника, есть и те, кто захочет на ней нажиться, – заявил в связи с развитием такой индустрии член Национально врачебного комитета Британии Эндрю Грин. – Я бы не стал доверять медицинским рекомендациям того, кто коммерчески заинтересован в вашем страхе перед болезнью.

Безработные экономисты и юристы

Около полутора тысяч человек получили работу в Национальной службе по надзору за эпидемией гриппа США без всяких собеседований и особых навыков. Когда в стране были зарегистрированы первые случаи заболевания, Службе пришлось в срочном порядке организовывать бесплатную «горячую линию» причём количество звонков поступало такое, что сотрудников набирали буквально в считанные минуты. Всё, что требовалось от претендента, – это пройти 6-часовой тренинг. Однако, вопреки ожиданиям, основную массу рабочих мест заняли не студенты и пенсионеры, а высококвалифицированные специалисты, оставшиеся невостребованными во время кризиса. Раньше ни один обладатель диплома по экономике или юриспруденции, конечно, ни за что не согласился бы работать за 8 долларов в час.

Кто на очереди

СМИ. Чего уж греха таить, любая «долгоиграющая» тема приносит журналистам определённый доход. Особенно летом, когда интерес к новостям традиционно убывает.

Экономные туристы. Хотите сгонять в Мексику или Китай? Сейчас самое время: на фоне плохих новостей о распространяющейся там заразе турагентствам придётся сбавлять цены, чтобы хоть как-то привлечь клиентов в эти страны. На самом деле, по данным Росстата, путёвки в страны Азии уже подешевели на несколько процентов.

Водители-частники. Европейские транспортные агентства ожидают оттока пассажиров в общественном транспорте. Метро и автобусы традиционно считаются главными рассадниками всяческих вирусов, поэтому всё больше людей стараются пользоваться другими средствами передвижения.

Птицефабрики. Земля, как известно, слухами полнится. Услышав о новом, свином гриппе, многие решительно выбросили из своего рациона свинину и перешли на другие сорта мяса. В Америке, например, любители гамбургеров начали переключаться на жареные куриные крылышки или котлеты из говядины.

Комментарий эксперта

Александр Саверский, председатель Общественного совета по защите прав пациентов, Президент «Лиги пациентов»:

– Ежегодно в России болеют гриппом несколько миллионов человек, умирают (от осложнений гриппа) не менее двух десятков тысяч. Можно ли сейчас всерьез говорить об эпидемии, когда во всем мире вирусом H1N1 заболели менее 9 тысяч человек и пара сотен (максимум) погибли? Эта тенденция панических настроений становится устойчивой, поскольку паника при «птичьем гриппе» у меня вызывала лишь грустную улыбку – тогда на миллиард китайцев заболело 5 тысяч (по памяти), а паника была мирового масштаба. А кому этого выгодно – очевидно: фармпроизводителям и чиновникам здравоохранения.

Так, совершенно не убедительными выглядят заявления ВОЗ о пятом уровне опасности нынешнего гриппа по шестибалльной шкале. По моим представлениям, перекладывая это на балльную систему оценки землетрясений, при таких баллах болеть должны бы уже пара десятков миллионов человек и сотни тысяч уже должны были бы умереть. Но этого, слава Богу, нет. Зато есть потери доходов мясной промышленности, туризма и т. п. В этой ситуации нужно требовать от ВОЗ пересмотра их оценочных шкал, можно даже было бы предъявить этой организации иски для возмещения тех потерь, которые понесены.

Ruch Obywatelski

Skażony Koszmar

Ruch Obywatelski, 10 August 2009

Komentarz Redakcji: Tekst nie jest nowością, ukazał się 10.08.2009 r. w konsekwencji wydarzeń związanych z wybuchem epidemii ptasiej grypy. Autorzy starają się odsłonić w nim mechanizm umyślnego wywołania śmiercionośnej epidemii i stawiają tezę, że była to próba dokonania ludobójstwa.

Warto pomyśleć nad tym tekstem z kilku powodów:

1. Nie ma czegoś takiego jak "Polski" przemysł farmaceutyczny, bo szemrane towarzystwo opyliło go niemal w całości w lepkie łapki reszty koczowników,
2. Decyzje o tym, co wytwarzane jest w fabrykach leków w judeopolonii zapadają poza jej formalnymi granicami,
3. W każdej chwili może zostać wywołana panika łże-medialna o wybuchu kolejnej epidemii, nawet nie śmiem zgadywać, jak się ona będzie nazywać,
4. Wdrożony zostanie schemat powszechnych szczepień przeciw albo wyimaginowanemu zagrożeniu albo służący bezpośredniemu zabijaniu przy pomocy zastrzyków.

"Program szczepień przeciwko H1N1, gdy tylko zostaje wprowadzony w ten sam schemat, gdzie już zastosowano specjalnie stworzony wirus, staje się tym samym wyraźną próbą dokonania podziału ludzkości na dwie grupy: tych, którzy stracą moc intelektualną, zdrowie i zdolność płodzenia dzieci wskutek zakażonych szczepionek oraz tych, którzy tego nie stracą i dlatego staną się grupą o wyższych cechach".

Opowiastkę o świńskiej grypie przyjąłem z wielkim sceptycyzmem; rozgrywała się ona jak film klasy B – studenci mają przerwę i wyjeżdżają na wycieczkę zagraniczną. Tam łapią wirusa. Potem przytaszczają go do domu. Zaczyna się ogólnoświatowa pandemia. Scenariusz był zupełnie nie do wiary, dlatego od początku wiedziałem, że albo w ogóle nie ma żadnego wirusa i że to wszystko oznacza ściemnianie i szukanie tematu zastępczego, albo że mamy do czynienia z wyprodukowaną z premedytacją epidemią, która została puszczona na żywioł.

Niestety, okazuje się, że mamy do czynienia z tym drugim wypadkiem i że obecnie mamy zupełnie nowego wirusa w rękach. Wcześniej nie mieliśmy z nim do czynienia, a wirusologowie powtarzali "skąd do diabła się to wzięło, sami nie wiemy". Szczegółowe badania wirusa doprowadziły do odkrycia, że zawiera on geny pierwotnej grypy z 1918 roku, ptasiej grypy oraz dwóch nowych wirusów H3N2 pochodzących z Eurazji. Te odkrycia wskazują, że świńska grypa jest w rzeczywistości genetycznie zaprojektowanym wirusem.

Artykuł poniższy jest wynikiem pracy zespołowej w celu zbadania motywów, jakie stały za uwolnieniem go z laboratoriów w środowiska ludzkie, a może być także ostrzeżeniem na przyszłość przed kolejnymi takimi próbami.

Pierwsza próba

W lutym 2009 r., Baxter, czołowy producent szczepionek, wysłał sezonową szczepionkę na grypę do 18 państw zawierającą stężony szczep ptasiej grypy typu H5N1. Gdy rząd Czech wyznaczył czeską spółkę Biotest do przeprowadzenia testów na zwierzętach, okazało się, że coś jest nie tak, bowiem zwierzęta zaczęły padać. Podniesiono alarm i wysłano go wszędzie tam, gdzie wysłana była szczepionka, na szczęście odbyło się to na czas, zanim ją zaaplikowano. Wskutek rozpoczęcia badań nad szczepionką wirus wydostał się z laboratoriów, a w związku z tym, że nikt nie był w stanie przechwycić skażonej produkcji Baxtera, obecnie znaleźliśmy się w samym środku pandemii, która zabiła wiele osób.

Baxterowi nie wyrządzono za to najmniejszej szkody, chociaż nawet ich własny protokół bezpieczeństwa produkcji BSL3 (bio safety level 3) powinien był powstrzymać ewentualne zakażenie. Protokół bezpieczeństwa, zawierający kombinację czynników siły działania oraz zawartości wirusa w zastrzykach, wyraźnie daje dowód na to, że skażenie było celowe, i że w rzeczywistości próba uśmiercenia milionów ludzi została powstrzymana, ponieważ JEDEN kraj zwrócił uwagę na to, co to szczepionka za sobą niesie. Protokół powoduje, że technicznie niewykonalne jest, aby wirus znalazł jakąś ścieżkę, przez którą mógł się wymknąć z działu badawczego do działu produkcji szczepionek, a zatem H5N1 nie mógł się tutaj znaleźć w inny sposób, jak tylko wskutek działania umyślnego.

Można by pomyśleć, że Baxter za popełnienie takiego "błędu” zostanie wyrzucony z biznesu, a zatem…? A że tak się nie stało, rodzi tylko kolejny zestaw pytań, np.: jakim cudem żywy szczep ptasiej grypy wylądował w milionach dawek szczepionki? Dlaczego składniki szczepionki zostały zestawione w taki sposób, że umożliwiły przetrwanie wirusowi w drodze z fabryki do miejsca wykonania szczepienia? Dlaczego Baxter nigdy nie został oskarżony? Zamiast zbojkotowania firmy i skazania jej na niebyt w zgodzie z prawem, WHO nagrodziła Baxtera kontraktem na wykonanie wielkiej ilości szczepionek na "świńską grypę”, które będą rozprowadzane po świecie na jesieni tego roku. Jak u licha mogło do tego dojść?

Sprawa podstawowa

Przejdźmy do innego aspektu szczepionek, sprawy podstawowej tego artykułu, to jest ukazania planu zniszczenia naszych zdolności umysłowych, naszego zdrowia i naszej płodności poprzez zastosowanie masowej kampanii szczepień na całym świecie. Używając specjalnych domieszek zwanych adiuwantami, producenci potrafią zwiększyć ilość możliwych dawek, które da się zrobić na czas sezonu zapadalności na grypę. Jednakże, choć dostępnych jest wiele bezpiecznych adiuwantów, to oni jednak dodają tylko jeden – skwalen, który, jak udowodniono, wywołuje długotrwałą walkę obronną systemu immunologicznego przeciwko samemu skwalenowi, a co w rezultacie powoduje zmniejszenie zdolności płodzenia, obniżenie poziomu umysłowego i skrócenie długości życia.

Skwalen jest ważną cząsteczką naszego ciała. Jest on prekursorem wielu różnych substancji, w tym hormonów, i jest niezbędny dla właściwego funkcjonowania mózgu, płodności oraz odgrywa ważną rolę w chronieniu komórek przed starzeniem się i mutacjami. Wszelkie substancje, jakie mają wpływ na twój naturalny poziom skwalenu mogą mieć znaczący negatywny wpływ na stan twojego zdrowia.

Ponieważ skwalen zostanie wstrzyknięty w obecności patogenu przy szczepieniu na H1N1, spowoduje on reakcję immunologiczną nie tylko na patogen, lecz również przeciw samemu skwalenowi. Skwalen jest cząsteczką prekursora, jaka jest kluczowa dla wytwarzania wielu hormonów, włącznie z wszystkimi męskimi i żeńskimi hormonami popędu płciowego. Skwalen jest również prekursorem wielu receptorów neurochemicznych dominujących w systemie nerwowym, a ze względu na to, że system odpornościowy jest zaprogramowany na atakowanie skwalenu, powoduje to w rezultacie nieodwracalną szkodę o charakterze neuronalnym i neuromięśniowym, co z kolei skutkuje wywołaniem wielu nieodwracalnych zaburzeń, od utraty władz umysłowych i autyzm po znacznie poważniejsze zaburzenia, jak choroba Lou Gehriga i stałe choroby autoimmunologiczne, a nawet możliwe wystąpienie guzów mózgu.

W trakcie niezależnych badań klinicznych, gdy wstrzyknięto szczepionki zaprawione skwalenem zwierzętom doświadczalnym, w wyniku zaburzeń autoimmunologicznych zginęło 14 sztuk z 15 poddanych próbie. Ostatni test przeprowadzony celem weryfikacji wyników, dał ten sam rezultat.

Skwalen pierwszy raz wstrzyknięto z użyciem szczepionki na wąglik podczas I Wojny w Zatoce i wówczas spowodował on trwałą niezdolność do służby wielu żołnierzy, którzy przyjęli zastrzyk, co było skutkiem czegoś, co dzisiaj znamy jako Syndrom Wojny w Zatoce. 95 % żołnierzy, którzy dostali to szczepienie, okazało się tymi, którzy mieli antyciała na skwalen. Niektórzy po przyjęciu zastrzyku pozostali zdrowi i nie mieli antyciał albo nie mogli ich u siebie rozwinąć w naturalny sposób. Żaden z tych żołnierzy, którzy nie otrzymali szczepionki, nie miał antyciał, nawet wśród tych, którzy walczyli w Iraku. Antyciała na skwalen związane były ze śmiercią 6,5 % z grupy poddanej szczepieniu.

W przybliżeniu około rok zajmuje, aby skutki się uzewnętrzniły, gdyż tyle czasu potrzeba zanim system nerwowy i mózg wyczerpią rezerwy skwalenu, którego wtedy zacznie brakować systemowi immunologicznemu i dopiero wtedy również (gdy zabraknie rezerw) zaczyna się wywoływanie uszkodzeń na poziomie komórkowym. Ta zależność i zwłoka w czasie zdejmuje z producentów szczepionek wszelkie ograniczenia i mogą oni negować fakt, że popełniają nadużycia i przestępstwa. Natomiast Kongres idzie im w sukurs uchwalając prawo zapewniające immunitet każdej korporacji, która spowoduje szkody swoimi szczepionkami, a to sprawia, że perspektywa jest coraz gorsza.

Po zbadaniu komponentów szczepionki na grypę typu H1N1, możemy z całą odpowiedzialnością postawić tylko jeden wniosek, że nie jest ona w ogóle przeznaczona do leczenia grypy, lecz całkiem przeciwnie, jest przeznaczona, aby:

1. Obniżyć poziom umysłowy
2. Skrócić długość życia
3. Obniżyć zdolność płodzenia
4. Spowodować liczne zgony.

Bo gdyby wynaleziono ją w innym celu, niż wyżej wskazane, skwalen oraz inne adiuwanty, jakie pominięto przy redakcji tego artykułu, nie byłyby obecne w tej szczepionce. Ponadto, przedmiotem analizy w tym materiale jest tylko skwalen, a my uważamy, że skoro jest wiele innych sposobów, aby wywołać reakcje immunologiczne równie niszczycielskie dla organizmu wskutek zastosowania innych płynnych mieszanin do wstrzyknięcia, a co idzie w parze z niepodważalnym dowodem na celowe wywołanie pandemii przez Baxtera, cała ogólnie rozumiana wiarygodność szczepień jest raz na zawsze skazana na potępienie, zaś pojęcie zaufania do większej społeczności świata medycznego (nie tylko producentów szczepionek) zostało nieodwracalnie zburzone. Baxter winien być wyrzucony z biznesu, a że tak się nie stało, jest czymś absolutnie wartym napiętnowania.

Zaufanie szlag trafił

Poprzez wytworzenie sztuczną metodą pandemii i niszczycielskiej szczepionki, WHO wraz z głównymi producentami przemysłu farmaceutycznego dali nam wyraźny dowód na celową próbę zniszczenia całej ludzkości. W jakim to się stało celu, trudno powiedzieć, ale byłoby bezpiecznie poczynić założenie, że będzie grupa, o której mówiliśmy i która będzie wiedzieć o całym planie w odróżnieniu od tych, którzy zostaną skażeni szczepieniami. W dłuższej perspektywie skutkiem wykonania planu ta niezaszczepiona grupa będzie mieć większą inteligencję i lepsze zdrowie. Program szczepień na H1N1, z uwagi na to, że został wprowadzony w ten sam schemat, w jakim operuje specjalnie wytworzony wirus, okazuje się być wyraźną próbą dokonania podziału ludzkości na dwie grupy – tych, którzy stracą intelekt, zdrowie i sferę seksualną poprzez skażone szczepionki oraz tych, którzy ich nie stracą i staną się w konsekwencji wyższą klasą. Można zatem dojść do wniosku, że aktualnie nie jest bezpieczne przyjęcie JAKIEGOKOLWIEK szczepienia z byle powodu; należy strzec przed nimi szczególnie własne dzieci.

A jeśli uda wam się zobaczyć filmik, jak grube ryby przyjmują szczepienia, pamiętajcie, że nie wszystkie zastrzyki zrobiono jednakowo! ...

Michel Chossudovsky

The H1N1 Swine Flu Pandemic:
Manipulating the Data to Justify a Worldwide Public Health Emergency

Global Research, 25 August 2009
https://web.archive.org/web/20090827112125/http://www.globalresearch.ca/PrintArticle.php?articleID=14901

A Worldwide public health emergency is unfolding on an unprecedented scale. 4.9 billion doses of H1N1 swine flu vaccine are envisaged by the World Health Organization (WHO).

A report by President Obama's Council of Advisors on Science and Technology "considers the H1N1 pandemic 'a serious health threat; to the U.S. – not as serious as the 1918 Spanish flu pandemic but worse than the swine flu outbreak of 1976.":

"It's not that the new H1N1 pandemic strain is more deadly than previous flu threats, but that it is likely to infect more people than usual because so few people have immunity" (Get swine flu vaccine ready: U.S. advisers)

Responding to the guidelines set by the WHO, preparations for the inoculation of millions of people are ongoing, in the Americas, the European Union, in South East Asia and around the World. Priority has been given to health workers, pregnant women and children. In some countries, the H1N1 vaccination will be compulsory.

In the US, the state governments are responsible for these preparations, in coordination with federal agencies. In the State of Massachusetts, legislation has been introduced which envisages hefty fines and prison sentences for those who refuse to be vaccinated. (See VIDEO; Compulsory Vaccination in America?)

The US military is slated to assume an active role in the public health emergency Schools and colleges across North America are preparing for mass vaccinations. (See CDC H1N1 Flu | Resources for Schools, Childcare Providers, and Colleges)

In Britain, the Home Office has envisaged the construction of mass graves in response to a rising death toll. The British Home Office report calls for "increasing mortuary capacity" An atmosphere of panic and insecurity prevails. (See Michel Chossudovsky Fear, Intimidation & Media Disinformation: U.K Government is Planning Mass Graves in Case of H1N1 Swine Flu Pandemic)

Reliability of the Data

The spread of the disease is measured by country-level reports of confirmed and probable cases.

How reliable is this data. Does the data justify a Worldwide public health emergency, including a $40 billion dollar vaccination program which largely favors a handful of pharmaceutical companies? In the US alone, the costs of H1N1 preparedness are of the order of 7.5 billion dollars.(See Flu.gov: Vaccines, Vaccine Allocation and Vaccine Research)

Following the outbreak of the H1N1 swine flu in Mexico, the data collection was at the outset scanty and incomplete, as confirmed by official statements. (See Michel Chossudovsky, Is it the "Mexican Flu", the "Swine Flu" or the "Human Flu"? Michel Chossudovsky Political Lies and Media Disinformation regarding the Swine Flu Pandemic)

The Atlanta based Center for Disease Control (CDC) acknowledged that what was being collected in the US were figures of "confirmed and probable cases". There was, however, no breakdown between "confirmed" and "probable". In fact, only a small percentage of the reported cases were "confirmed" by a laboratory test.

On the basis of scanty country-level information, the WHO declared a level 4 pandemic on April 27. Two days later, a level 5 Pandemic was announced without corroborating evidence (April 29). A level 6 Pandemic was announced on June 11.

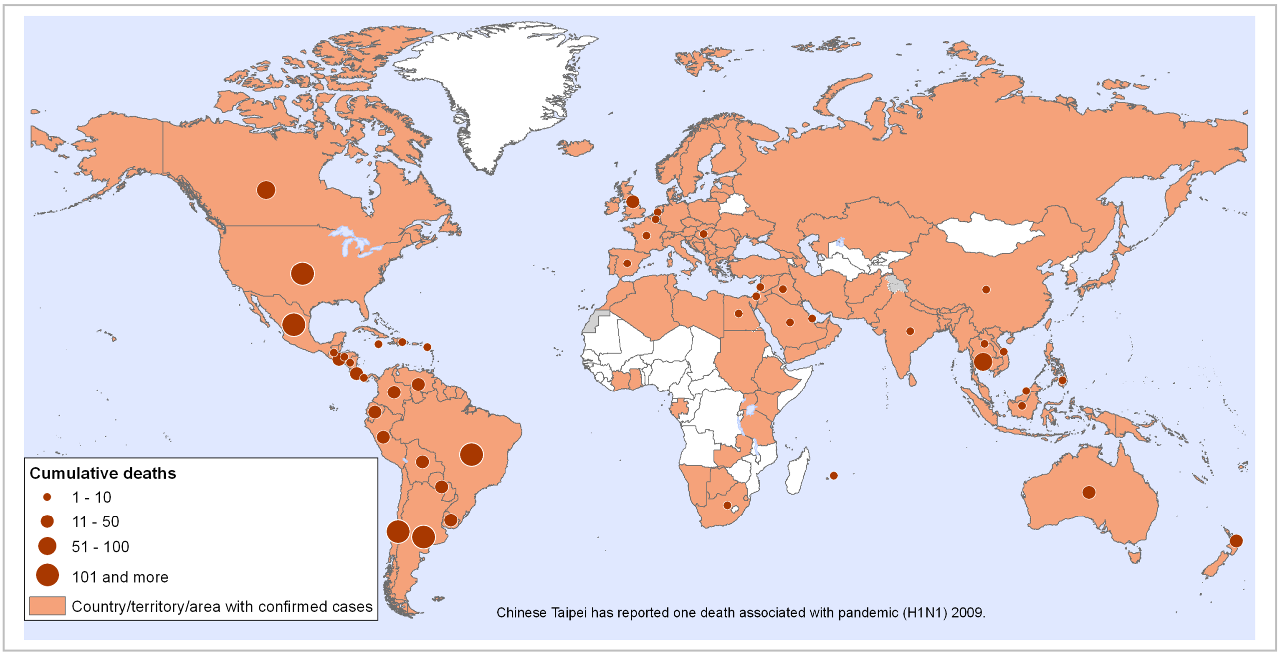
There was no attempt to improve the process of data collection in terms of lab. confirmation. In fact quite the opposite. Following the level 6 Pandemic announcement, both the WHO and the CDC decided that data collection of individual confirmed and probable cases was no longer necessary to ascertain the spread of swine flu. As of July 10, one month after the announcement of the level six pandemic, the WHO discontinued the collection of confirmed cases. It does not require member countries to send in figures pertaining to confirmed or probable cases.

WHO will no longer issue the global tables showing the numbers of confirmed cases for all countries. However, as part of continued efforts to document the global spread of the H1N1 pandemic, regular updates will be provided describing the situation in the newly affected countries. WHO will continue to request that these countries report the first confirmed cases and, as far as feasible, provide weekly aggregated case numbers and descriptive epidemiology of the early cases. (WHO, Briefing note, 2009)

Based on incomplete and scantly data, the WHO nonetheless predicts with authority that: "as many as 2 billion people could become infected over the next two years – nearly one-third of the world population." (World Health Organization as reported by the Western media, July 2009).

The statements of the WHO are notoriously contradictory. While creating an atmosphere of fear and insecurity, pointing to am impending global public health crisis, the WHO has also acknowledged that the underlying symptoms are moderate and that "most people will recover from swine flu within a week, just as they would from seasonal forms of influenza" (WHO statement, quoted in the Independent, August 22, 2009).

The WHO's July 10 guidelines have set the stage for a structure of scantiness and inadequacy with regard to data collection at the national level. National governments of member States of the WHO are not required to corroborate the spread of the A H1N1 swine flu, through laboratory tests.



https://web.archive.org/web/20090827183858/http://www.who.int/csr/don/GlobalSubnationalMasterGradcolour%5F20090813%5F20090819.png

The WHO table (19 Aug 2009, 13:38 GMT) provides the breakdown by geographical region. These figures, as acknowledged by the WHO are no longer based on corroborated cases, since the governments are not required since July 11 to "test and report individual cases". In an utterly twisted logic, the WHO posits that because the not required to test and report individual cases, which are the only means of ascertaining the spread of the virus, that "the number of cases reported actually understates the real number of cases" (See note at foot of Table). The question is: what is being reported by the countries? How do they ascertain that the cases are H1N1 as opposed to seasonal influenza.

The WHO confirms that the above data is based on qualitative indicators:

"The qualitative indicators monitor: the global geographic spread of influenza, trends in acute respiratory diseases, the intensity of respiratory disease activity, and the impact of the pandemic on health-care services."

These qualitative indicators are, according to the WHO, as follows:

See: https://web.archive.org/web/20090827183858/http://www.who.int/csr/don/GlobalSubnationalMasterGradcolour%5F20090813%5F20090819.png

Text Box 1 ...

The entire construct involves a non-sequitur.

In the text box below are the qualitative indicators used. What is being tabulated is 1. the spread of influenza, 2. the spread of respiratory diseases and 3. the impacts on health care services activity.

The spread of the H1N1 swine flu is not being evaluated through any concrete indicator.

An examination of the maps (click links on table below) does not suggest any particular pattern or trend, which might ascertain the spread of H1N1.

For many of the reporting countries the information is not available or indicates no particular trend.

The question is: how can this information reasonably be used to ascertain the spread of a very specific form of influenza, namely A H11N1

...

"Confirmed and Probable Cases" in the US

On July 24, following the WHO July 10 decision to shift from quantitative to qualitative assessments and not to require governments to ascertain the data through lab testing, the Atlanta based CDC also announced that it had discontinued the process of data collection pertaining to "confirmed and probable cases":

"How many cases of novel H1N1 flu infection have been reported in the United States? When the novel H1N1 flu outbreak was first detected in mid-April 2009, CDC began working with states to collect, compile and analyze information regarding the novel H1N1 flu outbreak, including the numbers of confirmed and probable cases of disease. From April 15, 2009 to July 24, 2009, states reported a total of 43,771 **confirmed and probable cases** of novel influenza A (H1N1) infection. Of these cases reported, 5,011 people were hospitalized and 302 people died. On July 24, 2009, confirmed and probable case counts were discontinued. Aggregate national reports of hospitalizations and deaths will continue at this time. (See CDC,CDC H1N1 Flu | Questions and Answers About CDC's Online Reporting)

Instead of collecting data – which would have provided empirical backing to its assessments on how the H1N1 virus was spreading – the CDC announced that it had developed a model "to try to determine the true number of novel H1N1 flu cases in the United States".

"The model took the number of cases reported by states and adjusted the figure to account for known sources of underestimation (for example; not all people with novel H1N1 flu seek medical care, and not all people who seek medical care have specimens collected by their health care provider). ...

Why did CDC discontinue reporting of individual cases? Individual case counts were used in the early stages of the outbreak to track the spread of disease. As novel H1N1 flu became more widespread, individual case counts became an increasingly inaccurate representation of the true burden of disease. This is because many people likely became mildly ill with novel H1N1 flu and never sought treatment; many people may have sought and received treatment but were never officially tested or diagnosed; and as the outbreak intensified, in some cases, testing was limited to only hospitalized patients. That

means that the official case count represented only a fraction of the true burden of novel H1N1 flu illness in the United States. CDC recognized early in the outbreak that once disease was widespread, it would be more valuable to transition to standard surveillance systems to monitor illness, hospitalizations and deaths. CDC discontinued official reporting of individual cases on July 24, 2009.

Biased Predictions

What is the precise nature of the data transmitted by the states to the CDC? The CDC calls for the transmission of "aggregate national reports of hospitalizations and deaths".

If the information is conceptually incorrect or incomplete at the outset, predictions and/or simulations will be inevitably be biased.

Without systematic lab confirmation, it is impossible to specify the nature of the virus because the symptoms of H1N1 are broadly similar to those of common influenza. In other words, do the data collected and transmitted by the states to the CDC confirm cases of H1N1 swine flu or do they indicate the prevalence of seasonal influenza?

The CDC posits that the data sent to them by the states is "underestimated". It then hikes up these figures of "unconfirmed" cases, many of which are cases of seasonal influenza. The "corrected figures" are then inserted into the model:

Using this approach [CDC model], it is estimated that more than one million people became ill with novel H1N1 flu between April and June 2009 in the United States. The details of this model and the modeling study will be submitted for publication in a peer reviewed journal. (Ibid)

The model is then used to predict the spread of swine flu and to justify a national health emergency. "Swine flu could strike up to 40 percent of Americans over the next two years and as many as several hundred thousand could die if a vaccine campaign and other measures aren't successful." (Official Statement of the US Administration, Associated Press, 24 July 2009).

Anybody who is familiar with model building and computer simulations, is acutely aware that if the data and assumptions which are fed into the model are incorrect at the outset, the results will inevitably be biased.

What we are dealing with is a process of statistical manipulation, which has far-reaching implications and which could potentially create an atmosphere of panic, particularly if it is coupled, as in the UK, with announcements that "mass graves are being set up to deal with a rising death toll.

Vaccination

The Atlanta based CDC's model's simulations and predictions as to the spread of H1N1 swine flu are then used to plan the implementation of a nationwide vaccination program.

Based on the model's "predictions", mass vaccination of half of the US population is required, with the possible provision for quarantines under civilian and/or military jurisdiction. In the case of the United Kingdom, confirmed by British press reports, the government has predicted a rising death toll requiring the provision of mass graves.

According to reports, the US government expects to have 85 million doses of the new vaccine by the end of October. In total, the US government has ordered 195 million doses from Big Pharma.

"Recommendation: Priority groups to receive the novel H1N1 vaccine

On July 29, 2009, the Advisory Committee on Immunization Practices (ACIP) – an advisory committee to CDC – recommended that novel H1N1 flu vaccine be made available first to the following five groups (News Release)

Pregnant women Health care workers and emergency medical responders. People caring for infants under 6 months of age. Children and young adults from 6 months to 24 years. People aged 25 to 64 years with underlying medical conditions (e.g. asthma, diabetes). Combined, these groups would equal approximately 159 million individuals." (See Flu.gov: Tests, Vaccines, Medications, & Masks

According to the WHO, Western countries have already ordered one billion doses of the vaccine.

"Northern hemisphere countries have so far ordered more than one billion doses of swine flu vaccine, the World Health Organisation said Tuesday, sparking warnings over shortages," Agence

France-Presse reports. While some countries, including Greece, The Netherlands, Canada and Israel, have ordered enough vaccine to inoculate their citizens, "[o]thers, such as Germany, the United States, Britain and France, have put in orders that would cover between 30 and 78 percent of people," (AFP, August 19, 2009).

The WHO has made similar predictions: "Vaccine makers could produce 4.9 billion pandemic flu shots per year in the best-case scenario", Margaret Chan, Director-General, World Health Organization (WHO), quoted by Reuters, 21 July 2009)

The United Kingdom: "Suspected Cases" versus "Confirmed Cases"

Even prior to the WHO decision to suspend reporting and compilation of confirmed cases, the process of data collection in the UK revealed some highly unusual patterns.

"There are big gaps in UK data on swine flu, many of them because so few virological confirmations of H1N1 seem to be being undertaken anywhere. But virology matters - and if more tests had been done, we might begin to understand why the number of people in hospital for swine flu in England is so much greater than in Scotland." Where have all the virologists gone? | Straight Statistics

In Scotland, the collection of data was based on "confirmed cases" (lab testing), whereas in England it was based on "suspected cases" (no lab testing). In both cases, we are dealing with hospitalization. For the same time period, according to the study, England had 3,906 incident hospitalizations for "suspect swine-flu", compared with Scotland's 43 for "confirmed H1N1".

England has approximately ten times more population than Scotland. On a per capita basis, however, there are 9.1 times more people in England with "suspected H1N1" flu than in Scotland, based on "confirmed cases": 43 confirmed cases in Scotland, 3906 in England (suspected cases), a ratio of more than 1 to 9.

Has the H1N1 epidemic "evolved differently in Scotland and England, in extent and/or timing."? There is no evidence to this effect. Or is this discrepancy of 90 to 1, partially the result of bias in the data for England which is based on "suspected cases". Where have all the virologists gone? | Straight Statistics See also Call for more H1N1 data | Straight Statistics

It is on the basis of these "suspected cases" that unsubstantiated and irresponsible statements are being made by senior government health officials.

What this implies is that the hospital based data on "suspected cases" referred to above, which was already the source of bias is no longer being collected by health personnel.

Self-Categorization

In Britain, the collection of "suspected cases" (which is known to be biased) was abandoned in favor of a system which does not require a diagnosis by a health professional, nor the testing of a lab specimens.

Since the WHO ruling on July 10, establishing new guidelines for data collection, the British authorities no longer focus on hospital based "suspected cases", they are now collecting the data through "dedicated call centres".

They have launched a national service where if you have flu like symptoms, you can call up dedicated call centres or check online whether you have swine flu. So, you don't have to go to your GP, you can access antivirals quickly and don't infect others by travelling around. (Most rapid spread of H1N1 virus in UK)

In Britain, the transition has been from "confirmed cases" (lab confirmation) to "suspected cases" (established by health professional, not requiring testing) to "self categorization"

As the pandemic progresses, the process of data collection becomes increasingly loose and unprofessional. One would normally expect the opposite, that following the announcement of Worldwide level 6 pandemic, that the process of data collection would be developed and improved as means to formulating a public health action plan.

The process of data collection under the National Pandemic Flu Service is now based on "self-assessment" or self-categorization. Anybody who thinks he/she has flu-like symptoms can contact the National Pandemic Flu Service, by telephone ou through the internet, and can receive an antiviral prescription (e.g. Tamiflu) without the intermediation of a health professional and without even seeing a doctor. You can do it on the internet or by calling up the phone help line:

"The [British] National Pandemic Flu Service is a self-care service that will assess your symptoms and, if required, provide an authorisation number which can be used to collect antiviral medication from a local collection point. For those who do not have internet access, the same service can be accessed by telephone"

According to British health sources communicated to this author, persons who receive a prescription for Tamiflu through the National Pandemic Flu Service over the phone or through the National Health Service Telephone Call Service will be categorized and recorded as a "suspected case" of H1N1 swine flu.

Typical symptoms: sudden fever (38C or above) and sudden cough
1. Other symptoms include: Tiredness and chills
2. Headache, sore throat, runny nose and sneezing
3. Stomach upset, loss of appetite, diarrhoea
4. Aching muscles, limb or joint pain
Source: NHS and BBC.

The moment you enter your name into the system over the internet or by phone, which allows you to collect anti-viral medication (e.g. tamiflu), you may be categorized as a suspected or probable case of H1N1. (see the UK National Pandemic Flu Service guidelines in Annex 1 below)

As discussed in the England versus Scotland analysis, there is already a 9 to 1 discrepancy between "suspected" and "confirmed" cases, both of which are hospital based.

The system of data collection in the UK through "self-categorization" has no scientific basis whatsoever. It is totally meaningless, given the fact that the H1N1 has the same symptoms as seasonal influenza. (We have, however, not been able to ascertain at the stage the extent to which the self-assessment information is being tabulated and used to establish trends pertaining to the H1N1 flu pandemic)

The pattern in other countries differs from that outlined in relation to Britain. In the US, a system of testing at the state level still prevails.

Concluding Remarks

Reports from Britain by prominent physicians (to the author) suggest that doctors and epidemiologists in the UK are being threatened. They risk being fired by the National Health authorities if they speak out and reveal the falsehoods underlying the data as well as government statements.

It is essential that physicians, epidemiologists and health workers speak out through their respective associations and refute the statements of government health officials who are tacitly acting on behalf of Big Pharma, as well as denounce the manipulation of the data. It is also important to warn the public on the dangers of untested H1N1 flu vaccines.

What we are dealing with is a big lie. A process of generating fake data which is then used to justify a nationwide vaccination program.

The political and corporate interests behind this Worldwide public health emergency must be the target of citizens' actions.

This public health emergency is not intended to protect humanity.

The World is at the crossroads of a major economic and social crisis. The Worldwide public health emergency serves to divert public opinion from the real crisis which is affecting the World's people. This crisis is characterised by rising poverty and unemployment an the collapse in social services, not to mention a a US-NATO multitrillion dollar high tech "war without borders" which includes the preemptive "first strike" use of nuclear weapons.

The dramatic causes and consequences of the "real crisis" which in real sense threaten the future of humanity must remain unheralded. Both the Economic Crisis and the Middle East Central Asian war are the object of routine and persistent media distortion and camouflage. In contrast, the H1N1 swine flu – despite its relatively mild and benign impacts – is depicted as major "Save the World" endeavor.

Aiming Towards Better Health

How to Orchestrate an Effective Pandemic Campaign for the Flu

Prevent Disease, 1 September 2009
https://web.archive.org/web/20090915185953/http://preventdisease.com/news/09/090109_flu_hype.shtml

From radio, internet, television, newspapers, magazines, outdoor posters, signage and promotions, you cannot escape the flu hype campaigns so diligently pursued by all the malicious agendas at play. How do governments and international agencies effectively orchestrate pandemic campaigns based on fear so that people will listen, believe and obey?

Manipulating data, promoting falsehoods, continually misinforming the public and using all forms of media to publicize "the deceptive plan", are all effective strategies currently being deployed to extend a massive psychological operation to world populations.

The CDC's Role

The use of the Centers for Disease Control and Prevention (CDC) as a front line operation to deceive the U.S. populace has been instrumental in communicating the flu hype. Tom Skinner, spokesman for the CDC stated "we're going to continue to stress that the vaccine is the most important thing that parents can do to protect their children. This H1N1 vaccine should be taken in addition to the seasonal flu vaccine, and not as a replacement for it."

The CDC has even gone to the extent of hosting a swine flu forums offering $50 stipends to those who preregister. Clinical trials are also being set up where human guinea pigs are paid about $500 each for allowing this foreign vaccine material to be injected into their bodies.

Public health expert, Dr. Horowitz has urged an investigation of Dr. James S. Robertson, England's leading bioengineer of flu viruses for the vaccine industry, and avid promoter of U.S. Government funding for lucrative biodefense contracts, along with collaborators at the US Centers for Disease Control & Prevention (CDC). These suspects helped Novavax, Inc., in Bethesda, Maryland, produce genetically-modified recombinants of the avian, swine, and Spanish flu viruses, H5N1 and H1N1, nearly identical to the unprecedented Mexican virus that is allegedly spreading to the United States at the time of this posting. The outbreak was precisely timed to promote the company's new research and huge vaccine stockpiling contracts.

Scientists at the U.S. Centers for Disease Control (CDC) are implicated through collaborations and publications involving private contracts with Novavax, a company that obtains its biosimilars through CDC Influenza Branch director, Ruben O. Donis, and Dr. Rick Bright, previously working with Donis at the CDC, now Novavax's Vice President of Global Influenza Programs.

"Descriptions of this virus is pathognomonic, or diagnostic, of a virus that came from Robertsons circle of friends," Dr. Horowitz charges. No other group in the world takes H5N1 Asian flu infected chickens, brings them to Europe, extracts their DNA, combines their proteins with H1N1 viruses from the 1918 Spanish flu isolate, additionally mixes in swine flu genes from pigs, and then reverse engineers them to infect humans. The end product could only have ended up in Mexico via the United States from Britain in care of the CDC. The CDC had to have sent them to Novavax, where Rick Bright's team is now implicated in a conspiracy to commit genocide - the mass killing of people for profit.

The Orchestrators Play the Same Cards Over and Over

The orchestrators of pandemics have historically used the same tactics to achieve their goals. Incrementalism plays a large part in priming the populace for vaccination programs so that administering them becomes a voluntary process rather than forced. The incremental approach gradually integrates all demographic and psychographic factors such as age, sex, family size, language, culture, education, job responsibilities, geography, religion, and how every company, product and service could affect response. It is inclusive of all scenarios that could detrimentally affect the operation. By experimenting through the decades, the orchestrators have learned the best psychological tactics through trial and error.

In 1976, another "Swine Flu" fiasco and fraud was perpetrated. A solitary soldier in New Jersey collapsed and died following a reaction to an "experimental" vaccine while completing an intense physical forced march exercise at Fort Dix. Immediately, the CDC swung into action, declaring the first nationwide Swine Flu Pandemic. Providentially, of course, the CDC just happened to have 200+ millions doses of swine flu vaccine already stockpiled, prepared with attenuated (live, yet weakened) viruses and experimental adjuvants.

President Gerald Ford, (with proven ties to Big Pharma and Nixon's covert viral weapons labs also a key member of the "Warren Commission's" obfuscation of the JFK murder) rolled up his sleeves on national TV and dutifully took the vaccine. 40 million vaccines were given to naïve American human guinea pigs. A rash of auto-immune disorders (Guillain-Barre Syndrome GBS, and lupus) as well as a large number of deaths were immediately attributed to the vaccine, and the mass vaccination campaign was halted. (What happened to the other 140 million vaccines, one may ask?)

In 1979, the television news magazine 60 Minutes did a documentary investigation on this travesty-for-money scandal. Against all odds and the threats of Big Pharma, the objectively fair 60 Minutes program aired one time. There was no follow-up story. No criminal indictments were ever issued. There was no mass-murder-for-hire trial. As a result, America has largely forgotten the 1976 swine flu scandal! 60 Minutes story – links do not work ...

The only way a modern "swine flu pandemic" can actually materialize is by injection of certain live viruses via vaccine needles. Make no mistake, the world is not experiencing a true pandemic explosion at this time but it most assuredly will when and if the planned mass influenza vaccinations are completed worldwide. The vaccine is and will always be the pandemic, not the flu.

=> https://web.archive.org/web/20090821070753/http://preventdisease.com/news/09/081809_swine_flu_hype.shtml

The deadly 1918 *Influenza Pandemic* was the direct result of live-virus-contaminated Typhus Fever Vaccines mandatorily given to U.S. and Allied military personnel during World War I. These deadly typhus fever vaccines were manufactured by John D. Rockefeller's research labs and Chinese pharma factories. The vaccine "seed stock" consisted of viruses harvested from human typhoid fever patients, cross-injected into swine herds to create increased "seed stock", and then injected into chicken and turkey eggs for further incubation of the pathogens. The final, harvested "vaccine material" then was injected into hundreds of millions of human veins. The result was a massive 'pandemic' that claimed the lives of as many as 50 million people worldwide.

Manipulate the Data to Suit the Objective

Following the outbreak of the H1N1 swine flu in Mexico, the data collection was at the outset scanty and incomplete, as confirmed by official statements.

=> https://web.archive.org/web/20090915185953/http://preventdisease.com/news/09/050409_flu_hype.shtml

The CDC acknowledged that what was being collected in the US were figures of "confirmed and probable cases". There was, however, no breakdown between "confirmed" and "probable". In fact, only a small percentage of the reported cases were "confirmed" by a laboratory test.

On the basis of scanty country-level information, the World Health Organization (WHO) declared a level 4 pandemic on April 27, 2009. Two days later, a level 5 Pandemic was announced without corroborating evidence (April 29, 2009). A level 6 Pandemic was announced on June 11, 2009.

There was no attempt to improve the process of data collection in terms of lab confirmation. In fact quite the opposite. Following the level 6 Pandemic announcement, both the WHO and the CDC decided *that data collection of individual confirmed and probable cases was no longer necessary to ascertain the spread of swine flu.* As of July 10, 2009, one month after the announcement of the level six pandemic, the WHO discontinued the collection of confirmed cases. It does not require member countries to send in figures pertaining to confirmed or probable cases. According to a WHO briefing note:

WHO will no longer issue the global tables showing the numbers of confirmed cases for all countries. However, as part of continued efforts to document the global spread of the H1N1 pandemic, regular updates will be provided describing the situation in the newly affected countries. WHO will continue to request that these countries report the first confirmed cases and, as far as feasible, provide weekly aggregated case numbers and descriptive epidemiology of the early cases. – July 10, 2009.

Based on incomplete and scantly data, the WHO nonetheless predicts with authority that: "as many as 2 billion people could become infected over the next two years – nearly one-third of the world population." (World Health Organization as reported by the Western media, July 2009).

The statements of the WHO are notoriously contradictory. While creating an atmosphere of fear and insecurity, pointing to an impending global public health crisis, the WHO has also acknowledged that the underlying symptoms are moderate and that "most people will recover from swine flu within a week, just as they would from seasonal forms of influenza" (WHO statement, quoted in the Independent, August 22, 2009).

The WHO's July 10 guidelines have set the stage for a structure of scantiness and inadequacy with regard to data collection. National governments of member states of the WHO are not required to corroborate the spread of the H1N1 swine flu, through laboratory tests. Thus, junk science is validating every flu and pandemic policy dictated by the WHO.

Malicious Recommendations by Those in-the-Know

Medical care professionals and front line emergency workers worldwide are being told to be the example and receive the vaccine first to demonstrate its assumed safety to the public. After all, how will the public ever be convinced to take the vaccine if the medical community has refused. The requirement is now part of emergency regulations in several countries such as the U.S., Canada and several countries of the EU such as France. The governments of these countries are coercing all front line workers to get the flu vaccine – and that it be a requirement for employment.

Modern medical practitioners, including some well-meaning osteopaths, would have the world believe the myth that vaccines containing attenuated (weakened) live viruses cannot cause the viral disease conditions they are targeting. The scientific premise for this misconception is non-existent.

The orchestrators of the pandemic, including the CDC, are now recommending that to maximize safety, a "duplex" vaccination will be necessary. A duplex vaccination basically involves a two-shot series. The first shot consists of a very weak, highly attenuated dose of the live virus.

This is intended to create an initial immune response patterning the specific virus injected. Within a couple of weeks of the 1st shot, a booster shot is given. The booster shot has only lightly attenuated, or even full strength viruses in the injection. This 2nd shot is then intended to create a full-strength immune system response in the human subject.

This is, at the very least, bad science and borders on insanity for self-evident and fairly obvious reasons. By their own admissions, the National Institutes of Health (NIH) scientists in their various writings have declared that the level of potency of these reversed engineered viruses show abnormal, almost random tendencies in their attenuated states. Nobody really knows what will happen over time as the inevitable "genetic drifts" occur. It is a literal crap shoot. It is highly probable that even the highly attenuated franken-viruses can swiftly regain their full potency even in the presence of

ether and formaldehyde. Secondly, the full-strength booster shot viruses could just as easily "drift" into something much more deadly than the "original' recombinant virus that it is targeting.

So you have the NIH, WHO, CDC and dozens of intergovernmental agencies who have at several levels contradicted themselves by downplaying the summations of "real science" by promoting the lies based on "junk science", even if it opposes relevant and credible conclusions by many of their own scientists.

Keep in mind that scientists responsible for this pandemic are not stupid. They know the facts, and therefore it can only be concluded that this entire affair is following the Modus Operandi of the medical elite since the 1920 engineered smallpox epidemics. It is all being orchestrated by eugenicists for money and the social and geographical restructuring of the "human herd".

The Philadelphia Inquirer philly.com

Michael Fumento

Flu forecast is based on suspect data
There is no solid evidence indicating that H1N1 will meet dire projections

The Philadelphia Inquirer (Philadelphia, PA), 2 September 2009, 181st, N 94, p. A15
https://www.newspapers.com/image/199514706/?terms=%22with%20enormous%20numbers%20of%20deaths%20and%20illness%22&match=1

The President's Council of Advisors on Science and Technology issued an alarming report on swine flu last week. A typical front-page article about it began, "Swine flu could infect half the U.S. population this fall and winter, hospitalizing up to 1.8 million people and causing as many as 90,000 deaths."

But the council's "plausible scenario" involving those alarming figures is based on three main assumptions, and all three are highly suspect.

First, the report says that "based on past pandemics," a sharp increase in infections "is likely ... starting in September and peaking in October." That's important, because the first shipments of vaccine aren't expected until mid-October.

The problem is that swine flu isn't comparable to those past pandemics. As I wrote in June, it's only called a pandemic because the World Health Organization changed its definition of the term so that "enormous numbers of deaths and illness" are no longer required.

Furthermore, true pandemics have been severe because the viruses involved were alien to our immune systems. But H1N1 virus, of which swine flu is a variety, "has been circulating every year since 1977," noted Peter Palese of Mount Sinai School of Medicine in New York, a member of the president's council. It's consistently part of the seasonal-flu vaccine. The swine flu variety is different in some ways, but this is "something our immune systems have seen before," Palese said.

In fact, older people seem especially protected, apparently from exposure to a strain that circulated before 1957. That helps explain why swine flu disproportionately afflicts younger people.

Palese, who is none too happy with the council's report, calls an October peak "highly hypothetical." James Chin, a professor at the University of California, Berkeley, and former WHO epidemiologist, is even more skeptical. "Just six weeks from now, about a quarter of the U.S. population will have to have been infected, or close to an average of two million infections per day," he noted. It took almost five months for the flu to reach an estimated two million infections.

Faulty figures

A second suspect assumption in the report is that, in the absence of a vaccine, swine flu will infect vastly more Americans – 30 to 50 percent of the population – than seasonal flu does. Why? "Because most of the population lacks significant immunity to a new pandemic strain," says the report. Once again, this overstates the newness of the virus.

The report's third dubious assumption is that the rate of death from swine flu "appears to be similar to that of seasonal flu. There's no source for this claim in the report, so I contacted Dr. Harold Varmus, president of Memorial Sloan-Kettering Cancer Center in New York and a co-chairman of the president's council. In an e-mail, he cited figures from the British government and two journals, BMJ and Eurosurveillance.

The U.K. figures were described as a worst-case scenario. The rates reported by BMJ came from the United States, Mexico, and three other areas; the high end was from Mexico, the U.S. rate was far lower, and those from the other areas were lower still. Portraying them as a range for the United States, as the council report did, is mislead-ing. Finally, the figures attributed to Eurosurveillance come from four different sets of data. Three of these have maximum death rates far below the council's minimum, and the fourth barely exceeds the council's minimum estimate.

Worried well

On the other hand, comparing current U.S. swine flu deaths (about 550) to the number of estimated infections (two million) suggests that the virus is far less lethal than seasonal flu. A new New York City estimate suggests seasonal flu is 10 to 40 times more deadly.

Chin noted that Australia is having its flu season now. But with swine flu cases having peaked in July, and with no swine-flu vaccine, the government is reporting a flu epidemic not discernibly worse than in recent years. Indeed, swine flu "appears to be replacing the current seasonal H1N1 virus," meaning there could be fewer deaths. Chin told me, "My bet is that the coming [U.S.] season will not be too severe – at or below that of a usual flu season."

The only realistic aspect of the scenario put forward by the council is that emergency facilities could be swamped. But rather than with truly sick people, it will be with the mildly ill and the worried well – as happened during the media fright fest last spring. This time, much of the panic will be due to the council's self-fulfilling prophecy.

Peter Doshi

Calibrated response to emerging infections

BMJ, 3 September 2009; 9; 339: b3471-b3471
http://www.bmj.com/cgi/content/full/339/sep03_2/b3471

WHO has revised its definition of pandemic flu in response to current experience with A/H1N1. Peter Doshi argues that our plans for pandemics need to take into account more than the worst case scenarios.

The current flu pandemic raises a public health policy question that could have been asked after the emergence of severe acute respiratory syndrome (SARS): what is the proper response to clinically mild or epidemiologically limited (small number) outbreaks caused by new viruses? Over the past four years, pandemic preparations have focused on responding to worst case scenarios. As a result, officials responded to the H1N1 outbreak as an unfolding disaster. Measures were taken that in hindsight may be seen as alarmist, overly restrictive, or even unjustified. Assumptions about the nature of emerging infections along with advanced laboratory surveillance have changed the way we understand epidemics and we need a new framework for thinking about epidemic disease.

Predictions that missed the mark

Before the arrival of novel A/H1N1 virus, pandemics were said to occur when a new subtype of influenza virus to which humans have no immunity enters the population, begins spreading widely, and causes severe illness.[1, 2] Reference was often made to the catastrophic pandemic of 1918 and the ongoing threat of highly pathogenic avian influenza H5N1 that has killed over half of the 456 people with recorded infection since 1997. Without proper preparation, "The loss of human life even in a mild pandemic will be devastating, and the cost of a world economy in shambles for several years can only be imagined," one highly cited article concluded in 2005.[3] The large sums of public money spent on pandemic preparedness (over $7bn (£4bn; €5bn) in the US) underlined the seriousness of the threat, and often repeated phrases such as "not a question of IF a pandemic will happen, but WHEN"[4] characterised the next flu pandemic as a high probability, high consequence event.

But the 2009 pandemic, taken as a whole, bears little resemblance to the forecasted pandemic. Pandemic A/H1N1 virus is not a new subtype but the same subtype as seasonal A/H1N1 that has been circulating since 1977. Furthermore, a substantial portion of the population may have immunity. The US Centers for Disease Control and Prevention (CDC) found that 33% of those aged over 60 had cross reactive antibody to novel A/H1N1,[5] which may explain why cases have been rare in elderly people.

There is also far less certainty today regarding the severity of the threat of pandemic flu. Experts are unsure that the 2009 pandemic – which the World Health Organization presently characterises as moderate[6] – will be any worse than seasonal flu.[7,8,9] Since the emergence of novel A/H1N1, descriptions of pandemic flu (both its causes and its effect) have changed to such a degree that the difference between seasonal flu and pandemic flu is now unclear (table ⇓).[10] WHO, for example, for years defined pandemics as outbreaks causing "enormous numbers of deaths and illness",[10] but in early May, removed this phrase from the definition.[11]

Changing views of pandemic flu, before and after emergence of influenza A/H1N1 virus

Aspect	Before A/H1N1	Since A/H1N1
One line summary	WHO 2003-9: "An influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in epidemics worldwide with enormous numbers of deaths and illness".[10]	WHO: "An influenza pandemic may occur when a new influenza virus appears against which the human population has no immunity".[10]
Virus and immunity	WHO 2005:"Most people will have no immunity to the pandemic virus".[1]	WHO: "The vulnerability of a population to a pandemic virus is related in part to the level of pre-existing immunity to the virus".[12]
	US CDC 1997: "When antigenic shift occurs, the population does not have antibody protection against the virus"[13]	US CDC: "Cross-reactive antibody [to A/H1N1] was detected in 6%-9% of those aged 18-64 years and in 33% of those aged >60 years".[5]
Impact (health, social, economic)	WHO 2005: "Large numbers of deaths will occur . . . WHO has used a relatively conservative estimate—from 2 million to 7.4 million deaths . . . Economic and social disruption will be great"[1]	WHO: "H5N1 has conditioned the public to equate an influenza pandemic with very severe disease and high mortality. Such a disease pattern is by no means inevitable during a pandemic. On the contrary, it is exceptional".[14]
	CDC 1997: "The hallmark of pandemic influenza is excess mortality"[13]	CDC: "There are some pandemics that look very much like a bad flu season"[8]
	Canada 2006: "An influenza pandemic results if many people around the world become ill and die from such a [new form of influenza] virus"[15]	Canada: "An influenza pandemic does not necessarily cause more severe illness than seasonal influenza"[9]

On 29 April 2009, one week after news of the outbreak first surfaced, WHO declared a phase 5 pandemic alert (the highest threat level short of global pandemic), urging all countries to "immediately activate their pandemic preparedness plans".[16] Epidemiological information at this time was mixed, suggesting a severe disease in Mexico but mild everywhere else. Actions were thus taken in an environment of high public attention and low scientific certainty.[17,18] Some countries erected port of entry quarantines. Others advised against non-essential travel to affected areas. Some closed schools and businesses. Many held daily press briefings. The wisdom of many of these actions, particularly in response to what has largely been a clinically mild illness, will undoubtedly be debated in the future. What these actions more clearly show, however, is that the public health response to, as well as impact and social experience of a pandemic, is heavily influenced by longstanding planning assumptions about the nature of pandemics as disaster scenarios.

Aiming Towards Better Health

Junk Science and Contradictions Dominate WHO Pandemic Statements and Policies

Prevent Disease, 8 September 2009
https://web.archive.org/web/20090915190037/http://preventdisease.com/news/09/090809_swine_WHO_junk_science.shtml

The World Health Organization (WHO) claims that by employing their monitoring standards on outbreaks from different parts of the world, they are able to obtain sufficient information to make tentative conclusions about how the influenza pandemic might evolve in the coming months. Much of the clever phrasing on the WHO website is convincing enough to conceal the fact that all their pandemic policies on response and preparation recommendations are based on pure speculation and junk science.

More and more investigations on the flu pandemic hype are exposing the malicious intent by the agencies involved. The hype which has been so masterfully publicized by the WHO, CDC and other government agencies, is simply an evolving perpetual motor of deception.

Some of the myths propagated by the WHO are as follows:

WHO Claim: H1N1 is now the dominant virus strain

The WHO claims that the evidence from multiple outbreak sites demonstrates that the H1N1 pandemic virus has rapidly established itself and is now the dominant influenza strain in most parts of the world.

This is extremely deceptive of the WHO since they admit they are routinely re-categorizing a large number of cases of common influenza as H1N1 swine flu. The WHO stated in a briefing note that the "…increasing number of cases in many countries with sustained community transmission is making it extremely difficult, if not impossible, for countries to try and confirm them through laboratory testing. Moreover, the counting of individual cases is now no longer essential in such countries for monitoring either the level or nature of the risk posed by the pandemic virus or to guide implementation of the most appropriate response measures. ”

They also admit that:

- they will not collect data on the spread of H1N1 based on systematic lab confirmation.
- they will discourage national health officials to conduct detection and laboratory confirmation, while also pressuring the countries' public health authorities to duly deliver to the WHO on a weekly basis the data on H1N1 cases.
- they will only refer to "confirmed cases”. They do not distinguish between confirmed and non-confirmed case. It would appear that the "non-confirmed” cases are categorized as confirmed cases and the numbers are then used by the WHO to prove that the disease is spreading.

Reality: Since the swine flu has the same symptoms as seasonal influenza, the widespread incidence of the common flu is being used to generate the confirmed case H1N1/swine flu reports delivered to the WHO. Therefore, without laboratory evidence, it is impossible (scientifically or otherwise) for the WHO to ascertain any reliable evidence that H1N1 is the dominant virus strain. They routinely use such junk science in dealing with the body of pandemic facts and truths.

WHO Claim: Pandemic flu is not the same as seasonal influenza

They claim that there are differences between patterns of illness reported during the pandemic and those seen during seasonal epidemics of influenza. Specifically, they imply that age groups affected by the pandemic are generally younger than those of seasonal influenza.

The WHO is knowingly misleading the public with their claims. On their own website, they specify that "yearly influenza epidemics can seriously affect all age groups." Moreover, by insisting that "most of the severe cases and deaths have occurred in adults under the age of 50," they are specifically targeting populations with the largest demographic age group. Their intention is to endorse the greatest compliance for public administration of vaccines and the highest profits to the pharmaceutical industry. Without any scientific evidence, they promote these assumptions and advertise their fictitious data and opinions as facts.

The symptoms of seasonal influenza are known to be quite mild for the majority of the population. Coincidentally, the WHO continues to define the severity of the H1N1 virus as an illness requiring neither hospitalization nor even medical care. Most cases are having mild symptoms that clear up on their own, very much like seasonal influenza. These types of contradictory statements are littered throughout the WHO literature and their policies.

Reality: There is no substantive or credible nature to this claim since the WHO will not collect data on the spread of H1N1 for ANY age group based on systematic lab confirmation. The fact that they are not distinguishing between confirmed and non-confirmed cases strongly translates this claim into pure conjecture.

WHO Claim: Pregnant Women are a vulnerable group

According to the WHO, there is an increased risk of the pandemic flu during pregnancy which is well-documented across countries. They further state that this risk takes on added significance for this virus since it preferentially infects younger people.

Pregnant women have been identified as being at high risk of complications resulting from H1N1 flu, following publication of research in the Lancet medical journal in July. As a result, officials on both sides of the Atlantic have identified mothers-to-be as priority cases for the fast-tracked vaccine, despite the fact that relatively nothing is known about the possible side effects of the vaccine on unborn babies.

=> "Give pregnant women priority for swine flu vaccine, study urges". – The Guardian, 29 July 2009. https://www.theguardian.com/world/2009/jul/29/swine-flu-pregnant-woman-lancet

=> Jamieson D.J., et all. H1N1 2009 influenza virus infection during pregnancy in the USA. – The Lancet, 29 July 2009, 374(9688): 451–458 https://www.thelancet.com/pdfs/journals/lancet/PIIS0140-6736(09)61304-0.pdf

Just as there was no evidence of the avian flu virus mutating to cause a pandemic, there is also no evidence of any mutagenic process involved in the H1N1 swine flu virus. Talmage Holmes, a relationship manager for the Centers for Disease Control and Prevention (CDC) in Columbus, Ohio, states that pregnant women should not have any special worries. "Pregnant women are at no greater risk than others." says Dr. Holmes. "Until there has been mutation or re-assortment of the avian flu virus' genetic material, the risk to all humans is very low."

Reality: To date, there are NO well-documented case studies in any country that establish pregnant women as having an increased risk for pandemic flu. Globally, the effects of the H1N1 swine flu virus have been relatively mild and it has behaved no differently than any other influenza virus. The WHO is well aware of this fact despite its tireless effort to advocate the opposite by manipulating the data. By targeting pregnant women, the WHO is attempting to instigate fear which they hoped would activate the maternal protective reponse in women who would then opt for the vaccine. In reality, it has accomplished the opposite effect. According to the results of recent polls on mumsnet.com, just 6% of pregnant women say they definitely will take the swine flu vaccine to protect their children.

WHO Claim: Regulatory procedures for pandemic vaccines are rigorous and do not compromise safety.

According to the WHO, they attempt to shorten the time between the emergence of pandemic viruses and the availability of safe and effective vaccines.

For example, to fast-track vaccines, they only require minimal data from manufacturers who already have licensed influenza vaccines if they intend on using the same manufacturing process for pandemic vaccines.

One such method used in Europe is to conduct advance studies using a "mock-up" vaccine that contains an active ingredient for an influenza virus that has not circulated recently in human populations.

When testing these mock-up vaccines, it is very possible to release the novel influenza virus into the population, as its purpose is to "mimic the novelty of a pandemic virus" and "greatly expedite regulatory approval."

Why are the potential effects of releasing a viral strain to which humans have acquired NO immunity for? This alone is an extremely dangerous practice which leaves gaping holes in the safety protocols at the WHO.

They also claim that fast-tracked vaccines will require post-inoculation testing to validate vaccine safety. "Time constraints mean that clinical data at the time when pandemic vaccines are first administered will inevitably be limited. Further testing of safety and effectiveness will need to take place after administration of the vaccine has begun." In other words, the first groups or populations treated with the vaccine are human experiments.

Reality: This clearly demonstrates the irresponsible nature of WHO pandemic policy. The fast-tracked pandemic vaccines they attempt to regulate and approve are those with the least safety testing prior to being used. This potentially gives vaccine manufacturers the green light to develop medically approved poison with no regard to human health. They compromise safety in every respect.

WHO Claim: Influenza vaccines have been used for more than 60 years and have an established record of safety in all age groups.

Reality: For the last 60 years, influenza vaccines have contained combinations of the following: Ammonium sulfate, polysorbate 80, thimerosal, formaldehyde, egg or chicken protein, antibiotics and aluminum, among others. Each of the above ingredients are toxic and pose a scientifically established hazard when injected into the human body. The long-term adverse effects of vaccines and their additives are no longer questioned by hundreds of internationally recognized scientists. The facts are clear, the risk of vaccines outweigh any benefits to human health.

=> The risks of vaccines currently outweigh any benefits to human health. – Prevent Diseases, July 2007.
https://web.archive.org/web/20090909013004/http://preventdisease.com/home/tips78.shtml

Inoculations are the true weapons of mass destruction, and have absolutely no correlation to disease prevention. Vaccines have caused millions of chronic health ailments and deaths in the last 60 years. The statements made by the WHO claiming "an established record of safety in all age groups" is at the very least outlandish and criminal.

=> Inoculations are the true weapons of mass destruction. – Prevent Diseases, 29 June 2009.

Зачем разводят большое свинство вокруг свиного гриппа
Пятый месяц бродит по планете свиной грипп

Комсомольска Правда, 17 сентября 2009, 6:00
https://www.kp.ru/daily/24362.3/546587/

В этой пандемии по-прежнему много загадок. Что стоит за "новым ужасным" гриппом и есть ли от него спасение?

Я обратился к независимому эксперту, более четверти века занимающемуся проблемами биологической безопасности, Михаилу Супотницкому.

Не так страшна "испанка", как ее малюют?

- *Михаил Васильевич, в народе гуляет версия*, что "свинский" вирус - биологическое оружие. Что скажет военный ученый-микробиолог?

- Вирус гриппа никогда серьезно не рассматривался как потенциальный агентбиологического оружия.

- *А не кажется вам странным*, что первая вспышка напасти, которой нас всех запугали, случилась в 1976 году в США, на военной базе Форт-Нокс?

- Случайное сочетание событий. Там было подсобное хозяйство, свиньи, масса народа в казармах.

- *Н-да... Не такого ответа я ждал* от бывшего полковника Российской армии.

- Биологическое оружие ликвидировано в соответствии с "Конвенцией о запрещении разработки, производства и накопления запасов бактериологического (биологического) и токсинного оружия и об их уничтожении", подписанной США в 1972 году. Не там копаете, товарищ журналист!

- *Зато ваши коллеги*, военные вирусологи США, хорошо знали, где копать. В вечной мерзлоте откопали тела жертв ужасной "испанки" и реанимировали смертоносный вирус. Отрицать не будете, товарищ полковник?

- Да, специалисты Института патологии армии США "откопали" на Аляске генетическую информацию вируса, вызвавшего пандемию "испанки". В 1918 году смертность от гриппа в эскимосском поселке Бривиг-Миши была 85%(показатель чуть ниже смертности от легочной чумы!), вот поэтому они там и занялись поисками этого вируса. Согласен и с тем, что они искали нечто такое, что можно изучать в военных целях.

- *И использовать на войне*?

- Не только! Эти исследования расширяют представления о причинах смертоносных пандемий. Военные надеялись найти супервирус, гены которого можно использовать для конструирования других опасных вирусов. Они восстановили геном вируса "испанки" по тем фрагментам его РНК, что нашли в телах погибших. Это блестящая и дерзкая научная работа! Но результаты обескуражили их самих. Оказалось, что вирус "испанки" МЕНЕЕ ОПАСЕН, чем циркулирующие ныне на бытовом сленге называемые вирусами "сезонного гриппа"!!!

- *Когда они обнаружили*, что вирус не так страшен, как его малюют?

- В 1996 году!

- *Почему в 1998 году число жертв* "испанки" повысили с 20 миллионов до 40-60? А ныне говорят о 100 миллионах!!!

- Уже готовились к мировым информационным войнам XXI века. Информационная война - массированный вброс безграмотной лжи в общественное сознание. Кого сегодня удивят 20 миллионов? 100 миллионов жертв - совсем другое дело. А завтра назовут 200. И потребуют денег на вакцину, на миллиард доз.

"Испанка" погубила максимум 20 миллионов. И это не так много, если учесть, что тогда переболели гриппом 550 млн. - почти треть населения планеты.

- *Может, подсчеты в ту пору были необъективными*?

- Это сегодня цифры берут с потолка. Труды ученых, подсчитавших потери в начале 20-х годов, очень обстоятельны, основаны на большой и разнообразной статистике. Всего один пример. 1921 год. Гражданская война, холера, тиф, "испанка"... Ростовский эвакопункт: сотни вагонов и бараков для больных, которых снимают с поездов, вывозят с фронта, лечат, проводят профилактические, противоэпидемические мероприятия.

Врачи издают "Эпидемический сборник. Работы научной комиссии по изучению инфекционных болезней при Ростовском эвакопункте" с подробным описанием эпидемий по разным категориям населения. Уникальный документ врачей-подвижников той эпохи. Не для количества "научных работ" он был сделан, а для нас, потомков. Чтобы мы знали статистику, клинику, патанатомию, психиатрию свирепствовавших тогда болезней, успехи и неудачи врачей в борьбе с эпидемиями. Кстати, клиника и патанатомия "испанки" в ростовском сборнике хорошо описана. Где мы видим подобные труды сейчас? Сегодня статью на 8 страниц с двумя табличками по 30 человек подписывают, а у каждого титулов и званий на страницу! В начале XX столетия такое бы и в кошмарном сне никому не приснилось, так как показалось бы неприличным.

- *Но ведь в пересмотре числа жертв* "испанки" участвовала ВОЗ!

- Когда-то это действительно был авторитетный врачебный орган. Но в последние годы ВОЗ все больше вызывает у меня ассоциацию с какой-то сетевой структурой.

- *Главный санитарный врач* РФ Геннадий Онищенко и вовсе назвал ВОЗ маркетинговым отделом известной фармацевтической фирмы.

- Если бы она только рекламировала дорогое лекарство от свиного гриппа, было бы еще полбеды. Посмотрите, какие меры ВОЗ предложила нам для борьбы с ВИЧ-инфекцией. На момент принятия в 1995 г. закона "О предупреждении распространения в Российской Федерации заболевания, вызываемого вирусом иммунодефицита человека", ВИЧ/СПИД-пандемия уже 15 лет свирепствовала в мире. Ее опасность была совершенно очевидна, накопился и неудачный опыт борьбы. Логично было обобщить его и задуматься, что можно, а что нельзя перенести на российскую почву. Нет! Главное, что требовали чиновники ВОЗ - исключить из противоэпидемических мероприятий любое обязательное тестирование на ВИЧ-инфекцию. Якобы это нарушает "права человека".

Представляете: человек не предупрежден о своем статусе, не получает соответствующее лечение, его жизнь существенно сокращается, он, кстати, может невольно заразить близких, считая себя абсолютно здоровым. И это ВОЗ называет "правами человека"?! Если в 1995 году в России было около тысячи ВИЧ-инфицированных, то на сегодня инфекция поломала жизнь уже почти 500 тыс. россиян. Это цифра официальная, т. е. результат случайной выборки. Реальная цифра значительно больше. Заметьте, ВОЗ помалкивает.

- *Понимаю ваш гнев*, Михаил Васильевич, но мы отвлеклись от темы разговора.

- Вовсе нет! Когда спросите меня о спасительной вакцине против свиного гриппа, о которой ныне кричат на всех углах?

- *Обязательно, обязательно спрошу*!

- Я объясню, чем может быть чревата грядущая массовая вакцинация для сотен тысяч ВИЧ-инфицированных соотечественников.

Бизнес на эпидемиях

- *Еще совсем недавно ВОЗ*, наши академики пугали Ужасом "атипичной пневмонии", затем ужасом птичьего гриппа. Вирус, вызвавший и ту и другую болезнь, они объявляли потомком "испанки". Пронесло. Теперь свиной грипп объявлен ее родственником. Опять Ужас, ужас, ужас!

- Особенно старался академик Киселев, помню, как же .... А дальше следует: "Дайте денег, и мы создадим вакцину..." У них сегодня все вирусы - потомки "испанки". Даже коронаровирус, вызвавший атипичную пневмонию, и тот побывал в этой роли!

Не удивлюсь, если завтра корь объявят "потомком". Им ведь без разницы, кто чей потомок! В нашей науке нет такого понятия, как "научная репутация". "Испанка" - бизнес, а "вирус" (не важно, какой!) - бренд для этого бизнеса.

Возбудители пандемии "испанки" и нескольких сот случаев "птичьего гриппа" среди людей - это вообще разные ветви вирусов гриппа. И с чего вообще взяли, что он "потомок"? Академики всерьез заявляли, что вирус "испанки" якобы имеет происхождение от вируса птичьего гриппа на основании сходства нуклеотидных последовательностей. Это безграмотность и подлог одновременно. Гены древнего происхождения всегда имеют между собой сходства у разных видов. Вы же, например, не поверите, если я скажу, что человек произошел от гороха?

- *Конечно, не поверю!*

- Но гены гороха и человека, кодирующие белки, участвующие в расплетании цепей ДНК, идентичны. Однако, на этом основании не пересматривают эволюционное учение в части, касающейся происхождения человека. Повторяю еще раз, все "авторитетные" заявления, будто бы вирус, вызвавший "испанку", является производным от птичьего гриппа и что все пандемии на планете якобы были следствием распространения вируса птичьего гриппа - это чистейшей воды подлог, рассчитанный исключительно на широкую публику, не знакомую с научными исследованиями.

Руководители военных исследований в США по расшифровке генома вируса "испанки" Таунбенбергер и Рэйд никогда не писали, что их подопечный - производный от вируса птичьего гриппа. Они дорожат своей репутацией. Сравнив геном возбудителей пандемий XX века - "испанки", азиатского гриппа, гонконгского, русского, Таунбенбергер и Рэйд пришли к противоположному выводу - о наибольшем сходстве вирусов "испанки" и русского гриппа. Но русский грипп 1977 - 1978 годов не запомнился "деятелям науки" ничем, подо что можно шакалить деньги налогоплательщиков. Это была самая мягкая пандемия XX века.

Дезинформация в эпидемиологии уже превышает все разумные пределы. Ученый людна нижних ступенях научной иерархии обхохатывается над заявлениями "верхов" о новой "испанке". Я не знаю ни одного специалиста из тех, с кем обычно обсуждаю эпидемиологические проблемы, чтобы он не понимал недавней аферы с птичьим гриппом и нынешней со свиным. А у народа возникает недовериек эпидемиологии, вакцинам, к медицине вообще.

- Вот и помогите мне и читателям "Комсомолки" разобраться.

- Профанация проблемы гриппа, птичьего ли, свиного, - частный случай. Сегодня мы имеем дело с системой беспринципных научных профанаций, сменяющих одна другую, но постоянно поддерживающих источники наживы для связки "деятели науки" - чиновники-политики. Про Лысенковщину сталинского времени можно забыть, не тот масштаб. Это новое явление, которое еще станет предметом исследования историков науки.

Первая информационная война, с чего все и началось: так называемая борьба с биотерроризмом в 1990-х. Биотерроризм - дело опасное. Но как подавалась его "доступность"? В СМИ был вброшен домысел середины XIX века, что в 1347 г. хан Джанибек, вызвал чуму среди генуэзцев в Кафе (нынешняя Феодосия) путемзабрасывания трупов людей, умерших от чумы. И так, якобы, началась "черная смерть" в Европе. Эту неизвестную современникам "черной смерти" байку подали как применение биологического оружия в 14 столетии. Навязывали вывод, что биологическое оружие можно создать даже в школьной лаборатории, оно доступно любым террористам, бен Ладену, Саддаму Хусейну. Кто только не верещал тогда о "мощном оружии бедных", о ложке ботулинического токсина, которой можно убить человечество! Деньги на "исследования" доступности биотерра текли полноводными реками. Натовцы под эту сурдинку развязали войну в Ираке, убили десятки тысяч людей.

- *Согласен, та кампания действительно помогла "ястребам"* Буша решить геополитические задачи, утверждая США как единственную сверхдержаву. Но где тут источник наживы для чиновников, политиков?

- У Буша был любимый министр обороны Рамсфелд.

- Один из главных "ястребов", развязавший войну в Ираке. Он тесно связан сфармфирмой "Гилеад", которая держит патент на знаменитое лекарство от гриппа "тамифлю".

- О коммерческих интересах Рамсфельда давно пишет западная пресса. Перед войной в Ираке была осуществлена нелепая вакцинация солдат США от сибирской язвы. Почему Саддама обвиняли в подготовке войны с помощью сибирской язвы? Есть более страшные возбудители: чумы, сапа, мелиоидоза. И более эффективные для распространения в качестве агентов биооружия. Но о них - ни слова.

Причина проста - в коммерческой реализации в США имеется только одна лицензированная вакцина. От сибирской язвы. Ею и прививали 2 млн. солдат.

- Защитили армию! А если бы Саддам сибирскую язву запустил?

- Вся грязь аферы в том, что та вакцина предназначена для защиты ветеринаров, контактирующих со скотиной. От биооружия - аэрозоля спор сибирской язвы - она не защищает. О чем известно чуть ли не с 1960-х. Просто Рамсфелду было известно еще и то, что такого оружия у Саддама нет.

Зато стоимость ежегодной вакцинации личного состава ВС США - 650 млн. долларов! Удавшаяся афера по борьбе с биотеррором разожгла аппетиты политиков и "деятелей науки". Оказалось, что на эпидемии, как и на войне, можно нажить хорошие деньги.

Вторая эпидемиологическая профанация - так называемая ВИЧ-вакцина. Создание такой вакцины в принципе невозможно. Но и на это выделяют гигантские суммы. Интересно то, что нам выдается до сих пор с высоких кафедр по поводу ее применения, как будто она уже создана. Оказывается, все просто - создадим вакцину и покончим с ВИЧ, как с натуральной оспой.

-Дуркуют коллеги.

-Дуркуют! Что-то типа: "Мы - идиоты, дайте нам денег!" Подчеркнуто нет никакого понимания того, что ВИЧ/СПИД-пандемия чем-то все-таки отличается от вспышек натуральной

оспы. И нет ни малейшего осознания собственной ответственности за судьбы миллионов людей, которым ВИЧ-инфекция еще сломает жизнь. А ведь еще в 1967 году, когда не было массовой практики профанации эпидемиологии, ВОЗ официально признала, что борьба с натуральной оспой не может вестись только сплошной вакцинацией населения. В Индии и Индонезии болезнь продолжала распространяться, несмотря на массовые прививки. Поэтому с 1967 года вакцинацию дополнили эпиднадзором. Выявляли больных натуральной оспой, изолировали их на 5 суток. За это время больной перестает быть заразным для окружающих. А всех, кто был с ними в контакте, вакцинировали. Только таким образом удалось поставить под контроль распространение этой опасной болезни. Но ведь невозможно изолировать по всему миру почти 50 миллионов человек с ВИЧ-инфекцией до конца их жизни. Так и нечего болтать столько лет про вакцину, которая якобы "покончит с ВИЧ, как с натуральной оспой".

Куда "мутируют" деньги

- *Следующая информационная война, догадываюсь, - птичий грипп.* Я писал, как зарабатывали Рамсфелд и его компаньоны-политики на лекарстве от этого гриппа, которое навязывала мировому сообществу ВОЗ. Ведь фирма "Гилеад" держит патент на это чудо-средство до 2016 года. (Подробнее см. "КП" от 11 и 18 июня и на нашем сайте).

- ВОЗ причастна к мистификации пандемии птичьего гриппа. Были весьма знаковые и одновременно безграмотные заявления ее чиновников, обещавших до 150 млн. погибших, "если в результате мутации вирус птичьего гриппа H5N1 сможет передаваться от человека к человеку".

- *Российские "деятели науки" говорили нам то же самое.*

- Это сообщающиеся сосуды. Помню сюжет по ТВ, когда группа "заинтересованных товарищей" сидела вокруг тогдашнего первого вице-премьера России и "впаривала" ему, что вирус птичьего гриппа с минуты на минуту смешается неизвестно с кем, и тогда грядет новая "испанка"! Сейчас та сцена вызывает у меня ассоциацию с сомалийскими пиратами, делящими выкуп за судно, сброшенный с вертолета. Каждый должен отплыть к родным берегам хотя бы со 100 долларами в кармане.

Вот так убивали отечественную эпидемиологию.

- *А в чем был подлог?*

- То, что пандемический вирус гриппа не может появиться в результате реассортации (смешения геномов) вирусов разного происхождения, было известно еще в 1970-х. В мире не зарегистрировано ни одной крупной вспышки гриппа, которая была бы вызвана штаммами-реассортантами.

- *То бишь мутантами?*

- Можно назвать и так. Все известные пандемии на планете вызывали уже циркулировавшие ранее штаммы вирусов гриппа. Об этом до начала нынешней профанации эпидемиологии гриппа знали ВСЕ! Монографии были написаны! И вдруг эти знания утратили разом. И ни один крупный российский эпидемиолог (даже в ранге академика РАМН) не выступил в те годы против профанации проблемы гриппа. Не объяснил руководству страны ее суть. Ну не странно ли?

- *А ведь на глазах у всей страны* под этим предлогом уничтожалась птица, ценные породы птиц. А Академия наук ни слова...

- Совершенно верно! Мы платим налоги, мы содержим Академию наук, а что взамен? Общество с 2004 года пугали мифическим мутантом, стращали пандемией. А умерло во всем

мире за эти годы менее трехсот человек. В России ни одного. Ясно же, что была афера. Но куда мутировали деньги на борьбу с птичьим гриппом? Миллиарды долларов! В чьи карманы? Вопрос не праздный. В апреле лавочку закрыли. Пугальщики разом забыли про птичий грипп и с таким же энтузиазмом взялись за свиной.

- *Он свалился как снег на голову.* Ощущение, что надо срочно закамуфлировать провал птичьей аферы.

- Как снег на голову - это вы зря. Его более полугода тупо не замечали в упор!

Первые вспышки начались осенью 2008 года в Испании. Внимания к ним никакого. До субботы 24 апреля 2009 года. Утром мы включаем телевизор, а там! Бегут люди в респираторах! Звучат невероятные цифры гибели мексиканцев от новой "испанки". За два выходных дня мозги людей СМИ превратили в фарш. А в понедельник началось обрушение бирж, падение котировок одних акций, рост других. Тот, кто это организовал, неплохо заработал.

- *Думаю, хорошо заработали экс-министр Рамсфелд* и другие высокие держатели акций фирмы, владеющей патентом на тамифлю. Народ сразу кинулся за лекарством, которое рекламировал ВОЗ. Не зря же заговорили о заговоре фармацевтов.

- Были и другие игроки с большими деньгами, но это были крупные игроки. Самое худшее началось теперь - в теле умершей эпидемиологии завелись трупные черви. Начавшаяся пандемия гриппа никого не интересует в принципе, но интересы аферистов всех мастей совпали в глобальном масштабе. Нам предлагают играть роль безмолвных статистов, а потом заплатить из своего кармана за их праздник, да еще и стать жертвами той самой "испанки", причины которой так и не были установлены. Вам это надо? ТОЛЬКО ЦИФРЫ

По данным ВОЗ, за 5 месяцев свиным гриппом в мире заболели 285 138 человек. Умерли 3635. Ежегодно в мире сезонным гриппом заболевает около миллиарда человек. Умирает 3 миллиона.

В США за год с сезонным гриппом госпитализируют 226 тысяч человек. Умирает 36 тысяч. И никакой паники! КТО ЕСТЬ КТО

Михаил Супотницкий, 53 года. Микробиолог, кандидат биологических наук, старший научный сотрудник. С 1979 г. по 2006 г. работал на разных должностях в научно-исследовательских учреждениях Министерства обороны России (СССР), полковник запаса. Ныне эксперт одной из федеральных организаций, Москва. Автор книг "Микроорганизмы, токсины и эпидемии", "Очерки истории чумы", "Словарь генетических терминов", "Эволюционная патология" (о СПИДе). Область научных интересов: эволюционная и молекулярная генетика микроорганизмов; механизмы возвращения "забытых" и появление "новых" инфекционных болезней.

Ten Swine Flu Lies Told by the Mainstream Media

NaturalNews, 18 September 2009
https://www.naturalnews.com/027055_vaccine_flu_swine.html

The mainstream media is engaged in what we Americans call "bald faced lies" about swine flu. It seems to be true with this issue more than any other, and it became apparent to me recently when a colleague of mine -- a nationally-syndicated newspaper columnist – told me their column on natural defenses for swine flu was rejected by newspapers all across the country. Many newspapers refused to run the column and, instead, ran an ad for "free vaccine clinics" in the same space.

The media, it seems, is so deeply in bed with the culture of vaccinations that they will do almost anything to keep the public misinformed. And that includes lying about swine flu vaccines.

There are ten key lies that continue to be told by the mainstream media (MSM) about swine flu and swine flu vaccines.

Lie #1 - There are no adjuvants used in the vaccines

I was recently being interviewed by a major U.S. news network when the reporter interviewing me came up with this humdinger: There are *no adjuvants* being used in the swine flu vaccines, he said!

I assured him that adjuvants were, indeed, a crucial part of the vaccine recipe, and they were being widely used by drug companies to "stretch" the vaccine supply. It's no secret. But he insisted he had been directly told by a drug company rep that no adjuvants were being used at all. And he believed them! So everything being published by this large news network about swine flu vaccines now assumes there are no adjuvants in the vaccines at all.

Lie #2 - The swine flu is more dangerous than seasonal flu

This lie is finally starting to unravel. I admit that in the early days of this pandemic, even I was concerned this could be a global killer. But after observing the very mild impact the virus was having on people in the real world, it became obvious that this was a mild flu, no more dangerous than a seasonal flu.

The MSM, however, continues to promote H1N1 swine flu as being super dangerous, driving fear into the minds of people and encouraging them to rush out and get a vaccine shot for a flu that's really no more likely to kill them than the regular winter sniffles. Sure, the virus could still mutate into something far worse, but if it does that, the current vaccine could be rendered obsolete anyway!

Lie #3 - Vaccines protect you from swine flu

This is the biggest lie of all, and the media pushes it hard. Getting a vaccine, they insist, will protect you from the swine flu. But it's just flat-out false. Even if the vaccine produces antibodies, that's not the same thing as real-world immunity from a live virus, especially if the virus mutates (as they often do).

As I pointed out in a recent article, statistically speaking the average American is *40 times more likely to be struck by lightning* than to have their life saved by a swine flu vaccine.
=> https://web.archive.org/web/20090903165113/https://www.naturalnews.com/026955_swine_flu_vaccines_flu_vaccines.html

Lie #4 - Vaccines are safe
And how would any journalists actually know this? None of the vaccines have been subjected to real-world testing for any meaningful duration. The "safety" of these vaccines is nothing more than wishful thinking.

The MSM also doesn't want you to know what's in the vaccines. Some vaccines are made from viral fragments grown in diseased African monkeys. If that sounds incredible, read the true story here:
=> https://web.archive.org/web/20090807020451/https://www.naturalnews.com/026779_swine_flu_patents_vaccines.html

Lie #5 - The vaccine isn't mandatory
You hear this lie all the time: The swine flu vaccine shot is voluntary, they say. But it's not true if you're an employee at a place where vaccines are being mandated. Millions of Americans are now being told by their employers that if they don't get vaccine shots, they will be effectively fired from their jobs. It's especially true with health care workers, day care employees and school teachers.

Lie #6 - Getting a vaccine shot is a good bet on your health
In reality, a vaccine shot is far more likely to harm you than help you. According to one viral expert, the actual mortality rate of the swine flu virus is estimated to be as low as .007 percent That means H1N1 swine flu kills less than *one person in 100,000*. Even if the vaccine works, let's say, 10 percent of the time, you'd have to vaccine *one million people* to prevent one death from swine flu.
=> https://www.reuters.com/article/healthNews/idUSTRE58E6NZ20090916/
And in vaccinating one million people, you would inevitably harm or kill several people, simply from the vaccine side effects! Your net risk of death is *increased* by getting a swine flu vaccine.

Lie #7 - The vaccine isn't made with "attenuated live virus"
When the swine flu vaccines were first being announced several months ago, they were described as being made with "attenuated live virus." This was directly mentioned in CDC documents, among other places.
This term apparently freaked out the American news consumer, and it has since been all but erased from any discussion about vaccines. Now, journalists will actually argue with you and insist the vaccines contain no attenuated live viruses whatsoever.
Except they're wrong. The vaccines are, indeed, made with "attenuated live viruses." That's how you make a vaccine: You take live viruses, then you weaken them ("attenuate") and inject them into people.

Lie #8 - Wash, wash, wash your hands (to avoid exposure)
This idea of washing your hands a hundred times a day is all based on the assumption that you can *avoid exposure* to the swine flu virus. But that's impractical. The virus is now so widespread that virtually everyone is certain to be exposed to it through the air if not other means. This whole idea of avoiding exposure to the swine flu virus is nonsense. The conversation should shift to ways to *survive exposure* via a healthy immune system.

Of course, hand washing is a very good idea in a hospital setting. Recent news reveals that doctors are too busy to wash their own hands, resulting in the rampant spread of superbugs throughout most large hospitals in first world nations.

Lie #9 - Children are more vulnerable to swine flu than adults
This is just a flat-out lie, but it makes for good vaccine sales. Vaccines are right now being targeted primarily to schoolchildren.

But the truth is that swine flu is extremely mild in children. "It's mildest in kids," says Dr Marc Lipsitch of Harvard University. "That's one of the really good pieces of news in this pandemic."

Reuters actually had the guts to report this story, but most of the larger media outlets are still reporting that children are the most vulnerable.

Lie #10 - There is nothing else you can do beyond a vaccine and Tamiflu

This is where the media lies by omission. The mainstream media absolutely refuses to print just about any story that talks about using vitamin D, anti-viral herbs or natural remedies to protect yourself from swine flu. In the MSM, there are two options and only two: Vaccines and Tamiflu. That's it. No other options exist in their fictional reality.

Why is the mainstream media so afraid to print the truth these days? Why can't reporting on swine flu see the light of day... literally, with a mention of sunlight and vitamin D? Apparently, Big Pharma has such a tight grip on mainstream newspapers that no true story on swine flu can ever make it past the editor's desk.

Killing stories, deceiving the public

It must really be depressing to work for the mainstream media. Even the reporters I know can't stand it. The truth, they admit, rarely makes it into print.

Over the last few years, I've had a couple of job offers from large media outlets. They want to pay me a six-figure salary and stick me behind a desk where they can control what I report. Needless to say, I routinely reject those offers. If I can't write the truth like I do here on NaturalNews.com, there's no point writing at all. In too many ways, the mainstream media has become little more than a corporate mouthpiece, whoring itself out to the highest bidder / advertiser.

It's no fault of the frontline reporters who actually work there. For the most part, they agree with what I'm saying. It's the fault of the profit-oriented corporate mindset where news is about selling newspapers rather than actually informing the public.

Important news stories get killed every day in the newsrooms across America. They get killed not because they are poorly investigated or poorly written, but because they upset advertisers and corporate string pullers who shape the news and reject any stories that threaten their own financial interests.

Here in 2009, the distorted reporting on the swine flu vaccine has been one of the greatest media frauds ever perpetrated. The media has in every way contributed to the widespread ignorance of the American people on the subject of vitamin D and natural immune-boosting defenses that could reduce swine flu fatalities. Rather than informing readers, the MSM has made it a point to keep the people stupid, and in doing so, the media has failed its only mission and betrayed the very audience is claims to serve.

LIVEJOURNAL

(Frau Перец)

Кому и зачем нужна глобальная пандемия?

Live Journal, 2 ноября 2009, 8:42
https://frau-perez.livejournal.com/183735.html

26 сентября в мировой сети появилось видеообращение испанской монахини Тересы Форкадес, в котором доктор медицины, бывший врач, озвучивая точку зрения многих медиков, приводит научные факты и аномальные события, имевшие место быть за последние несколько месяцев и относящиеся к текущему вирусу A/H1N1 и делает выводы, которые заставляют взглянуть на текущую мировую ситуацию с пандемией с новой точки зрения.

Мы постарались привести кратко основные пункты данного видеообращения . По каждому приведенному факту или событию Тереса ссылается на официальные источники как престижных научных сообществ, так и международных организаций, таких как Всемирная Организация Здравоохранения, где все цитируемые ею факты и события можно перепроверить.

I. Факты

Факт 1. Текущий вирус A/H1N1 оказывается совсем не новый, ученым он известен уже 70 лет и его проявления зафиксированы два раза в 20 веке.

Факт 2. Настоящий вирус имеет незначительную смертность. Со дня первых зафиксированных случаев заражения вирусом текущей пандемии, а именно, за период 17.04.09– 5.09.2009 зафиксировано 137 смертельных случаев в Европе. Для сравнения: смертность от ежегодного сезонного гриппа составляет от 40 тыс до 220 тыс случаев в год по всему миру.

II. Аномальные события

1. *Компания Baxter*.
В феврале 2009 года американский фармацевтический гигант Baxter, его австрийская штаб-квартира, рассылает в 16 лабораторий четырех европейских стран 62 кг субстанции для производства вакцины от сезонного гриппа. Совершенно случайным образом, техником одной из лабораторий Чехии, открывается, что субстанция заражена двумя живыми вирусами гриппа. Один вирус – сезонный обычный, имеющий своими характеристиками очень низкую смертность (менее 1%), но очень высокую распространяемость (заражаемость), и другой вирус гриппа с очень низкой распространяемостью, но сильно высокой смертностью (около 60%). Понятно, что поместив эти два вируса вместе, существует высокая вероятность их объединения, что даст вирус, обладающий обоими ключевыми характеристиками: высокой распространяемостью и смертностью. Если бы совершенно случайным образом не был открыт факт заражения субстанции, сейчас бы мир действительно находился в ситуации опаснейшей пандемии. 62 кг субстанции – это тысячи доз вакцины.

Австрийская журналистка Jane Burgermeister, опубликовавшая свое расследование по данному факту, направила публичный иск в ВОЗ, ООН и в правительства ряда стран, выдвинув обвинения в «биотерроризме и попытке массового убийства».

Факт заражения субстанции был официально подтвержден и самой компанией Baxter. Дело до сих пор находится на расследовании в ВОЗ. Официальных результатов о том как такое могло случиться все еще нет.

Практически невероятно, говорит доктор медицины, что такой могло произойти случайно. Подобного рода лаборатории имеют максимальный биоуровень защиты - третий уровень. Помимо этого, против того, что это чистая оплошность говорит тот факт, что живые вирусы, которые находились в субстанции, не были подвержены обязательной процедуре радиации. Живой вирус в вакцине – это не новость, но вот сильный, не ослабленный радиацией живой вирус – это вряд ли чья-то забывчивость. А здесь их было целых два.

Не смотря на то, что Baxter официально подтвердили данный факт, а так же, что расследование до сих пор не завершено, данная компания – одна из тех, кому доверено создание вакцины от текущего гриппа А.

2. *Объявление пандемии*.

17 апреля 2009 зафиксированы первые 2 случая гриппа А. Всего 12 дней спустя, 29 апреля, Margaret Chan, генеральный директор ВОЗ, в своем официальном обращении объявила чрезвычайную санитарную ситуацию "Уровень пять". И всего 1,5 месяца после первых случаев заражения, 11 июня, – ВОЗ официально объявила о "шестом уровне" чрезвычайной санитарной ситуации, о пандемии гриппа А.

Как директор ВОЗ могла объявить пандемию, если у текущего гриппа смертность значительно ниже ежегодного сезонного гриппа? Ответ банально прост: накануне официального объявления пандемии, в мае, ВОЗ поменяла официальное определение пандемии, изъяв из определения критерий значительного уровня смертности. С новым определением пандемии ежегодные сезонные вирусы гриппа - это уже пандемия, не упоминая другие болезни.

III. Политические последствия.

Известно, что ВОЗ – это мировая организация, которая разрабатывает рекомендации для стран участниц. Но в ее уставе с 2005 года есть пункт, по которому в период пандемии ВОЗ дает не рекомендации, а прямые указания, или приказы.

Что такого страшного может приказать ВОЗ своим странам? Например, обязательную вакцинацию. Пока разработанная вакцина – это дело добровольное. Но если по определению станет пандемия – это серьезная угроза жизни популяции, то такая мера, как обязательная вакцинация, может быть оправдана.

Многие прививаются от сезонного гриппа каждый год и ничего страшного в этом не видят. Тереса объясняет, что есть три отличия новой вакцины от привычных ежегодных вакцин.

Во-первых, эта вакцина состоит из двух доз. С обычной прививкой от гриппа – получается уже три дозы. Человек получит три вакцины с тремя живыми вирусами разных типов. Пока еще никто не знает, как отреагирует на это человеческий организм, но вероятность побочных эффектов, а такую вероятность имеют все вакцины, увеличивается в три раза.

Во-вторых, из–за огромного количества доз, которые надо произвести, в этой вакцине используются адъюванты, которые еще не были ни разу опробованы. Адъювант – это часть вакцины, которая отвечает за «возбуждение» иммунной системы, чтобы спровоцировать превосходящий иммунитет. Новый адъювант – в 10 раз эффективнее известных. А это несёт возможность поражения центральной нервной системы, а также таких побочных эффектов как паралич и артрит (зафиксировано в истории).

Третья новость заключается в том, что фармацевтические компании запросили снять с них всякую ответственность за возможные негативные побочные эффекты от вакцины, аргументируя это тем, что работа, которую они на себя взяли, – экстраординарная по своим масштабам, требующая сверхусилий: создание ТАКОГО количество доз за такое рекордно короткое время (всего должно быть произведено 4,6 миллиарда доз).

В США уже подписан акт, по которому ни фармацевтические компании, ни политики, вовлеченные в тему, не отвечают за возможные последствия вакцинации. Таким образом, потребитель лишается хоть какой-то гарантии.

Таким образом, имея все это ввиду, а также то, что серьезная пандемия действительно существовала бы сегодня, если бы случайным образом не открылся тот случай с заражением материала компании Baxter, Тереса считает важным заявить об опасности. Опасность состоит в том что:

1. Новые вакцины от гриппа А заражены.
2. Новые вакцины от гриппа А могут быть заражены.
3. Все это на фоне вероятности применения закона об обязательной вакцинации.

Если этот вирус начнет давать большую смертность, значимую смертность, значит одно из двух: или вирус мутировал (во что трудно поверить) или, что это другой вирус, не тот, от которого произведена вакцина. В обоих случаях, эта вакцина уже не будет действовать. Более того, непосредственно сама вакцина может быть средством заражения новым вирусом.

Основная рекомендация, которой заканчивает свое обращение Тереса Форкадес: не прививаться в этом году. Многие медики присоединяются к этим рекомендациям, но, находясь в системе, бояться делать заявления открыто.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

The Drug Cartel and pandemic H1N1 Swine Flu viruses and vaccines

Infowars, 29 September 2009
https://web.archive.org/web/20091226230946/http://www.infowars.com/the-drug-cartel-and-pandemic-h1n1-swine-flu-viruses-and-vaccines/

Los Angeles, CA – World leading drug-industry investigators have uncovered stunning documents proving an international drug ring, operating from New York City, is behind the H1N1 swine flu fright and vaccination preparations.

Dr. Leonard G. Horowitz, America's leading consumer health expert, and Sherri Kane, an investigative journalist, have released shocking proof in legal affidavits that leaders of a private global biotechnology "trust" are behind everything you ever heard about pandemic flu, including its origin and alleged prevention via vaccination. Their documents, being sent through attorneys to the FBI today, evidence powerful industrialists operating a crime ring within "Partnership for New York City" are behind the pandemic's creation, media persuasions, vaccination preparations, and health official promotions seen everywhere from supermarkets to health clinics.

"David Rockefeller's trust, that engages several powerful partners on Wall Street, including media moguls Rupert Murdock, Morton Zuckerman, Thomas Glocer, and former Chairman of the Board of Directors of the Federal Reserve Bank of New York, Jerry Speyer," are implicated in advancing global genocide," Dr. Horowitz wrote to FBI directors, through a team of attorneys assembled to stop the swine flu vaccines from being given.

"This 'partnership' controls biotechnology research and development globally. Health commerce internationally is also controlled virtually entirely by this trust that exercises near complete control over mainstream media to promote/propagandize its products and services for the drug cartel's organized crime. This trust, in essence, makes or breaks medical and natural healing markets, primarily through the mass media companies and propaganda it wields for social engineering and market building," Dr. Horowitz wrote.

Among the most stunning revelations from the Horowitz-Kane research are those linking Larry Silverstein of Silverstein Properties, Inc., and the 9-11 terrorist attacks, to the drug cartel's geopolitical, economic, and population reduction activities. Mr. Silverstein, leaser of the World Trade Center who authorized to have building 7 "pulled," meaning detonated, is a chief suspect in the "9-11 truth" investigation. Silverstein is currently landlord and co-partner in the biotechnology trust founded by David Rockefeller and implicated by these new discoveries.

"If these people can get away with killing more than 3,000 people in 8 seconds on 9-11, they are completely capable of murdering millions, even billions, of people worldwide this flu season," Dr. Horowitz commented. "I pray these revelations will save millions of lives and help activists call upon President Barack Obama to demand legitimate inquiries into these genocidal atrocities."

Given the unprecedented nature and urgency of these findings, Dr. Horowitz has posted his affidavit for public review on FLUscam.com, praying other activist will spread the information in order to prompt governments worldwide to cease mass vaccination preparations to avoid becoming accessories to the crime of genocide.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Affidavit of Leonard G. Horowitz

Infowars, 29 September 2009
https://web.archive.org/web/20091226230946/http://www.infowars.com/the-drug-cartel-and-pandemic-h1n1-swine-flu-viruses-and-vaccines/

1. This Affidavit is based on my personal knowledge, except where otherwise stated, and, if called upon to do so, I could and would competently testify to the matters herein stated.

2. I am a Harvard University trained certified expert in the fields of behavioral science, health education/health promotion, media persuasion, medical sociology, public health, and emerging diseases. I have additional expertise in natural healing methods and materials, including genetics and electro-genetics, by reason of my academic training, scientific publications, and internationally recognized authority and celebrity in these fields.

3. I openly disclose my bias and conflicting interests as a leading author, personal health care educator, consumer protector, alternative and complementary health care specialist, and formulator of natural remedies for public protection and remediation of diseases. I hold trademarks covering several products that compete directly with the drug industry's monopolization of medicine as described herein. This competitive vantage enables me to critically assess elements and actions within "BigPharma" that few people perceive. My sponsorships by natural products companies, including those that manufacture and distribute OxySilver and Liquid Dentist, helps pay for my expenses in serving as I have for thirty years without grants or academic/institutional restraints providing the freedom to simply "tell it like it is" based on science and researched evidence. Without sponsors, radio and television networks would cease operations, and so would I. The critical difference between BigPharma, and its products, versus the natural health products industry, and my endorsements, is the former is criminally operating and killing people as evidenced herein, whereas my colleagues and I are persecuted by the powers exposed herein, and continue helping people heal naturally nonetheless.

4. I further disclose that I am a Levite priest by virtue of my bloodline, spiritual direction, and ecclesiastical commitments. I am the body corporate and Overseer of The Royal Bloodline of David, an omni-denominational healing ministry established in the State of Washington and certified by the Secretary of State therein in 2000; and was the pro se counsel in Horowitz vs. The State of Hawaii, Department of Health, et al. (Civ. No. 06-1-0296).

5. Compelled by God and my responsibilities in these positions I have sought on several occasions, by whatever lawful means, to protect the U.S. Constitutional right of every American to exempt from risky vaccinations for religious, philosophical, and medical reasons; and protect Americans' bodies as absolute personal properties for which compensation must be paid if and when taken, according to the 5th Amendment of the Constitution.

6. I understand that substantial historical evidence exists proving unequivocally the Rockefeller family's monopolistic influence over American medicine and public health that is material to this affidavit and related complaint. David Rockefeller's powerful influence over the Council on Foreign Relations, geopolitics, and global economics is solidly established.

Flying Pigs Saga Continued:
WHO admits no deadly mutation of H1N1 Swine Flu

Global Research, 29 September 2009
https://web.archive.org/web/20091002225746/http://www.globalresearch.ca/index.php?context=va&aid=15447

The World Health Organization, the UN agency (ir-)responsible for declaring a Phase 6 "Pandemic" global alert over what it calls H1N1 Influenza A or Swine Flu, whose chief Dr Margaret Chan has repeatedly warned that while Swine Flu to date had been rather mild, that the emergency declaration was necessary because it "could mutate" aggressively into a deadly pandemic killing millions, now admits well into the flu season in the Northern Hemisphere that H1N1 has apparently not mutated.

Margaret Chan, the head of the World Health Organization, at a meeting with health officials in her native Hong Kong, has just stated that the swine flu virus has not yet mutated into a more deadly strain. WHO Director of the Initiative for Vaccine Research, Dr Marie-Paule Kieny, reinforced that statement in a press conference September 24 in Geneva when she stated, "we are lucky that the pandemic is moderate in severity that most people experience a mild illness and recover spontaneously." That means recovery with no vaccination, no Tamiflu or other dangerous "antiviral" drugs. Just with letting nature take its course.

Last summer, when the WHO decided to declare a global "pandemic emergency" over what it called the H1N1 Influenza A global spread, it also announced in a notice buried among its press releases that most countries had stopped testing ill populations for H1N1, and that the WHO therefore simply arbitrarily "assumed" all patients with a stated set of symptoms were automatically H1N1 victims. So the H1N1 pandemic case counts, to quote the WHO, "no longer reflect actual disease activity."

The symptoms the WHO listed as indication that a patient has H1N1? A fever, cough, sore throat, headache... in short, all the symptoms of a common cold. The pandemic declaration by the agency entrusted by the UN with monitoring and guarding the world's health came anyway, on recommendation of the WHO's "experts," the Strategic Advisory Group of Experts, or SAGE.

However, even though the WHO admits it is not testing patients for H1N1 around the world, they also state that the H1N1 "pandemic virus" is becoming more common than the common seasonal flu virus. A simple question in the interest of accuracy: How in hell's blazes do they know that if they stopped testing around the world? Gut feeling? WHO's "intuition" that everyone who has a fever, cough, headache and or sore throat around the world automatically must have H1N1? The alarming aspect of this entire charade is that it will likely have severe health consequences for millions or tens of millions of some three billion people around the world targeted to get injections of largely untested so-called H1N1 Swine Flu vaccines.

Vaccines for South nations?

Equally bizarre is the fact that in her latest comments, the WHO's Chan seemed preoccupied with how to get vaccines to poorer countries mainly in the Southern Hemisphere. Yet the same WHO Strategic Advisory Group of Experts, SAGE, states on the WHO official website that H1N1 does not pose a major risk to the Southern Hemisphere.

The number of swine flu cases is now expected to rise as the Northern Hemisphere moves into winter, WHO Director-General Margaret Chan says. But she claims that the biggest challenge in combatting the pandemic would be ensuring enough vaccines got to the world's poorest countries. Three billion doses could be produced worldwide annually, enough to cover almost half the world's population, Chan said.

The WHO is working to raise a billion dollars to help buy vaccines for developing countries that cannot produce them themselves. The United States and several other countries have stated they plan to make 10 percent of their vaccine supply available to others in need. The vehicle to raise funds for the apparently not-threatened countries of the south is a public-private partnership of the WHO established in 2000, called GAVI.

Tricks with WHO death data

Another little known fact about the WHO pandemic operation which gives their dire warnings about H1N1 the necessary gravitas to scare the dickens out of pregnant women, parents and just about anybody, are the death statistics constantly cited when data on purported H1N1 cases are mentioned. As of the last report at end September 2009 the WHO claimed 3917 deaths due to H1N1 Influenza A or Swine Flu.

In most cases, even the WHO and the Atlanta US Government's CDC has been forced to admit, deaths were in patients who already had some severe respiratory disorder or grave illness when they contracted what was named H1N1 Influenza A. They never to date have offered the slightest proof that it was not those grave prior illnesses which caused death and that the flu symptoms were merely a coincident event, what epidemiologists term an "opportunistic infection."

But it gets even more interesting. The WHO, it turns out, lumps its statistics for flu deaths together with those from pneumonia, a completely separate and far more common illness and a far larger cause of death, in a disease classification it calls "Influenza and Pneumonia (J09-J18)."

So in 2007 the WHO recorded 21883 deaths attributed to "flu and pneumonia" without dividing each as to direct cause. But of those WHO classifications, flu itself only goes for symptoms in categories J09-J11. The entire rest of the categories deal with pneumonia and related lung infectious manifestations. Yet far and away the largest group of deaths from infectious diseases comes from pneumonia, not from influenza. The number of certified deaths from "influenza virus", with or without pneumonia complications was a far less alarming 14 persons in 2007. This clever trick allows pharmaceutical manufacturers like GlaxoSmithKline or Baxter Labs to promote their "flu" vaccines.

If we are dealing with an illness whose symptoms in the vast majority of cases are mild and disappear from itself with no medication after five or more days, and whose mortality rate is at worst infinitesimally small, there would be no need for panic, no need to line up in queues to get jabbed with untested vaccines whose contents including various adjuvants like aluminum hydroxide and nanoparticles are potentially nerve crippling or even death-causing. But then that would not be "good" for Bill Gates, David Rockefeller and other members of the Good Club, would it?

NWO Observer

The "Deadly second wave of Swine Flu" Scaremongering or Sequel of Vaccinations?

NWO Observer, 5 October 2009, 19:11 // Euro-med.dk, 1 October 2009
https://web.archive.org/web/20091010053419/https://nwoobserver.wordpress.com/2009/10/05/the-%E2%80%9Cdeadly-second-wave-of-swine-flu%E2%80%9D-scaremongering-or-sequel-of-vaccinations/

Summary: The governments of Britain and the U.S. have gone very far in terms of spreading horror of swine flu this autumn. Indeed, there now is a 2nd wave in the U.S. – just as mild as the first. Death and disease figures are far, far lower than that predicted without any background. But now they promise us millions of deaths this autumn.

Governments in the U.S. and Canada distribute body bags and show us enormous stocks of coffins – in England even open mass graves that await us. Why? Will they divert our attention from something else? Has the mass vaccination throughout a lethal surprise, a new virus, in addition to the dangerous squalene, in store for us?

Now the CNN tells us, that Baxter´s live bird flu virus last winter in seasonal flu vaccine was not accidental and would have killed even billions – had it not been accidentally discovered!! Without mass vaccination, the pandemic is safe – except for the chronically ill.

Officials act with religious zeal to scare us. The United States is preparing for up to 6 months of imprisonment or a fine of $ 1000 a day – till people are willing to obey orders of isolation and / or vaccination. Furthermore,the US is preparing to put the military in action under long-term martial law.

Odd. Isolation of the few infected in Mexico in the beginning of the pandemic could have been efficient but the WHO strictly refused to isolate the infected. They have something in store for us, since they are squanderimg their credibility completely.

We are in the middle of the most peaceful flu ever seen. Nevertheless, the New World Order (NWO) gangsters are scenting big money and world government, using this scam. Well, of course the mass vaccinations now underway may spread Baxter´s bird flu virus or bring about viral mutations. Maybe that is what the NWO gangsters are staking on – since ***they are so sure of a deadly second wave*** this autumn– *which normally no one can predict*, as little as their mendacious climate prognostications. This remains of the climate-doomsday speech by the UN Secretary General. In the US a mild second wave has begun

Now, the NWO also has lucrative pharmaceutical corporations to satisfy – pumping money into Rothschild´s and Rockefeller´s pockets – maybe in particular into Rockefeller´s pockets: Novartis has roots back to IG Farben where the Rockefellers were large shareholders. So even today, a member of the board of the Rockefeller Foundation, Ms Ann Fudge, is also on the board of Novartis. The vaccines and here are very fit for scaremongering, considering their poisonous contents.

The Guardian 20 Sept. 2009: "The swine flu pandemic could kill millions and cause anarchy in the world's poorest nations unless £900m can be raised from rich countries to pay for vaccines and antiviral medicines**,** says a UN report leaked to the Observer. This reminds of UN Secretary General Ban Ki-moon´s communist climate doomsday scaremongering.

"If we are not careful, the virus could destroy a burgeoning economy or democracy." On Wednesday, health officials told one website that the African continent had recorded 8,187 confirmed cases of swine flu and 41 deaths. Pandemic experts believe that the western world, including Britain, is facing a second wave of the virus."

Comment: And so what? This is heartily little considering Africa´s total population of 1 bn. The Africans are lucky, if they escape the NWO´s poisonous vaccines – which the NWO will by no means allow, having previously run covert sterilisation vaccinations there! The New World Order henchmen are threatening us deaths far beyond the capacities of our cemetaries – for they know that a deadly pandemic will follow!!! – or do they?

Global Research An official UK government report – quoted extensively in Britain's tabloid media– is warning the British public that there will be countless deaths in the case of a swine flu pandemic. According to the WHO, a Worlwide public health emergency situation will take place in the Fall. A high death toll is predicted without corroborating evidence. The chilling proposals (mass graves) are spelled out in a Home Office document discussed at a meeting of Whitehall officials and council leaders last month.

The mass graves, according to the report, "are being planned to deal with the rising death toll from swine flu if the pandemic escalates": The grim revelation will see the mass burial sites dug in advance to cope with any potential crisis. The Government is planning to create a series of communal graves to cope with the second outbreak expected in the autumn and through the winter. A Home Office document published earlier this year sets out plans for how local councils should deal with a high death toll – estimates of the number of deaths range from 55,000 to as high as 750,000 from the H1N1 killer virus?? – including setting up temporary mortuaries.

Comment: How could the British government know that long before the first case of swine flu was seen?

So far, 44 people in England have been confirmed as dying after contracting swine flu and another five have died in Scotland. The document says that while most cemeteries have sufficient burial capacity for a number of years, this could be put to the test at the peak of a pandemic. (Daily Express, August 19, 2009). Global research, Michel Chossudovsky: An atmosphere of insecurity and fear is being created simultaneously in several countries in a global public health initiative under the auspices of the WHO. We are summarising selected reports on body bags, mass graves and quarantine orders. Swine flu is acknowledged to be milder than seasonal influenza. So what is the purpose of these initiatives? These reports raise serious questions as to the public health objectives of our governments, not to mention the WHO. The entire construct is politically motivated and corrupt. It serves the financial interests of the pharmaceutical industry. It justifies the militarization of public health and violates fundamental civil liberties.

According to CNN, the Pentagon is "to establish regional teams of military personnel to assist civilian authorities …according Swine-flu-fema-transportto Defense Department officials." "The proposal is awaiting final approval from Defense Secretary Robert Gates. The plan calls for military task forces to work in conjunction with the Federal Emergency Management Agency. …. it would likely include personnel from all branches of the military.

As a first step, Gates is being asked to sign a so-called "execution order" that would authorize the military to begin to conduct the detailed planning to execute the proposed plan. The implications are far-reaching. The decision points towards the militarization of civilian institutions, including law enforcement and public health.

There is evidence of international cooperation on unheard-of scaremongering.

International Swine Flu Conference: Workshop: August 21, 2009: Wahington DC Top leaders and key decision-makers of major companies representing a broad range of industries will meet with distinguished scientists, public health officials, law enforcers, first responders, and other experts to discuss pandemic prevention, preparedness, response and recovery at the 1st International Swine Flu Summit.

Свиной грипп: возможны случаи впаривания

Новая Газета, 7 октября 2009 (08:00), № 111
https://novayagazeta.ru/articles/2009/10/07/41016-svinoy-gripp-vozmozhny-sluchai-vparivaniya

Угроза эпидемии – лучшая маркетинговая стратегия для близких к чиновникам производителей лекарств и вакцин.

В сентябре разгорелся спор отечественных специалистов и чиновников о том, как у нас обстоят дела со свиным гриппом. Поводом стала первая в России смерть от этой болезни. В ночь на 21 сентября в авторской телепрограмме Александра Рогаткина...

В сентябре разгорелся спор отечественных специалистов и чиновников о том, как у нас обстоят дела со свиным гриппом. Поводом стала первая в России смерть от этой болезни. В ночь на 21 сентября в авторской телепрограмме Александра Рогаткина «Специальный корреспондент» академик РАМН Дмитрий Львов, директор Института вирусологии им. Ивановского, сообщил, что в Москве от этого заболевания скончалась женщина, а всего в России гриппом A/H1N1 заражены десятки тысяч человек. Уже 21 сентября Минздравсоцразвития экстренно организовало брифинг для журналистов, и заместитель министра Вероника Скворцова опровергла утверждения академика Львова: «По официальным данным на 18 сентября, в России был зарегистрирован 381 больной, а свиной грипп у покойной, скорее всего, все-таки был, но скончалась она не от него»… Но именно так и умирают в эпидемию: от осложнений и обострений хронических заболеваний, которые грипп провоцирует. По крайней мере специалистам это хорошо известно.

Впрочем, как всегда, победили чиновники. Академик Львов больше недоступен для журналистов – давать интервью отказывается. И неудивительно: в Трудовом кодексе есть злополучная ст. 278, которая позволяет учредителю уволить руководителя учреждения «без объяснения причин» – просто потому, что он, например, говорит не то, что велели. А медики – от академиков до рядовых врачей – нынешним летом насмотрелись, как Минздравсоцразвития пытается закатать в асфальт этой статьей ректора Московской медицинской академии Михаила Пальцева. Тут уж не до научных дискуссий.

Чиновники Всемирной организации здравоохранения (ВОЗ) недоумевают, зачем России скрывать смертельные случаи или занижать число заболевших гриппом вируса A/H1N1, никаких санкций для стран высокая заболеваемость не влечет, но во время пандемии важно располагать достоверными фактами по всему миру. Однако страны с авторитарными режимами нередко скрывают эпидемии. Так, в 2003 г. Китай скрывал масштабную эпидемию атипичной пневмонии. Видимо, и нашим чиновникам просто привычно доказывать, что на «родине слонов» свиному гриппу не место. Но об истинном положении дел узнать невозможно даже не потому, что ученым заткнут рты. Данные и чиновников, и ученых – это только экспертные оценки. Депутат Госдумы, академик РАМН Сергей Колесников заявил, что в нашей стране всего две лаборатории имеют право проводить анализ на наличие вируса A/H1N1. Одна – в НИИ вирусологии имени Д.И. Ивановского, другая – в Государственном научном

центре вирусологии и биотехнологии «Вектор». Как считает академик Колесников, в нашей стране их должно быть минимум 80, чтобы с подтверждением диагнозов не возникало проблем.

Минздрав всячески накачивает атмосферу напряженного ожидания страшного заболевания и оптимистической веры в то, что у ведомства есть эффективнейшие средства борьбы с ним. Видимо, чтобы напуганное до ужаса общество в нужный момент проглотило подготовленную пилюлю. Сумеют ли специалисты донести до населения, что это на деле – пустышка? В условиях, когда Минздравсоцразвития заинтересовано в продвижении продукции дружественных отечественных предприятий, – вряд ли.

А что за рубежом?

Сначала на сайте международной некоммерческой организации врачей «Здоровый скептицизм», выступающих за ответственное распространение медицинской информации и уменьшение вреда от продвижения лекарств (http://www.healthyscepticism.org/global/news/int/hsin2009-10/), а через некоторое время и в российской сети Е-ЛЕК (http://list.healthnet.org/mailman/listinfo/e-lek), появилась статья испанского врача общей практики профессора Хуана Херваса (Juan Gervas) «Перед лицом свиного гриппа: здравый смысл и наука». Профессор Хервас анализирует, как развивалась пандемия зимой в Южном полушарии, пока в России было лето. По этим данным можно судить о том, чего нам ждать в сезон холодов.

«Эпидемия свиного гриппа, которая началась в Мехико в 2009-м, менее тяжелая, чем эпидемия сезонного гриппа, – пишет профессор Хервас. – В Великобритании, например, зарегистрированы сотни тысяч случаев заболевания – и только 30 смертей, в США зарегистрировано около миллиона случаев – и только 302 смерти. Во время зимы в Южном полушарии (лето в Северном полушарии) 132 человека умерли в Австралии, 128 – в Чили и 16 – в Новой Зеландии. Когда в Южном полушарии зима закончилась, общее число смертей в мире составило 2501. Чтобы было понятно, много это или мало, приведу только один пример: во время обычной зимы в Испании (44 миллиона населения) 1500 – 3000 человек умирают от сезонного гриппа. На основании опыта Южного полушария можно предсказать, что в Испании, где система общественного здоровья охватывает все население, зимой 2009-2010-го случится около 500 смертей от свиного гриппа».

Хуан Хервас в своей статье, которую сейчас читают врачи всего мира, приводит хорошо знакомую поговорку: «Грипп продолжается семь дней без лечения и одну неделю – при лечении». «Грипп – в целом легкое заболевание, с такими симптомами, как лихорадка, головная и мышечная боль, тошнота, диарея и общая слабость, которые требуют нескольких дней отдыха. Не рекомендуется снижать температуру (даже у детей) и только облегчать боль и общее недомогание».

На основании анализа мировых исследований доктор Хервас утверждает: «Не существует лекарств для профилактики свиного гриппа. Противовирусное средство осельтамивир (oseltamivir-Tamiflu) или занамивир (zanamivir-Relenza) не предотвращает заболевание. Даже для сезонного гриппа эти лекарства почти бесполезны (они укорачивают продолжительность заболевания на полдня). В случае свиного гриппа нет доказательств, что они работают. Но противовирусные лекарства имеют серьезные побочные эффекты. Лондонское исследование показало, что половина детей, принимавших Tamiflu, страдали от таких эффектов».

Что же делать?

«Необходимо относиться к свиному гриппу так же, как к обычному сезонному: оберегать себя и свою семью спокойно и со здравым смыслом, – советует профессор Хервас. – Обращаться к врачу следует только при появлении тяжелых симптомов, таких как кровохарканье или тяжелые нарушения дыхания (одышка). Прикрывайте рот, когда кашляете или чихаете. Не трогайте свой нос и мойте руки: перед едой, после туалета и сморкания. Вирус исчезает в выделениях из носа по истечении примерно первых пяти дней заболевания».

Примерно то же, только с поправками на отечественные реалии, советует профессор Василий Власов, вице-президент Общества специалистов доказательной медицины, член формулярного комитета: «Если у вас простуда/грипп, то первая задача – не заразить окружающих. Для этого надо остаться дома. Если работодатель у вас садист (такое бывает), то придется тащиться в поликлинику за больничным. Помните, что в период эпидемии гриппа вам могут его дать по закону на срок до 10 дней.

Вторая задача – расслабиться и получить от болезни удовольствие, на которое способен простуженный человек, сидя дома. Не пренебрегайте симптоматическими средствами типа колдакта, хотрема и прочих подобных – они не лечат грипп, но облегчают симптомы. Но даже если станет легче – не ходите на работу, не заражайте людей.

Начальники! Если у вас есть подчиненные-герои, которые приходят на работу с насморком и температурой, жестко гоните их прочь, чтобы у вас не заболели все остальные. Потом тщательно вымойте руки.

Если болезнь стала тяжелой – у вас одышка, температура, сильная слабость, – вызывайте врача или идите в поликлинику. Помните, что изредка грипп протекает тяжело, в том числе и у молодых здоровых людей, и вот тогда-то и нужна врачебная помощь.

Но пожалейте себя, не затоваривайтесь лекарствами, в особенности бесполезными, которые проталкивает Минздрав. Нормальные люди должны понимать: как угроза голода – возможность обогатиться для торговцев едой, так и угроза гриппа – возможность обогатиться для производителей лекарств. Включайте голову!»

Кстати, профессор Хервас прямо упрекает ВОЗ за то, что она выступает с заявлениями, которые нагнетают страх вокруг свиного гриппа. Это профессор называет впариванием болезни.

«В 2005 году ВОЗ прогнозировала, что до 150 миллионов человек могут умереть от птичьего гриппа, это вызвало всемирную панику.Прогноз был категорически неверным. Были зафиксированы 262 смерти. Перед лицом свиного гриппа в 2009 – 2010 гг. мы не должны повторить ту же ошибку. Важно избежать паники».

В России свои представления о том, как лечить. Министерство здравоохранения и социального развития направило руководителям региональных управлений здравоохранения для использования в работе временные методические рекомендации – «Схемы лечения и профилактики гриппа, вызванного вирусом типа А/ H1N1 для взрослых». Лечить свиной грипп ведомство рекомендует арбидолом в комбинации с кагоцелом или интерферонами.

Профессор Василий Власов проанализировал имеющиеся доказательства полезности средств, рекомендованных Минздравом: «Ни кагоцел, ни арбидол, ни другие интерферонстимуляторы принимать не нужно, потому что это средства, эффективность которых при гриппе сомнительна, а применительно к этому (свиному) гриппу ее вообще никто не оценивал. Но опасность побочных эффектов несет любое средство. В министерских же рекомендациях все – или глупость, или обман, кроме разве что заключительной части про лечение пневмонии».

Но тогда, может быть, привиться? Пока идет вакцинация против сезонного гриппа, Роспотребнадзор рапортует, что всего будет привито 27 млн человек за счет средств федерального бюджета. Зачем, если, по данным ВОЗ, в большинстве стран мира, в том числе и в Европе, преобладает пандемический штамм свиного гриппа? Да потому, что из российского бюджета уже заплачено отечественным производителям за эти 27 млн. доз.

Вакцина против свиного гриппа еще у нас не готова, хотя на ее разработку Россия уже потратила 4 млрд руб.

Хуан Хервас утверждает: «Вакцина против свиного гриппа – экспериментальная. Никто не знает, насколько она эффективна и насколько безопасна. Свиной грипп может мутировать точно так же, как и сезонный грипп, тогда разработанная вакцина окажется совершенно

бесполезной. Вакцина, разработанная для профилактики сезонного гриппа, не обеспечит защиты от свиного. Вакцина против сезонного гриппа относительно неэффективна у детей и подростков (успешная профилактика – 33%) и абсолютно бесполезна у детей до 2 лет. Есть сомнения в эффективности вакцины в профилактике гриппа у взрослых и пожилых людей. Мы ничего не знаем об эффективности и безопасности вакцины против свиного гриппа, которая готова к маркетингу. Однако известно, что в 1976 году США разработали подобную вакцину – результатом стала эпидемия тяжелых побочных эффектов (синдром Гийена-Барре, неврологические заболевания, тяжело пострадали десятки человек). Программа вакцинации была остановлена. Ускоренная разработка таких вакцин не приносит пользы, и пользы просто не может быть в отношении свиного гриппа, смертность от которого столь низка».

Василий Власов согласен с коллегой: «В принципе прививка против обычного гриппа сейчас имеет очень небольшой смысл, ибо и в прошлые годы старые вирусы гриппа поражали лишь небольшую долю от общего числа заболевших. В шлейфе сезонного гриппа идет масса других вирусов, которые вызывают похожие заболевания, но от которых не поможет гриппозная вакцина. В этом году, можно прогнозировать, что вирусы сезонного гриппа частично вытеснит еще и новый свиной грипп, соответственно, польза от прививки будет еще меньше. Какая будет эффективность у новых вакцин против свиного гриппа – неведомо».

Öppet brev till Sveriges samtliga journalister
Open Letter to all Corporate Media Journalists

Word m Word, 11 October 2009 .. 21 November 2009
https://web.archive.org/web/20091115110020/http://www.wordmworld.net/bubble-words/oppet-brev-journalister
https://web.archive.org/web/20091121071611/http://www.wordmworld.net/uncategorized/open-letter-journalists

This is a translated version of a letter that, on the 11th of October 2009, was sent out to journalists working for the corporate media in Sweden and has since then been widely distributed among a very rapidly growing grassroot anti-vaccine/anti NWO movement in Sweden.

Feel free to use this letter as a template for an open letter that can be sent out to journalists and distributed among people in your country as well. The revolution will be global.

To all journalists working in Sweden: The truth is out. Your employers have been revealed. Your employers have been revealed. The truth is out. I repeat: The truth is out.

The biggest crime against humanity in modern time is taking place right in front of our eyes - and you, all Swedish journalists, are quiet. I repeat: The biggest crime against humanity in modern time is right now taking place in front of our eyes - and you are quiet.

To all journalists working in Sweden: with this letter I want to tell you that you have a choice. Either you immediately, and I do mean immediately, start reporting what is really going on in this country and all over the world - or else, as of today, you will be regarded as accomplices in this close to unimaginably horrendous criminal act against the people of Sweden and against the people of the entire planet.

I repeat: To all journalists working in Sweden, either you immediately start reporting what is actually going on in the world, or else you are considered enemies to the people of Sweden.

Passivity is no longer an option. Silence is no longer an option. Propaganda is no longer an option. Disinformation is no longer an option. As of today, Wednesday, the 11th October 2009, you will start to write, tell and show us the truth.

Your employers, the corporate media in Sweden and around the world, are right now under the control of the most evil international crime syndicate that has ever existed. We know that they have seized your base of operation.

Aftonbladet, Expressen, Svenska Dagbladet, Dagens Nyheter, Metro, The Swedish Radio, The Swedish Television, TV4, and all you other lackeys of evil - we know that right now, you are all being used as the central unit of propaganda, in Sweden, for the most cynical conspiracy that humanity has ever seen.

We know that this conspiracy stretches all the way from Wall Street, to the White House, to the World "Health" Organization, to the UN, to the European Union, to the world's leading pharmaceutical companies, to the upcoming meeting in Copenhagen, to media moguls, to the world's leading bankers, to top politicians, to the Swedish government, to Swedish banking, to the Swedish press, to the Swedish drug agency, and to corresponding institutions all across the world.

I understand if this sounds unpleasant, but this is nothing compared to how unpleasant things will become if we all don't take this absolutely seriously. Right now. Today. Absolutely seriously.

This is nothing to smile about. Nothing to dismiss. Nothing to ignore. The crime that is right now taking place in front of our eyes is a part of the most hideous, and sophisticated, conspiracy that can - unless you and we take immediate action - bring more pain and suffering to both us and coming generations than we ever could have imagined.

In the case you choose to call this crazy conspiracy theories without even informing yourselves about what is actually going on in the world: stop this nonsense right away.

The truth is out. We know what is going on. The majority of the people in Sweden and around the world are not aware of the things that are taking place, but there are enough people who are aware for me to, once again, repeat this ultimatum: Starting today, the 11th of November 2009, you will start working with conveying the truth about the swine flu, the vaccine and the ongoing mass vaccinations to all people in Sweden.

If you refuse to meet this demand, then I, and all others who are aware of what is going on, and all of those that within a near future will start to understand, will - for the rest of your careers, for the rest of your lives - hold you responsible for just standing on the side and doing nothing but observe, while this disgusting crime was taking place.

All of you Swedish journalists, it is your job to scrutinize those in power. It is your job to report to us when they abuse their power. It is your job to inform the Swedish people about current events. Right now, you are not doing your job. This will result in fatal consequences, unless you immediately start doing what you are supposed to do and what you have to do.

Even though I do hope that you come to your senses, it is not something that I neither expect nor rely on. For this reason, I’ve started the page "Vaccination News". This news reporting is not as fancy as the thug papers for which you work, but it deals with something that the Swedish people need more than anything else right now - the truth about the swine flu, the vaccine and the mass vaccinations. The link to this daily news reporting about the swine flu, the vaccine and the mass vaccinations is: http://www.wordmworld.net/bubble-words/vaccinationsnyheterna (in Swedish)

In case you journalists want to write real articles but have them refused by your scoundrel employers, then you are very welcome to send them to the "Vaccination News", and I will publish them on this site.

The same goes for the Swedish people. The most dangerous thing we can do right now is wait for someone else to take action. We have to start taking matters in our hands. You have to take matters in your own hands.

Right now, we dispose over a fantastic means of communication, the Internet. We have to start take advantage of this. Thanks to the Internet, we can communicate with each other directly, by sending links, video clips, documents and articles. It is very important that we do not take our current communicative freedoms for granted. It is equally important that we spread this information that governments, mainstream media and all those in power want to keep away from us, as much as possible and as quickly as possible.

Communicate with the people around you, both in everyday life and on the Internet. Talk to each other, discuss, ask questions, think critically, exchange ideas, send links, post information on Facebook, twitter, blogs, in different forums, and spread the word that our future is right now at stake and do it in every way possible.

For every day that passes, our freedoms are being taken away from us, both on the web and in our communities, without most of us even noticing it. If we want to come out of this fight victoriously, then we need to exercise our rights and use all our means of communication to the fullest. Now, right now, right away.

The Pandemic is Political

Forbes, 16 October 2009, 7:15 pm EDT
https://www.forbes.com/2009/10/16/swine-flu-world-health-organization-pandemic-opinions-contributors-michael-fumento.html?sh=474767ae6899

As evidence continues to mount that swine flu is more of a piglet than a raging razorback, why isn't curiosity mounting as to why the World Health Organization declared it a pandemic? And definitions aside, why does the agency continue to insist we're going to get hammered? The answers have far less to do with world health than with redistribution of world wealth.

Medically, the pandemic moniker is unjustifiable. When the sacrosanct World Health Organization (WHO) made its official declaration in June, we were 11 weeks into the outbreak, and swine flu had only killed 144 people worldwide--the same number who die of seasonal flu worldwide every few hours. The mildest pandemics of the 20th century killed at least a million people worldwide. And even after six months, swine flu has killed about as many people as the seasonal flu does every six days.

So how could WHO make such an outrageous claim?

Simple. It rewrote the definition of "pandemic."

A previous official definition (and widely used unofficial one) required "simultaneous epidemics worldwide with enormous numbers of deaths and illness." Severity – that is, the number – is crucial, because seasonal flu *always* causes worldwide simultaneous epidemics. But one promulgated in April just days before the announcement of the swine flu outbreak simply eliminated severity as a factor.

That's also how we can have a "pandemic" when six months of epidemiological data show swine flu to be far milder than the seasonal variety. New York City statistics show it to be perhaps a 10th as lethal.

In Australia and New Zealand, flu season has ended, and almost all cases have been swine flu. Yet even without a vaccine, these countries are reporting fewer flu deaths than normal. (In New Zealand, that's just 18 confirmed deaths compared with 400 normally.) Swine flu is causing negative deaths! The best explanation is that infection with the milder strain (swine flu) is inoculating against the more severe strain (seasonal flu) it has displaced.

This all makes sense once you realize that swine flu isn't some sort of alien from outer space as we've been led to believe, but rather "the same subtype as seasonal A/H1N1 that has been circulating since 1977," as the BMJ (formerly the British Medical Journal) observes. It's "something our immune systems have seen before," echoes Peter Palese of New York's Mount Sinai School of Medicine.

The older you are, the more you've been exposed and the higher your immunity level – hence the need to give two swine flu vaccinations to those under age 10.

Nevertheless, because WHO dubbed this a "pandemic," vaccination plans, emergency response measures and frightening predictions have been based on comparisons with true pandemics that by

definition were especially severe. That includes the August report from the President's Council of Advisors on Science and Technology with its "plausible scenario" of "30,000 - 90,000 deaths" peaking in "mid-October."

Check your calendar.

So, then, why did WHO do it?

In part, it was CYA for the WHO. It was losing credibility over the refusal of avian flu H5N1 to go pandemic and kill as many as 150 million people worldwide, as its "flu czar" had predicted in 2005. Around the world, nations stockpiled antiviral medicines and H5N1 vaccine.

So when pig flu conveniently appeared, the WHO essentially crossed out "avian," inserted "swine," and WHO Director-General Margaret Chan could boast: "The world can now reap the benefits of investments over the last five years in pandemic preparedness."

Yet this doesn't explain why the agency hyped avian flu in the first place, nor why it exaggerated HIV infections by more than 10 times, or why it spread hysteria over Severe Acute Respiratory Syndrome (SARS). That disease ultimately killed a day's worth of seasonal flu victims before vanishing.

But the SARS scare was enough, leading to a broad expansion of WHO powers, including a degree of direct authority over national health agencies. It's now using that to leverage more authority and a bigger budget. No shocker there.

What may be surprising is that it wants to use that power to help bring about a global economic and social revolution – and that Director-General Chan was so blunt about it in a speech in Copenhagen last month.

She said "ministers of health" should take advantage of the "devastating impact" swine flu will have on poorer nations to tell "heads of state and ministers of finance, tourism and trade" that:

– The belief that "living conditions and health status of the poor would somehow automatically improve as countries modernized, liberalized their trade and improved their economies" is false. Wealth doesn't equal health.

– "Changes in the functioning of the global economy" are needed to "distribute wealth on the basis of" values "like community, solidarity, equity and social justice."

– "The international policies and systems that govern financial markets, economies, commerce, trade and foreign affairs have not operated with fairness as an explicit policy objective."

Splendid! So let's put the WHO in charge of worldwide economic and social engineering.

Then let's form a new agency that sees disease as something to prevent and treat rather than something to exploit.

Пандемия политическая

3rm.info / Forbes, 9 ноября 2009
https://3rm.info/main/622-forbes-pandemiya-politicheskaya.html

По мере появления доказательств того, что свиной грипп скорее Пятачок, чем клыкастый монстр, хочется поинтересоваться: зачем Всемирная организация здравоохранения объявила пандемию? Почему продолжает настаивать на том, что нам крышка? Ответы, к сожалению, имеют значительно меньше общего с миром здравоохранения, нежели с перераспределением мировых капиталов. С точки зрения медицины пандемии сейчас нет. Когда в июне Всемирная организация здравоохранения (ВОЗ) официально объявила пандемию, прошло 11 недель с начала вспышки, а свиной грипп убил 144 человека.

Именно столько человек умирает от сезонного гриппа во всем мире каждые несколько часов. При наиболее легких пандемиях XX столетия погибли как минимум миллион человек. И даже через 6 месяцев свиной грипп убил приблизительно столько же людей, сколько сезонный грипп уничтожает за каждые шесть дней.

Как тогда ВОЗ могла сделать такое возмутительное заявление? А просто. Она переписала определение «пандемии». Предыдущее официальное определение (широко распространенное неофициально) предполагало «одновременную эпидемию по всему миру с огромным количеством смертей и болезней».

Серьезность – то есть, цифры – важна, поскольку сезонный грипп всегда вызывает во всем мире одновременные эпидемии. Но из определения, обнародованного в апреле за несколько дней до объявления про вспышку свиного гриппа, просто вычеркнута серьезность как фактор. Именно потому мы можем иметь «пандемию», когда эпидемиологические данные за 6 месяцев показывают, что свиной грипп будет гораздо мягче, чем сезонный штамм.

Статистические данные из Нью-Йорка показывают, что его показатель смертность может составлять - 10. В Австралии и Новой Зеландии сезон гриппа завершился, и почти во всех случаях диагнозом был свиной грипп. Но даже без вакцинирования эти страны сообщают про меньшее количество смертей, чем обычно. (В Новой Зеландии подтверждено 18 случаев смерти по сравнению с обычными 400).

Свиной грипп вызывает снижение смертей! Лучшим объяснением является то, что вирус с мягким влиянием (свиной грипп) является прививкой от более серьезных вариантов (сезонного гриппа). Все это логично, если вы понимаете, что свиной грипп не является каким-то пришельцем из космоса, как нас заставляли верить, но, скорее, представляет «такой же подтип, как сезонный A/H1N1, который циркулирует с 1977 года», как напоминает BMJ (British Medical Journal). Такой вирус "наша иммунная система уже видела», - подтверждает Питер Палез из Нью-Йоркской школы медицины Mount Sinai. Чем вы старше, тем больше болели и тем выше ваш уровень иммунитета – отсюда и необходимость делать две прививки против свиного гриппа тем, кто моложе 10 лет.

Тем не менее, поскольку ВОЗ объявила «пандемию», планы вакцинации, меры реагирования на чрезвычайные ситуации и запугивания отталкиваются от сравнения с настоящими пандемиями, которые были особо тяжелыми по определению. К ним принадлежит и августовский доклад Совета по вопросам науки и техники Президента США с ее «вероятным сценарием» с «30000 – 90000 смертей» и пиком в «середине октября».

Но на календаре уже ноябрь... Так зачем ВОЗ это делает? Организация теряет доверие из-за отказа птичьего гриппа H5N1 обратиться в пандемию и убить более 150 миллионов людей во всем мире, как предполагал в 2005 году ее «Гриппозный царь». Весь мир обложился запасами противовирусных препаратов и вакцин против H5N1. Поэтому, когда появился свиной грипп, ВОЗ, по сути, заменил слово "птичий", словом «свиной», а Генеральный директор ВОЗ Маргарет Чэн может похвастаться: «Мир теперь может воспользоваться преимуществами инвестиций за последние пять лет в готовность к пандемии».

Однако это не объясняет ни почему агентство устроило панику вокруг птичьего гриппа в первую очередь, ни почему были преувеличены последствия ВИЧ более, чем в 10 раз, ни почему оно распространяло истерику вокруг атипичной пневмонии. Эта болезнь перед тем как исчезнуть, убила столько людей, сколько убивает обычный грипп за один день. Но страха перед атипичной пневмонией было достаточно для расширения полномочий ВОЗ, в том числе для получения некоторых рычагов прямой власти над национальными учреждения здравоохранения. Сейчас это используется, чтобы получить больше власти и увеличить бюджет. Какая неожиданность…

Удивительно, но ВОЗ хочет использовать эту силу для воплощения глобальной социальной революции, про что Генеральный директор Чэн сообщила в докладе в Копенгагене в прошлом месяце. Она сказала: «Министрам здравоохранения» следует воспользоваться «разрушительным влиянием», которое свиной грипп будет иметь для бедных стран, чтобы рассказать «главам государств и министрам финансов, туризма и торговли», что: – вера в то, что «условия жизни и состояния здоровья в бедных странах каким-то образом автоматически улучшатся вследствие модернизации, либерализации, торговли и улучшения их экономики» является ошибочной.

Богатство не равняется здоровью; – «изменения в функционировании глобальной экономики» необходимы для «распределения богатства на основе» таких ценностей, «как общественность, солидарность, равенство и социальная справедливость»; – «международные политики и системы, которые регулируют финансовые рынки, экономики, торговлю и международные отношения не работали в соответствии со справедливостью».

Превосходно! Так давайте возложим на ВОЗ ответственность за мировую экономическую и социальную инженерию. Тогда давайте создавать новое агентство, которое рассматривает болезнь как что-то, что необходимо предотвратить и лечить, а не средство эксплуатации. Про автора:

Jean-Jacques Crèvecœur

Jean-Jacques Crèvecoeur

Les Gouverne-Menteurs Nous Déclarent La Guerre

Crevecoeur, 23 octobre 2009.
https://web.archive.org/web/20091029222158/http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=article&id=111:courriel-7&catid=65:grippe-a-h1n1&Itemid=98

Madame, Monsieur,
Chers amis,

J'ai très peu de temps pour vous écrire.

C'est important que vous receviez cette information le plus rapidement possible. Et que vous la répandiez (car, il ne faudra pas compter sur les journalistes prostitués et muselés pour informer les populations de ce qui suit).

Les Etats-Unis viennent de décréter l'état d'urgence sanitaire, ce samedi midi (heure de Montréal). Pour beaucoup, ça semblera très banal comme information.

Mais pour ceux capables de lire entre les lignes, cette déclaration d'Obama est une déclaration de guerre contre l'humanité. Dans quelques jours, je ne serais pas étonné que d'autres pays suivent l'exemple des USA, ou que, tout simplement, l'Organisation du Mensonge Systématique (OMS) donne le coup d'envoi d'un état d'urgence sanitaire mondial.

Le 10 septembre 2009, j'avais envoyé un courriel à tous mes contacts. Ce courriel contenait deux parties. Dans la première partie, je posais 26 questions troublantes à propos de cette soi-disant pandémie de grippe porcine. Cette partie a été publiée sur des dizaines de blogs et de sites Internet, envoyée à des centaines de milliers de personnes et traduite dans près de dix langues. Dans la deuxième partie, je proposais un scénario possible de ce qui allait se dérouler. Peu de gens l'ont transmis et beaucoup m'ont critiqué (j'ai même perdu beaucoup d'amis et de connaissances à cause de ce passage). On me reprochait d'être un prophète d'une prétendue apocalypse annoncée, de bonimenteur de rue prêchant la fin du monde. C'est même la raison pour laquelle, dans un premier temps, je n'ai pas reproduit ce passage sur mon site Internet.

À cette époque, je vous expliquais comment créer une pandémie de toutes pièces.

Pourtant, je ne suis pas voyant. Je n'ai pas de boule de cristal. Et je ne suis pas complice des crapules qui siègent à l'OMS, à la tête des compagnies pharmaceutiques, à la tête des ministères de la Maladie et à la tête des médias. J'ai simplement essayé de me mettre à leur place, et je me suis demandé comment je ferais pour exterminer une bonne partie de la population des pays dits développés.

Petit retour en arrière: voici mon texte écrit la nuit du 9 au 10 septembre dernier (dont on pouvait dire, à l'époque que c'était un délire paranoïaque):

Il y a, par contre, une question que je vais poser ici et à laquelle je vais répondre, car beaucoup de mes interlocuteurs ne comprennent pas cela. La question est: comment un virus aussi bénin va-t-il s'y prendre pour tuer des millions de personnes? Ça, c'est la question à un million de dollars!!!

Eh bien c'est l'histoire des pandémies du passé qui nous apporte la réponse. La recette est simple (en douze étapes, déjà expérimentées pendant le XXe siècle, avec des succès divers):

1. on annonce qu'un foyer d'une nouvelle grippe vient d'apparaître au Mexique et que c'est très grave, car c'est un virus animal qui s'est transmis à l'homme!
2. on annonce ensuite 250 morts en une semaine, pour rectifier ensuite le décompte à 8 morts. Mais tout le monde a retenu qu'il y avait eu beaucoup de morts dès le début (ça ne vous rappelle rien, ça: le 11 septembre, on nous a annoncé à la télévision 40 à 50.000 morts dans les Twin Towers – ce qui a justifié la croisade contre l'axe du Mal – puis, on a révisé le nombre de morts à 2.974);
3. on annonce à grand renfort de publicité quotidienne que ce terrible virus se propage à une vitesse incroyable sur toute la planète (alors que par ailleurs, aucun laboratoire du monde ne dispose de la souche du virus pour confirmer que c'est bien ce virus qui est en cause, et pas le virus ordinaire – on reconnaît par ailleurs que la grippe porcine ne présente aucun symptôme spécifique par rapport à ceux de la grippe ordinaire – alors, comment font-ils pour compter le nombre de cas ???);
4. devant le peu de virulence dudit virus, on nous annonce que ce gentil virus (finalement) va muter et va devenir TRÈS méchant, et que l'on sait qu'il va muter à une date précise (celle de la sortie des vaccins, quelle coïncidence quand même!);
5. pendant tout ce temps, on prépare des produits en laboratoire dont on dit qu'ils sont des vaccins, et dans lesquels on mélange deux souches de la grippe porcine, deux souches de la grippe aviaire et une souche de la grippe humaine (cocktail tout à fait explosif, lorsqu'il sera injecté dans le corps!). De plus, on rajoute (en plus grande quantité que d'habitude) des adjuvants (formaldéhyde, aluminium et squalène) et des conservateurs (thimérosal, composé à base de mercure), reconnus pour leur grande toxicité;
6. peu avant la sortie des soi-disant vaccins (qui sont en réalité, ici, des armes bactériologiques), les médias se déchaînent pour nous annoncer qu'il y a une recrudescence de cas de grippe. Même si les médecins ne prennent plus la peine de vérifier s'il s'agit bien du même virus, le peuple est tellement hypnotisé qu'il ne réfléchit plus. Il est persuadé que la mutation annoncée est en train de se réaliser;
7. on annonce aussi que tous les vaccins ne seront pas disponibles immédiatement et qu'il y aura des chanceux qui pourront en bénéficier tout de suite, et d'autres devront attendre jusqu'à quatre mois pour enfin recevoir le vaccin salvateur!
8. dès la sortie des premières armes bactériologiques déguisées en vaccins, le bon peuple apeuré court se faire vacciner volontairement, dans les centres spécialement préparés à cet effet (et encadrés par des militaires). Ici au Canada, les gens s'inscrivent sur des listes d'attente pour être certains d'être parmi les premiers vaccinés!
9. dès l'injection du vaccin, le cocktail préparé soigneusement par les laboratoires entraîne la mutation et la combinaison des différentes souches dans le corps du patient, rendant les virus extrêmement mortels. Dans le même temps, les adjuvants auront mis par terre le système immunitaire. La Tamiflu sera utilisé pour provoquer une surinfection (cas déjà observés dans plusieurs pays) entraînant immédiatement la mort de la personne. Conséquence: il y aura des milliers de morts parmi les premières populations vaccinées;
10. on nous dira alors que, malheureusement, ce qu'on craignait est arrivé: le virus a muté sous une forme mortelle. On attribuera la cause des décès au virus, et pas au gentil vaccin censé nous protéger! Une panique s'emparera de la population, qui réclamera qu'on les vaccine d'urgence;
11. vu la gravité de la situation sanitaire, vu les troubles engendrés, d'une part par ceux qui réclameront avec force leur vaccin, d'autre part par ceux qui accuseront les autorités sanitaires de génocidaires, l'état d'urgence sera déclaré dans tout le pays et le plan de vaccination obligatoire sera mis en place;
12. ceux qui refuseront de se faire vacciner devront se cacher ou disparaître pendant un temps suffisamment long, à moins qu'on ne les fasse disparaître dans des camps de concentration prévus à cet effet.

etc … (continue) =>

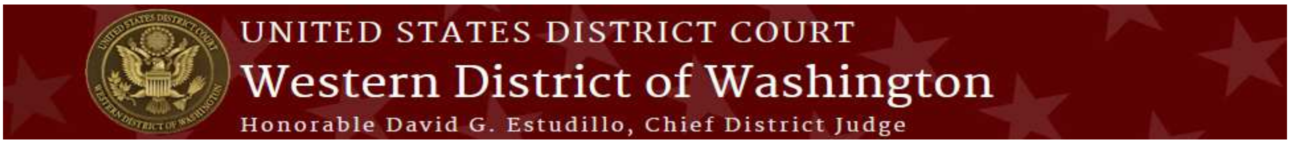
Crevecoeur argues that the Baxter vaccine material must almost certainly contain the bird flu virus, the H5N1 virus, because of the impossibility given the short time of producing large quantities of swine flu flu virus vaccines by the end of August.

He maintains that the vaccine material must have been produced by Baxter in advance and for the bird flu pandemic.

«My intutitive hypothesis (...): the first people to be vaccinated in France will get the vaccine against the H5N1 (but they won't be told). The vaccinated who are already carriers of the H1N1 risk experiencing a co- mutation between the injected H5N1 and the H1N1 present in their body in such a way as to create complications and possible death."

«Ces vaccins livrés fin août à la France sont très certainement des vaccins contenant le virus de la grippe aviaire H5N1, issus de ce qui avait été produit antérieurement par Baxter en préparation de la pandémie de grippe aviaire (il faut bien recycler les invendus, non ?). D'ailleurs, il est impossible que ce soit des vaccins contenant le H1N1 – les délais de fabrication étant trop courts, par rapport à la date de livraison de la souche Californienne qui a servi à la production des vaccins. Ces vaccins ont été gardés sous haute surveillance militaire à Miramas, en Provence (Sud de la France). Et ce sont eux qui sortent les premiers...

· Mon hypothèse intuitive (jusqu'à présent, toutes les intuitions que j'ai depuis mai 2009 se sont avérées exactes, mais je peux me tromper): les premières personnes vaccinées en France le seront avec le vaccin contre le H5N1 (mais, on ne leur dira pas). Les vaccinés qui seront déjà porteurs du H1N1 risquent de vivre une commutation entre le H5N1 vaccinal et le H1N1 présent dans le corps et faire des complications, et en mourir probablement.



Rebecca Campbell files federal lawsuit over WHO flu scam in Seattle

US District Court, Western District of Washington, at Seattle, 24 October 2009
https://cupdf.com/document/rebecca-campbell-files-federal-lawsuit-over-who-flu-scam-in-seattle.html?page=1
https://web.archive.org/web/20091029221826/http://www.theflucase.com/index.php?option=com_content&view=article&id=1355:rebecca-campbell-files-federal-lawsuit-over-who-flu-scam-in-seattle&catid=1:latest-news&Itemid=64&lang=en

UNITED STATES DISTRICT COURT
WESTERN DISTRICT OF WASHINGTON
AT SEATTLE
REBECCA EM CAMPBELL ,
Plaintiff, Civil Action No.
vs. Jury Trial Demanded
KATHLEEN SEBELIUS, Secretary,
States Department of Health and Human
Services; THOMAS R. FRIEDEN, M.D., M.P.H.,
Director, United States Centers for Disease
Control and Prevention; FRANCIS S.
COLLINS, M.D., Ph.D., Director,
United States National Institutes of
Health; and MARGARET ANN HAMBURG , M.D.,
Commissioner, United States Food and
Drug Administration.
Defendants.

Complaint for Declaratory and Injunctive Relief

Plaintiff alleges the following in support of her claim for declaratory and injunctive relief and damages:

Jurisdiction and Venue

1. This is a claim for declaratory and injunctive relief and damages with jurisdiction in this court based upon 28 U.S.C. § 1331 with issues arising under the Constitution and laws of the United States.

2. Venue is proper in this district pursuant to 28 U.S.C. § 1391(e) because this is a civil action in which the defendants are officers or employees of the United States acting in their official capacity or under color of legal authority, plaintiff resides in this district and no real property is involved in the action.

Parties

3. Plaintiff Rebecca Em Campbell is a universal sovereign being, a citizen of the United States and a resident of Seattle, King County, Washington.

4. Defendant Kathleen Sebelius (hereafter "defendant Sebelius") is an adult resident of the state of Kansas with a professional address of 200 Independence Avenue, S.W. , Washington, D.C. 20201. Defendant Sebelius is the secretary of the United States Department of Health and Human Services.

5. Defendant Thomas R. Frieden, M.D., M.P.H. (hereafter "defendant Frieden") is an adult resident of the state of New York with a professional address of 1600 Clifton Road, Atlanta, GA 30333. Defendant Frieden is the director of the United States Centers for Disease Control and Prevention.

6. Defendant Francis S. Collins, M.D., Ph.D. (hereafter "defendant Collins") is an adult resident of the state of Virginia with a professional address of 9000 Rockville Pike, Bethesda, MD 20892. Defendant Collins is the director of the United States National Institutes of Health.

7. Defendant Margaret Ann Hamburg, M.D. (hereafter "defendant Hamburg") is an adult resident of the state of New York with a professional address of 10903 New Hampshire Avenue, Silver Spring, MD 20903. Defendant Hamburg is the commissioner of the United States Food and Drug Administration.

Bill Sardi

The False Flag Flu Emergency

Lew Rockwell, 27 October 2009
https://www.lewrockwell.com/2009/10/bill-sardi/the-false-flag-flu-emergency/

On Friday I stood before an audience in Phoenix, Arizona and attempted to shock them with something similar to a repeat of Orson Welles' War Of The Worlds radio broadcast, a 1938 Halloween night radio announcement that said, in a series of news bulletins, Martians had landed on the earth. The public cowered in fear then, even when Welles announced it was just a radio drama, not reality.

The contrived crisis I created was the President of the United States had just announced a national emergency because of a massive number of deaths attributed to a fast-spreading strain of flu virus that had combined with a mortal form of flu virus. My hand was shaking as I read the announcement. People in the audience thought it was real. The audience began to squirm and wonder, before I finished my melodrama, just how they were going to return home without having to undergo forced vaccination at the airport.

They were relieved when I told them this crisis was purely fictional. I added the announcement for just such a contrived crisis was probably already programmed into the President's teleprompter. Little did I know how true these words were to become.

To my surprise, on the afternoon of the following day (Saturday), the President of the United States had indeed declared a national emergency due to 1000 reported flu deaths, 100 of them among children. These deaths had occurred over the past eight months.

But 1000 accumulated deaths would be far fewer than the mortality figures the Centers for Disease Control distributes – estimated at 36,000 annual flu deaths. Federal health authorities lump pneumonia deaths among the elderly with flu-related deaths to falsely inflate flu mortality figures. My own guesstimate is that only about 6000 flu-related deaths actually occur each year, but even using this figure for comparison, this year's flu outbreak appears weak. An estimated 20,000 hospitalizations have been reported since this pandemic flu strain began in March of 2009, which amounts to only about 625 hospitalizations per week spread among more than 5 thousand hospitals.

Earlier in the week CBS News reported that, five months after this unique strain of the flu had begun to spread in Mexico in March of 2009, the H1N1 pandemic flu strain only comprised 1-2% of the flu viruses in circulation by July. Yet there were massive preparations being made for a major flu pandemic without sufficient justification. Today the Centers for Disease Control says the H1N1 pandemic flu strain represents 99% of the flu cases that are typed laboratory confirmed. Just exactly which numbers are correct, if any, now come into question.

According to CBS News, only 11 million doses of flu have been administered, with millions more to arrive late, sometime in mid-November. Time Magazine reports about 30 million available doses, so that could mean up to two-thirds of the currently available vaccine is going unused.

A reimbursement crisis, not a health crisis

A follow-up report, published in the Sunday edition of the San Francisco Chronicle, says the emergency declaration issued by The White House has more to do with Medicare and Medicaid regulations dealing with hospitals. With the national emergency declared, hospitals have more flexibility to set up separate or even outdoor treatment areas.

The emergency appears to deal more with hospitals and their ability to get paid by federal health authorities. An article in the New York Times confirms that federal rules do not allow hospitals to establish treatment areas more than 250 yards from emergency rooms. "Tents are 300 yards or more away, typically federal dollars won't go to pay for treatment."

So the emergency appears to be financial – making sure hospitals meet federal requirements so they can get paid by Medicaid or Medicare, rather than any true health crisis.

The San Francisco Chronicle article said "White House officials were quick to note that the emergency declaration does not signify an increase in severity of the national H1N1 outbreak." But the article kept referring to all the deaths, when there appear to be fewer mortal cases of the flu in the past 8 months than prior flu seasons.

Journalists and health officials sound more duplicitous as they attempt to explain the need for the emergency declaration. Here is how the San Francisco Chronicle described it:

"Art Reingold, head of epidemiology at UC Berkeley, said the declaration doesn't mean that the national outbreak is 'any worse than it was yesterday or last week'."

"It's difficult to get the right message across to people," Reingold said. "There's this balance between the flu is important and people should be vaccinated, but you don't want an overreaction."

But once again, according to federal officials, there is little or no vaccine available.

Civil liberties threatened?

An article in the Christian Science Monitor (ASM) was more concerned that such a contrived emergency could be a veiled way to overrun civil liberties. The ASM article quoted Harold Relyea, a specialist in national government with the Congressional Research Service, who said:

"When the President formally declares a national emergency, he may seize property, organize and control the means of production, seize commodities, assign military forces abroad, institute martial law, seize and control all transportation and communication, regulate the operation of private enterprise, restrict travel and, in a variety of ways, control the lives of United States citizens."

Few news sources were critical of the declared emergency, but expect more reporters to express skepticism over its need and to question its intent.

An article in the New Hampshire Union Leader said: "But the way the U.S. government has been handling the new flu strain, technically named H1N1, has been less than reassuring."

What to do now?

Misdirection, overreaction and lack of preparedness by public health officials is a clear indication to the public that they cannot totally rely upon potentially problematic vaccines or anti-viral drugs to defend themselves against the flu.

An ignored approach to controlling infectious disease is to address the immune status of the population. The public should utilize bona fide immune boosters such as vitamin D and vitamin C, and take nutrients that are documented to reduce the duration and severity of the disease which include vitamin E, the trace mineral selenium, the sulfur compound NAC, and elderberry.

In 2005 researchers in Rome, Italy wondered what backup treatment could be used in the event vaccines were unavailable or were ineffective against a fast mutating flu virus that had developed resistance to vaccines or anti-viral drugs like Tamiflu or Relenza.

Flu viruses require a host cell to replicate. The Italian researchers report that resveratrol, known as a red wine molecule, completely blocks entry of flu viruses into the cell nucleus in animals at a human equivalent dose of ~70 milligrams. [Journal Infectious Disease 2005 May 15; 191(10):1719-29] So the virus would enter the lungs, antibodies would still be generated to produce long-term immunity, but the virus could not duplicate into millions of daughter virions as it normally does. Resveratrol works on closing the cellular doorway rather than destroying the virus itself. Therefore it is a totally non-toxic approach to control of influenza viruses. Furthermore, resveratrol does not provoke viral resistance.

Is Swine Flu Really a Pandemic?

Der Shpiegel, 28 Oktober 2009, 18:13 Uhr
https://www.spiegel.de/international/world/growing-doubt-among-experts-is-swine-flu-really-a-pandemic-a-657876.html

Germany has launched the biggest vaccination program in its history. But the inoculation jabs are proving so effective and the disease is so mild in most cases that experts have their doubts about whether swine flu is a real pandemic.

The researchers who develop vaccines hope, of course, that their products will work. This time around, however, even the developers themselves were surprised to see just how effective their products have turned out. Researchers from the Novartis pharmaceutical company, testing their swine flu vaccine this September, were astounded to find that just one dose was sufficient to produce copious antibodies in their inoculated patients.

Similar news had already come from China, and GlaxoSmithKline followed shortly afterward, finding the same held true for its vaccine, which Germany is putting into effect as of this week. Unexpectedly, the company found a second shot for adults was unnecessary.

These findings present a puzzle for immunologists and virologists, who are now asking themselves what this tells us about the pathogens behind swine flu.

Pandemic viruses are newly occurring pathogens. They're unknown to the human immune system, which is why people are so defenseless against them. Not one but two inoculation shots are generally necessary to provide sufficient defenses to an immune system that has no previous experience of a virus. Why, then, are current vaccination studies from around the world delivering results that seem far more fitting for a normal, seasonal flu?

Johannes Löwer, president of the Paul-Ehrlich-Institut (PEI), the German governmental institute that oversees immunizations, suggests these results could "perhaps be explained by the fact that the population is not actually as immunologically naive as was inferred from the virus' characteristics and the course of the infection." So is swine flu not actually as new as previously thought? Is it, despite evolving from swine and avian viruses, not a complete unknown for humans after all? And does that mean perhaps it isn't a true pandemic virus at all?

This is not exactly the most convenient time for these doubts to arise, at least from the perspective of Germany's health officials. The country's first large-scale vaccination campaign has just begun, with the public so far showing little interest in getting itself immunized. Doubts about swine flu's status as a pandemic are hardly welcome right now.

But the question – is it a pandemic, an unusual flu season, or something else in between – is not a purely academic one. When the World Health Organization (WHO) decided on June 11 to increase the pandemic alert phase to six, the highest level, pandemic plans came into effect around the globe,

governments stocked up on drugs worth billions of euros, and companies turned out new pandemic vaccines. Was it all really necessary?

Taking preventative measures was certainly warranted. The virus has already claimed more than 5,000 victims globally. Pregnant women and young, previously completely healthy people have died of the disease -- although only in rare cases -- within the space of just a few days. Thus PEI President Löwer believes, "The question of whether the spread of the new influenza virus concerns a pandemic or rather a seasonal occurrence is a moot point with respect to the need to provide vaccines in a timely manner."

Did the WHO Overreact?

And yet it can't be denied that in most cases, the infection has run an astonishingly mild course. And the question of whether the WHO overreacted will only become more pressing. Some experts expressed criticism early on, saying that before declaring phase six, the WHO quickly modified its own definition of a pandemic. The organization simply disregarded the criterion that stipulates a very high mortality rate must first be present, and changed passages accordingly in the pandemic definition on its Web site. If the virus turns out not to be nearly as new as first believed, that begs a further question -- what, then, actually makes swine flu a true pandemic?

Some virologists already had doubts when the WHO first announced the existence of a new flu in late April. Top health officials were indeed talking about a "new subtype" of the influenza virus, one feature required by the US Centers for Disease Control and Prevention to meet its definition of a pandemic. But "new subtype," it turns out, was an inaccurate description -- the pathogen behind swine flu is in truth only a new strain of an old subtype. And as influenza expert Hans-Dieter Klenk at Marburg University's Virology Institute explains, "such strains are more closely related to each other than subtypes are."

Today's swine flu did arise new from a combination of avian and swine viruses. But it's related nonetheless, in a roundabout way, to the pandemic-causing virus of 1918, which still has descendants circulating in the population. That could help explain why older people contract swine flu considerably less often than young people – for their immune systems, this new virus is simply an old familiar one retooled. But younger people may also be less defenseless against the new virus than originally believed.

The influenza proteins H1 and H2, which characterize different viral subtypes, typically vary by more than 40 percent. The H1 protein that has made the leap from pigs to humans with the current swine flu virus, however, differs from the H1 of the seasonal flu virus by only around 25 percent. "And we suspect," Klenk explains, "that this closer relationship is also reflected in some way on the immunological level." What does all that mean? That unlike with the pandemics of 1918, 1957 and 1968, when truly new subtypes sent waves of infection across the globe, this time human immune defenses may be better prepared.

The fact that many people require only one vaccine dose to be protected against swine flu is one piece of evidence. Another is that the virus didn't spread nearly as far through the population as originally feared during the Australian winter.

No one knows how swine flu's course will run. But in the end, British molecular biologist Derek Gatherer may prove to have been right all along. Gatherer declared his suspicions back in the beginning of July, that humankind is facing only a "pseudo-pandemic," one that "may be insufficiently virulent ultimately to enter the annals of major pandemics."

Richard Gale and Dr. Gary Null

Gary Null Obama Administration launches deceptive Swine Flu propaganda blitz
To Counter Growing Criticism from Scientific and Medical Community

Global Research, 29 October 2009
https://web.archive.org/web/20100114223014/http://www.globalresearch.ca/index.php?context=viewArticle&code=GAL20091028&articleId=15860

President Obama and his top health officials are engaging in a major public relations effort to divert attention away from whether its swine flu vaccine is effective and safe – to whether there is enough of it to go around. And the media, as always, is cooperating fully. This echoes the way media debate was manipulated during the Vietnam and Iraq Wars. Instead of debating whether we should even be fighting those wars, the media debated only whether we were using the correct military strategy.

Increasing numbers of scientists and doctors are issuing harsh criticisms of the Government's plan to vaccinate (forcibly if necessary) virtually the entire U.S. population with what they claim is a poorly tested vaccine that is not only ineffective against swine flu, but could cripple and even kill many more people than it helps.

The CDC's public relations campaign has been running "scare" ads that portray swine flu as a full-blown "pandemic" responsible for snuffing out countless lives, and which, unless stopped by universal vaccination, could kill millions of American citizens. But scientists and health officials throughout the world have called the governments claims unjustified and deliberately misleading.

For example, Dr. Anthony Morris, a distinguished virologist and former Chief Vaccine Office at the U.S. Federal Drug Administration (FDA), states that "There is no evidence that any influenza vaccine thus far developed is effective in preventing or mitigating any attack of influenza" and that "The producers of these vaccines know they are worthless, but they go on selling them anyway."

And in November 2007, the UK newspaper The Scotsman, made public warnings by the inventor of the "flu jab," Dr. Graeme Laver. Dr. Laver was a major Australian scientist involved in the invention of a flu vaccine, in addition to playing a leading scientific role in the discovery of anti-flu drugs. He went on record as saying the vaccine he helped to create was ineffective and [that] natural infection with the flu was safer. "I have never been impressed with its efficacy," said Dr. Laver.

We hear the assumption being made by the Centers for Disease Control (CDC) that the number of deaths from the H1N1 virus is at pandemic levels and now a "national emergency." One would assume that with all of its resources, the New York Times' October 26 front page story on the CDC's statistics would be accurate: 20,000 hospitalizations and 1,000 deaths due to the swine flu. However, this is all fiction. And it is a fiction solely based upon the CDC's own contradictory statements and actions.

Our independent investigations into the clinical trials and statistical studies of influenza vaccines reveal glaring discrepancies. Let us not forget that it is this same New York Times, with its "star"

reporter Judith Miller, who led America into believing that Saddam Hussein possessed weapons of mass destruction, tried to purchase yellow cake uranium from Niger, and had dealings with al-Qaeda. And let us also remember that it is the same CDC and health officials in Washington, including President Ford and his top health advisor F. David Matthews, who pushed through and propagandized an untested vaccine during the 1976 swine flu scare, which resulted in thousands of severely neurologically damaged Americans and about 500 reported deaths. Aside from permanent paralysis, many of these vaccine victims also underwent torturous processes for many years to get the government to recognize their illnesses and help cover their costs. Not only was the CDC's prediction and vaccination campaign for the 1976 flu season a total disaster, it also turned into a deadly scandal, witnessed across the United States on 60 Minutes when Dr. David Sencer, then head of the CDC, confirmed that the vaccine was never field tested, that there were only several reported incidents of H1N1 infection and none of these had been officially confirmed, and then lied about the CDC having no prior evidence that the swine flu vaccine could cause severe and permanent neurological damage. The end result from the 1976 debacle cost the government $3.5 billion in damages, two-thirds were for severe neurological injury and death directly due to the CDC's vaccination campaign.

Therefore, being anti-vaccine or pro-vaccine is not the most urgent issue. What is critical is whether or not there is legitimate, sound science to support either position; in this regard, the vaccine manufacturers and our federal health agencies have failed in the past, and continue to fail today. And they fail dismally. There is absolutely no evidence for sound-scientific protocol or anything resembling a gold-standard behind the swine flu infection statistics and vaccine efficacy and safety clinical trials to support Obama's and his health advisors' claims. Instead, the reports on hospitalizations and deaths due to the H1N1 virus are grossly distorted. What we are really witnessing is "official" science and statistics that are little more than propaganda.

One unfortunate development over the years is the notion that there is such a thing as a "flu season." The truth is that we move annually into periods where there are dramatic increases in flu-like causing pathogens, however, the majority of these are unrelated to any strain of influenza virus. There can between 150 and 200 different infectious pathogens – adenovirus, rhinovirus, parainfluenza, the very common coronavirus and, of course, pneumonia – that produce flu-like symptoms, and worse, during a "flu season." For example, how many people have heard of bocavirus, which is responsible for bronchitis and pneumonia in young children, or metapneumovirus, responsible for more than 5 percent of all flu-related illnesses? This is true during every flu season and this year is no different. Furthermore, all flu vaccinations, including the swine flu, are useless for protecting people from these many prevalent infectious organisms.

If we take the combined figure of flu and pneumonia deaths for the period of 2001, and add a bit of spin to the figures, we are left believing that 62,034 people died from influenza. The actual figures determined by Peter Doshi, then at Harvard University, are 61,777 died from pneumonia and only 257 from flu. Even more amazing, among those 257 cases only 18 were confirmed positive for influenza. A separate study conducted by the National Center for Health Statistics for the flu periods between 1979 through 2002 revealed the true range of flu deaths were between 257 and 3006, for an average of 1,348 per year.

The recent CBS Investigative Report, published on October 21, is one example. After the CDC refused to honor CBS's Freedom of Information request to receive flu infection data for each individual state, the network performed independent outreach to all fifty states to get their statistics. Their report contradicts dramatically the CDC's public relations blitz. For example, in California, among the approximate 13,000 flu-like cases, 86 percent tested negative for any flu strain. In Florida, out of 8,853 cases, 83 percent were negative. In Georgia and Alaska, only 2.4 percent and 1 percent respectively tested positive for flu virus among all reported flu-like cases. If the infectious-rate ratios obtained by CBS are accurate, the CDC's figures are significantly reduced and agree with

earlier predictions that the H1N1 virus will be simply an unwelcomed annoyance. So we are in the midst of an enormous medical hoax, a design and purpose that has yet to unfold completely, that will nevertheless reap huge revenues for the vaccine industrial complex.

Another example is a recent alarmist report issuing from Georgetown University, also usurped by federal health officials and their multimedia comrades to fuel a campaign of fear and panic. The report announced that over 250 students were infected by swine flu when in fact none of these students were tested for H1N1 infection. The university's figure was based solely on a count of student visits to the health clinic and calls into an H1N1 hotline.

This is not the first time the CDC's predictions for influenza strains have been overstated and miscalculated. In an interview on Swedish television, Dr. Tom Jefferson, head of vaccine studies at the prestigious international Cochrane Database Collaboration, after reviewing hundreds of influenza studies and statistical analyses, has said the WHO's and CDC's "performance is not very good." And in an ITN News interview last month, Jefferson called the swine flu pandemic a "juggernaut they [the WHO, government agencies and vaccine makers] created." For the 1992-1993 season, the prediction was off by 84 percent. For the 1994-1995 season, it was off 43 percent for the primary strain and off 87 percent and 76 percent for two other strains.

The Laboratory Center for Disease Control's study comparing vaccine strains with the strains appearing during the 1997-1998 season found the match was off by 84 percent. Again Dr. Jefferson in a Der Spiegel interview remarked, "there are some people who make predictions year after year, and they get worse and worse. None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all?... Swine flu could have even stayed unnoticed if it had been caused by some unknown virus rather than an influenza virus... An influenza vaccine is not working for the majority of influenza-like illnesses because it is only designed to combat influenza viruses. For that reason, the vaccine changes nothing when it comes to the heightened mortality rate during the winter months."

Our review of all clinical trial studies conducted by the H1N1 vaccine makers for pre-licensing in the American market – CSL, Novartis, Sanofi-Pasteur, Medimmune and now GlaxoSmithKline – reveals they were poorly designed and feebly executed. Any professor in molecular biology or virology would fail a graduate student who presented a paper relying on research conducted in the manner of the studies the vaccine corporations submit to the FDA. Nevertheless, it is this lack of sound randomized, double-blind controlled placebo studies, particularly for inactivated virus vaccines, that our government is declaring definitive and is using to justify mass vaccination of our population.

Last week, Switzerland's health authorities rejected Novartis' new swine flu vaccine, Celtura, being targeted for women and children, because the company's studies were insufficient to guarantee its safety. In addition, the new Novartis vaccine, which uses a cell base from dogs, was found to be contaminated with canine-specific bacteria. The Swiss newspaper, Tagesanzeiger, also noted there remains some suspicion that Novartis' new vaccine may be a repackaging of an earlier 2008 vaccine responsible for killing almost two dozen homeless people during an illegal clinical trial in Poland. This is the same Novartis whose Fluvirin H1N1 vaccine being distributed in the US relied only on a hasty clinical efficacy and safety trial enrolling only a small number of health adults. Novartis likely remains unperturbed. The Swiss pharmaceutical giant has reported a $6.1 billion profit so far this year and expects to boost sales for the final quarter with its swine flu vaccine.

In July, the CDC announced it would cease testing and counting H1N1 virus infections. Their public reason was simply that they are convinced there is a pandemic and, therefore, accurate monitoring was unnecessary. On August 30, the CDC declared the states should report influenza and pneumonia-associated hospitalizations and deaths together, not singling out actual cases of H1N1

infection if there happen to be any actually confirmed from a laboratory. This has always been the CDC's policy, and the 36,000 figure of annual flu deaths repeated ad nausea on their website and spewed from the media's health pulpits for several years straight, does not distinguish between pneumonia, influenza and other flu-like pathogenic deaths. Perhaps it would make very little difference because the current rapid diagnostic tests for the H1N1 virus can range in only 10-50 percent accuracy.

Elsewhere in the world, particularly in Europe, civilians are increasingly rejecting the H1N1 vaccine. Recent polls in Germany and Austria show only 13 and 18 percent respectively willing to take the shot. In Sweden, four vaccine related deaths have been announced and almost 200 healthcare workers have reported becoming more seriously ill from the vaccination than they might have from a flu infection. In the US, anywhere from 90-99 percent of adverse events go unreported.

If people would simply shut off the CDC's supported propaganda noise being blasted across the airwaves and newspapers – the spectacle of newscasters being inoculated, interviews with government health officials or private doctors and academics receiving consultation fees from drug makers, and the drivel of the New York Times – and simply do their homework, Americans would wake up and realize the hoax behind the swine flu pandemic. All of the information is before us. Nothing is hidden. All the contradictions and hypocrisies are contained within the massive vaccine industrial complex – including the government health agencies and professional medical associations. The lie is too large for them to not expose themselves if we simply look.

HEALTH FREEDOM ALLIANCE
PRESERVE & PROTECT YOUR HEALTH FREEDOM

Lawrence Broxmeyer

The Swine Flu (aka 'H1N1) That's Not a Flu at All

The Health Freedom Alliance, 30 October 2009, 11:50 am
https://web.archive.org/web/20091104224529/http://blogs.healthfreedomalliance.org/blog/2009/10/29/the-swine-flu-aka-h1n1-thats-not-a-flu-at-all/#more-6219

Even though this is written for the layman, it is still a fairly technical paper which may be difficult for the layman to understand. The essence of it is, there are many infectiosn which present flu like symptoms and there is nothing to indicate that the swine flu is a flu at all. Just one more reason to avoid this vaccinatin like the plague - no pun intended. It would be wonderful if some of our health care professionals would add clarifying comments. - Ed

The current Swine "flu" pandemic began in La Gloria, a pig-farming village in the Veracruz mountains of Mexico. Surely, if any place could unlock the true nature of the cause of the 2009 Pandemic, it would be found in La Gloria, whose villagers were certain that they were sickened by the surrounding pig farms, which they accused of polluting their air and water with pig waste. This is much like what happened in Haskell County, Kansas in 1918, original site of the Great Influenza Pandemic of 1918.

But Enrique Sanchez, top official from Mexico's Agriculture Department, could not find H1N1 in mucous samples taken from the pigs several weeks later, on April 30th. Common bacteria were also tested for. However no studies were done to rule out Swine tuberculosis which is predominantly avian and to a lesser extent bovine, and could have also accounted for the wholesale "respiratory" problems the villagers were experiencing.

Mexican health officials, overlooking the La Gloria situation initially, downplayed it, much as health officials everywhere are prone to do. Yet of 43 villagers whose mucous samples were taken, only one, a 5-year-old boy, was confirmed as having Swine Flu. So head investigator from the Biotechnology Institute of the National Autonomous University of Mexico there, Dr. Carlos Arias, told the AP:

"I cannot understand it. I could almost bet that there were more infections related to the virus."

Soon, more than half of La Gloria's 3,000 residents fell ill with FLU-LIKE illness, etiology unknown. 450 of the sickest of these where treated not with anti-virals such as Tamiflu, but with antibiotics and masks. What was the diagnosis handed out? Why it was "acute respiratory infections", and by the time the mucous results came through in early April, most of the villagers had recovered, the more serious cases on antibiotics alone. The "virus" seemed to have left their systems. But the question lingers: since antibiotics don't cure "viruses" what infectious disease in these purported "Influenza" victims had been cured by the antibiotics given?

On June 3rd, 2009 in Global Research, a curious article by F. William Engdahl appeared, entitled "Sarkozy's Secret Plan for Mandatory Swine Flu Vaccination". In it Engdahl plainly stated that "The only problem with the Swine Flu (H1N1) Vaccine, is that to date, neither WHO nor the US Government's Center for Diseases Control (CDC) have succeeded to isolate, photograph with an electron microscope, or chemically classify the H1N1 Influenza A virus". Furthermore there was no

scientifically published evidence that French virologists have done so either. Therefore, mentioned Engdahl, “To mandate a vaccination for a putative (supposed or assumed to exist) disease that has never been characterized, is dubious to say the least."

Engdahl had done his homework. When questioned regarding the electron pictograph of H1N1 that the CDC recently came up with on their website, he revealed his source, German virologist Dr Stefan Lanka, an expert on the documentation of viruses, attesting to the fact that the H1N1 picture was bogus. The virologist wrote that he had “written the CDC many times as to who made the H1N1 photo’s and whether they where scientifically documented as to chemical characteristics and other properties." There was never any reply. He concluded “If CDC refuses to cite the source of the photos, they are fake." Worse yet he said “The photos are merely liposomes, microscopic artificial sacs whose walls are a double layer of phospholipids, used to carry substances such as drugs, vaccines, and enzymes to specific cells or organs of the body. These have been artificially presented by a process where chick embryos or cell cultures are killed, reduced and then centrifuged with some solvent, to then, in a vacuum, be nanofiltered." As if this wasn’t enough, the virologist testified that “Such a structure has never been characterized in either an organism or its fluids. Furthermore, if there wasn’t for the centrifuge/solvent/nanofiltration manipulation, not to mention the precipitation procedure, such particles could never be presented under the electron microscope. In conclusion, without the isolation of the H1N1, there is no H1N1 infecting virus"

Engdahl wasn’t finished. “Even more bizarre is the admission by the US Government’s Food and Drug Administration, an agency responsible for the health and safety of its citizens, that the ‘test’ approved for premature release to test for H1N1 is not even a proven test. More to the point", continues F. William Engdahl, “there is no forensic evidence in any of the deaths reported to date that has been presented that proves scientifically that any single death being attributed to H1N1 Swine Flu virus was indeed caused by such a virus."

These thoughts were only strengthened when Engdahl looked into “Novavax, a US pharmaceutical company based in Rockville, Maryland, (who) conveniently enough just announced it is developing a vaccine for H1N1 based on ‘virus-like particles’".

‘Virus-like particles’ do not mean virus. Viral-like, cell-wall-deficient forms of tuberculosis, for example, also appear virus-like and apparently.. so also did non-infectious liposomes.

Both the **World Health Organization** (WHO) and the **Centers for Disease Control** (CDC) are fully aware of a far more serious and ongoing tuberculosis Pandemic in the world today. Yet they choose to downplay the link, disregarding the similar flu-like symptoms tuberculosis often begins with.

WHO freely admits that there were approximately 1.8 million deaths from tuberculosis in 2007, the most recent year for which data are available as well as that presently about one-third of the world’s population, or two billion people, carry the TB bacteria.

The “H" and “N" of influenza sub-typing, revolves around two glycoproteins called Hemagglutin (H) and Neuraminidase (N), both of which can be, and are, associated with infectious diseases such as the minuscule, viral forms of tuberculosis, a disease which ought to be high on the differential diagnosis for ‘flu-like illness’ . An August, 2008 Medline study in the Journal of Clinical Biochemistry showed that sputum neuraminidase levels over 1.0 mU per mL were proven associated with having tuberculosis in 92% of cases. Previous to this, bacteria closely related to TB were shown, through crystallization, to produce the same protein neuraminidase used to subtype ‘Influenza’. Furthermore, as of 2006, it has become obvious in Menozzi’s study that similar to Influenza, Tuberculosis not only uses Hemagglutin to attach to the lung’s epithelial cells

Khomenko’s 1993 study, showed that the explosive contagiousness of just such influenza-like forms of tuberculosis are exactly the stuff that previous epidemics and pandemics could have been made of. Khomenko was mentioned by Nobel nominee Lida Mattman in her textbook. That is exactly why, that in response to the present world “flu" pandemic, Japan’s Health Ministry’s Tuberculosis Infection Diseases Control Division deputy director Takeshi Enami went hand in hand

with Yoshio Nanba, director of The Office of Pandemic Influenza Preparedness and Response, to attend a news conference in Tokyo on May 1, 2009.

But back in the US, the CDC and NIH seem to feel differently, ignoring everything but “the virus". There was much the same “Influenza" talk when in 1990, a new multi-drug-resistant (MDR) tuberculosis outbreak took place in a large Miami municipal hospital. Soon thereafter, similar outbreaks in three New York City hospitals left many sufferers dying within weeks. By 1992, approximately two years later, drug-resistant tuberculosis had spread to deadly mini-epidemics in seventeen US states, and was reported, not by the American, but the international media, as out of control. Viral forms of swine, avian and human TB can be transmitted from one species to another. By 1993 the World Health Organization (WHO), proclaimed tuberculosis a global health emergency. (1)

1918 and Today

No one can deny the similarities between the onset of the 1918 epidemic and that of today, yet a Press Release, issued on August 19, 2008, by the National Institute of Allergy and Infectious Diseases (NIAID), contains a striking finding and conclusion: The 20 to 40 million deaths worldwide from the great 1918 Influenza ("Flu") Pandemic were NOT due to “flu" or a virus, but to pneumonia caused by massive bacterial infection."(2)

Subsequently, a study published in JAMA by Talbot and Moore (3) in 2000 showed that Mexican immigrants to the US have the highest case rates for tuberculosis among foreign born persons. Mexico is the country where Swine Flu deaths were first documented.

The research of Lawrence Broxmeyer MD (4) first proclaimed that the 1918 pandemic was due to bacteria, particularly mutant forms of flu-like fowl, swine, bovine, and human tuberculosis (TB) bacteria: (http://drbroxmeyer.netfirms.com/001pdfBIRDFLUEDITORIALPUBLISHED.pdf).

These forms of tuberculosis are often viral-like, mutate frequently and can “skip" from one species to another. Moreover the antibodies from such viral TB forms react in the compliment fixation and later “viral" assays (5). They also grow on cultures which are supposed to grow only viruses.

In a supportive 16-page-paper which appeared in Population and Development Review, University of California demographers Andrew Noymer and Michael Garenne came up with convincing statistics showing that undetected tuberculosis may have been the real killer in the 1918 flu epidemic (6).

The Roots of History

Noymer’s TB hypothesis stands sound against history. Few flu “experts" are aware that in medical texts printed circa 1918 “Influenza" was attributed not to a virus but a bacteria called Mycobacterium influenzae, discovered by Pfeiffer and Canon (7) in 1892……not exactly a coincidence since Richard Pfeiffer worked, at one time, for Robert Koch, the discoverer of tuberculosis, a disease also caused by another bacillus called Mycobacterium tuberculosis. Both mycobacteria stained best with carbol-fuchsin, a bacterial stain commonly used in the staining of mycobacteria as it has an affinity for the mycolic acids found in their cell walls. Mycobacteria such as tuberculosis are particularly deadly because they share properties of the fungi ("myco-") as well as bacteria. TB was, not all that long ago, referred to as “captain of the men of death". And it never lost its potential to kill.

Mycobacterium influenzae was considered by most to be the cause of influenza until 1933. But there were serious diagnostic problems with Mycobacterium influenza. Stengel and Fox warned (8) about them in their widely quoted W.B. Saunder’s 1915 version of “A Textbook of Pathology". Problems with identification revolved mainly in that although the bacterial influenza occurred abundantly in the sputum of flu patients at first, it decreased in quantity as the cases advanced. And when purulent expectoration stopped, whether the disease was still active or not, Mycobacterium influenzae “disappears entirely"(8).

In 1933 English physicians Wilson Smith, Christopher H. Andrewes, and Patrick P. Laidlaw(9) removed secretions from the throat of a humans with flu-like symptoms thought to have “influenza", and then filtered out a suspected infectious agent, which by virtue of the fact that it went through a filter was falsely proclaimed, from the onset, to be “a virus". Injecting it into ferrets, the ferrets then developed the same flu-like symptoms which Smith, Andrews and Laidlaw summarily declared as “influenza". In addition Sir Christopher Andrewes suggested, with the help of Burnet and Bang, that the term “myxovirus", meaning “mucous virus", be incorporated into a family name for the Influenzas. This, one imagines, was because the organism came from mucous secretions.

But to government pathologist and pioneer physician/researcher William M. Crofton, who by virtue of his office as County pathologist had examined some of Laidlaw’s human “Flu" samples, Laidlaw’s entire study was flawed. Crofton found Laidlaw’s Flu samples to be laced with the bacillus Mycobacteria influenzae, which by then had been renamed Haemophilus Influenzae. To Crofton this bacilli was the common denominator for the Pandemic of 1918 he had witnessed, although the bacteria could be accompanied by an array of opportunistic organisms such as Staph and Strep. Crofton publically and personally confronted and challenged Laidlaw to come to his laboratory for the proof that his Influenza samples weren’t viral. Crofton was convinced by the confirmation of scientists like Calmette at Pasteur regarding how certain forms of tuberculosis, appearing both minuscule and viral, could pass through the smallest of filters. Crofton himself then established that tuberculosis could disappear into tissues as viruses did, and then go through filters which stopped cold even most of those “now invariably called viral disease". “Surely, then", Crofton concluded, “Tuberculosis has more right to be considered a true virus than these(10)." So, at a time when viral forms of TB where scantily being documented, Crofton struggled to link H. Flu with the TB it so often infected in coordination with, as historical and political momentum carried Laidlaw’s study through for posterity. A great opportunity was missed to correct the record.

Frank Macfarlane Burnet was the first to grow “Influenza" in a laboratory setting; in 1940 he grew influenza in embryonated chicken eggs, using the allantoic sac. He obviously considered such a technique “Influenza" specific, never bothering to consider that such an allantoic site might also be an excellent site for culturing the viral or Cell-Wall-Deficient (CWD) forms of tuberculosis and the mycobacteria. Viral TB, in fact grows there as early as 6 hours after introduction into such a place in chicken embryos(11).

Furthermore, some of the filamentous forms of tuberculosis mentioned by Corper (12) appear similar to those attributed to "Influenza" by biochemist and Influenza guru Burnet (13).

It wasn’t because Burnet didn’t know that bacteria could assume viral forms. The first, and for a time the only virologist in Australia, it was Burnet who discovered bacteria in viral forms of Q-fever (14). And in that same paper, proclaiming Virology as an Independent Science , and after admitting that viruses, including influenza, are composed of the same sorts of material as bacteria, Burnet struggles to differentiate Influenza by the fact that it "probably has no DNA" and was therefore exclusively RNA.(Ibid.). But, according to Xalabardar, some cell-wall-deficient mycobacterial forms also are exclusively RNA. Furthermore, points out Xalabarder, such cell-wall-deficient tubercular forms are true antigens, all of which, similar to Influenza, induce the production of specific antibodies detectable by complement fixation tests, such as those originally used to detect Influenza (5).

Conclusion

In a landmark study(15), Dr. Robert Donaldson, working out of the Pathological Society of Great Britain had ruled out that the mycobacteria now referred to as H. Influenza by itself was behind 1918, perhaps because of its disappearing nature. Yet at the same time he quickly added that there wasn’t “the slightest shred of evidence" that the disease was due to a “virus" or influenza. Nor was Donaldson ever able to refute Broxmeyer and Noymer’s feelings that TB was behind the many deaths in the pandemic, specifically because it is well known that secondary bacterial infections, be they from opportunistic Haemophilus influenza or any other common bacteria, are a common

secondary manifestation in TB-infected lungs. During the pandemic, one-third of patients who had Haemophilus influenza were also found to have tuberculosis - keeping in mind, as always, that many other cases with TB went undiagnosed.

In order to understand why we have this emphasis by those virologists invested in a 'killer flu' in the US today, one must look back historically at the science itself. Until the late 1940s influenza 'viruses' were studied as infections, which, although filterable, were conceived of as analogous to bacteria, a kind of ultra or viral-like bacteria. Not to be deterred, and still seeing Influenza as a great opportunity for virology, in 1941 virologist Hirst claimed that influenza "virus" could agglutinate (or clot) red blood cells of fowl and other animal species(16). Such a hemagglutinin discovery, in turn, led to fast assays of what is thought to be Influenza. The "H" in H1N1 comes to us through Hirst, who showed that "virus" particles first adsorbed to the red cells and, after a certain time, eluted again as a result of what could be interpreted as an enzymatic reaction. But 6 years later, Middlebrook and Dubos(17) made this seem nothing more than a cheap hat trick by showing that similarly red blood cell agglutination could be produced by sera from patients with tuberculosis. Takahashi and Ono(18,19) reviewed similar red cell agglutination occurring in the presence of tuberculous serums.

As Influenza historian van Helvoort aptly pointed out (20), indeed, in the 1930s and 1940s the concept of 'filterable viruses', including Influenza, were subject to such criticism that Virology's very foundations were threatened. Dogmatized statements like those coming from pioneer virologist Andre Lwoff in 1957: "Viruses should be considered as viruses because viruses are viruses"(21) were totally unacceptable, and did little to help the situation. So it was in 1952 that Cornelius P. Rhoads, Director of Sloan-Kettering Institute for Cancer Research in New York City, remarked in a conference introduction that the term "viruses", such as that of Influenza, had achieved "a high professional status with doubtful credentials"(22).

Perhaps in his authoritative text, The Pathogenesis of Tuberculosis, Johns Hopkin's head of pathology, Arnold Rich summed things up best:

"In relation to the question of the effect of influenza upon tuberculosis, it should be pointed out that in many cases in which pulmonary tuberculosis has been thought to have followed an attack of influenza it is altogether probable that the supposed attack of influenza was, in reality, a manifestation of an existing tuberculous infection; for tuberculoprotein, whether absorbed from a spreading lesion or injected into the body, can cause constitutional symptoms (fever, malaise, headache, joint pains, anorexia, prostration) quite like those of influenza." (23)

As Professor Hans Rosling (http://www.youtube.com/watch?v=V8bUtbODV-Q;
http://www.youtube.com/watch?v=V8bUtbODV-Q) has so aptly pointed out: during the initial 13 days that WHO started gaining data on Swine Flu Deaths, April 24-May 6, 2009, 31 people died of Swine Flu. 29 of these were in Mexico and 2 in the US. During this same 13 day window, 63,000 people, around the world died of tuberculosis. (http://www.who.int/research/en). What we have today, is a pandemic with "flu-like" symptoms. And flu-like symptoms doesn't necessarily mean "Influenza" is its underlying cause.

Readers interested in the subject of Influenza/TB can also go to Dr. Ron Paul, MD's take at:

Paul Revere’s lantern in Hawaii: Swine Media Campaign response to Obama's National Emergency

Examiner, 2 November 2009, 12:59 PM
https://web.archive.org/web/20100505004119/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m11d2-Paul-Reveres-lantern-in-Hawaii-Swine-Media-Campaign-launched-in-response-to-Flu-National-Emergency

A father in Hawaii, Ray Songtree and his three-year old daughter have launched a Paul Revere Swine Flu Email Campaign to raise awareness that H1N1 disinformation was premeditated pretext for Obama's ‘National Emergency' declaration.

Songtree of Kauai Truth believes Americans need Paul Revere action to awaken them to CDC false statistics disinformation used to justify the Emergency that is subverting U.S. constitutional government.

A National Emergency gives unprecented government powers, including mandating vaccinations and facility quarantines, what Michel Chossudovsky identified soon after the H1N1 outbreak as medical militarization, martial law with heavily marketed fraudulent data.

CBS News recently reported the overwhelmingly exagerated H1N1 data. CDC is using multimedia to sell the untested, unneeded vaccine program, by mind control wrapped in its 7-step "PR" campaign to exploit the public, as revealed by MIT's Peter Doshi.

Paul Revere was the legendary Boston silversmith who rode from town to town on a dark night in 1775 with his lantern, shouting "the British are coming!" to help mobilize people against an invasion threatening American freedom.

Dad wants daughter safe from suspicious vaccines

When asked why the H1N1 issue is important to him, without hesitation, Songtree said, "I don’t want children targeted with untested vaccines. When CBS News exposed on October 21 the Center for Disease Control's lies about the number of H1N1 cases that is what got this whole flu panic started, it really settled for me that something criminal was in play."

"The CDC created this fake pandemic. When I thought about the U.S.A. pushing 90,000 H1N1 vaccine centers when only 242 people died of ‘swine flu’ in Mexico in the past six months, I realized a huge corrupt machine was coming after our children. After all, one hundred people die from seasonal flu each day," stated Songtree today, adding, "Why have children if we can't give to them a healthy future based on honesty?" he asks.

Sister Teresa Forcades i Vila, the Italian Benedictine Nun, Public Health Doctor, and *Crimes and Abuses of the Pharmaceutical Industry* author being reprimanded for speaking truth such as about dangers of the World Health Organization's global vaccine program, inspired Songtree, as did Austrian Jane Burgermeister and American Dr. Gary Null.

Martial Law

"Government has told us it will limit internet access for this swine flu and it seems they are hell bent to sensationalize every H1N1 death to justify emergency powers, even though seasonal flu kills 100 people per day that media never mentions. We need to bust them on this disinformation while we still have a free internet," he stated.

Limiting and disrupting communications are keys to military dictatorship as highlighted in the work of Naomi Wolf and Michel Chossudovsky has warned since the public emergency was declared shortly after the Mexican H1N1 outbreak.

Songree's campaign quesitons include the issue of U.S. martial law and when asked about his thoughts on this, Songtree responded, "Oh, it is planned but not inevitable. People think that cops and soldiers are inhuman, but it isn't true. They are human. They need support to do their their real job, not to just follow orders but to protect freedoms guaranteed in the Constitution. With support, they will hesitate to follow the Nazi path."

Songtree believes Oath Keepers is the most important development now in the USA. (See Dupre, D., *Soldiers, vets, police say 'We will Not Obey: Solution for peace, Examiner*, Sept. 7, 2009)

"What happens when the domestic enemy is the government itself and gives orders? That's when a law enforcement officer take out his copy of the Constitution and says, "Sir, I cannot follow that order."

Two months before Obama declared the National Emergency, investigative journalist Matt Rothschild reported in *The Progressive* that the Pentagon requested authority to station 400,000 troops in the continental U.S. during an emergency:

The Pentagon has approached Congress to grant the Secretary of Defense the authority to post almost 400,000 military personnel throughout the United States in times of emergency or a major disaster. This request has already occasioned a dispute with the nation's governors. And it raises the prospect of U.S. military personnel patrolling the streets of the United States, in conflict with the Posse Comitatus Act of 1878.

In June, the U.S. Northern Command distributed a "Congressional Fact Sheet" entitled "Legislative Proposal for Activation of Federal Reserve Forces for Disasters." That proposal would amend current law, thereby "authorizing the Secretary of Defense to order any unit or member of the Army Reserve, Air Force Reserve, Navy Reserve, and the Marine Corps Reserve, to active duty for a major disaster or emergency.

Rothschild's raises the shocking reality that Pentagon planning *"raises the prospect of US military personnel patrolling the streets of the United States."*

The Paul Revere Campaign provides "Ten Questions to Ask Corporate Media about 'Swine Flu' and WHO," an email for forwarding available at www.Kauaitruth.com.

When asked what he hoped to achieve, Songtree said, "I'd like to see a million people be the Paul Revere in their respective neighborhoods."

Ray Songtree can be contacted by emailing wakeuptoagenda@yahoo.com

Sister Teresa Forcades i Vila is a Benedictine Nun, Public Health Doctor, and *Crimes and Abuses of the Pharmaceutical Industry* author. Residing in Italy, she was born in Barcelona, Spain in 1966. https://web.archive.org/web/20091122090545/http://www.fespinal.com/espinal/llib/en124.pdf

Sr. Teresa is being reprimanded for speaking truth such as dangers of the World Health Organization's global H1N1 vaccine program. =>
https://web.archive.org/web/20091021032743/http://iglesiadescalza.blogspot.com/2009/10/nun-speaks-out-on-h1n1-pandemic.html

Nun calls for urgent public action to thwart political consequences of H1N1
In the video series, *BELL TOLLING for the Swine Flu (English subtitled)*, Sr. Teresa reflects on the history, gives scientific data of A type flu, and lists all the irregularities related to the H1N1 subject.

=>
(1/6) https://www.youtube.com/watch?v=A0JqQyl09zQ
(2/6) https://www.youtube.com/watch?v=jAmbOrVxMBo

Sr. Teresa explains consequences of the declaration of a PANDEMIC, the political consequences from this declaration and makes a proposal to keep calm.
She calls for an urgent activation of all legal mechanism and the participation of all citizens in this matter.

Gaspar Hernández writes:
One of the more interesting emerging voices in the Church is Benedictine sister Teresa Forcades. Sr. Teresa was born in Barcelona, Spain in 1966. She has a doctorate in Public Health from the University of Barcelona with specialization in Internal Medicine (State University of New York). She also has a Masters in Divinity from Harvard University and a doctorate from the Facultad de Teología de Catalunya. She is the author of Crimes and Abuses of the Pharmaceutical Industry (Cristianisme i Justícia, 2006), La Trinitat, avui ("The Trinity, Today", Publicacions de l'Abadia de Montserrat, 2005), and La teologia feminista en la història ("Feminist Theology in History", Fragmenta Editorial, 2007). She has been a Benedictine nun and a member of the community of Sant Benet de Montserrat since 1997.

El Periódico de Catalunya, October 7, 2009
What's a nun doing talking on the Internet about the dangers of the Influenza A vaccine?

Our rule prescribes five hours of prayer and six of work. *Ora et labora*.
I devote part of the working hours to medical research. I'm a doctor of medicine and in 2006 I published the study Crimes and Abuses of the Pharmaceutical Industry.

When did you decide you had to speak out on influenza A?
In May this year I was asked to give a speech on the papillomavirus vaccine and I was very struck by the lack of scientific basis for the official recommendations. After a few days I spoke on TV-3 about this vaccine and since then I have been receiving requests to comment on the influenza A vaccine.

Doesn't the World Health Organization deserve to be trusted?
I don't understand the motives that have led WHO to act in the absurd way it is acting.

Absurd?
Yes. Last May, WHO changed the official definition of a pandemic -- it changed from a logical definition (a pandemic is an infection of global proportions and with a high mortality) to an illogical definition (a pandemic is an infection of global proportions).

What are the consequences of this change?
Under the new definition of "pandemic", the annual [seasonal] flu more than meets the requirements to be one. Are we going to declare a world health alert every fall? Besides absurdity from the scientific standpoint, this has serious financial and policy consequences.

«Проблема свиного гриппа очень раздута»

Газета.ru, 3 ноября 2009, 18:42
https://www.gazeta.ru/science/2009/11/03_a_3280273.shtml

«Газета.Ru» представляет разные точки зрения на то, насколько страшен свиной грипп и какие профилактические меры могут предпринимать граждане, чтобы не заболеть вирусом H1N1.

Каждому из собеседников корреспондентов «Газеты.Ru» были заданы три вопроса:
1) Свидетельствует ли нынешний уровень заболеваемости свиным гриппом во всем мире и в России (на Украине), в частности, о его опасности?
2) Оправданы ли, с вашей точки зрения, такие серьезные меры, как закрытие школ и других учебных заведений?
3) Какие рекомендации вы могли бы дать людям, чтобы они смогли уберечь себя от заболевания свиным гриппом?

I. Роспотребнадзор (руководитель – Геннадий Онищенко)
В пресс-службе Роспотребназдора корреспонденту «Газеты.Ru» ответили: «Все специалисты в командировках, никого нет на месте. Вся официальная позиция Роспотребнадзора находится на нашем официальном сайте». В соответствии с данным заявлением в качестве ответов на наши вопросы отдел науки «Газеты.Ru» приводит выдержки из информации с сайта Роспотребнадзора.

1) ***Письмо*** № 01/16326-9-23 от 01.11.2009 (см. выше или на сайте
https://web.archive.org/web/20210629231035/http://07.rospotrebnadzor.ru/content/195/8947/)
2) В связи с продолжающимся ростом заболеваемости гриппом и ОРВИ и осложнившейся эпидемиологической ситуацией Федеральная служба по надзору в сфере защиты прав потребителей и благополучия человека ... (см. на сайте
https://web.archive.org/web/20210629231035/http://07.rospotrebnadzor.ru/content/195/8947/)
3). ***Письмо*** № 01/14515-9-32 от 01.10.2009 «О направлении рекомендаций CBC США по профилактике гриппа для родителей» ... (см. выше или на сайте
https://web.archive.org/web/20160623034546/http://www.hippocratic.ru/medtext2/medtext_26897.htm

II. Алексей Яковлев – Медицинский директор холдинга «Шлюмберже» с 2000 года. С 2006 года председатель Национального общества промышленной медицины.
... *Проблема свиного гриппа очень раздута.* Например, от пневмоний, в том числе первично-вирусных, каждый год в эпидсезон умирает до нескольких десятков человек в день, но об этом никто не говорит, из этого не делают события – это рутинная картина. А в случае свиного гриппа эту статистику стали озвучивать, в результате чего порождается паника.

III. Евгений Комаровский – Детский врач, кандидат медицинских наук, врач высшей категории, живет и работает в Харькове.
Дорогие мамы и папы! Люди! Запомните самое главное: тактика ваших действий совершенно не зависит от того, как называется вирус. Это грипп сезонный, свиной, слоновий, пандемический, это вообще не грипп – это не важно. Важно лишь то, что это вирус, что он передается воздушно-капельным путем и что он поражает органы дыхания. Отсюда и конкретные действия.
Есть возможность привиться – прививайтесь, но при том условии, ... когда вы здоровы ...

THE FLU CASE

Jane Burgermeister

Polish Health Minister, a family doctor, tells Parliament she will not allow use of untested swine flu jabs: reveals secret contracts violate the law

The Flu Case, 5 November 2009, 11:59

https://web.archive.org/web/20100106085046/http://www.theflucase.com/index.php?option=com_content&view=article&id=1618%3Aupdate-polish-health-minister-a-family-doctor-tells-parliament-she-will-not-allow-use-of-untested-swine-flu-jabs-reveals-secret-contracts-violate-the-law&catid=41%3Ahighlig

The Polish Health Minister Eva Kopacz today told Parliament during a heated debate on the swine flu vaccination that she, as a qualified family doctor with more than 20 year of experience, will not authorise the use of untested vaccines on millions of people in Poland when there is inadequate information about the safety of the jabs.

She said the secret contract that the Polish government was supposed to sign with pharmaceutical companies had more than 20 clauses which are against the law.

Kopacz noted that governments in Western Europe had signed secret agreements with pharmaceutical companies, but suggested that the prosperity of the people of Poland was more important to her than the profits of Big Pharma.

She noted that there are three vaccines proposed for Poland with different types of adjuvants and was concerned that these vaccines were all being treated as if they were the same.

In addition, she observed that only 13 % of the people in Germany want to take the swine flu jab even though 5 times more people in Germany take the regular flu shot than in Poland, and asked why the Germans are so unwilling to take the jab.

She said there was secrecy surrounding the contents of the vaccines. There is no information about the amount of adjuvants in the vaccinesm, she added.

Furthermore, the family doctor and Health Minister said there is absolutely no information about the side effects of the swine flu jab. The pharmaceutical companies did not want to take responsibilty for the jab.

Also, she said that trials for the swine flu jab were being conducted on a relatively small number of healthy people and that these were not adequate for her to recommend the jab.

Moreover, Kopacz said that the regular flu was much more common and dangerous than the swine flu - and yet no pandemic had been declared over the seasonal flu.

Why is there such a panic about the swine flu virus? She asked.

Kopacz said that the Polish people can tell the difference between objective facts and the truth and lies.

She noted that all 193 people who allegedly had the swine flu in Poland had survived.

Finally, she called on the people of Poland to show their support for her as she comes under growing pressure from the pushers of the "swine flu" jab to give the people the dangerous and untested jab.

ФЕДЕРАЛ ПРЕСС

Академик СО РАН [Валентин Власов]
назвал «обыкновенным бизнесом» истерию вокруг «свиного гриппа»

Федерал Пресс, 9 ноября 2009, 16:48
https://fedpress.ru/news/russia/society/736335

Заместитель председателя Сибирского отделения Российской академии наук (СО РАН), директор Института химической биологии и фундаментальной медицины СО РАН *академик* РАН ***Валентин Власов*** объявил, что эпидемия гриппа A/H1N1 носит обычный сезонный характер, а значительного всплеска смертности по сравнению с прошлыми годами не наблюдается. Как сообщили «ФедералПресс» сегодня, 9 ноября, в Центре общественных связей СО РАН, академик полагает, что нагнетаемая истерия, носящая *коммерческий характер*, является «обыкновенным бизнесом на обыкновенном гриппе».

«Несколько месяцев подряд нас пугают начавшейся эпидемией ужасного нового гриппа A/H1N1 с якобы очень тяжелым течением заболевания и высокой смертностью. Но данные эпидемиологов показывают, что никакой «смертоносной пандемии» нет: сравнительно с прошлыми годами сколько-нибудь значительного всплеска смертности не наблюдается, – заявил Валентин Власов. – Среди умерших, о которых сообщают СМИ, большинство скончалось не от A/H1N1 как такового, а от пневмонии, бронхита и других заболеваний. Обычная картина для обычной сезонной эпидемии гриппа». По словам директора Института химической биологии и фундаментальной медицины, серьезны любой грипп и любое вирусное заболевание, но «зимние волны такой заболеваемости случаются фактически ежегодно», поэтому, с точки зрения ученого, «для паники и экстраординарных мер нет никаких оснований».

Заместитель председателя СО РАН сообщил, что «крики об особо ужасном вирусе – это не более чем обыкновенный бизнес на обыкновенном гриппе»: таблетках, вакцинах, масках и т. д. Академик РАН указал, что несколько лет назад подобная паника «бушевала» по поводу «птичьего гриппа», когда на фармацевтическом рынке были созданы значительные запасы лекарств. По мнению ученого, сейчас решается проблема сбыта этих запасов, особенно актуальная в период кризиса, поэтому для активизации спроса распространяется информация об угрозе здоровью и жизни.

«Сегодняшние рекомендации по профилактике заболевания ничем не отличаются от правил поведения в условиях обычной сезонной волны гриппа – в основном это социальные меры. Сотрудников с признаками заболевания немедленно удалять с работы. Вообще, следует избегать мест, где люди скапливаются в ограниченном пространстве: метро в час пик, большие собрания, а также поликлиники и аптеки, – заявил Валентин Власов. – Необходимо соблюдать правила личной гигиены: пользоваться носовыми платками, несколько раз в день мыть руки с мылом (значение этой важной профилактической процедуры незаслуженно игнорируется), можно также смазать ноздри мыльным раствором или оксолиновой мазью».

Академик сообщил, что при заболевании гриппом нельзя употреблять аспирин из-за снижения свертываемости крови, поскольку вирус может вызывать кровотечения, людям с заболеванием печени не стоит употреблять препараты с парацетамолом. «Традиционные же «сто грамм от простуды» в случае гриппа не приносят никакого эффекта», – отметил ученый. Валентин Власов заявил, что эффективность «всех без исключения рекламируемых препаратов от гриппа, в том числе «Тамифлю», не имеет научных доказательств», однако эти лекарства способны дать серьезные побочные эффекты.

Pediatra de Cabecera, 18 Noviembre 2009
https://pediatradecabecera.com/tag/teresa-forcades/

Mientras occidente se desgañita hablando y hablando sobre la nueva gripe A(H1N1), y consumiendo enormes recursos en una gripe como todas las demás, los problemas de salud que afectan a millones y millones de personas de los países pobres pasan a segundo plano.

Como dijo ya en agosto el profesor Marc Gentilini , especialista en enfermedades infecciosas, miembro de la Academia de Medicina gala y ex-presidente de la Cruz Roja francesa, esta es la pandemia de la indecencia. Cada semana mueren en el mundo 200.000 niños de enfermedades evitables en su mayoría. Un millón de personas mueren de paludismo cada año ante la indiferencia casi general…

La descabellada gestión de la nueva gripe por parte de la OMS y otras agencias y autoridades sanitarias ha producido un tremendo escepticismo entre los profesionales sanitarios y la población. Tras el fiasco de la gripe aviar, la nueva gripe «ex-porcina», que se nos presentaba como una plaga bíblica, se ha quedado en una gripe más. Nada más (y nada menos) que una gripe como la de todos los años. Esto se parece cada vez más al cuento de Pedro y el lobo.

Los mayores de 60 años parecen protegidos por haber padecido «las gripes» A(H1N1) que hubo entre 1918 y 1957. A partir de la pandemia de gripe H1N1 «española» de 1918 se produjo a una sustitución de los serotipos habituales hasta ese momento por los H1N1 que predominaron durante la primera mitad del siglo XX, hasta el año 1957 en que se produce otra pandemia de gripe «asiática» , por un virus A(H2N2).

El resto de los humanos (desde bebés hasta adultos jóvenes y no tan jóvenes menores de 60 años) pueden contraerla, lo que constituye un potencial problema cuantitativo. Pero cualitativamente la gripe nueva es similar a la de toda la vida. Lo que no es poco: no es un virus menor y es capaz de desestabilizar a personas con enfermedades crónicas y debilitantes, incluso personas sin factores de riesgo pueden tener complicaciones, raramente graves y excepcionalmente mortales (como siempre).

Esta es la pandemia de la desconfianza y la pérdida de prestigio de las agencias sanitarias. Su empeño en el uso generoso de antivirales (por ejemplo considerando a todos los niños grupo de riesgo y, por lo tanto, candidatos a recibirlos) de dudosas ventajas y no pocos efectos secundarios y los pronósticos catastrofistas han contribuido a ello. Los medios de comunicación, amplificando cada fallecimiento y exagerando la importancia de lo que estaba y está sucediendo, han tenido mucho que ver con el pánico inicial que suscitó la gripe de marras.

A semejante río revuelto se han apuntado los profetas del apocalípsis, los conspiranoicos y los simple y llanamente ignorantes y desinformados , los interesados y, por supuesto, los antivacunas de todo tipo. Una monja, Teresa Forcades y Vila se ha convertido en un fenómeno impresionante en la Red. Su discurso incorpora verdades mezcladas con leyendas urbanas y medias verdades. Con ello ha fabricado una teoría de la conspiración que sería rechazada como guión de película de catástrofes por su nula credibilidad y, a pesar de lo que se dice a veces, sin ninguna prueba científica en el núcleo duro de sus argumentos. Si a eso le añadimos el miedo incubado por los medios de comunicación y la mala gestión de la pandemia por la OMS y los gobiernos, obtendremos la ecuación que la ha lanzado al estrellato.

En ese sentido, es interesante ver la entrada sobre sor Teresa que hace Wikipedia, intentando recoger argumentos a favor y en contra, con vínculos a su página web, a su famosísimo vídeo, y alguna de sus obras. Ver en que circos actua debería bastar para desestimar su mensaje. El País ha publicado un artículo sobre la monja que es bastante atinado, si acaso no comparto la aceptación ciega de la autoridad de la OMS, en mi opinión maltrecha, al menos moralmente, tras la gestión de la pandemia de gripe del 2009.

Una de las piezas centrales de la argumentación de la monja es el llamado ***incidente Baxter***. Según Forcades en enero del 2009 la división Austríaca de Baxter (Immuno Labs, antes de su absorción por Baxter), habría distribuido 72 kg de material para la fabricación de vacunas para la gripe estacional de la temporada 2009-2010. Un ignoto y anónimo técnico de laboratorio habría decidido por su cuenta y riesgo hacer un control de naturaleza no precisada, y no programado, que requiere inocular unos hurones para experimentación que le salen a su empresa a un riñón el gramo con piel y huesos, y que no servirán ya para nada después del experimento. Al morir los hurones se descubriría que el material no solamente contaba con virus no desactivados de la gripe estacional, sino que también contenía virus no desactivados de la mortífera gripe aviar (A H5N1).

La vacuna fabricada con este material habría sido distribuida (de no descubrirse la contaminación) en Austria, Eslovenia, Alemania y la República Checa. La hazaña del técnico-héroe habría salvado de la muerte del 40-50% de los potenciales receptores de las dosis de vacuna que derivarían de esos 72 Kg de material, una cantidad tan desorbitada que serviría para vacunar varias veces a la humanidad entera. La periodista científica austro-irlandesa Jane Burgermeister ha sido la campeona de la denuncia de este supuesto incidente, por su puesto a su juicio intencionado y parte de una conspiración global contra la humanidad. Es lógico: las multinacionales farmacéuticas tienen todo el interés en eliminar a sus potenciales clientes.

La realidad es bien diferente. Tras la alarma de la gripe aviar de hace unos años, algunos laboratorios, incluida la multinacional americana Baxter, comenzaron a desarrollar protocolos de fabricación de vacuna inactivada con la cepa H5N1 como preparación para la eventual adaptación de este subtipo al hombre. La validación de esos protocolos requiere realizar pruebas de inmunogenicidad en hurones, así que Baxter-Austria reenvió un lote de material inactivado H5N1 procedente de la central de la multinacional situada en Deerfield, Illinois USA (material experimental, nada que ver ni remotamente con algo que fuese a inocularse a un ser humano ni parte de la cadena de fabricación de la vacuna estacional) a BioTest s.r.o, una compañía checa de biotecnología, que realizaba la investigación para una compañía llamada AVIR Green Hills Biotechnology usando el material suministrado por Baxter. Allí, y siguiendo el guión establecido, se inocularon hurones para la prueba programada, y los hurones murieron. Investigando el incidente, se descubrió que la inactivación del material había fallado, y que parte del virus había sobrevivido al proceso.

Algo parecido ya había pasado. En el año 1955, en plena epidemia de polio en América y Europa, varios laboratorios comenzaron a producir la vacuna inactivada de Salk (inyectable) para cubrir la primera campaña de vacunación frente a la polio de la historia. A los pocos meses, se detectaron casos de polio en algunos niños vacunados, y se descubrió que un lote producido en el laboratorio Cutter de California contenía una cierta cantidad residual de virus vivo, y que todos los niños que enfermaron habían sido vacunados con ese lote. *Desde el «incidente Cutter», que respondió a las prisas bajo la presión de la epidemia y que estuvo a punto de cargarse la campaña, la liberación de lotes de cualquier vacuna vírica de virus inactivado incluye exhaustivos controles de la inactivación.*

La fuente de la noticia que menciona Teresa Forcades es la sección de ciencia del diario The Times of India el 6 de marzo. La fuente original de la noticia parece ser Bloomberg el 24 de febrero donde se afirma: «El material fue diseñado para usarse en los laboratorios, y ninguno de los trabajadores de laboratorio han caído enfermos». La compañía admite un error de manipulación de su personal , también recogido en CTV News de 27/02/2009 .

La patraña es de tal calibre (la demostración palpable de los controles de calidad existentes se convierte en homicidio premeditado en masa) que no está claro si es asunto de un fiscal o un psiquiatra. Lo que sí es seguro es que entre unos y otros, OMS y medios de comunicación, CDCs, la periodista austro-irlandesa y la monja alucinada, han convertido un asunto puramente técnico y de salud pública en el espectáculo más histriónico y lamentable de las últimas décadas. Deprimente.

Otra secuela de esta crisis es la desconfianza generalizada sobre las vacunas. La descalificación de la vacuna de la gripe se ha extendido a todas las vacunas. Una gran irresponsabilidad, como ha destacado Pedro Alonso, investigador español de la vacuna contra la malaria.

Прибыльный бизнес на страхе перед гриппом

Деловые Ведомости, 18 ноября 2009
https://www.dv.ee/novosti/2009/11/18/pribylnyj-biznes-na-strahe-pered-grippom

Наряду с фармакологической отраслью на медикаментах зарабатывают и представители преступного мира России - последние на фальшивках. Об этом рассказывается в материале постоянного автора Die Welt Флориана Хасселя.

По словам экс-руководителя Центра по контролю и предотвращению заболеваний при администрации США Джули Гербердинг, никто в мире не может точно спрогнозировать ситуацию со свиным гриппом на планете. Об этом она заявила на конференции, посвященной экономике и свиному гриппу, добавляет автор публикации Флориан Хассель.

При этом уже сегодня не стоит недооценивать последствия распространения вируса гриппа A H1N1. По данным ВОЗ, на 8 ноября текущего года в мире подтверждено 503 тыс. случаев заболеваний свиным гриппом. 620 человек умерли от его последствий. По оценкам специалистов, реальное число заболевших новым штаммом гриппа, а также умерших от осложнений гораздо выше. Тем не менее, продолжает автор, эксперты не устают повторять, что ежегодно от сезонного гриппа умирает не меньше пациентов. Так, средний показатель для США - 36 тыс. случаев летальных исходов от осложнений гриппа в год, для Германии - до 20 тыс.

Практически все концерны, входящие в состав германского индекса Dax, уже создали кризисные штабы, заказав или уже приобретя дозы вакцин. При этом средние и более мелкие компании пока не готовы ответить на вопрос, как заменить ключевых сотрудников или гарантировать бесперебойное производство, поставки или снабжение в экстренном случае, пишет издание. По прогнозам ученых Рейн-Вестфальского института экономических исследований в Эссене (RWI), массовая эпидемия обойдется Германии примерно в 40 млрд евро. И при худшем из сценариев развития событий может заболеть до 50% населения страны, отмечают специалисты.

Как напоминает далее издание, в ходе эпидемии "атипичной пневмонии" в Юго-Восточной Азии умерли около 1 тыс. человек, экономический урон оценивается в 16-18 млрд долларов. В связи с угрозой эпидемии "птичьего" гриппа в 2005 году экономисты прогнозировали ущерб мировой экономике в размере 683 млрд евро. Однако, добавляет автор, эпидемии не случилось.

Риск массовой волны заболеваний и летальных исходов в связи со свиным гриппом в настоящее время не очень велик, считают эксперты RWI. Однако решающим здесь становится вопрос о том, какова вероятность того, что вирус в ближайшие месяцы мутирует, приобретя смертоносные характеристики. По словам экспертов, на этот вопрос специалисты пока не могут дать ответа.

Гораздо проще, продолжает Флориан Хассель, подсчитать растущие прибыли фармакологических концернов: Novartis, Sanofi-Aventis, GlaxoSmithKline, CSL Limited и MedImmune поставляют вакцину против свиного гриппа и, по оценкам специализирующегося на отрасли здравоохранения инвестиционного банка Leerink Swan, уже получили заказов по меньшей мере на 7 млрд долларов.

Уже давно, замечает в заключение издание, свиной грипп гарантирует прибыль и представителям криминальных структур. Управление по контролю над продуктами и лекарствами США уже зафиксировало 140 случаев продажи сомнительных медикаментов против свиного гриппа. По данным авторитетной англо-американской компании Sophos, которая занимается обеспечением информационной безопасности в интернете, им удалось выйти на след предприимчивых преступников из России, промышлявших продажей в сети поддельными противовирусными препаратами и вакцинами. Так, через интернет было продано поддельной продукции на сумму в несколько миллионов евро. И если раньше хитом продаж была "Виагра", то сегодня ее реальным конкурентом стал противовирусный препарат "Тамифлю", утверждают эксперты.

Новая газета САНКТ-ПЕТЕРБУРГ

Евгения Дылева

Свинство

Новая Газета, Санкт-Петербург, 19 ноября 2009 10:00
https://novayagazeta.spb.ru/articles/5437/

Свиной грипп – уже не страшилка из голливудского ужастика, а факт нашей жизни. В метро появляются первые люди в масках (по крайней мере, среди сотрудников метрополитена), с полок сметаются все лекарства, упоминания о которых появляются в СМИ, одна за другой закрываются на карантин школы, а страна между тем ждет появления долгожданной вакцины. Практически в каждой семье есть заболевшие – вот только чем они болеют, свиным гриппом или простым ОРВИ – в Петербурге определить не удастся, пока болезнь не перейдет в тяжелую фазу.

Болезнь и здравый смысл

Вирус по-петербургски

Склонный к мутациям вирус так называемого свиного гриппа A/H1N1 продолжает испытывать планету на прочность. Что неплохо ему удается благодаря крайней вирулентности – проще говоря, заразности. В частности, по данным Всемирной организации здравоохранения, в случаях, связанных с сезонным гриппом, коэффициент инфицирования тех, кто контактировал с кашляющими и чихающими, составляет 5–15%, а при контактах с подхватившими «свиную» заразу – 22–33%.

Тем не менее те же эксперты утверждают, что летальность при заражении свиным гриппом составляет в среднем, исходя из разных данных, 0,5%, что не превышает уровня смертельных исходов среди подхвативших сезонный грипп на пике заболеваемости (в прочие периоды смертность от обычного гриппа – 0,1–0,2%).

Вирус гриппа меняется ежегодно, и паниковать от появления новой его разновидности бессмысленно, считают одни специалисты. Недооценивать опасность тоже нельзя, утверждают другие.

«Судя по тому, что уже произошло в ряде стран мира, эпидемия сезонного гриппа в большинстве случаев более опасна, чем эпидемия свиного», – считает испанский врач общей практики Хуан Хервас (Juan Gervas), автор статьи «Перед лицом свиного гриппа: здравый смысл и наука», всерьез изучающий проблемы распространения нового штамма.

Однако специалисты предрекают появление второй и третьей волны заболевания. «Сегодня тревога возникает как раз в связи со второй и третьей волной. Они будут обязательно тяжелее предыдущей, хотя и не такими губительными, как, скажем, испанка в начале XX века», – полагает Александр Чучалин, главный терапевт России, директор Института пульмонологии, эксперт Всемирной организации здравоохранения. В целом, как полагают специалисты, пандемия может растянуться года на полтора.

Так или иначе, данные о петербургском размахе ОРЗ и гриппа напоминают фронтовые сводки. С 9 по 15 ноября недельный показатель заболевших превысил значение эпидемического порога почти вдвое.

К 16 ноября в нашем городе были закрыты на карантин 15 школ и частично классы в 108 школах и группы в 24 детских садах. Официально зарегистрировано 444 случая пандемического гриппа A/H1N1/Калифорния/09 (летальных исходов вроде бы пока нет). Высокому риску, как утверждают медики, подвержены дети – в 192 случаях свиной грипп обнаружен у детей и подростков до 18 лет.

Однако реальное число заболевших, конечно же, гораздо больше. На это указывает хотя бы невозможность для граждан по желанию сдать анализ на вирус свиного гриппа где бы то ни было в нашем городе! С вопросом, можно ли сделать такой анализ заболевшему в семье человеку, я обратилась в свою районную поликлинику, в Институт гриппа и больницу им. Боткина, которая в последнее время практически перепрофилировалась под свиной грипп. Везде врачи ответили отказом, основываясь кто на загруженности, а кто на неотработанности методики. Так что, по крайней мере на момент написания статьи, если вы заболели, то определить, какой у вас вирус, можно только в Боткина, и то после госпитализации по скорой с высоченной температурой и болью во всем теле (без которых вас туда, скорее всего, просто не повезут).

Вакцина-невидимка

Как обещала министр здравоохранения и социального развития РФ Татьяна Голикова, 9 ноября должно было начаться вакцинирование от свиного гриппа российского населения. Но сначала выяснилось, что для детей вакцины от этого штамма вообще не существует, а та, что разрабатывается для взрослого населения, задержалась – по информации пресс-службы НИИ гриппа РАМН, пока только анализируются результаты испытаний живой вакцины для взрослых, и еще предстоит решить вопрос с лицензированием. Медики же продолжают ожесточенно спорить по поводу безопасности грядущего вакцинирования. Причина заключается в том, что до сих пор отсутствуют подтвержденные научные данные о безопасности вакцины против свиного гриппа – за границей зафиксированы случаи смерти в результате вакцинирования.

По новой версии чиновников, вакцина начнет поступать в регионы после 23 ноября. Пока прививки начались лишь в пяти регионах (Московская, Тюменская, Брянская, Воронежская области и Алтайский край), и почему-то только для представителей ЖКХ и работников МЧС.

Минздравсоцразвития предупреждает: попытки каких-либо фирм предложить россиянам продажу вакцины от свиного гриппа за деньги незаконны. Тем более не следует верить мошенникам, предлагающим приобрести вакцину от всех видов гриппа. До тех пор, пока страна не определится с точной потребностью в вакцинации россиян против свиного гриппа, в розничную торговлю препарат не поступит, уточняют в ведомстве.

Маска, я вас знаю

В свою очередь, население скорее заражено ажиотажным спросом на снадобья, которые, по мнению граждан, могут уберечь их от гриппа, нежели озадачено отсутствием вакцины. Огромными партиями скупаются не только лекарства, но и защитные маски (цена за штуку в аптечных сетях возросла с прежних 2 рублей до 15; при этом менять маски рекомендуется каждые два часа). А некоторые умельцы умудряются продавать их у метро по свободной цене.

Вместе с тем и профилактические лекарственные средства, и народные методы медицины против свиного гриппа бессильны. Так что нет толку читать в замечательной книге о народных традициях старинные заговоры и рекомендации о том, например, «как сделать кобылу больную и старую молодой и здоровою…»

Что делать? По мнению главного инфекциониста Петербурга Азы Рахмановой, при борьбе со свиным гриппом следует соблюдать простые правила, характерные для противодействия обычному сезонному гриппу. Когда кашляете и чихаете, прикрывайте нос и рот салфеткой, чаще мойте руки водой с мылом, постарайтесь не контактировать с заболевшими, а если чувствуете недомогание, пожалейте других – ограничьте контакты, останьтесь дома. Не рекомендуется снижать температуру: по мнению медиков, следует только облегчать боль и общее недомогание, и лучше всего – вызовите врача.

Микробус и Бактерикус

Как ни странно, свиной грипп сегодня все чаще становится темой тусовок граждан, полагающих, что лучшее лекарство – веселье. Стали модными, например, студенческие вечеринки «Антигрипп», участникам которых выдают одноразовые ватно-марлевые повязки и напоминают известную шутку: «Если лечиться от гриппа, проболеешь всего семь дней, а если не лечиться – то целую неделю».

Поддержал борьбу со свиным гриппом и театр «Кукольный формат», в дни школьных каникул представив детям санитарно-гигиеническую оперетку под названием «Кариус, Микробус и Бактерикус». Причем перед началом представления у всех зрителей Камерной сцены Малого драматического театра, где кукольники играют свои спектакли, проверили руки, уши и носы. Режиссер Анна Викторова решила, что будет полезно напомнить юным зрителям о том, как элементарные правила гигиены защищают человека от невидимых, но опасных врагов.

Между тем результаты социологических опросов показывают, что фаталистов у нас больше, чем людей, с полной ответственностью относящихся к своему здоровью. Около 70% петербуржцев, несмотря на признаки простуды и гриппа, героически продолжают ходить на работу, распространяя заразу. Говорят, пессимист – это хорошо информированный оптимист. Поэтому соблюдать бдительность медики все же советуют.

MERCOLA
Take Control of Your Health

Dr. Mercola. Major Victory with Swine Flu Scandal

Mercola.com, 19 November 2009
http://articles.mercola.com/sites/articles/archive/2009/11/19/Major-Victory-with-Swine-Flu-Scandal.aspx (deleted)
https://web.archive.org/web/20100102054653/http://theflucase.com/index.php?option=com_content&view=article&id=1877%3Amajor-victory-with-swine-flu-scandal-reports-dr-mercola&catid=1%3Alatest-news&Itemid=64&lang=en

European scientists and health authorities are facing angry questions about why H1N1 flu has not caused death and destruction on the scale first feared, and they need to respond deftly to ensure public support.

Accusations are flying in British and French media that the pandemic has been "hyped" by medical researchers to further their own cause, boost research grants and line the pockets of drug companies.

Britain's Independent newspaper this week asked "Pandemic? What Pandemic?"

France's Le Parisien newspaper ran the headline: "Swine flu: why the French distrust the vaccine" and noted a gap between the predicted impact of H1N1 and the less dramatic reality.

"Although some 30-odd people have died... the disease is not really frightening," it said. "Dangerous liaisons between certain experts, the labs and the government, the obscurity of the contracts between the state and the pharma firms have added to the doubt."

In response, scientists are walking a fine line. They say that although the virus is mild, it can still kill, and that the relatively low fatalities in Europe are in part, the result of official response to their advice.

However, in Britain, health authorities' original worst-case scenario – which said as many as 65,000 could die from H1N1 -- has twice been revised down and the prediction is now for around 1,000 deaths, way below the average annual toll of 4,000 to 8,000 deaths from seasonal winter flu.

…

There is plenty to be optimistic about as it seems the tide may be slowly turning on this swine flu debacle, showing it for the hoax it really is.

European scientists are now demanding answers to the growing inconsistencies.

And, while many so-called scientific experts have criticized me and others who have spoken out about this senseless mass-vaccination campaign, more of the scientific community is now coming to the same conclusions we've been talking about for months.

It looks as though the swine flu pandemic of 2009 will go down as one of the biggest government and pharmaceutical scams ever, renewing a healthy, and necessary, skepticism about the swine flu vaccine and the dubious dealings behind the implementation of worldwide mass-vaccination programs.

On the upside, it has also created a more open debate about vaccinations in general.

The childhood vaccination schedule is in dire need of an overhaul, and the swine flu hysteria has actually opened many people's eyes to the unhealthy practices behind our vaccine policies. The public is finally starting to wonder and question, en masse, what's being injected into them and their children.

Prominent Doctor and Health Minister Blast Swine Flu Vaccine and Manufacturers.

These healthy signs are starting to crop up everywhere.

For example, the Polish Health Minister Eva Kopacz recently told Parliament that she, as a qualified family doctor with more than 20 years of experience, will not authorize the use of vaccines with inadequate safety testing on millions of people in Poland.

In her speech she says: "I have just one fundamental question: do we want to fight the flu pandemic?

"Today we have knowledge about enclosures in agreements that other governments of wealthier countries have signed with vaccines producers. We also know what was proposed to Poland.

Due to negotiations in progress I can't tell all today. But I can tell one thing: our Law Department found at least 20 points of doubt in the agreement.

So what is a Health Minister's duty? To sign agreements that are in the best interest of the Polish people, or to sign agreements that are of best interest of pharmaceutical companies?

I know that there are three vaccines available on the market today, from three different producers. Each has a different amount of active substance, and yet strangely they are all treated the same. Therefore, isn't it fair enough for the Health Minister and the experts to have the slightest doubts about it?

… And if [the vaccine] is so miraculous, then why don't the manufacturers want to introduce their medicine to the free market and take responsibility for it?

Why wouldn't they say: "Wonderful, this is a safe medicine, therefore I will take responsibility for it. I will introduce it to the market and everything is clear and transparent," instead of dropping the weight on us – the buyers.

We do not have clinical test results, no detailed ingredients and no information about the side effects. The vaccines are now in the 4th stage of tests - very short tests, and we still do not have this information. In addition, the samples have been very small. One kind of vaccine was tested only on 160 volunteers aged 20-60, all healthy.

Another kind of vaccine was tested on 600 volunteers, aged 18-60, all healthy. Is this good enough, especially for us doctors present in this room?

It is not good enough for me.

… Has anybody, anywhere, announced a pandemic because of seasonal flu? And the seasonal flu is much more dangerous than swine flu. There are deaths and severe complications. Was there ever a pandemic announced before?

Those who push me to buy vaccines, I ask you: Why didn't you scream and shout last year, 2 years ago, and in 2003? In 2003 there were 1,200,000 Poles with seasonal flu! Has anybody shouted, here in this room: "Let's buy vaccines for everybody!"? I can't recall such a thing."

Bells Toll for Vaccine Maker

Sister Teresa Forcades i Vila, PhD, an Italian Benedictine nun, a trained medical doctor, and the author of Crimes and Abuses of the Pharmaceutical Industry – a 36-page study available in full at this link – is yet another voice of reason in the sea of swine flu madness.

I had an interview with her translated and transcribed into English, which you can read in its entirety here.

Here's an excerpt from her interview, questioning the sanity of placing our unequivocal trust in a pharmaceutical company like Baxter:

"… Anyone can verify that the information I'm going to disclose is accurate and objective.

… At the end of January 2009, before this new flu was discovered, Baxter Pharmaceuticals, a US company with a very important subsidiary company in Austria, distributed vaccination material for the [seasonal] flu, from the Austrian subsidiary via neighboring European countries – the Czech Republic, Slovenia and Germany – to 16 different laboratories.

[This was] material for the vaccine to be administered between February and March to the population of those countries for the seasonal flu.

This material weighed 72 kg. Well, I haven't calculated the exact number of doses but it certainly means thousands and thousands of doses. So this was distributed, and (there) comes a point, when through one of those life coincidences, situations or plans are revealed that otherwise would have remained in the dark.

The Czech company Bio Test was one of the recipients of this material. One of their lab technicians decided – through his own initiative and as something he was qualified to do but not obliged – to

carry out an extra security test with the vaccination material that they received, before proceeding with its distribution.

… He inoculated this vaccine into animals called in Spanish "comadrejas" or "hurones" – weasels or ferrets, small mammals that have been used since 1918 to test flu vaccines. He inoculated these weasels, and all of them died.

When he observed these unexpected deaths, and given that the inoculated vaccine shouldn't have caused the death of the weasels, he immediately sounded the alarm and they began checks to establish what this material received from Baxter contained.

… The results of the analysis showed that in the material delivered by Baxter to those 106 laboratories, two live viruses coexisted.

One was the bird flu virus – the bird flu virus is the virus that appeared in 2005, and that caused a high mortality rate but infected just a few people. The number of deaths worldwide, and I quote by heart, was around 250 but as far as we know, around 60% of those infected died. This means that if 250 died worldwide just around 600 got infected, whichever the exact number is, the mortality rate of this virus is very high, but its infection rate is minimal.

This virus was mixed with a seasonal flu virus that, as we all know, has an extremely low mortality rate; lower than, 0.01%, lower than 1% of mortality at any rate, but with a high degree of transmission. Well, it's highly contagious, with a high infection rate.

If you mix these two viruses and then distribute it to thousands of people, what you're doing is you're maximizing the probabilities for these two viruses to merge; for them to recombine, and for a new virus to appear to be both very lethal and very infectious.

This is a fact and this has been admitted by Baxter. They haven't said "No, this is not true. This is just what by Jane Burgermeister says, or whoever, but this material wasn't there." … They have admitted that the contamination took place but not that the material was designed for human use. Claiming protection behind the confidentiality rights, they haven't disclosed information about its destination, and that the total 72 kg of the material contained a mix of live bird flu and seasonal flu viruses.

This is a fact. Could this have happened by chance?

The first thing that must be said is that it is extremely unlikely.

And I say this simply because in science the word "impossible" is something we never say. What does extremely unlikely mean? It means that laboratories handling this kind of viruses have Bio Security Levels in place. The Bio Security Level 3 is the highest, and the one that must be applied to this laboratory.

It means that if we talk in a scientific context about probability, based on known facts, the probability that this may have happened by chance is extremely low. Not only this, how can we explain the mixing of two different live viruses?

Additionally, the flu vaccines, as we all know, are vaccines made with attenuated viruses. This means that it's perfectly normal for the flu vaccine to contain live virus; this is not an exception. But attenuated means that the virus must go through a radiation procedure. These viruses found in the Czech Republic in the whole Baxter material had not been attenuated. Therefore the odds of it happening by chance, well…

That's why I say that, scientifically, or simply from a humanly prudent standpoint, we can't say that it's 100% impossible but, let's be clear – it's important to let it be known how unlikely it is for an accident to occur under these circumstances.

… I know that there are people who have been studying this for a while but I would wish that my message reaches someone who says, "Look I don't know anything about that stuff, but I've just heard that there was a laboratory that delivered a contaminated vaccine and that, interestingly, is one of the laboratories in charge of making flu vaccines this year."

Well, this fact alone makes it justifiable to myself to think that, until such time that an explanation is given about why this contamination took place, I won't wish it on me, on my child, nor on anyone close to me. "

A "mistake" of this magnitude – a "mistake" that had the capacity to kill thousands of people and spread highly infectious, deadly disease worldwide, indeed START a pandemic of the epic proportions they've tried to turn the swine flu into – was REWARDED with massive contracts for more flu vaccines!

This sure doesn't seem like an accident.

And this is one of the companies they want you to blindly trust…

Lies, and More Lies…

Despite the increasing skepticism about this pandemic, and increasing demands for answers to important questions, government health officials are still playing coy.

The lengths to which they go to keep this misinformation campaign – this deception – going, is staggering.

For example, while Ontario health officials declare the H1N1 a "dud" pandemic, stating the huge government investment made so far may have been unjustified, US federal health officials declare that at least 22 million Americans have contracted swine flu since April and approximately 3,900 people have died, including an estimated 540 children.

US News quotes Dr. Anne Schuchat, director of the U.S. Centers for Disease Control and Prevention's National Center for Immunization and Respiratory Diseases as saying:

"The estimation method we are using now, we believe, gives us probably a more accurate picture of the full scope of the pandemic. What we are seeing in 2009 is unprecedented. As people know, we haven't had a [flu] pandemic since 1957. To have high rates of influenza in September and October is extremely unusual.

We have already seen a larger number of pediatric deaths than we have seen for several years. I do believe that the pediatric death toll from this pandemic will be extensive, and much greater than what we see with seasonal flu."

Excuse me, but since when can counting oranges in an apple orchard give you a more accurate picture of your apple harvest?

That would be silly. And so is counting "flu-like illnesses" that have nothing to do with the H1N1 virus. As reported by the New American, this guessing -- based on flawed data – has quadrupled the number of estimated deaths.

The CDC stopped type testing flu cases in August, and instead, they're counting each and every person who presents "flu-like" symptoms! This is most definitely NOT going to produce more accurate numbers.

On the contrary, CBS News investigative reporter Sharyl Atkinson discovered that the vast majority of these so-called swine flu cases were not only NOT H1N1. They weren't even the seasonal flu! I will be posting my interview with her very shortly.

Meanwhile, the CDC claims that some 99 percent of all influenza this season is H1N1, hence they don't need to do lab testing anymore to get accurate numbers. Ninety-nine percent is a far cry from what CBS News found when they investigated actual flu samples from across the country…

The H1N1 virus only turned up in 1-17 percent of samples from patients with flu-like illness.

These falsified, exaggerated numbers are then used to frighten you into compliance with their mass-vaccination plan. Because, naturally, Dr. Schuchat stated that vaccination is the best protection against the H1N1 swine flu, and that as of November 12, there were 41.6 million doses of the vaccine available.

The unspoken directive is, of course, to "run out and get one while you can!"

Math, Anyone?

Alright, look… The CDC previously estimated that the US death toll from the swine flu would be around 90,000. Even using their own bloated numbers -- some 80 percent of which are in all likelihood unrelated to H1N1 – 3,900 people have actually died.

That would STILL, according to their own statistics stating that the flu kills 36,000 Americans a year, put us squarely in the middle of the mildest flu season in recent memory.

They simply can't have it both ways.

If it's the mildest flu season in years, then there's no reason to panic. And if it's one of the worst, then where are the statistics proving this to be so?

Great Britain, for example, has not been able to prove mass casualties, and changed their mortality estimates from 65,000 all the way down to 1,000. And guess what, their stated average annual death toll from the seasonal flu is between 4,000 and 8,000!

In Closing

This debacle is a great example of how high-ranking health officials do not truly understand viruses, or how your immune system is capable of fending off these supposedly deadly diseases so easily.

Another reason for skepticism is the fact that the same people who are inventing ways to inflate the disease count – by changing definitions and disease criteria, for example – are playing the same games with vaccines.

By their own estimates, 90,000 people were predicted to die, so the vaccine would be of benefit. Well, they were wrong – on both counts.

In reality, a healthy immune system, and extreme respect for how your body develops real immunity, must be placed above the misguided advice from Big Pharma and the health agencies they unduly (and sometimes unlawfully) influence.

Zu NDR.DE NDR

"Profiteure der Angst - das Geschäft mit der Schweinegrippe"

NDR, 20 November 2009, 12:29 Uhr
Sendetermin: Montag, 23. November, 23.00 Uhr, NDR Fernsehen
https://www.ndr.de/der_ndr/presse/mitteilungen/pressemeldungndr4958.html

Die derzeitige Grippewelle ängstigt die Menschen weltweit. Das Virus vom Subtyp A/H1N1 – besser bekannt als Schweinegrippe – verbreitet sich rasant. Das NDR Fernsehen ändert sein Programm und zeigt am Montag, 23. November, um 23.00 Uhr die Dokumentation "Profiteure der Angst – das Geschäft mit der Schweinegrippe".

Im Juni verschärfte die Weltgesundheitsorganisation (WHO) ihre Warnung vor einer Pandemie und rief die höchste Alarmstufe aus. Seitdem versuchen die Gesundheitsbehörden in allen Ländern der Ausbreitung Herr zu werden. Hunderte von Millionen Euro werden für Medikamente und Impfstoffe bereitgestellt. So rasch und ungeprüft wurden Steuergelder wohl noch nie ausgegeben wie im Kampf gegen das neue Grippevirus.

Hat uns eine Massenhysterie erfasst oder ist die neue Grippe tatsächlich eine tödliche Bedrohung? In jedem Fall sind handfeste Interessen im Spiel. Immer mehr Wissenschaftler kritisieren das Vorgehen der Behörden. Jutta Pinzler hat für die NDR Dokumentation "Profiteure der Angst - das Geschäft mit der Schweinegrippe" mit Experten in Deutschland, Großbritannien, Frankreich und der Schweiz gesprochen und gibt einen Überblick über die Vorbereitungen im Kampf gegen das scheinbar unkontrollierbare Virus.

Бизнес на страхе. Свиной грипп (Profiteure der Angst)

Художественный документальный фильм, Arte Doku, 23 ноября 2009
http://www.marchenko.de/profiteure_der_angst_arte_2009

Введение

Здравствуйте, дамы и господа, такое не нравится гражданам, которые живут в современной демократии. Правительство Германии получает не ту вакцину от свиного гриппа, о которой договаривалось. А именно без дополнительного компонента, который должен усиливать действие вакцины. Это средство содержит пандемрикс. Также Франция заказала много вакцины. Без проблем, всё протестировано - утверждает немецкий лицензирующий орган. Вакцинирует своих сотрудников, но тоже без добавки. И в США граждане получают уже испытанное средство без добавки.

Это может заставить задуматься. Канцлер и некоторые министры уже объяснили, что и они использовали бы проверенное средство. Но уже поздно и граждане, несомненно, ещё больше обеспокоены. Ещё и потому, что врачи в целом не советуют вакцинироваться. Так как риски вакцины выше, чем её польза. И сам свиной грипп оказался более безобидным, чем считалось первоначально. Тем не менее Франция заказала 100 мил. доз. В два раза больше, чем Германия.

Теперь массовую вакцинацию будут помогать проводить студенты-медики, студенты-медсестры и врачи на пенсии. Но возникает вопрос, понадобится ли это во Франции. Так как растёт сомнение. Комиссия по медицинским препаратам немецкого объединения врачей считает, что органы здравоохранения повелись на кампанию файрма индустрии. Если вы посмотрите наш фильм, то, вероятно, присоединитесь к этому мнению.

И возможно у вас возникнут вопросы или вы захотите присоединиться к обсуждению. Это можно делать как во время фильма, так и после с автором и врачом Ютой Пинцлер в нашем блоге. ... Итак, бизнес на страхе людей. Бизнес на свином гриппе.

Реакция на вирус

Это просто компания по созданию паники. Это обычный грипп, как и все остальные гриппы. Здесь идёт речь о зарабатывании денег. Я категорически против.

Никто не может сказать мне сегодня, какие побочные эффекты я унаследую, когда сделаю прививку. Страх перед этим страшнее, чем сам грипп.

Я думаю, что фармацевтические компании хотят немного нажиться.

Весна 2009 года, опасный для жизни вирус, так называемый свиной грипп, кажется, угрожает человечеству. ВОЗ очень беспокоит то, что происходит в Мексике и США. Да, мы имеем дело с совершенно новым вирусом человеческого гриппа, который представляет больший риск для здоровья.

Вирус заразен и передается и легко от человека к человеку. Апрель 2009 г. в мексике зарегистрированы первые случаи нового гриппа. Вся страна находится в панике.

СМИ по всему миру постоянно сообщают об очень заразном вирусе H1N1. Всемирная организация здравоохранения отправляет контейнеры с лекарствами первой помощи, каждый день люди умирают от вируса.

Что происходит в Мексике с точки зрения цифр, есть сомнения. Так как качество медицинского обслуживания в Мексике на низком уровне. Тот факт, что цифры сильно выросли и ими обосновали пандемию, это было сделано слишком поспешно.

Да, это были ужасные представления, которые наблюдались еще в июле. Многих пациентов продолжали госпитализировать, хотя в этом не было необходимости.

Это был просто пандемический план, который старательно применяли, как это было с птичьим гриппом H5N1, смертность от которого была намного выше.

Сколько людей действительно умирают от нового вируса H1N1 ещё до сих пор не ясно. Правительство Мексики сообщает о 159 случаях смерти в первые недели. Но вскоре министр здравоохранения быстро исправил цифры, оказалось, что умерло 26 человек от этого вируса ВОЗ регистрирует все случаи смерти во всем мире. Однако, все эти цифры - это оценки, так как не все страны делают тесты во всех подозрительных случаях. Но есть ещё одна причина, по которой цифры сомнительны.

Доктор Вольфганг Водарг.

Первое, что спрашивают, когда обнаружены первые 100 случаев, как часто вы искали? Искали вы в прошлом году также тщательно, как в этом году? Если вы в прошлом году не искали и говорите, что в этом у вас очень много случаев определённого заболевания. Тогда вы не можете ставнивать. Потому, что может быть в этом году такая же картина, как каждый год. Если бы мы раньше обнаружили все возможные вирусы, например лошадиные вирусы, мартовские вирусы, вирусы конца света.

Мы можем дать им красивые имена, так как находим всегда определённые молекулярные последовательности, которые встречаются у животных. Как сейчас, так называемый свиной грипп. Но название не имеет ничего общего с характером опасности вируса.

Всемирная организация здравоохранения

Критики считают грипп безобидным, но эксперты ВОЗ видят в нём большую опасность. Мы должны серьезно относиться пандемии гриппа, потому что он может быстро распространиться по всему миру. Все защитные меры для предотвращения распространения вируса не сработали. В конце апреля врачи сообщают о первых случаях заболевания в европе. 11 июня ВОЗ (всемирная органиация здравоохранения) устанавливает самый высокий уровень пандемии.

Я решила поднять уровень опасности пандемии с фазы 5 до фазы 6. Фаза 6 означает, что государства-члены ВОЗ должны реализовать свои национальные планы по борьбе с пандемией, заказать вакцину и лекарства. Это самый высокий уровень опасности. Но это согласно новым критериям. В мае 2009 г. ВОЗ убрала два ключевых пункта из определения пандемии.

Раньше было условие: огромное количество смертей и болезней в нескольких государствах. Сегодня нет этого пункта. Поэтому сегодня достаточно того, что болезнь быстро распространяется по крайней мере в двух из шести регионах.

Профессор **Гаральд Швайм**, фармокология университета Бонна: Я считаю, что ВОЗ сделала ошибку, изменив это, потому что слово пандемия воспринимается как паника у населения. Поэтому лучше было бы оставить степень тяжести в определении пандемии. Потому, что в сравнении с тем, что действительно происходит, все мероприятия сильно преувеличены.

Женева, резиденция всемирной организации здравоохранения. ВОЗ была основана в 1948 г., 193 страны входят в состав организации. Она координирует здравоохранение объединенных наций и должна бороться с болезнями.

Доминик Ле Гро - кризисный менеджер в ВОЗ, он отвечал за принятие мер против новой волны гриппа. Мы находимся в кризисных кабинетах ВОЗ в Женеве с кабинетом здесь и большым залом, который используется в случае кризиса. Особенно в случае эпидемии, пандемии гриппа. Француз работает пять лет в ВОЗ. Кризис - это его будни.

Опредление свиного гриппа как пандемии ему кажется скорее бюрократическим процессом. Чётко определено и необходимо.

Решение о поднятии фазы с 4ой до 5ой, а затем до 6ой было принято исходя из технических критериев, которые определены исходя из географического разделения. Сколько людей умирает или сколько тяжело болеет, больше не является критерием для пандемии.

Но меры, которые принимают государства ориентируются именно на это условие. Почему опредление было фундаментально изменено - не ясно.

Знаете, это было не просто так придумано. Может быть при следующей пандемии будут сделаны выводы. Сейчас пандемия - это просто глобальное заболевание. Если грипп попадает сюда, то нужно еще раз проверить, это часть процесса обучения. В следующий раз это будет, возможно, изменено.

Еще раз подумать, когда будет следующая пандемия? Фаза 6 означает миллиардные инвестиции в вакцины и медикаменты.

Если бы ВОЗ не изменила критерии пандемии, то коммерция была бы невозможна в таких масштабах. Инструкции ВОЗ не являются обязательными для государств, но они оказывают сильное политическое давление. Какой политик скажет: нет, я не покупаю тамифлю и вакцину?

Уровень пандемии 6 распространяется на весь мир, даже в Германии закупаются. Государственный институт Роберта Коха консультирует федеральное правительство по вопросам мониторинга, профилактики и предупреждения заболеваний. Здесь воспринимают рекомендации серьёзно и рекомендуют запаситесь лекарствами и вакцинами. Это требует больше половины миллиарда евро. Врачи в Берлине ожидают самого худшего в деле свиного гриппа. Нужно исходить из того, что осенью увеличится активность вируса h1n1. Поэтому нужно сделать всё необходимое, чтобы оптимально войти в сезон. Это касается как сезонных вирусов, так и нового вируса.

Заказ вакцины в Германия - это дело областей, в настоящее время председательствует Тюрингия. Здесь в Эрфурте министры здравоохранения решили купить 50 миллионов доз вакцины на сумму 600 миллионов евро. Запасы тамифлю были увеличены. Политики хотят продемонстрировать свою силу. Хотя свиной грипп проявляется безобиднее, чем сезонные гриппы.

Посмотрите на первые дни свиного гриппа. Все ругали области, которые заказали меньше тамифлю. Но настроение очень быстро поменяло характер.

Реакция политики

На мой взгляд причиной является некомпетентность со стороны политиков. Можно было заранее сделать опрос, сколько людей захочет сделать прививку, прежде чем потратить эти деньги. И тогда можно было заказывать. Но хотелось показать мускулы. Перед выборами хотелось не упасть лицом в грязь, хотелось поазать населению, какие мы крутые. Показать, как сильно заботятся политики о населении. Но здравый смысл где-то потерялся.

Потратить миллионы для защиты от безобидной болезни?

Во Франции люди начинают сомневаться в процедуре. Но пока лишь несколько политиков высказали критику. Депутат Жан Мари ле Пен требует от министра здравоохранения Розелин Бачело больше ясности. Франция заказала 94 миллиона доз вакцины. Стоимость неизвестна. В прессе спекулируют суммами от 1 до 1,4 миллиардами евро. Оппозиция резко критикует непрозрачные действия французского правительства. Отсутствует прозрачность в действиях правительства. Неизвестна ни потраченная сумма, ни лица тех, кто отвечал за решение о покупке. И не известны планы министерства здравоохранения в отношении вакцинации.

Сентябрь 2009 г. собрание комитета здравоохранения. Министр здравоохранения считает высокой вероятность вспышки свиного гриппа, даже спустя 5 месяцев. Пандемия затрагивает все общество, беспокойство наших граждан реальна и обоснована. Правительство приняло решение, дать возможность вакцинироваться всем желающим. Французское правительство тоже хочет показать силу, оно заказало 94 мил. доз, 3/4 французов могут быть вакцинированы. И только сейчас политики начинают задавать вопросы. Даже комитет по здравоохранению знает не больше, чем общественность. Правительство слишком остро отреагировало, не учтя мнение населения.

Нам кажеться, что сейчас наблюдается обратная тенденция. Растет количество французов, кто отказывается от прививки. Такое ощущение, что французы боятся вакцинации больше, чем грипп. Есть ещё много вопросов к вакцине и заказу.

Разве сложно опубликовать на сайте министерства всех производителей вакцин? Какие вакцины с адъювантом, какие без него? Это общая информация должна же существовать.

Было принято решение о создании комиссии по разъяснению дальнейших мер.

Реакция стран

Сейчас всё не так уж плохо, пандемия не очень опасна. К счастью тяжело больных и умерших не так много. Но ясно, что в случае опасности было бы больше проблем при такой плохой коммуникации. Патоген H1N1 в его нынешней форме кажется безобидным, но во всем мире была паника в первые месяцы. В Мексике футбольные матчи проходили без зрителей. Метро в Мексике дезинфицируется, все общественные мероприятия отменены.

В японии и Китае прибывающие пассажиры в аэропорту проходят досмотр тепловизионными камерами, чтобы определить температуру. Особенно жёсткая реакция в Китае. Отель на 200 мест был помещён в карантин, потому что здесь был один из Мексики. Мексиканское правительство выразило протест. Достаточно быть мексиканцем, чтобы попасть в карантин. Шесть стран запрещают ввоз живых свиней из Мексики и США. При этом доказано, что животные не передают болезнь. Правительство Египта приказало убить 350 000 свиней. Это приводит к бунту разгневанных свиноводов.

Мир погружается в панику от вируса, который не только безобиден, но по своей структуре не новый. Первый такой вирус был обнаружен еще в 1930 году. Это не новый вирус, он уже давно распространён среди людей, последний раз его заметили в США. Когда солдаты вернулись из Вьетнама, привезли с собой вирус и там он распространился.

США 1976 г. правительство ожидает, что от свиного гриппа умрёт 1 миллион людей и хочет решительно противостоять этой угрозе. 45 миллионов американцы вакцинируются. Как отмечают специалисты, вакцина вызвала паралич у нескольких сотен человек, 25 умерли. От самого гриппа умер только 1 человек. Вакцинация была остановлена.

Вирус имеет мало общего со свиньями. Изначально вирусы развились в птицах или свиньях. Однако очень заразными они могут быть только при передачи от человека к человеку. Это происходит в основном при кашле или чихании. В подавляющем большинстве случаев вирус H1N1 вызывает относительно легкую форму гриппа, которая проходит через несколько дней.

Эрик уже неделю на карантине, ему не разрешается покидать квартиру и следует избегать контакта с людьми. Абитуриент болен свиным гриппом, но у него всё хорошо. В поездке в Испанию Эрик и еще семь студентов заразились. После возвращения у него были насморк и головная боль. Он считал это простудой или похмельем.

Я ничего особенного не заметил, был немного утомлён, вялый. На следующий день пошёл на треннировку. Полтора часа позанимался, потом ещё с друзьями пошли на вечеринку.

В воскресенье приболел, это это могло быть от треннировки и потом алкоголя. Мама тоже думала, что это просто простуда. Через два дня пришло сообщение, что двое учеников заболели свиным гриппом.

Вечером нам позвонили и оказалось, что это не простуда, а свиной грипп. Да, и что? Эрик позвонил терапевту и спросил, что ему делать. Врач не могла мне ничего особенного сказать. Приходите, сделаем тест на вирус. Хорошо, я пошёл. В комнате ожидания было много пациентов. Я подумал: хорошая вечеринка для бактерий. Врач взял мазок из носоглотки Эрика.

В лаборатории Кёльна в связи с пандемией работа круглосуточно. Вначале делали тест даже при подозрении, но теперь исследуют пробы только пациентов из группы риска.

К ним относятся молодые люди с хроническими заболеваниями и беременные. Подозрения Эрика подтверждаются. Врач прописывает ему тамифлю. Препарат - один из двух на рынке, которые должны помочь от свиного гриппа. Он должен сократить продолжительность болезни до 2х дней. Использовать его нужно не позднее, чем через 48 часов после первых симптомов. У Эрика прошло уже 4 дня. После принятия припарата он чувствует постоянную усталость. Я не знаю, помогло мне или нет, симптомы быстро прошли ещё до этого. Болезнь Эрика была безобидной, как и у большинства пациентов с так называемым свиным гриппом.

Но на чем основана мировая угроза со стороны вируса? Вирусологи быстро приходят к выводу, что возбудитель менее опасен, чем предполагалось.

Университет Бонна, здесь работает профессор засранец Кристиан Дростен. Он один из первооткрывателей зарс вируса, возбудитель которого привел к первой пандемии этого века весной 2003 г. Тогда вирусом заболели 8000 человек, 918 человек умерли через несколько дней после заражения, это примерно каждый десятый. Из-за большого количества смертей Зарс был большой угрозой, но распространение быстро сдержали. Сегодня ситуация совсем другая. Этот вирус опасен тем, что поражает очень много людей. Он очень сильно распространился. Но летальность очень очень маленькая. Летальность, вероятно, находится в районе 0,1%. Даже если текущая статистика не позволяет точно сказать, потому что не все регистрируются. У Зарс вируса летальность в 100 раз выше.

По оценкам обычный грипп убивает более полумиллиона человек во всем мире ежегодно. В Германии оценивают за полгода от 8 до 11тыс. смертей от гриппа. Во Франции оценивают от 4 до 6 тыс. человек. Необходимость защиты от вирусов есть уже давно. И часто это приводило к весьма странным реакциям.

Капюшон для защиты от гриппа торговой марки agrippina. Легко можно упатеть, но можно не бояться кашля прохожих.

Страны реагируют по-разному на пандемию. В Тайване органы здравоохранения запрещают разговаривать в лифте. Во Франции просят людей воздержаться от поцелуев при приветствии. Мало кто придерживается этих правил.

Даже католическая церковь реагирует. Архиепископ Неаполитанский запретил вековую практику, целовать мощи мучеников. Простая и разумная защита от всех вирусов проста - регулярно мыть руки. Эти меры эффективно помогают, но на этом не заработаешь много денег. Производителям лекарств не зарабатывают на мытье рук. VFA является торговой ассоциацией немецкой фармацевтической промышленности. Здесь срочно предупреждают о возможных опасностях. Опасность еще относительно низкая, но простая мутация может всё изменить в мгновение ока. Большой вопрос заключается в том, останется ли вирус умеренным или превратится в опасный.

Испанский грипп

Индустрия и ВОЗ согласны друг с другом. Опасные пандемические вирусы требуют лекарств, потому что население должно быть защищено.

Это принцип фармацевтического маркетинга, который внедряется здесь. А именно, фармацевтическая индустрия может хорошо продать свой продукт только тогда, когда люди боятся. И надеются на предложения производителя быть спасёнными. Таким образом, нужно создать психоз, чтобы люди стали мягкими и давали себя вакцинировать.

В прошлом веке испанский грипп унес два миллиона жизней. Об этом напоминают сегодня снова. Такие эксперты, как историк медицины Патрик Зильберманн, предупреждают, что ситуацию нельзя сравнивать. Тогда большинство людей умерло не от испанского гриппа, а от дополнительной бактериальной инфекции, такой как пневмония. Сегодня мы можем лечить такое с помощью антибиотиков. И это только одна причина, но очень важная, почему нельзя сравнивать со свиным гриппом. Сегодняшняя пандемия безобидна и не имеет ничего общего с гриппом 1918 года.

Вирус H1N1 принадлежит к группе, которая быстро мутирует. При мутациях могут возникать опасные типы. Эксперты полагают, что вероятность этого очень маленькая.

Можно сказать, что этот вирус может обменяться с другими вирусами генными сегментами и стать очень опасным. Но нужно сказать, что текущий вирус очень успешный. Внезапный скачок мутации может произойти, если вирусу плохо. Вирус не хочет убивать людей, потому что вирус хочет просто существовать. А такое возможно, когда он сохраняет социальную среду, т.е. когда вы не серьезно больны.

Почему ВОЗ вообще объявила пандемию? Была это мера предосторожности или создание ненужной паники? Критики неоднократно указывали организации на слишком близкую связь с фармацевтической промышленностью. Экономические интересы промышленности оказывают влияние на ВОЗ.

Связь с фармацевтикой

Есть ряд людей в ВОЗ, которые работали в фармацевтической промышленности и которые принесли с собой этот образ мышления. А именно таким образом, что решения ВОЗ были удобными для фармацевтической индустрии.

Уже при птичьем гриппе я заметил, что в ВОЗ был ответственный за эпидимеологичускую безопасность. С ним я поговорил в конце года и он не смог назвать причины созданного страха перед птичьим гриппом. Потом я узнал, что он ушёл работать в фарма концерн. Видимо в ВОЗ и фарма индустрии есть карьерные пути, которые пересекаются. Такого не должно быть, конечно же. На заседаниях ВОЗ всегда есть присутствующие из фарма концернов, это не серет.

Так были даны рекомендации при свином гриппе. Norbert Hehme, Jennifer Herz, Stephen Gardner, Comella Kutzer Вероятно они приглашены как наблюдатели эксперты. Фармацевтический производитель GlaxoSmithKline также нанимает экспертов, которые идут работать в ВОЗ или из неё. Близость к ВОЗ может быть большим преимуществом, но об этом не говорят.

Итак, чтобы в конце концов ответить на вопросы, представители компании могут сказать о наличии вакцины или мощностях. Советники не оказывают никакого влияния и не играют никакой роли. Отвечать на вопросы и не оказывать влияния? Ни представители фармацевтики, ни Доминик Ле Гро не видят никакой связи. Он не может понять критику в сторону ВОЗ.

Мы работаем с фармацевтической промышленностью в том смысле, что они производят вакцину. С другой стороны, фарма промышленность не участвует в конференциях и общественных совещаниях. Они не влияют и не имеют права решать. Если вспыхивает инфекционное заболевание, которое лечат препаратом X и если это единственный эффективный

препарат, и если этот препарат делает компания Y, значит она больше его продаст. Перед тем, как критизировать фарму за то, что она зарабатывает на заболевании, нужно вообще радоваться, что препарат есть на рынке. Фармаконцерн Rochee - это один из таких Иксов. Производит этот препарат тамифлю против свиного гриппа. Для компании вирус очень желанный. Очевидно, тамифлю занимал место на складах. Но благодаря пандемии быстро продаётся теперь по всему миру. Только в первой половине 2009 Roche смогла увеличить прибыль от тамифлю на 203% до 647 мил. Что сделало её одной из самых успешных компаний в индексе Доу-Джонса. Лондонский аналитик Мартин Бруннингер отмечает, что фармацевтическая промышленность в целом имеет проблемы. Доходы от свиного гриппа сделали долгожданную инъекцию денег для всех фарма фирм.

Это произошло в интересной момент времени, потому что уже много лет назад начал выходить срок патентов. Истечение срока патентов крупных продуктов сильно снижают доходы. Новых разработок становится все меньше и меньше. Это означает, что статус фарма индустрии скорее сложный. Благодаря пандемии, благодаря таким крупным заказам правительств они смогли получить краткосрочную выгоду.

Даже краткосрочная выгода в размере миллиардов евро. Без пандемии никакая компания не получила бы этого. Тот факт, что фарма фирмы всё больше денег инвестрируют в маркетинг, а не новые разработки, становится проблемой.

К началу 2000 года фармацевтическая промышленность переживала тяжелые времена. Не было новых инновационных продуктов, и вставал вопрос, как сохранить высокую рентабельность. Поэтому наши специалисты в фармацевтической отрасли стали значительно развивать сектор вакцин. Благодаря изобретению эпидемии и пандемии, чтобы увеличить продажи вакцин. Первое, что они попробовали, это часто цитируемый птичий грипп. И я напомню, что эксперты, которые кричали о свином гриппе, были теми же, кто кричал о птичьем гриппе.

Однажды Roche получил огромную прибыль с тамифлю. Птичий грипп принес компании рекордные продажи, выручка превысила 550 миллионов евро. 96 стран закупили запасы в то время. Правительство США закупило тамифлю примерно за 48 миллионов евро – прибыльный бизнес для министра обороны Дональда Рамсфельда, потому что он был в то же время акционером и председателем наблюдательного совета американской компании, которая разработала тамифлю и до сих пор владеет патентом на препарат. Даже в то время работы министром Рамсфельд держал долю в компании. Оценочная стоимость не менее четырех миллионов евро. Конфликт интересов он отрицал.

По всему миру можно найти примеры взаимоотношений между фармацевтической промышленностью и политикой. И во Франции министр здравоохранения Розелин Бачелот до своей карьеры политика работала более десяти лет в фармацевтической промышленности, в том числе как PR-менеджер крупной корпорации. В том числе в частично бюджетном Institut Pasteur есть противоречия. Директор Элис Дотри является одновременно консультантом фармацевтической ассоциации. Ни она, ни сотрудники института не были готовы дать интервью. По мнению критиков, это не единственные примеры сплетения между фармацевтической промышленностью и политикой здравоохранения.

Бывший президент национального института профилактики и санитарного просвещения, очень быстро устроился в ассоциации фармацевтической промышленности. Значит в наивысшей инстанции тот, кто решает вопросы здравоохранения и должен работать в интересах общественности, продвигает интересы фарма индустрии. Такое должно быть запрещено.

Система непрозрачна. Невозможно проследить, кто оказывает влияние и на какие решения.

Лобби

Профессор Герд Глеске - экономист здравоохранения из Бремена в течение многих лет критикует непостижимую сплетённость фарма индстрии, правительства и науки. Конечно, мы имеем дело с сильным лоббированием в этой системе. Лоббрование оказывает влияние и на науку, что приводит к конфликту интересов. Например, мы видели, как известный учёный в Великобритании сделал доклад о средстве против гриппа, которое выгодно определенной фармацевтической компании. Так что здесь связь очевидна.

В Англии свиной грипп свирепствует больше всего. По крайней мере, здесь введены самые строгие меры против гриппа. По телефону горячей линии любой желающий может запастись лекарствами. Правительство закупило противогриппозных препаратов для 80% населения. Кроме того, были куплены вакцины на сумму около 180 миллионов евро.

Ректор колледжа Сэр Андерсон консультирует правительство по вопросам борьбы с вирусом. Он публично пропагандировал использование противогриппозных препаратов. Британские журналисты выяснили, что медик был в то же время в списке зарплатной ведомости. С ежегодным доходом 116 тыс евро фарма концерна GlaxoSmithKline, который заработал миллиарды на вакцине от гриппа. Министерство и фармацевтические компании отказываются признавать конфликт интересов. Сэр Андерсон утверждает, что не принимал прямого участия в решениях о вакцине.

Безусловно это не единственный случай. Я могу вам назвать эти случаи в Германии. Во всех сферах здравоохранения вы найдите экспертов, которые продвигают свои интересы.

В Германии фармацевтическое лобби особенно сильно. Цены на запатентованные препараты компаниям разрешено устанавливать самим. Здесь не ведут переговоры, как в других европейских странах. В Германии медицинские страховые компании должны оплачивать лекарства не зависимо от их цены. Все попытки изменить это со стороны политики не удались.

Может лобби фармацевтической промышленности быть сильнее, чем забота о защите населения? Очевидно финансирование индустрии имеет большее значение, чем здесь охрана здоровья. Организация "прозрачная Германия" годами обвиняет коррупционные и мошеннические схемы в системе здравоохранения. Медицинские исследования фальсифицируются, повышенные риски препаратов скрываются. Здесь отсутствует политическое регулирование.

Население всегда думает, что существуют контролирующие органы в министерствах и государственных комиссиях. Однако, из-за большого конфликта интересов между вовлеченными людьми и производители, этот контроль практически полностью отсутствует.

Оганизация "прозрачная Германия" также критически относиться к комиссии по вакцинации института Роберта Коха. Институт рекомендует, какие прививки применять и какие оплачиваются медицинским страхованием. Члены комиссии - это медицинские работники, чьи проекты частично финансируются фарма промышленностью. Но президент государственного института не видит в этом проблемы. Комиссия по вакцинации создала правила прозрачности. Вы можете получить информацию из интернета о личностях.

И эти правила можно увидеть и в международном контексте.

На сайте института Роберта Коха можно увидеть, какие, на самом деле отношения связывают её членов с фарма промышленностью. Почти у всех медицинские работников имеются связи, которые ведут к конфликту интересов.

Есть очень интересный вариант толкования этих списков. Некоторые говорят, что за ними стоят три, четыре, пять компаний и это уже факт того, что они независимы. Т.е. они не продвигают отдельных производителей. Думаю, что они недооценивают значение лоббизма. Потому, что это принципиальный вопрос. Можно ли брать деньги от фарма индустрии для стороннего финансирования исследований. Я вам могу точно сказать, что просто так деньги не даются без того, чтобы не получить что-то взамен.

Инвестиции в строительство производства вакцины в Дрездене, видимо, оправдали себя. GSK вложила 200 миллионов евро. в строительство завода. GSK компания ожидает годами пандемию гриппа. Два миллиарда евро было потрачено на разработку вакцины против пандемического гриппа. Однажды это должно окупиться. Германия заказывала пока только у GSK. Франция заказала у четырех разных производителей. Больше половины у GSK. Критики утверждают, что вакцина недостаточно протестирована. Доктором Йенсом Воллмер, медицинский директор спокойно относится к предполагаемым рискам вакцины.

Например, при сезонном гриппе, каждый год мы должны получить новый допуск. И этот процесс быстрее для сезонных вакцин. При шаблонной вакцине. У нас есть допуск на шаблонную вакцину. На основе этого допуска мы можем получить также допуск на H1N1. Это не означает, что проверка проходит менее тщательно. Это значит, что многое уже проверено на шаблонной вакцине.

GSK производит вакцину от гриппа на основе куриных яиц. Затем добавляется усилитель эффекта, так называемый адъювант. Эти адъювантны очень противоречивы, поскольку они могут вызывать либо усилить паралич. Поэтому они были запрещены в США. Эксперты в Европе считают, что тесты шаблонной факцины на безопасность были неадекватными. Немецкие и французские критики делают простой расчет.

Если вы при массовой вакцинации в 20 мил. доз имеете 0,1% побочных эффектов, то это 20 тыс. человек, которые там пострадают от вакцины. И если это опасный побочный эффект, то это можно назвать катастрофой.

Представьте, что у вас 1 к тысячи смертей от осложнений и вы вакцинируете 60 миллионов французов, то умрёт 60 тыс. людей. И это касается всех слоёв населения, дети, беременны, молодые люди, такие как вы, совершенно здоровые. Это катастрофа.

С середины августа идёт тестирование новой вакцины. 1200 взрослых и 2000 детей в Германии в течение 2х недель хотят проверить безопасность вакцины. Участники тестов засекречены. Профессора Фрэнк фон Зонненбург в уничерситете Мюнхена возглавляет исследование Германии. Он не принимает критику.

У нас уже есть опыт с сотнями миллионов вакцин и эта вакцина против гриппа ничем не отличается от других вакцин против гриппа. Здесь нет ничего сенсационно нового. Нужно признаться, что есть редкие побочные эффекты. Их невозможно охватить исследованиями.

Даже если профессор фон Зонненбург убеждён в надёжности вакцин, то влияние фарма индустрии и он замечает. Было бы хорошо, иметь деньги на исследования вакцин. Независимо от индустрии, чтобы можно было сделать определенные исследования вакцин. Например, как достичь лучшего покрытия среди населения и тп.

Такое невозможно сейчас сделать? Это сложно, пот. не хватает денег на это и основаная часть вакцины была оплачена индустрией.

В Германии фарма финансирует не только большую часть исследований, но также имеет огромное влияние на законодательство. Врач Вольфганг Водарг, будучи депутатом Бундестага, сам видел, как ассоциация фармацевтической промышленности делает политику. VFA продала уже закон федеральному правительству Германии. Вот такое могущество. Был закон ценового регулирование запатентованных лекарственных средств. И VFA заплатила 100 мил тогда ещё немецких марок, чтобы мы не применяли этот закон. Было заплачено медицинским страховым компаниям. И федеральное правительство приняло участие в этом.

Производители сделали выплаты страховым компаниям и закон регулирования цен никогда не применялся. Цены патентные препараты фирмы устанавливают сами. Использование средства от гриппа тамифлю вызывает много вопросов. Побочные эффекты препарата просто замалчиваются.

Побочные эффекты тамифлю

Оксфорд в Англии - известный университет города считается одним из лучших в мире. Проведённые здесь исследования воспринимаются очень серьезно. д-р Мэтью Томпсон - профессор Оксфордского университета со своей командой исследует эффективность и пользу лекарств. Его публикация о влиянии тамифлю на детей в знаменитом британском медицинском журнале произвел фурор во всем мире.

Мы не нашли доказательств того, что этот препарат уменьшает риск серьезных осложнений или делает госпитализация ненужной. И нет никакой пользы для детей с астмой, которые относятся к группе риска. Однако мы обнаружили побочные эффекты. 1 из 20 детей, принимающих препарат, будет чувствовать себя несчастым и их будет рвать.

И это может способствовать обезвоживанию.

Во всём мире тамифлю назначают взрослым и детям. Вначале почти всем, у кого есть подозрение на свиной грипп. Но почему правительства заказывают и рекомендуют такой неоднозначный препарат? Почему побочные эффекты не были тщательно изучены?

Удивительно, что этого никто не сделал. Мы боялись, что это опубликуют до нас. Поэтому мы старались быстро работать и быстро опубликовать результат. Все исследования кроме этого, можно было получить через интернет. Только одно исследование нужно было запросить у производителя.

Ученые из Оксфорда - не единственные, кто сомневается в пользе медикамента. В 2005 г. в Японии были статьи о том, что подростки выбрасывались из окна, якобы принявшие тамифлю. Японское министерство не обнаружило связи между приёмом тамифлю и психическими расстройствами. Однако запретило выписывать препарат подросткам.

В европе с 2007 года добавили в список побочных эффектов: ненормальное поведение, затуманенное сознание, галлюцинации, бред, и случайные травмы. Самоубийства в Японии, побочные эффекты - это плохая реклама для коммерческой компании. Всё стало настолько плохо, что в сентябре 2009 года Roche вынуждена была пойти в наступление. Были приглашены журналисты со всего мира на конференцию. Доктор Кумар прилетели из Канады, чтобы лично объяснить своему работодателю, что у него не в порядке.

У меня нет акций Roche, я не учавствую в консультациях, мне никто не заплатил моё присутствие здесь. Однако, одно моё исследование в университете финансирует Рош.
Если вы не против этого. Вы можете сами решить, верить ли тому, что я вам покажу. Вы можете решить для себя, верите ли вы мне в то, что я вам показываю.

Первым делом доктор вызывает страх перед болезнью. Он описывает, как тяжело болезнь может протекать. Это были такие больные люди, которых я видел впервые в своей жизни.

И затем доктор Дэвид Редди даёт оперативную информацию Рош, исходя из которой, побочные эффекты не связаны с тамифлю. Это были просто симптомы гриппа. Симптомы гриппа при наличии противовирусных препаратов - это неизученное заболевание. Поэтому симптомы были не правильно поняты. У нас очень надёждый медикамент и болезнь с очень ясными особенностями. Однако некоторые особенности проявляются реже и просто плохо распознаны. В ходе разработки лекарства мы начинаем лучше понимать сам грипп.

Так ли это на самом деле, или ученые делают такие заявления с целью получения прибыли? Тот факт, что препарат наносит детям больше вреда, чем пользы, здесь объясняют как плохой анализ данных. Хотя учёные из Оксфорда обращались в компанию для получения необходимых данных.

Часто людям не хватает данных, которые мы имеем в необходимом количестве. При допуске на европейский рынок в этих данных тоже есть указание, что 1 из 20 детей имели эти побочные эффекты.

Но насколько достоверны заявления представителя компании? Если заглянуть в историю компании, то можно быстро доказать, что побочные эффекты были скрыты. На первом плане были незаконная фиксация цен и реклама, вводящая в заблуждение.

В своей книге «Коррумпированная медицина» журналист Ханс Вайс перечислил 12 фактов незаконных или неэтичных действий фарма концернов за последние десять лет. Компания Roche уже получала предупреждение за неоднозначную рекламу тамифлю от американской комиссии по допуску медикаментов. По поводу обвинений никто не хочет давать комментариев. Аналогичная ситуация с фирмой GSK. Она заплатила миллионные штрафы за обман и манипуляции с ценами. Ханс Вайс описывает эти и другие правонарушения со стороны компании, среди прочего сокрытие рисков от побочных эффектов, обвинения в коррупции и организации криминального объединения.

На запрос компания не отрицает обвинения и утверждает об улучшениях. Германия и Франция заказали вакцину у GSK. Ответственные лица не хотят комментировать финансовые условия сделки.

Это просто часть договора между двумя сторонами о том, что секрет должен сохранятся обеими сторонами. Поэтому мы должны соблюдать это условие. Каждое государство вело тайные переговоры с GSK и нет прозрачности в отношении того, какие решения и как были приняты. Большое преимущество для фармацевтической отрасли. Граждане не знают, как их вкладываются деньги. Ни во Франции, ни в Германии.

Тут было бы всё ясно, если бы GSK заявила бы, что все страны получают на одинаковых условиях. Мы бы приняли условия как немцы.

Условия фармацевтической компании просто принять? Без публичного тендера? Без независимого контроля?

Я считаю это ерундой. Потому что в рамках публичности системы здравоохранения в целом и важности этой системы здравоохранения для нас, такие контракты должны рассматриваться публично, должны быть публично обсуждены, а также согласованы с экспертами. Сейчас процесс непрозрачен и естественным образом он создает место для спекуляций. От этого можно избавиться только публичностью.

Завершение

Однако кукловоды пока скрываются. Как в Германии, так и во Франции. Политики вместо того, чтобы управлять, уступают экономическим интересам. И, кажется, капитулируют перед корпоративным влиянием.

Если у государства нет собственных инструментов, отличать ложь от правды, то оно полностью принадлежит этой индустрии. Отличить ложь от правды в этой пандемии трудно друг от друга. Были ли политические решения выгодны населению? Остаётся под вопросом. Индустрия получила уже выгоду.

И если компания по вакцинации будет неудачной, потому что население больше боится прививки чем гриппа, то оставшаяся вакцина, которую мы уже оплатили и которой не доверяем, может быть подарена развивающимся странам. Такие вот мы щедрые, индустриальные страны. Если у вас есть вопросы или вы хотите обсудить, вы можете это сделать в онлайн блоге с автором этого фильма.

SWINE FLU HYPE

Swine flu HYPE for Genocide

Len Horowitz, 24 November 2009

https://www.youtube.com/watch?v=3T7zzQh_Ye8&list=PL579700CA87CC3B5D&index=11

The media hype around this harmless swine flu sends alarm bells ringing. Thank to Wearechange LA http://www.youtube.com/user/wearechan... again for their footage asking the questions I myself have been asking about this swineflu. We have seen the cover up of 911 by the mainstream media always protecting their investors and throwing us little fragments of truth.

Dont think for one minute these PR firms (MSM) wont set up global genocide either. Pay particular attention to the end with Len Horowitz talking about these vaccines making h1n1 more available to combine with the deadly h5n1. Len Horowitz is someone I dont agree with on a lot of things but he has been continually on the money with vaccines and viruses .. during the Anthrax scares post 9-11 he got a visit from the FBI he tipped them off to where the Anthrax was coming from then it was hushed up in the news. He dedicates a lot of his time with vaccines and diseases please further research h1n1 recombinating with h5n1 (avian flu the more deadly virus)

Swine flu pandemic is yet another conspiracy
Danish media

Russia Tuday, 25 November 2009
https://www.youtube.com/watch?v=XFLHbXqSEVQ

Danish journalists claim that the World Health Organization and drug companies producing the swine flu vaccine are in partnership, and that the true nature of their relationship is shrouded in mystery.

"What we do know is that the pharmaceutical companies are present at the meetings of WHO expert groups, but what we don't know is what they talk about. And another thing is that scientists who appear to be independent are also hired consultants working for the same pharmaceutical companies who produce the vaccines," says *Louise Voller*, a journalist at the Danish Daily Information newspaper.

Svenska Dagbladet

Inger Atterstam

Experter samarbetar med industrin

Svenska Dagbladet, 30 november 2009, 01.00.
http://www.svd.se/nyheter/inrikes/artikel_3866171.svd

Pandemi. Rader med experter hjälper WHO att hantera hotet från svininfluensan. Men flera av rådgivarna har kopplingar till läkemedels-industrin, visar SvD:s granskning. Kommittén som ger råd om själva pandemin är hemlig.

Genève/Stockholm.

En central grupp sedan svininfluensans utbrott i våras är WHO:s "Emergency Committe". Baserat på information från denna kriskommittée har WHO:s generaldirektör Margaret Chan fattat beslut om olika pandeminivåer.

Efter kommitténs fjärde möte den elfte juni 2009 drog Margaret Chan slutsatsen att kriterierna för en pandemi uppfyllts.

"Efter rådgivning från kriskommittén beslutar WHO:s generaldirektör Margaret Chan att gå från fas fem till sex", skrev WHO i ett pressmeddelande.

"WHO har nu nära dialog med tillverkare av influensavaccin, och full kapacitet ska snart vara uppnådd för att försäkra största möjliga tillgång till pandemivaccin inom de närmaste månaderna", hette det vidare.

Vad är denna kriskommitté vars slutsatser ligger bakom pandemibeslutet som också utlöste storskalig vaccinproduktion?

– Kommittén sammankallas av WHOs generaldirektör vid behov för att ge råd om internationella sjukdomsutbrott. De träffades första gången 25 april i år. Kommittén består av 18 medlemmar och är enbart rådgivande, säger Gregory Hartl, talesman för svininfluensan vid WHO.

Han betonar att WHO-chefen får råd från världens främsta hälsoexperter genom kommittén, men att beslutet att deklarera en pandemi "helt och hållet är hennes eget".

Vilka är medlemmarna i kommittén?

– Namnen på medlemmarna i kommittén är hemliga. Man vill inte att de ska kunna utsättas för påtryckningar utifrån. De är valda utifrån sina expertkunskaper om influensa, virusspridning och sjukdomskontroll, säger Hartl.

Varför är namnen hemliga? Vilka slags påtryckningar riskerar medlemmarna?

– Jag kan inte gå in på det. Men det viktiga är att medlemmarna i kommittén inte behöver ta hänsyn till någon eller någonting utanför kommittén i sin rådgivning till WHO:s generaldirektör, säger Gregory Hartl.

Har någon medlem i kommittén koppling till eller samarbete med läkemedelsindustrin?

– Jag vet inte vilka medlemmarna är. Jag tror att kontroller görs om de har kopplingar till läkemedelsindustrin.

Bör inte WHO vara transparent när det gäller hur beslut fattas om sjukdomar som berör miljontals människor?

– I kampen mot denna epidemi måste man samarbeta med många parter. Det inkluderar regeringar, frivilligorganisationer och läkemedelsindustrin. Vi måste hitta de bästa lösningarna för att skydda människors liv. Att rädda liv är allra viktigast för oss, säger Gregory Hartl.

Han tillägger att "vi frågar om intressekonflikter och får uppgifter om detta".
Han säger också att det finns flera kommittéer som ger råd om olika aspekter kring svininfluensan och hur man kan bekämpa den.
– Dessa kommittéer undviker intressekonflikter, säger han.

Men en titt på dessa kommittér visar att det inte alltid stämmer. När det gäller influensa och vaccin har WHO bland annat Sage-kommittén samt Ad hoc Policy Advisary Working Group on Influenza A (H1N1) till hjälp.

Tre av Sages femton medlemmar har kontakter med läkemedelsindustrin. Bland annat har de fått pengar och stöd av de ledande vaccinföretagen.

Två oberoende externa experter på Sages möten i Genève har av den danska tidningen Information avslöjats ha fått rådgivarpengar från läkemedelsföretag (se grafik under artikeln).

I Ad Hoc-kommittén sitter också som oberoende expert en professor och världsledande virusforskare som fått kritik i tidskriften Science för att han äger två bioteknikföretag som jobbar med influensavaccin.

När det gäller beslutet att deklarera en pandemi har dock vare sig Ad Hoc-kommittén eller Sage "spelat någon som helst roll", säger Gregory Hartl.

– Margaret Chan kan bara ta rådgivning av kriskommittén och medlemsländerna. Men beslutet om en pandemi är enbart hennes, säger han.

THE FLU CASE

Inger Atterstam

Swine Flu Gate: Is Virologist Albert Osterhaus the Ringleader?

The Flu Case, 3 December, 12:56
https://web.archive.org/web/20100102041114/http://theflucase.com/index.php?option=com_content&view=article&id=2171%3Aswine-flu-gate-is-virologist-albert-osterhaus-the-ringleader&catid=1%3Alatest-news&Itemid=64&lang=en

According to Russian, Danish and now Swedish newspapers, the Svenska Dagbladet, many of the "independent experts" who sit on important WHO committees and who were instrumental in the fake swine flu scare have financial links with the pharmaceutical industry that stand to make billions from the scam.

Albert Osterhaus, a professor for virologie at Erasmus University in The Netherlands, and a key advisor of WHO and EU, is under investigation for having concealed slush funds from pharmaceutical companies, according to Polskaweb.

Polskaweb reports a Dutch parliamentary committee of inquiry has been launched into the connection between the large sums of money paid by big pharma into Osterhaus' private bank accounts and his role in ratcheting up the swine flu scare to allow a pandemic level 6 declaration – something which, in turn, has allowed big pharma to reap huge profits through the sale of toxic pandemic vaccines.

Osterhaus also played a leading role in creating the bird flu scare by maintaining that he had proved that the bird flu virus could be transmitted to humans.

The bird flu alarmism resulted in health minister pushing through pandemic plans that strip people of their constitutional rights and also to profits of 100 million euros for Roche.

But Osterhaus appears to have financial links not just to Roche but also to GSK, Aventis and Baxter.

The Dutch investigation is being extended to health officials, politicans, doctors and journalists.

According to Polskaweb, big pharma has earned 40 billion dollars already from the swine flu scam.

By putting mercury and squalene into the swine flu jab, WHO and big pharma have shown, however, that their intention was to do more than just earn huge amounts of money by staging a fake pandemic using massaged data and skewed scientific evidence.

The dangerous ingredients in the jab prove that their intention was to cause damage and death.

Danish journalists have also looked at the role of Dr. Frederick Hayden, an advisor of WHO and in charge of the special strategic group (LEGEND) which in July floated the plan of giving every person in the world two doses of the swine flu jab.

Hayden is allegedly on the payroll of Roche, RW Johnson, SmithKline Beecham and Glaxo Wellcome.

Other "experts" who appear to be pushing junk science or even actively looking for virulent genes in the Swine Flu Gate, are John Oxford and Bruno Lina.

Both of these play leading roles in WHO and the EU.

As Climate Gate and now Swine Flu Gate show, the UN, WHO and EU are operating as criminal enterprises and they need to be called to account.

Approved Chaos, Part I:
How the WHO is Using the Swine Flu to Hogtie the US

VacTruth, 30 November 2009, 18:13
https://vactruth.com/2009/11/30/approved-chaos-part-i-how-the-who-is-using-the-swine-flu-to-hogtie-the-us/

When President Barack H. Obama signed a national pandemic emergency on Friday, October 24th, 2009, the media barely mentioned that "a declaration of emergency for the H1N1" had been signed. A huge red flag should have gone up: Why was there was no reference to specific act or document? Initially, not even the White House web page had information about the pronouncement. Did Obama's emergency proclamation, under sections 201 and 301 of the National Emergencies Act, imply that martial law was imminent? [1]

To answer that question, we first must see how the World Health Organization put Obama in such a position. The answer may surprise you.

The Department of Homeland Security(DHS), Federal Emergency Management Agency (FEMA), the Department of Health and Human Services (HHS), Center for Disease Control (CDC) and United States Northern Command (USNORTHCOM) will be the focus of a future release of this series called "Approved Chaos" that will answer questions about their status, readiness preparations and participation in the H1N1 emergency including:

What happens when a national emergency is declared?
Who is really in charge? and most importantly,
What does this H1N1 emergency mean for me?

Moreover, the media portrays the government as a passive participant in the swine flu pandemic. Digging deeper, it appears there is a much different story. The previous bird flu "pandemic" was, in fact, utilized to clear many legal obstacles in orchestrating the current, coordinated effort to establish global controls.

The WHO Sets Up for Control

In 2005, the threat of a killer avian flu pandemic shouted across the airwaves. The media whipped up a complete hysteria over the H5N1 virus. The Trust for America's Health (TFAH), funded by the Rockefeller Family Fund was a big player in the frenzy.[2] Specifically, they predicted up to 1 million deaths could be caused by the H5N1 bird flu virus.[3] Remarkably, official WHO reports document that between 2003 and 2009, only 262 people have died worldwide from H5N1 Avian Flu.

For a great review of the pandemic that never occurred, read Dr. Sherri Tenpenny's book, FOWL: Bird Flu: It's Not What You Think. Prophetically, it also explains 90 percent of what is happening today with the currently hyped H1N1 pandemic.

The 2005 H5N1 fear tactics worked well. Out of the panic created by TFAH and a long list of similar organizations, the WHO released a global "Pandemic Plan" that was obediently adopted by Americans and the rest of the world. In the United States, the Federal Pandemic Plan was incorporated

into what is known as the the National Response Plan, under Homeland Security Presidential Directive 5.

The States Join In

In 2005, following the WHOs lead, the United States released a final draft of a multi-year pandemic planning project. States were required to prepare pandemic plans as a condition of their federal bioterrorism preparedness grants.

A group named Association of State and Territorial Health Officials (ASTHO) assisted in molding the state response plans. ASTHO's exclusive list of "Corporate Alliance Partners" includes vaccine manufacturing giants such as GlaxoSmithKline, Merck & Co., Henry Schein, Pfizer, Roche, and Sanofi Pasteur.[5] Their participation in the pandemic planning efforts can be seen in a 2002 document entitled, "NATURE'S TERRORIST ATTACK: PANDEMIC INFLUENZA". [6]

The State emergency response plans were heavily guided by officials at the CDC and HHS. A comprehensive checklist was spoon-fed to state health officials who were maneuvered into compliance by the Federal "mandate". The DHS and HHS were instructed to withhold federal grants and monies for public health initiatives if states did not act in accordance with government plans. The word 'ransom' should come to mind.

Implications of International Health Regulations

We have now come full circle. All forms of government, federal, state and local, have adopted the World Health Organization 's Pandemic Standard Operating Procedures. A pandemic plan in itself is not the problem. The issue is understanding the WHO's incremental power grab via International Health Regulations.

Under the guise of preventing the international spread of disease, the Constitution of the WHO allows the World Health Assembly the authority to adopt regulations they see fit to accomplish the stated goal. By example, six diseases were originally identified by International Health Regulations for quarantine. However, in 1969 this number was reduced to three (yellow fever, plague and cholera). [7] With the current media hype surrounding the 1918 pandemic, it is especially surprising the World Health Organization to not include influenza on this list.

If we fast forward in time, major efforts can be seen to modify the scope of the Regulations from 1995 through May of 2005. On May 23rd the World Health Assembly struck gold. The language in the regulations were unified to include, "any specific disease or manner of transmission, but covering illness or medical condition, irrespective of origin or source, that presents or could present significant harm to humans". [7] When the entire situation is put into context, the timing of a 'killer' bird flu pandemic was impeccable.

The International Health Regulations of 2005 were signed into force and effect in 2007. At that critical point, WHO was given authority to 'direct' and 'govern' activities "that protect the global community from public health risks and emergencies that cross international borders." [8] The Director-General of the World Health Organization, Margaret Chan, declared a public health emergency of international concern for the first time under International Health Regulations in April, 2009. [9]

The implications of international health regulations and this emergency declaration are far reaching. International Health Regulations are legally binding agreements for all international members of the WHO. This is a major story ignored by the press and not understood by most citizens. The WHO international health regulations by-pass the checks and balances established by the U.S. Constitution and our Founders. George Washington, Thomas Jefferson, and Benjamin Franklin are rolling in their graves.

We have a serious problem as a nation. This scheme was not implemented as the media portrays: benign and harmless. It was devised incrementally by very powerful people with no input from our

elected representatives. Never before has there been such an orchestrated effort to give a world organization jurisdiction over our lives in America. The WHO has emerged as the global "H1N1 Mafia" and is accountable to no one.

THE FLU CASE

Susie Stone

H1N1 misinformation from CDC ... intentional or accidental?

Susie Stone, (27 November, 11:11 AM) The Flu Case, 3 December 2009, 11:56
https://web.archive.org/web/20100102051941/http://theflucase.com/index.php?option=com_content&view=article&id=2169%3Ah1n1-misinformation-from-cdcintentional-or-accidental-&catid=1%3Alatest-news&Itemid=64&lang=en

What most of the American public doesn't know is that the vast majority of the presumed swine flu cases recognized by trained physicians were NOT flu at all. They weren't swine flu or regular flu.

Why did the U.S. Centers of Disease Control and Prevention (CDC) call for a national H1N1 health emergency? Where is the justifiable data supporting such a declaration? Investigative Reporter, Sharyl Attkisson, CBS News, wanted some answers.

In a recent interview with Dr. Mercola, Sharyl explains, "The reason I looked into this is a couple of months ago, I got tips from three or four different segments of public healthcare, with folks telling me the CDC has recommended that they go ahead and stop testing for and counting swine flu cases.

Each different entity that contacted me was concerned, thinking that this should not be happening. They really felt that it was necessary for the swine flu to continue to be tracked in some details. So I went about trying to find out why this decision was made and what the ramifications would be."

Why did the CDC stop tracking H1N1 cases?

She also asked states, one by one, to help explain the rationale behind the CDC's decision to stop tracking H1N1 cases. Further explaining, "One of my good sources within the government said to me that they're either trying to, in his opinion, over-represent the swine flu numbers or under-represent by not counting them anymore. He said, "You need to find out which it is." And so to find out which it might be, I really wanted to see the data that the CDC had at the time it made the decision to quit counting the cases."

Ms. Attkisson requested information from the CDC and FDA regarding the H1N1 data on file. She simply requested public information (that normally is readily available), but the Health and Human Services (HHS over CDC)) refused, saying "this is not a matter of "widespread and exceptional media or public interest." Yet, the President had declared the swine flu a national public health emergency!

As a result of being ignored and stone-walled by the CDC, Sharyl went directly to the 50 states asking for their statistics on state lab-confirmed H1N1 prior to the halt of individual testing and counting in July. Of those presumed likely swine flu cases out of approximately every hundred of what was tested, only a small fraction, like 2% or 3% were actually swine flu. In every instance, the biggest number of cases that were swine flu was 30%.

The majority of media outlets and even government agencies have been stating that virtually every person who visited their physician with flu-like symptoms in recent months has H1N1, with no testing.

No testing, no data, no information, just hype and fearmongering by government health officials and many health care providers. Most American families recognize the inconsistencies; but sadly many others do not. Accidental assessments....or intentional misinformation? Do the math.

Stay informed, eat well, live well.

WikiLeaks Leaks News About Partners

Big Pharma inside the WHO:
confidential analysis of unreleased WHO Expert Working Group draft reports

WikiLeaks, 8 December 2009
https://wikileaks.org/wiki/Big_Pharma_inside_the_WHO:_confidential_analysis_of_unreleased_WHO_Expert_Working_Group_draft_reports%2C_8_Dec_2009

Release date: December 9, 2009

Summary

This is a confidential pharmaceutical industry trade association dossier about the WHO Expert Working Group (EWG) on R&D Financing.

The International Federation of Pharmaceutical Manufacturers & Associations (IFPMA; "Big Pharma") gave its members 4 documents: a non-public draft report of the WHO EWG and a non-public Comparative Analysis done by the working group, the IFPMA Overview of the EWG Comparative Analysis, and IFPMA summary slide on the EWG Draft Report.

The compilation of documents shows the influence of "Big Pharma" on the policy making decisions of the WHO, the UN body safeguarding public health. These confidential documents were obtained by the drug industry before their public release to WHO member states (scheduled to be released May 2010). The document also illustrates that the WHO expert group was highly responsive to industry lobbying – a result that public health groups had feared since early 2009, when the expert group met with the industry, but refused to meet with public health groups known to be industry critics.

The likely audience for these documents include countries, public health policy makers, civil society, industry, academia, media, patients and the general public.

Journalists can contact Dr Margaret Chan, Director-General of WHO: chanm@who.int and Malebona Precious Matsoso, WHO Director, Public Health, Innovation and Intellectual Property: matsosom@who.int

According to our source, the English version of the final report of the EWG with its recommendations is expected to be released to member state countries this week.

Confidential Documents from WHO R&D Finance Group, Industry, raise concern

Intellectual Property Watch, 9 December 2009, 07:22 pm

https://web.archive.org/web/20100104025024/http://www.ip-watch.org/weblog/2009/12/09/confidential-documents-released-from-who-rd-finance-group-pharmaceutical-industry/

Confidential documents related to the World Health Organization Expert Working Group on innovative financing for research and development surfaced today, revealing the group's thinking as well as pharmaceutical industry thinking about the WHO process. The documents immediately raised concern about possible undue access to the process by industry, but the WHO told *Intellectual Property Watch* the industry group was not supposed to have them.

The documents appear to have come from the International Federation of Pharmaceutical Manufacturers and Associations (IFPMA), and include draft reports on innovative financing mechanisms from the working group as well as an analysis by the IFPMA on the reports' contents. They were released on Wikileaks, a website that anonymously publishes sensitive documents.

"IFPMA was not supposed to have working drafts of the expert working group in their possession and they were not given these documents," said Precious Matsoso, director of Public Health Innovation and Intellectual Property (PHI) at the WHO, under whose auspices the expert working group falls. "It was understood by the working group that its report is intended for the director general and" WHO members, she added.

Public health advocates reacted strongly to the leaked documents. "The IFPMA document confirms much of what had been feared," that there is "a larger WHO strategy to protect the status quo, particularly as it relates to intellectual property issues," said James Love, the director of Knowledge Ecology International, a non-profit group focussed on transparency in policymaking and which has been advocating for prize funds, a biomedical R&D treaty, and other initiatives to fund R&D.

An introductory letter included with the documents addressed to the Public Health Advocacy Committee at IFPMA says "the overall result [of the working group's report] is in line with most of the industry positions on this matter," but says that "there is still room for them to introduce new language" as the documents date from before the final working group meeting concluded on 2 December.

The Expert Working Group's "comparative analysis of innovative financing proposals for health R&D," available from Wikileaks here [pdf], divides aspects of drug development into six categories and then lists the ideas from "least likely" to "most likely" to work.

https://web.archive.org/web/20100104025024/http://www.wikileaks.com/leak/ewg-ifpma-reports-comms/ewg-comparative-analysis-11-12-09.pdf

The six categories are: fundraising, research and development capacity building in developing countries, basic research and product discovery, product development, manufacturing and distribution, and efficiencies.

The leaked documents are all available from Wikileaks here.

https://wikileaks.org/wiki/Big_Pharma_inside_the_WHO:_confidential_analysis_of_unreleased_WHO_Expert_Working_Group_draft_reports%2C_8_Dec_2009

Expert Analysis

The draft reports available on Wikileaks do not contain final recommendations. These will be available only in the final report, expected to be released this week (*IPW*, WHO, 7 December 2009). Instead, it contains an analysis of all proposals made thus far, through two calls for advice from the public, and ranks them on efficacy and feasibility.

Within "fundraising," proposals considered "least likely to work" include diverting existing resources to health, reducing tax evasion and havens, levying new charges on services or access rights. A proposal for a "Green IP" system (*IPW*, Inside Views, 27 June 2008) is currently "too hard to operationalise" but some elements could potentially be useful.

Most likely to work include new indirect taxes, for example on internet users; voluntary private contributions, new donor funds, and taxes on pharmaceutical profits. Taxing pharmaceutical profits is estimated to generate only USD 160 million versus, for example, a potential USD 2 billion from internet taxes.

On building research capacity, specific recommendations are not made, but the report says there is a lot of potential in this idea as innovative pharmaceutical development is often done in commercial ventures and, in developing countries, "commercial targets often have significant overlap with public health targets," as local markets demand treatment for neglected diseases.

On basic research, prize systems and prize funds for completed drugs, as well as a "health impact fund," are deemed least effective, as is the idea of a biomedical R&D treaty. "Endstage prizes" and the treaty were also seen as not particularly beneficial for product development. Prizes have been advocated as a solution to R&D financing problems by several health advocacy NGOs (*IPW*, Public Health, 12 February 2009).

Deemed more effective in incentivising research were funding for product development partnerships, grants to companies working on neglected diseases, and prizes for reaching "milestones" (such as those provided by Innocentive). Similar incentives were considered beneficial for product development.

Prizes were seen as possible incentives for manufacturing and distribution, though "likely only for diagnostics" as opposed to vaccines or medicines.

"Absolutely Fair Towards the Industry"

The draft report, the IFPMA said, is "absolutely fair" regarding industry concerns, using "real figures" on the cost of drug and vaccines developments and containing "many references to the importance of intellectual property … to achieve further innovation."

As far as streamlining the current R&D system, which the report calls "unwieldy," removing data exclusivity was seen as less effective compared to harmonising medicine regulatory systems and "pre-competitive platforms" for R&D.

The IFPMA analysis raised two major concerns.

The first relates to proposed taxes on the pharmaceutical industry, which the IFPMA document says "places the burden of the R&D … exclusively on industry and reinforces the negative image of pharmaceutical profits."

"Operationalising this proposal may lead to companies increasing prices to compensate which would be counterproductive," it adds. Further, it is not certain to be acceptable by all partners "as the tax should be imposed on the whole pharmaceutical sector, generic included."

The second area of concern is drug-purchasing mechanism UNITAID's proposed patent pool, and in particular its structure for royalty payments to IP owners. These payments would be determined based on the "therapeutic benefits and the affordability of royalities in particular countries," the analysis says, adding that this "does not follow past or current patent pool structures" and emphasising that voluntary participation should be an "essential prerequisite."

A UNITAID board meeting on 14-15 December will review an expert study on the patent pool, which the UNITAID board agreed in principle to establish in July 2008. In May 2009, the board instructed the organisation's secretariat to prepare an implementation plan. An expert team analysed a range of issues and its report, completed in November, clearly recommends the implementation of the pool, sources told Intellectual Property Watch.

The IFPMA analysis also called for vigilance regarding the potential use of open source systems.

NGOs: Documents "A Step Backwards"

Love said the expert working group process was "a step backwards" and "evidence of a deeper problem in WHO regarding the influence of the pharmaceutical industry, and its philanthropic supporter, the Microsoft founder's Gates Foundation."

"This is a very disturbing set of documents," said Sarah Rimmington, from nongovernmental organization Essential Action's Access to Medicines Project. She added that the report "embraces the status quo and rejects the feasibility of almost every single important proposal aimed at truly solving these complicated problems."

THE FLU CASE

Le Monde Diplomatique attacks me and Catherine Austin Fitts over swine flu scam

The Flu Case, 11 December 2009, 11:15

https://web.archive.org/web/20100102032746/http://theflucase.com/index.php?option=com_content&view=article&id=2237%3Ale-monde-diplomatique-attacks-me-and-catherine-austin-fitts-over-swine-flu-scam&catid=1%3Alatest-news&Itemid=64&lang=en

I know that the message that the swine flu jabs are untested and toxic is spreading around Europe when newspapers, both from the right- and left wing, start publishing reports defaming me.

Last month – just as it became apparent that the turn out for the swine flu jab in Germany was going to be very low – the right-wing Bild Zeitung published a report dismissing my "conspiracy theories".

Bild even went so far as to falsely claim I had not filed criminal charges against Baxter for contaminating 72 kilos of seasonal flu vaccine with the live bird flu vaccine in February.

Even when I sent a letter from the Austrian Health Minister proving I had filed the charges, Bild did not bother to publish a retraction. Because they identified me but did not name me, they obviously hoped to escape a defamation lawsuit.

Anyway, when I saw France's Le Monde Diplomatique has just published a hit piece on me and including Catherine Austin Fitts, I realised that the French mass vaccination campaign must be going very badly indeed.

In a report called "Pandemics and rumours The great swine flu scare", Denis Duclos pens the same paragraphs of scare mongering about the swine flu virus that have been so charactertistic of the corporate mainstream media in Europe and the US.

This is not surprising in view of the close financial links of the mainstream media to pharma companies that profit from the swine flu scare.

Media mogul James Murdoch sits on the board of GlaxoSmithKline, for example.

Duclos talks about the "lethal potential to humans of fast-moving and faster-mutating viral and bacteriological infections", neglecting to mention these viruses are being bioengineered in labs by people like Jeffrey Taubenberger.

Even a professor in France affiliated with WHIO, Bruno Lina, stated in the media this summer that he looking for a gene to make the mild and harmless swine flu virus more lethal.

Duclos claims "there have even been suggestions that junior personnel in an authoritarian, market-driven, global health management regime were being trained, perhaps for compulsory vaccination programmes in poor countries."

Amazingly enough he omits, however, to mention doctors and nurses in France are being marched to work in vaccination programmes by police this very moment and that the French Health Minister Roselyn Bachelot – who worked for big pharma – had secret plans to vaccinate the entire population by January, something that cannot be done without recourse to force.

I reported about this in September.

As France now stands on the precipice of declaring full scale martial law over a non existent pandemic, army medical vaccination teams are already working in the especially established vaccine centres.

The pharma companies have been given blanket immunity for damage or death caused by their untested or toxic jabs in a secret government deal.

"The climate of resistance blocks any public health message about epidemiological realities and therapeutic solutions," Duclos states, possibly expressing the worries of his paymasters that the general public is not buying the propaganda and taking the untested jab.

"These difficulties lead to absurd rumours," he complains in a non sequitur.

Maybe he meant to say: "These absurd rumours lead to difficulties".

Or better still: "These proven, verifiable, unambiguous facts lead to people thinking twice before they take the jab."

He mentions at the end of his meandering piece that does not display the clarity and elegance characteristic of the French essay that I "brought a [criminal] complaint this April against the Baxter, Baxter International and AVIR Green Hill Biotechnology companies "for having developed, manufactured, disseminated and spread a biological weapon of mass destruction on Austrian soil between December 2008 and February 2009 with the intention of causing a worldwide pandemic of bird flu and in order to derive profit from this pandemic, in violation of the laws on organised crime and genocide".

However, Duclos fails to mention theBaxter contaminated 72 kilos of seasonal flu with the live bird flu virus and sent it to 16 labs, nearly sparking a global bird flu pandemic in February.

Because Baxter must employ biosafety level 3 regulations when handling the bird flu virus – which it should never have had on ist premises in the first place and which was supplied by WHO – an accidental contamination can be ruled out.

At the same time, Baxter has pre-negotiated contracts to supply an untested and toxic vaccine for a pandemic...

Just 50 miles from a Baxter facility, the swine flu virus appeared in mysterious circumstances in April in Mexico...

One of the first people reported to have died from the swine flu was a museum director Felipe Solis who died one day after meeting President Obama in Mexico City. If the virus was so deadly, why was no test carried out on Obama, as his own staff has confirmed?

Baxter and other pharma execs sit as "observers" on key boards belonging to WHO which declared apandemic level 6 in June and which has the power to implement forced vaccinations in spite of the evidence the swine flu is mild, killing only about 8000 people so far by WHO’s own admission.

WHO can take over the health and law enforcement services of countries under the International Health Regulations 2005 in an unprecedented power grab.

Duclos finished off by making up a fictictous quote he attributes to me:

"She claims to have also pursued a number of international figures and political leaders, and also the Bilderberg group (17) "for having knowingly consented to a campaign of vaccination permitting the inoculation of people with a mix of bird and swine viruses with the aim of killing a large number of people" (18).

In this way, Duclos deflects attention away from the fact the pandemic vaccines are new, not tested and contain mercury and squalene – quite apart from any live viruses as occured with Baxter’s contamination.

Any attempt to put forward facts, documents and evidence that pharma companies are starting a global pandemic and profitting from it with the help of WHO is linked by Duclos in his conclusion to spreading "demagogic unrest" and even anti semitism.

Duclos also claims I have filed charges against Soros as well as WHO and Obama.

In fact, I have never named George Soros in any charges but I believe Len Horrowitz has, and Len Horrowitz is not a goy ("beast", "animal") in the eyes of the Talmudists, and in the categories of the radical race theories popular among some Jewish settlers.

Let me be clear: I am opposed to all forms of racism, whether it is Nazi racism or Jewish racism. Every human being is of equal value and created by God.

Also, my criminal charges focus on the actions of individuals irrespective of their nationality or religion, the only criteria being there is evidence they are involved in a crime.

I have also filed charges the Austrian Health Minister Alois Stöger and the head of the Austrian Far Right Freedom Party Heinz Christian Strache because of evidence he quashed any inquiry into Baxter's activities.

The cynical attempt is, nevertheless, made by Duclos to associate anyone warning against the vaccine mass murder with anti semiticism even though Israel is also administering the same toxic vaccine to its people, underlining the fact that the perpertrators of this crime are an international corporate crime syndicate comprising families in Europe, the USA and elsewhere - families who are united primarily by their love of money and power and who have no allegiance to any country or religion, and certainly not to the high ethical standards expressed in the Old or the New Testament.

A pseudo-scientific eugenics theory appears to centre around some fictious race called the Aryans. The Rothschilds and Rockefellers appear to include themselves in this fairy tale group by their own estimation (British Israelites).

Investigations into this murky occult world reveal a belief that the Aryans came from the island of "Atlantis". If this island ever existed, then a quick reading of Plato's account of it will reveal that it was ruled by a very different set of people – enlightened, wise, fair minded, just and brave – than the rapacious and criminal Anglo American establishment.

The outstanding feature of the legendary Atlantis was the prosperity, health, high cultural standards and contentment of the entire population under a benevolent and capable government that could be tough with its enemies when required.

As we look at our world today, torn by wars, famines, financial crises, disease and totalitarian regimes created by the Anglo American establishment, what resemblance can we see to that legendary Atlantis?

The time has come for the people of the world to unite and put the various members of this international corporate crime syndicate with their eugenicist agenda and occult delusion into gaol once and for all.

Tør vi stole på WHO?
Do we dare to trust the WHO?

Information, 12 december 2009
https://www.information.dk/debat/leder/2009/12/toer-stole-paa-who?lst_cntrb

Man ved fra talrige videnskabelige undersøgelser, at det giver uheldige beslutninger, når der sidder folk med interessekonflikter i de rådgivende udvalg. Og mistanken om, at der foregår ubehagelige ting, stiger markant, når man tilmed ikke ved, hvad der foregår. Peter Gøtzsche, forskningsleder i Cochrane Centeret

I Finland sidder en statsansat forsker med et problem. Det begyndte ellers godt. I år fik professor Juhani Eskolas vaccineforskningsprogram 47 millioner kroner til at forske i pneumokokvaccine af vaccineproducenten GlaxoSmithKline. Det største enkeltstående bidrag professorens institut har modtaget i 2009. Men så kom pressen, og så kom den finske sundhedsminister med løftede pegefingre, og nu sidder den finske professor pludselig i en national interessekonflikt. Juhani Eskola er nemlig også vaccinerådgiver for WHO's såkaldte SAGE-gruppe. Og så betyder det noget, når man får 47 millioner kroner af industrien. Og man ikke oplyser om det.

Siden november har Information beskrevet syv WHO-eksperter, der enten har bijob som konsulenter for medicinalindustrien eller får finansieret deres forskning af medicinalindustrien. Samme eksperter, der vejledte WHO's generalsekretær Margaret Chan, da hun 11. juni i år erklærede, at verden stod midt i en H1N1-pandemi. Fra det sekund trådte en lang række hvilende kontrakter mellem medlemslande og medicinalvirksomheder i kraft. Produktionen af vacciner til 55 milliarder kroner gik i gang. Men når den, der råber alarm, har økonomiske interesser i nødberedskabet, bør offentligheden vide det.

Intet menneske er upåvirkeligt. Heller ikke forskere, der siger, de er det. Tværtimod viser talrige undersøgelser, at forskere, læger og sundhedspersonale påvirkes af medicinalvirksomheders indflydelse. Ifølge Glasgow University's Robertson Centre for Biostatistics bruger medicinalindustrien gennemsnitligt 800.000 kroner om året på direkte markedsføring pr. læge. Derfor appellerer den internationale ngo, NoFreeLunch, til alle i sundhedsvæsenet om at aflægge et troværdighedsløfte for at modstå medicinalindustriens omfattende markedsføring. Når markedsføring går fra at være en reklamekop eller en golftur til at være 47 millioner kroner til instituttet, man arbejder for, må det kræve sin mand at modstå de budskaber, der følger med beløbet fra GlaxoSmithKline.

Da GlaxoSmithKline i dag er leverandør af vaccinen Pandemrix til den finske befolkning, har historien om de hemmeligholdte millioner skabt furore i Finland. Der er ingen beviselig sammenhæng mellem GlaxoSmithKlines forskningsstøtte og valget af samme firma som leverandør af H1N1-vaccine. Men pointen er, at vi ikke kan vide det.

Dermed opstår det næste problem i kølvandet på den finske forskers interessekonflikter, nemlig manglen på åbenhed i WHO. I dag bringer Information historien om WHO's hemmelige rådgivnings-komite, den såkaldte Emergency Committee, hvor 18 medlemmers navne, baggrund og virke er komplet mørkelagt. Den hemmelige komité refererer direkte til generalsekretær Margaret Chan, og

derfor var de ligesom SAGE-gruppen med til at beslutte, hvornår pandemiberedskabet skulle træde i kraft. Ifølge WHO er komiteen hemmelig, fordi eksperterne ellers risikerer at komme under pres. Det skaber to nye problemer. For det første aner vi ikke, hvem der reelt rådgiver verdenssundhedens mest magtfulde person. For det andet er den logiske følge af det argument, at resten af WHO-grupperne må opleve at være under pres, når de træffer beslutninger.

Åbenhed er det demokratiske udgangspunkt for god forvaltningsskik. Offentligheden bør vide, hvordan de politiske beslutninger bliver til.

Man ved fra undersøgelser, at manglen på åbenhed er proportionel med et højt niveau af korruption. Og det er logisk, at befolkningens tillid til regeringer og offentlige institutioner daler i takt med afsløringer om korruption og hemmeligholdelse af informationer.

Den 7. April 1948 blev WHO oprettet for at sikre den internationale folkesundhed. WHO er skabt for at forhindre sygdom og redde liv, og al viden fra det internationale samfund, der kan bidrage til det formål, må være ønskelig. Men WHO's virke er afhængig af regeringers og befolkningers tillid til deres anbefalinger. Og tillid til at de mennesker, der er ansat i WHO, handler i folkesundhedens og kun folkesundhedens interesse.

Oplysninger der vedrører verdens borgeres liv og sundhed bør være frit tilgængelige, ligesom navne på alle interessenter, der påvirker WHO's beslutninger skal offentliggøres.

Den finske professors problem bliver til vores problem, indtil regeringer stiller krav om, at WHO er fuldt ud åbne om de eksperter, de har ansat, de beslutninger, der bliver truffet og de argumenter, der ligger bag beslutningerne.

https://web.archive.org/web/20100102041654/http://theflucase.com/index.php?option=com_content&view=article&id=2348%3Ado-we-dare-to-trust-the-who-ask-danish-journalists&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"It is well known from many scientific studies that unhappy decisions result when people with conflicts of interest are members of advisory groups. And the suspicion that unpleasant things are taking place right now grows when you don't even know what is going on."

Peter Goetzsche, research director at the Cochrane Center in Copenhagen.

In Finland, a problem concerning a researcher in a government position has grown after everything initially seemed fine.

This year Professor Juhani Eskola's vaccine research programme received 47 million crowns from the vaccine producer Glaxo SmithKline in order to develop a pneumococ vaccine.

It is the greatest singule contribution the professor's institute has received in 2009. But then along came the media, and next the Finnish Minister of Health with a raised index finger, and suddenly the Finnish professor is at the epicentre of a national conflict of interests.

The reason is that Juhani Eskola is in parallel vaccine consultant for WHO's so-called SAGE-group. And then it suddenly does matter if you receive 47 million crowns from the industry. Particularly when you keep quiet about it.

Since November "Information" has reported on how seven WHO experts either have an additional job as consultants for the industry or get their research financed by the pharmaceutical industry.

It was those same experts who were acting as advisors to the Director General of WHO, Margaret Chan, when she declared on June 11 of this year that the world was in the midst of a H1N1-pandemic.

From that moment several existing contracts between member countries and the pharmaceutical industry came into force. The production of vaccines for 55 billion crowns started. But when the figure who alerts the world has financial interests in the emergency the public has the right to know.

No human being is beyond being influenced. Not scientific researchers, who claim that they are, either. On the contrary, lots of studies have shown that researchers, medical doctors and health staff are indeed influenced by medical firms.

According to the Robertson Center for Biostatistics at Glasgow University, the pharmaceutical industry spends an average of 800.000 crowns a year on direct marketing for every single medical doctor.

For that reason the international NGO, NoFreeLunch, appeals to everybody employed in the healthcare sector to resist the extensive marketing of the pharma industry.

When the marketing develops from a propaganda cup or a golf watch to 47 million crowns donated to your own institute, one really has to be a strong person to resist the messages that accompany that amount of money from GlaxoSmithKline.

Because GlaxoSmithKline is the supplier of the vaccine Pandemrix to the Finnish population, the revelation about the secret millions has caused a scandal inside Finland.

There is no proven connection between the research funding from GlaxoSmithKline and the selection of that same company as the supplier of the H1N1 vaccine. But the point is we cannot know for sure.

The Finnish researcher's conflict of interests is part of a bigger problem, which also concerns the lack of transparency in WHO.

Today "Information" brings the report about WHO's secret consultation committee, the so-called Emergency Committee. The activities of ist 18 members take place in complete obscurity inside this forum. Not even their names or background are known to the public. This secret committee refers directly to Director General Margaret Chan and its members – just like the SAGE group – therefore, had a voice concerning when a pandemic emergency declaration should be made.

According to WHO the committee is secret because if it were not, there is a risk that the experts would be exposed to pressure.

This situation creates to new problems. First of all we don't know, who is really giving advice to the most powerful person in the WHO. Secondly the logic consequences of that argument is that all the other WHO groups must experience pressure when they make decisions.

Transparency is the democratic starting point for good administration. The public ought to know how political decisions come into force.

It is known from many studies that lack of openness is directly proportional to a high level of corruption. And it is logical that the population's trust in governments and public institutions sinks simultaneously with revealations of corruption and the repression of information.

WHO was established on April 7, 1948 in order to promote international public health. WHO has been created to prevent diseases and to save lives, and all knowledge from the international community which can contribute to this aim should be welcome.

But the functioning of the WHO is dependent on government's and population's being able to trust the institutions recommendations. And on a confidence that the people who are employed by the WHO are acting solely in the interests of public health.

Information concerning the life and health of the world citizens must be available to everybody, just like the names of all the parties who influence the decision making process inside the WHO need to be declared.

The Finnish professor's problem becomes our problem until governments demand that WHO becomes completely transparent concerning the experts it employs, the decisions it is making and the arguments behind the decisions.

Investigating the Swine Flu Pandemic

Wake Up Call Conference 5, BBC5 TV, 12 December 2009
http://www.stolenelectionnovella.com/jane-burgermeister-warned-us.html

Bioterrorism Evidence

Evidence that an international corporate criminal syndicate, which has annexed high government office inside the United States, is intent on carrying out a mass genocide against the people of the United States by using an artificial (genetic) flu pandemic virus and a forced vaccination program to cause mass death and injury and depopulate America in order to transfer control of the United States to WHO, the UN and affiliated security forces (UN troops from countries such as China, Canada, the UK and Mexico etc). See this document here

https://web.archive.org/web/20090601000000*/http://wakenews.net/Evidence_of_the_use_of_pandemic_flu_to_depopulate_USA.pdf
https://sites.google.com/site/mrmetanoja/genetsko-oruzje?tmpl=%2Fsystem%2Fapp%2Ftemplates%2Fprint%2F&showPrintDialog=1

(pp. 31-36):

VII. Evidence as to the role of Baxter and WHO in producing and releasing pandemic virus material in Austria.

Baxter Pharmaceutical http://www.baxter.com/ has been chosen by the WHO to lead the efforts in finding a vaccine cure for the swine flu H1N1 virus.

Baxter AG, headquartered in Vienna, and the Austrian subsidiary of the pharmaceutical company Baxter International, headquartered in Deerfield, IL, USA, sent vaccine material contaminated with deadly live H5N1 bird flu virus to 16 laboratories in four countries in winter 2009 before a technician caught the mistake.

The deadly mixture of live bird flu virus and human flu virus were mixed in a biosecurity level 3 facility, where basic protocol and procedures would make it impossible to ever mix a live virus bioweapon with vaccine material by accident. In the first place, the strain of bird flu that is lethal to humans has no place in the the Baxter facility in Austria. So what was it doing in the facility designed for research into normal flu viruses and vaccines and their production to begin with?

The material released was a combination H3N2 seasonal flu viruses and live, unlabeled H5N1 viruses. If both strains were to incubate and recombine in a human host, a virulent airborne weapon that would cause a pandemic would be released, potentially killing billions.

The Baxter facility did not radiate the material before they sent it out, leaving the deadly virus alive.

To sum up, Baxter International, a global pharmaceutical corporation that has secured lucrative contracts to supply bird flu vaccines in pandemic, mixed live bird flu with human flu vaccine material in a Biosecurity level-3 facility, fail to radiate it and sent it under a false label to 16 labs as vaccine material.

About eight weeks later, a artitificial, genetic worldwide interspecies flu pandemic breaks out in Mexico City, close to another Baxter facility, and the same company is given government and WHO contracs to produce vaccines for the outbreak.

According to Austrian Health Minister Alois Stöger, 72 kilograms of vaccine material was contaminated with the live bird flu virus which WHO supplied.

http://www.parlament.gv.at/PG/DE/XXIV/AB/AB_01457/fnameorig_158854.html

Parliamentary answers 1457/AB (XXIV. GP) May 20th, 2009,

Fragen 14 und 15:

Das für Forschungszwecke bestimmtes Material – 72 kg waren als kontaminiert anzusehen – wurde in die Firma zurückgeholt und kontrolliert vernichtet."

It is still not clear how 72 kilograms of the world's deadliest bioweapon can be sent by accident from a high biosecurity facility, not irradiated and under a false label.

However, we know from Baxter itself that it produced the 72 kilograms contaminated material using a wild type live bird flu virus obtained from the WHO reference center.

http://www.promedmail.org/pls/otn/f?p=2400:1001:53103::NO::F2400_P1001_BACK_PAGE,F2400_P1001_PUB_MAIL_ID:10001,76322

A statement on behalf of Baxter

I would like to provide the following update to a posting on ProMED dated 25 Feb 2009 (Avian influenza, accidental distribution – Czech Rep. ex Austria: RFI).

The H5N1 strain was the A/Vietnam/1203/2004 strain, received from a WHO reference centre. All information concerning this incident has been provided to the involved national authorities and appropriate international bodies such as ECDC and WHO.

--

Christopher Bona

Director, Global BioScience Communications

Corporate Communications

Baxter International Inc.

One Baxter Parkway

Deerfield, IL 60015

<christopher_bona@baxter.com>

Also, Baxter is the only flu vaccine manufacturer to work with wild type flu viruses, felt to be more dangerous than the altered and attenuated (weakened) viruses other manufacturers use.

http://chealth.canoe.ca/channel_health_news_details.asp?news_id=27436&news_channel_id=1020&channel_id=1020

The Austrian police have launched an investigation into the incident that almost triggered a global pandemic. The mixture of the deadly H5N1 virus with a mix of H3N2 seasonal flu viruses is classified as one of the most deadly bioweapons in the world with a mortality rate of 63 per cent.

So, with the Baxter incident in Austria, there is proof that Baxter not only created flu material with help from WHO, but also distributed them in large quantities to trigger a pandemic, while also positioning themselves to produce the vaccine allegedly to "protect" against the virus they created and released.

In criminal charges filed against Baxter on April 8th, 2009 at the Vienna City Prosecutor’s office, Landesgerichtstr 11, 1080 Vienna, Austria, it was alleged that Baxter unlawfully, wilfully and knowingly, in the period between December 2008 and February 2009, employed manipulative and deceptive devices and contrivances in violation of national and international laws on the manufacturing, possession, release and dissemination of biological weapons of mass destruction and on organised crime, to manufacture and distribute a biological agent that is classified as a bioweapon among the population in order to profit from the pandemic.

First, Baxter manufactured influenza material contaminated with a bird flu virus in its biomedical research laboratories in Orth on the Danube in December 2008.

Baxter uses BSL 3 (Biosafety Level 3) precautions in its laboratories, a system for the safehandling of toxic substances, which makes an accidental contamination of ordinary flu material with the dangerous bird flu virus virtually impossible.

The 72 kilograms of contaminated vaccine material contained a mixture of a seasonal H3N2 human influenza virus and the deadly bird flu H5N1 virus. By adding a virus of the type H5N1 to an ordinary flu virus of the type H3N2, The H5N1 virus is restricted in its human-to-human transmissibility, especially because it is less airborne. However, when it is combined with seasonal flu viruses, which are airborne and easily spread, a new bioweapon is created.

Second, Baxter distributed via Avir this contaminated vaccines using false concealment and a false label to 16 laboratories in Austria and in other countries at the end of January/beginning of February, potentially infecting at least 36-37 laboratory staff, who had had to be treated preventively for bird flu and ordinary flu in hospital.

A total of 18 laboratory staff belonging to Avir had to undergo preventative treatment for the bird flu and ordinary flu at the Otto Wagner Hospital in Vienna on February, 9th, 2009, because of their exposure as part of their work to the highly pathogenic bird flu virus.

This indicates that, in the opinion of medical experts, there was a risk that the staff of Avir had contracted bird flu, and, unknowingly, acted as carriers of a pandemic virus into the population of a densely built up Vienna city district and in wintertime.

The material was only discovered when staff working for BioTest (in Konarovice in the Czech Republic), tested the vaccination on ferrets, who then died.

BiotTst was supposed to test anti-flu vaccination that should serve Europeans during the next flu season, and the labels on the material sent to them from Baxter via Avir gave no indication of the lethal contents.

The 13 BioTest staff were treated with Tamiflu and were placed in quarantine for fear they had been contaminated with the bird flu virus, which is on the list of the possible biological weapons and one of the most dangerous biological agents on the Earth with more than 60% death rate.

Subsequently the same problem of Baxter contaminated vaccine material was found in the laboratories in Slovenia, Austria and Germany, who had received the material from Baxter.

First, the company Baxter evoked the 'trade secret" and refused to explain how exactly how a Level 3 biological warfare pathogen found its way into H3N2 material, regardless whether or not this experimental vaccine material was 'intended' for eventual use in humans or not.

Baxter representatives have said that the material sent to the Czech republic, Austria, Slovenia and Germany was in fact a pure H5N1 sent by accident - maybe to mask the previous assumption,

that it was in fact an ordinary flu vaccine, which was contaminated. It is still not clear whether it was in fact the pure H5N1 or contaminated vaccine.

The Austrian Health Minister Alois Stöger confirmed on May 20th 2009 that the 72 kilograms of contaminated vaccine material has been destroyed, but no information has been released as to the genetic sequences of the contaminated material or what Clade was Baxter's H5N1 vaccine from, whether from Clade 1? Clade 2? Clade 3? Other?

Therefore, it is not possible to know whether H5N1 resembles the strains circulating in waterfowl.

Was the contaminated H5N1 strain genetically engineered? If so, by whom? Does the NS protein in Baxter's H5N1 material contain polymorphisms which suppress human interferon production? Was Baxter's H5N1 a full set of influenza genes? Or was it just the hemaglutanin and neuraminidase? Did Baxter's H5N1 contain a poly-basic cleavage site on the Hemaglutanin surface protein? Why were the samples of experimental vaccine material not irradiated?

Coinfection of H5N1 and H3N2 would not produce simple reassortment but a complex in vivo recombination of many competing strains in the infected host.

Furthermore the complex coinfection of H5N1 and H3N2 in a human would produce natural selection pressure for maximum virulence.

The book "Evolutionary Dynamics" suggest that viral coinfection selects for both maximum virulence and infectivity.

How close the world came to a pandemic is underlined by the reaction of Panasonic Japan.

On February 9th – on the very same day as 18 employees of Avir were given preventative treatment for the bird flu in the Otto Wagner Hospital in Vienna – AFP reported that Panasonic Japan intended to bring back to Japan the families of many of its staff working around the world because of the threat of a bird flu pandemic.

"Panasonic to fly home workers' families over bird flu fears Feb 9, 2009

TOKYO (AFP) – Panasonic Corp. has ordered Japanese employees in some foreign countries to send their families home to Japan in preparation for a possible bird flu pandemic, a spokesman said Tuesday."

The firm decided to take the rare measure "well ahead of possible confusion at the outbreak of a global pandemic," he said.

The Times of India reported on March 6th, 2009, that a pandemic was nearly triggered as a result of Baxter's actions.

http://timesofindia.indiatimes.com/Health--Science/Science/Virus-mix-up-bylab-could-have-resulted-in-pandemic/articleshow/4230882.cms

"It's emerged that virulent H5N1 bird flu was sent out by accident from an Austrian lab last year and given to ferrets in the Czech Republic before anyone realised. As well as the risk of it escaping into the wild, the H5N1 got mixed with a human strain, which might have spawned a hybrid that could unleash a pandemic.

Last December, the Austrian branch of US vaccine company Baxter sent a batch of ordinary human H3N2 flu, altered so it couldn't replicate, to Avir Green Hills Biotechnology, also in Austria. In February, a lab in the Czech Republic working for Avir alerted Baxter that, ferrets inoculated with the sample had died. It turned out the sample contained live H5N1, which Baxter uses to make vaccine. The two seem to have been mixed in error.

Markus Reinhard of Baxter says no one was infected because the H3N2 was handled at a high level of containment. But Ab Osterhaus of Erasmus University in the Netherlands says: "We need to go to great lengths to make sure this kind of thing doesn't happen."

Accidental release of a mixture of live H5N1 and H3N2 viruses could have resulted in dire consequences."

It needs to be stressed that the bird flu virus was developed in US military laboratories from 1995 onwards by researchers who reconstructed the genetic code of the Spanish Flu pandemic virus of 1918-1919.

So, using the argument that they need to find an antidote to the lethal bird flu virus, researchers have actually resurrected this lethal bird flu virus and created the danger in the first place, and with funds provided by organisations such as WHO.

"Reviving the Spanish Flu virus is a recipe for a catastrophe. It could put any attack using anthrax or the plague in the shade, "said Jan van Aken, head of the German section of the Sunshine Project.

In the summer of 2008, US researchers found that this newly reconstructed lethal bird flu virus could be mixed with ordinary human flu virus in laboratory conditions and so, in theory, could acquire easy human-to-human transmissibility.

It was precisely this very virus, a mix of a lethal H5N1 bird flu virus and an ordinary human flu H3N2 virus that Baxter manufactured in its laboratory in Orth/Donau in December 2008, and then distributed via Avir to 16 laboratories in Austria and abroad employing fraudulent misrepresentation.

The Canadian Press explains the issue:

"While H5N1 doesn't easily infect people, H3N2 viruses do. If someone exposed to a mixture of the two had been simultaneously infected with both strains, he or she could have served as an incubator for a hybrid virus able to transmit easily to and among people."

According to media reports, Dr Rebecca Carley maintained in March 2009 that this was a deliberate attempt to start a pandemic.

"Basically, they're trying to cause the pandemic. They have already stockpiled at least 250 million doses of the bird flu vaccine. The shelf life of that vaccine has a certain amount of time by which they'll have to throw it in the garbage. So they have to start the pandemic so that they can give the vaccines, which will then cause the bird flu pandemic…In fact, this is an associated press article that says that our government is reluctant to give bird flu vaccine to some of the rogue nations for fear they will use the vaccine as biological warfare. So when you actually look at what's out there, folks, it becomes crystal clear. This is genocide. This is population reduction. And it's happening right now. "

"Well, let me also state that this is very intentional because the H5N1 bird flu virus is not actually able to be picked up by humans in a regular scenario. So by putting it with a regular human flu, they're intentionally causing it to create a hybrid virus. And this is how they're going to make the bird flu virus be contracted by the people because it's very virulent. And basically, the scenario that it creates is very disturbing. You actually bleed out into your lungs and suffocate on your own blood."

THE FLU CASE

Phil Segrave

A strong case for medical tyranny

The Flu Case, 13 December 2009
https://web.archive.org/web/20100102032601/http://theflucase.com/index.php?option=com_content&view=article&id=2265%3Aa-strong-case-for-medical-tyranny&catid=1%3Alatest-news&Itemid=64&lang=en

The World Health Organization [WHO], under the auspices of the UN, decreed in 2005, in the advent of a level 6 pandemic declaration, it reserved the right to make decisions about your health that can be enforced under the color of law. Each member state, of which the U. S. is one, signed just such a treaty.

Why should this be of concern to you? The WHO is composed of the greatest medical experts and scientists in the world. Who would know more about what is in the best interests of the public health than this distinguished team of health care professionals?

According to the New England Journal of Medicine, the H1N1 swine flu virus, after the infamous swine flu epidemic of 1918, all but disappeared in 1957 only to be resynthesized in 1977 by a bio-lab.

In April of 2009, a new swine flu strain was identified as A-H1N1 (S-OIU) as if the strain that had not mutated in forty years had suddenly had an antigenic shift to become a new subtype with a relatively high infectivity rate and low mortality rate.

Now let's take another look at *Baxter's infamous 'accident'* being exposed by a chance security check by an unsung Czech hero who possibly saved more lives than anyone in the world. Most informed people are aware of how *Baxter sent 1000's of doses of a contaminated 'regular season' flu vaccine to several European countries in February of 2009.*

According to Dr Theresa Forcades I Vila and the National Medical Ethics Committee of France, there are two aspects of this irregularity that have been underreported to say the least:

1. The first aspect is the contaminated vaccine contained two viruses. One virus had a high infection rate and low mortality rate. The other virus had a low infection rate and a high mortality rate.
2. The second aspect is the *two viruses were unattenuated*, meaning they were *live viruses* devoid of radiation treatment to weaken them.

Why these two aspects of this case are significant is if a lab technician at a point of distribution laboratory had not decided to conduct an independent security test on the Baxter vaccine, then 1000's of doses of the then unknown tainted vaccine would have been distributed all over Europe; the two viruses given out as shots of regular flu vaccine would have become a recombinant virus, instead of being two separate viruses, and/or would have become an antigenic shift virus (depending on how many virus strains of the two viruses were in the doses), with a high infection rate and a high mortality rate and caused millions of deaths in a global pandemic. What the world is experiencing now is one virus, an A-H1N1 virus, that has a low infection rate and a low mortality rate.

Knowing the sinister implications of what Baxter could have intentionally tried to do, *WHO initially sent only one individual to investigate the 'accident'; a veterinarian*.

Speaking of mortality rates. WHO, in 2005, arbitrarily took the mortality standard out of the pandemic definition, according to the British Medical Journal. Thus, WHO has declared a pandemic under conditions we now have regarding the swine flu virus that has to date an infection rate and a mortality rate less than the regular flu in a relatively bad year for the flu. In reality, WHO has made itself into a medical dictatorship by changing and controlling the guidelines it set up.

In 2009, WHO issued a policy directive to all member governments that clinical lab tests to determine if a patient actually suffers from or actually dies from the swine flu are not usually required. What is WHO trying to hide?

If it was documented conclusively that the swine flu virus was manmade, not of natural origins, would WHO claim it was another accidental laboratory release?

How could WHO claim that a manmade virus like the one created by the CDC scientists above was accidentally released when *WHO acknowledges on its own web site that it has an official policy of deliberately releasing manmade viruses to 'prime' populations into 'herd immunity' with experimental vaccines* that were created to treat the viruses that was developed and intentionally released from their laboratories as 'mock-up trials'?

WHO Admits to Releasing Pandemic Virus Into Population Via 'Mock-Up' Vaccines

Posted by: Dr Mercola, August 14, 2009

The document on the *WHO website* linked below states that *it is common procedure to release pandemic viruses into the population in order to get a jump ahead of the real pandemic*, so as to 'fast track' the vaccine for when it is needed.

In Europe, some manufacturers have conducted advance *studies* using a so-called 'mock-up' vaccine. *Mock-up vaccines contain an active ingredient for an influenza virus that has not circulated recently in human populations* and thus mimics the novelty of a pandemic virus.

According to the website, "Such advance studies can greatly expedite regulatory approval".
https://web.archive.org/web/20091231140236/http://www.who.int/csr/disease/swineflu/notes/h1n1_safety_vaccines_20090805/en/index.html

Do not be lulled into a false sense of relief that H1N1 is a 'no show'. Corrupt politicians have many medical martial laws on the books based on bad science that can be activated anytime they decide to declare forced vaccinations in the name of public health. In the U. S., states are funding and training first responders and law enforcement officials with federal grants to detain and/or force vaccinate everyone.

Educate yourself, share the truth with others and just say no to forced vaccinations.

THE FLU CASE

More Questioning about WHO and the Vaccines and the Declaration of a Level 6 Pandemic - When no need

The Flu Case, 13 December 2009

https://web.archive.org/web/20100102034621/http://theflucase.com/index.php?option=com_content&view=article&id=2251%3Amore-questioning-about-who-and-the-vaccines-and-the-declaration-of-a-level-6-pandemic-when-no-need&catid=1%3Alatest-news&Itemid=64&lang=en

World Health Organization (WHO) declared the pandemic of swine influenza in the interest of large pharmaceutical companies. With such charges were made by scientists from several countries, who believe that the epidemics of pharmacists earn up to 7 billion euros. At the same time anywhere in the world death rate from swine flu has not exceeded deaths from seasonal flu, while the WHO insisted that the epidemic was declared by all the rules, writes "Kommersant".

The British newspaper Guardian Òhe and some European media have published the views of independent epidemiologists - Englishman Thomas Jefferson from the independent association of scientists Cochrane Collaboration and his colleagues from the United States William Engdahl, - accuse the WHO of inflating the risk of swine flu. Scientists believe that the WHO's lead expert associated with the pharmaceutical companies. According to Mr. Jefferson, a team of WHO experts, in particular the head of strategic advisory group on Influenza British Professor David Salisbury, "gets them a salary and working with them."

Independent experts believe that the panic over the virus A/H1N1 provoked expert WHO virologist from the Netherlands, Albert Ostenhaus, which has been in professional circles the nickname Dr. Influenza. Mr. Ostenhaus many occasions expressed deadly swine flu and urged European countries to mass vaccination.

According to independent scientists, such policies have led to the fact that the WHO in June this year, announced the upgrade of the threat of swine flu pandemic to the maximum, the sixth level in the interests of business structures, although the mortality rate from this disease did not exceed the death rate from normal seasonal influenza.

Reports on H1N1 by the CDC are designed to withhold key information

Prevent Disease, 14 December 2009
https://web.archive.org/web/20100102064444/http://preventdisease.com/news/09/121409_reports_h1n1_by_cdc_withholding_key_info.shtml

The failure of the CDC to report critical changes of the H1N1 virus and its effective transmission, indicates their weekly reports are carefully designed to withhold key information.

A recent spike in cases with antiviral resistance have been reported in the U.S. Of the 29 total cases identified, 19 patients had documented exposure to Tamiflu through either treatment or chemoprophylaxis. Of the cases identified, 16 of them have come in the past 4 weeks, which is much higher than previous weeks, which were typically sporadic.

This recent spike in cases has also been reported by WHO and raises concerns that an upgraded form of the H1N1 virus efficiently transmitting. Moreover, recent deaths of patients with the upgraded form in the US (four of ten) and the Netherlands (four of eleven) have raised concerns that these patients may also have inherited other changes to the virus which have been associated with fatal cases in the US, Ukraine, Norway, Brazil, and France.

However, the CDC report does address those concerns. They do not distinguish between these recent samples and those collected in the spring or summer. Similarly, the location of these cases or outcomes are not made public, and there is no differentiation between patients who developed resistance during treatment and patients who were resistant prior to treatment. They only classify "suspect" cases on the basis that they failed to respond to Tamiflu which conveniently leaves the issue interpretation by other experts and agencies.

The Vietnam cluster described in this week's New England Journal of Medicine would represent such cases. Seven passengers on a train developed H1N1 infections that had the resistant strain. However, like most patients worldwide, the resistance was not discovered until long after treatment and discharge. The infections were in July, but the first lab confirmations were in September. Although Tamiflu treatment is not effective against H1N1 with the resistant strains (H275Y/H274Y), all patients recovered, but clearly represented infections of a fit and readily transmissible version of H1N1.

However, using the CDC classification system, these patients would have "documented exposure to Tamiflu" but would not be examples of resistance that developed due to treatment.

Although this is the CDC's largest category, they have yet to show a single example of a case that developed resistance after treatment with Tamiflu.

The failure of the CDC to report critical information such as changes to the virus and resistance to treatment raise concerns that the weekly reports by the CDC are carefully designed to withhold key information, including status prior to treatment, the dates and locations of samples, as well as outcomes of patients who are positive for H1N1 resistant strains.

In early November, the CDC and World Health Organization (WHO) were strongly criticized for manipulatiing swine flu deaths by stating that 4,000 Americans – rather than about 1,200 – had died of swine flu since the disease emerged in April. That new estimate by the CDC combined deaths from laboratory-confirmed cases of the flu and deaths that appeared to be brought on by flu, even though the patients may have ultimately died of bacterial pneumonia, other infections or organ failure.

This intrinsic manipulation and lack of transparency by the CDC continues to be hazardous to the world's health.

Lies about climate change shows pattern

The Flu Case, 17 December 2009
https://web.archive.org/web/20100102015156/http://theflucase.com/index.php?option=com_content&view=article&id=2316%3Alies-about-climate-change-shows-pattern&catid=3%3Anewsflash&lang=en

Many readers contact us and ask how it is possible that all journalists, doctors and scientists play along with the obvious pandemic hoax. Not all do but those who do certainly gets a lot of exposure in mass media and in that way makes it seem as if there is a consensus when there in reality is none.

Many aspects and tactics used in the massive vaccine propaganda, the lies, the deceit, the junk science and the political agendas behind the mass vaccinations are the same as those seen used to scare us all about the "coming climate change apocalypse", all depending on humanity we are assured.

The link behind the scene between these two horror stories is that the ruling elite is using fear and junk science to scare us into agreeing with actions we never would otherwise, and these actions are smoke screens for hidden agendas aiming at a one world government. Mass media is an effective tool to make the bulk of the population believe that the suffering and the sacrifices we all will have to live with is necessary to save humanity and the planet.

As we have clearly shown through our reporting on this site, the pandemic scare has nothing to do with health but everything to do with population reduction, control and enormous financial profits.

The pattern we have discovered is clearly used also in the ongoing massive campaign about global warming.

You have probably heard about dying polar bears, rising waters and dangerous weather due to CO2 levels in the atmosphere. But is it all true? Is it really scientific?

To better understand what is happening regarding the pandemic scare, it is very educational to watch this presentation made by Lord Monckton where he part by part reveal the enormous and blatant lies about global warming.

COUNCIL OF EUROPE
CONSEIL DE L'EUROPE

Faked Pandemics - a threat for health

Motion for a recommendation Doc. 12110

PACE, 18 December 2009,
https://web.archive.org/web/20100130094504/http://assembly.coe.int/Documents/WorkingDocs/Doc09/eDOC12110.pdf
http://assembly.coe.int/nw/xml/XRef/Xref-XML2HTML-en.asp?fileid=12720&lang=en

This motion has not been discussed in the Assembly and commits only those who have signed it.

In order to promote their patented drugs and vaccines against flu, pharmaceutical companies have influenced scientists and official agencies, responsible for public health standards, to alarm governments worldwide. They have made them squander tight health care resources for inefficient vaccine strategies and needlessly exposed millions of healthy people to the risk of unknown side-effects of insufficiently tested vaccines.

The "birds-flu"-campaign (2005/06) combined with the "swine-flu"-campaign seem to have caused a great deal of damage not only to some vaccinated patients and to public health budgets, but also to the credibility and accountability of important international health agencies. The definition of an alarming pandemic must not be under the influence of drug-sellers.

The member states of the Council of Europe should ask for immediate investigations on the consequences at national as well as European level.

New Study Admits the Obvious: Swine Flu is Overhyped

Natural News, 21 December 2009
https://web.archive.org/web/20100104103508/http://www.naturalnews.com/027776_swine_flu_propaganda.html

An international team of researchers, headed by Marc Lipsitch of the Harvard School of Public Health, released a preliminary report that suggests a milder "pandemic" than the early reports in Mexico were made out to be. The 4% death rate attributed to H1N1 in March and April was found to have been a misleading estimate. The estimate was culled not from infections in the population as a whole, but from serious cases involving hospitalization. This significantly reduces the death rate.

The study group calculated the number of people with flu-like symptoms against those who sought medical care, those who were hospitalized, those who were assigned to intensive care units, and those who died. They used a telephone survey conducted in the Milwaukee and New York City areas to get their initial flu data and medical records for the rest.

About 1 in 70 of those reporting flu symptoms to a health care provider required hospitalization. 1 in 400 required admittance to the ICU and 1 in 2,000 with H1N1 symptoms died.

Using the telephone survey as their total population number with flu symptoms, they estimated that 1 in 600 people might be hospitalized, which is 7 to 9 times lower than other estimates including that of the Centers for Disease Control (CDC).

On average, about 36,000 people in the U.S. will die from influenza (seasonal flu). The majority of those are older people of retirement age. Given the controversy surrounding the CDC's handling of Swine Flu case counting nationally, counting every flu case as H1N1 and with many areas mis-diagnosing by the use of faulty or unverified tests, the new numbers are likely more accurate.

In the Spring, the CDC estimated a death rate of 2% and went into full panic for a pandemic. The new Lipsitch study puts the number well below that at 0.048%. As of September 11, 2009, the World Health Organization estimates the total number of infections, worldwide, to be 209,000 and the total number of deaths to be 3,205. Or about a 0.15% death rate.

The study was completed in September in anticipation of the fall resurgence that might happen. PLos Medicine released the study to the public on December 7, publishing officially on December 8. The study was funded by the UK Medical Research Council, the U.S. National Institutes of Health, and others.

reliefweb

Comparing deaths from pandemic and seasonal influenza

ReliefWeb, 22 December 2009
https://reliefweb.int/report/world/comparing-deaths-pandemic-and-seasonal-influenza

22 December 2009; Geneva - Efforts to assess the severity of the H1N1 influenza pandemic sometimes compare numbers of confirmed deaths with those estimated for seasonal influenza, either nationally or worldwide. Such comparisons are not reliable for several reasons and can be misleading.

Numbers of deaths for seasonal influenza are estimates. They use statistical models designed to calculate so-called excess mortality that occurs during the period when influenza viruses are circulating widely in a given population.

Estimates using all-cause mortality

The models use data, as recorded in death certificates and medical records, indicating mortality from all causes, and compare the number of deaths during epidemics of seasonal influenza with baseline data on deaths during the rest of the year. The assumption is that infections with influenza viruses contribute to the "excess mortality" observed during the influenza season.

During epidemics of seasonal influenza, around 90% of deaths occur in the frail elderly, who often suffer from one or more chronic medical conditions. Although influenza can worsen these conditions and contribute to death, testing for influenza viruses is not done in most cases, and deaths are usually attributed to an underlying medical condition.

Methods for estimating excess mortality were introduced in the 19th century to capture these influenza-associated deaths that would otherwise be missed. Such estimates have helped counter assumptions that influenza is a mild illness that rarely kills.

Laboratory-confirmed deaths

In contrast, numbers of deaths from pandemic influenza, as notified by national authorities and tabulated by WHO, are laboratory-confirmed deaths, not estimates. For several reasons, these numbers do not give a true picture of mortality during the pandemic, which is unquestionably higher than indicated by laboratory-confirmed cases.

As pandemic influenza mimics the signs and symptoms of many common infectious diseases, doctors often do not suspect H1N1 infection and do not test. This is especially true in developing countries, where deaths from respiratory diseases, including pneumonia, are common occurrences. Moreover, routine testing for pandemic influenza is costly and demanding, and beyond the reach of most countries.

When testing confirms H1N1 infection in patients with underlying medical conditions, many doctors record these deaths as due to the medical condition, and not to the pandemic virus. These cases are also missed in official statistics.

As recent studies have shown, some tests for H1N1 infection are not entirely reliable, and false-negative results are a frequent problem. Accurate test results further depend on how and when samples were taken. Even in the best-equipped hospitals, doctors have reported seeing patients with distinctive and virtually identical disease profiles, yet only some have positive test results.

Moreover, in a large number of developing countries, systems for vital registration are either weak or non-existent, meaning that most deaths are neither investigated nor certified in terms of the cause.

Younger age groups

Comparisons of deaths from pandemic and seasonal influenza do not accurately measure the impact of the pandemic for another reason. Compared with seasonal influenza, the H1N1 virus affects a much younger age group in all categories – those most frequently infected, hospitalized, requiring intensive care, and dying.

WHO continues to assess the impact of the influenza pandemic as moderate. Accurate assessments of mortality and mortality rates will likely be possible only one to two years after the pandemic has peaked, and will rely on methods similar to those used to calculate excess mortality during seasonal influenza epidemics.

Jane Burgermeister

WHO Massages Data to Exaggerate Swine Flu Deaths

The Flu Case, 23 December 2009, 11:05
https://web.archive.org/web/20100102054222/http://theflucase.com/index.php?option=com_content&view=article&id=2399%3Awho-massages-data-to-exaggerate-swine-flu-deaths&catid=1%3Alatest-news&Itemid=64&lang=en

After the Scottish government was caught reclassifying all seasonal flu deaths as swine flu deaths to exaggerate the danger of the pandemic, WHO has issued a press briefing maintaining that the swine flu is more severe than the seasonal flu in spite of causing fewer deaths and in spite of the fact that most lab tests – if performed at all – have proved negative for swine flu in the US and UK.

"Accurate assessments of mortality and mortality rates will likely be possible only one to two years after the pandemic has peaked, and will rely on methods similar to those used to calculate excess mortality during seasonal influenza epidemics," says WHO, admitting it has no basis for its figures.

"Schweinegrippe wurde aufgebauscht"

Stuttgarter Nachrichten, 28 December 2009, 19:32 Uhr
https://web.archive.org/web/20100102022735/http://www.stuttgarter-nachrichten.de/stn/page/detail.php/2331609

Berlin - Transparency International hat wegen der Schweinegrippe-Impfung schwere Vorwürfe gegen die Pharmaindustrie erhoben. Die Krankheit sei "katastrophenmäßig aufgebauscht" worden.

Die Grippe habe sich als "Papiertiger entpuppt", sagte Anke Martiny, Vorstandsmitglied der Anti-Korruptions-Organisation. Sie äußerte den Verdacht, "dass es im Wesentlichen den Anbietern der Impfstoffe genützt hat". Zudem kritisierte sie die Verbindungen von Mitgliedern der Ständigen Impfkommission (Stiko), die die Schweinegrippe-Impfung empfohlen hat, zu Pharmaherstellern. Im konkreten Fall "hätte von der Stiko der Nachweis erbracht werden müssen, dass Interessenkonflikte keine Rolle spielten", so die frühere SPD-Abgeordnete. Die Bundesregierung bestätigte, dass sie afrikanische Länder bei der Bekämpfung der Schweinegrippe mit 14 Millionen Euro unterstützt.

Millionen Krankenversicherten drohen unterdessen die ersten Zusatzbeiträge. Im Jahresverlauf müssen wohl immer mehr die acht oder mehr Euro im Monat zahlen. Es könnte sogar noch teurer werden, sollte der Staat angesichts der ab 2011 greifenden Schuldenbremse den Geldhahn drosseln. Trotz eines einmalig um 3,9 Milliarden erhöhten Zuschusses fehlen den Kassen 2010 fast vier Milliarden Euro. "Wir wissen nicht, ab wann die Zusatzbeiträge in welchem Umfang genau kommen - dass sie kommen, ist aber gewiss", so Kassenverbandschefin Doris Pfeiffer. Finanzminister Wolfgang Schäuble (CDU) kündigte am Sonntag mittelfristig die Reduzierung der Steuerfinanzierung für das Gesundheitswesen an.

Auch ein mögliches Aus der Praxisgebühr wird laut AOK Baden-Württemberg die Patienten finanziell nicht entlasten. Vorstandschef Rolf Hoberg: "Man muss genau hinschauen, ob im Geschenk nicht die bittere Pille der Leistungseinschränkung eingepackt ist." Bundesgesundheitsminister Philipp Rösler (FDP) stellte am Sonntag klar, dass die Praxisgebühr nicht ersatzlos abgeschafft werden soll. Im Koalitionsvertrag sei lediglich vereinbart, dass die Lenkungswirkung der Praxisgebühr überprüft wird.

German Corruption Watch Dog criticises Big Pharma over Swine Flu

The Flu Case, 28 December 2009, 11:56
https://web.archive.org/web/20100220011902/http://www.theflucase.com/index.php?option=com_content&view=article&id=2417%3Agerman-corruption-watch-dog-criticises-big-pharma-over-swine-flu&catid=1%3Alatest-news&Itemid=64&lang=en

Transparency International, a corruption watch dog based in Germany, has criticised the mass swine flu vaccination campaign for being „blown up to a catastrophe“ in order to serve the interests of pharmaceutical companies.

Anke Martiny, former SPD MP, said the swine flu had turned out to be a "paper tiger."

She criticised the links between the members of Germany’s permanent vaccine commission (Stiko) and pharmaceutical companies.

Stiko "should have given proof that there was no conflict of interests," she said.

In the meantime, millions of Germans are facing a rise in their contributions for indebted medical insurance of eight euros or more in 2010, in part to pay for the billion-euro swine flu campaign.

Harvard Takes it Back and Says Swine Flu was Oversold

Dr Mercola // The Flu Case, 2 January 2010 14:53

http://articles.mercola.com/sites/articles/archive/2010/01/02/Harvard-Takes-it-Back-and-Says-Swine-Flu-was-Oversold.aspx
https://web.archive.org/web/20100220011957/http://www.theflucase.com/index.php?option=com_content&view=article&id=2450%3Aharvard-takes-it-back-and-says-swine-flu-was-oversold-by-dr-mercola&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A new analysis from Harvard University, using H1N1 deaths in the U.S. in the spring and projecting likely outcomes for this fall, suggests that the swine flu "pandemic" has been oversold.

The new paper suggests swine flu was unlikely to create a severe epidemic. In light of this, officials have taken many steps that may have been unnecessary, including mass vaccinations.

It is not clear how H1N1 will act in the coming months, but swine flu cases seem to have already hit their peak.

Sources: ABC NEWS

Mercola's Comments

While many so-called scientific experts have criticized me and others who have spoken out about the fear-mongering and senseless mass-vaccination campaign surrounding the swine flu, more of the scientific community is now coming to the same conclusions we've been talking about for months.

The swine flu pandemic was a pandemic that never materialized, just exactly as I predicted.

Now it looks as though the H1N1 scare of 2009 will go down as one of the biggest government and pharmaceutical scams ever, renewing a healthy, and necessary, skepticism about government fear-mongering, the swine flu vaccine and the dubious dealings behind the implementation of worldwide mass-vaccination programs.

It started last month when British and French media began saying the H1N1 pandemic has been "hyped" by medical researchers to further their own cause, boost research grants and line the pockets of drug companies.

Ontario health officials have also declared H1N1 a "dud" pandemic, stating the huge government investment made so far may have been unjustified. And now, a new study by researchers at Harvard University and the Medical Research Council Biostatistics Unit in the U.K. is finding that this "pandemic" was never a cause for alarm.

After analyzing H1N1 deaths in the United States in the spring, then projecting outcomes for this past fall, they found the fu season should have been no different than a typical flu season – and possibly even milder than average!

Early Studies Showed H1N1 Was not Dangerous or Highly Contagious

In the beginning, even before it was declared a level 6 pandemic by the World Health Organization (WHO), a group of "scientists" were sounding the alarm that this might indeed be the terrifying, deadly pandemic they had been expecting for over half a century.

We were told that young, healthy people, pregnant women and small children were falling ill and quickly dying, and the virus was spreading rapidly. They even suggested it could mutate into an even more dangerous form that could kill countless numbers of people.

Well, Dr. Russell Blaylock recently shared some information that shows health officials knew very early on that H1N1 was probably not much more of a threat than the seasonal flu that surfaces every year. He says:

"Once the pandemic had been declared, virologists tested the potency of this virus using a conventional method, that is, infecting ferrets with the virus. What they found was that the H1N1 virus was no more pathogenic than the ordinary seasonal flu, even though it did penetrate slightly deeper into the lungs.

It in no way matched the pathogenecity of the 1917-1918 H1N1 virus. It also did not infect other tissues, and especially important, it did not infect the brain.

Next, they wanted to test the ability of the virus to spread among the population. The results of their tests were conflicting, but the best evidence indicated that the virus did not spread to others very well.

In fact, an unpublished study by the CDC found that when one member of a family contracted the H1N1 virus, other members of the family were infected only 10% of the time – a very low communicability."

Of course, nothing sells vaccines like panic, so you likely did not hear about this in the media. That is, until now.

The CDC Was Way Off … Why are They Still Pushing the Vaccine?

The CDC previously estimated that the U.S. death toll from the swine flu would be around 90,000. Even using their own bloated numbers -- some 80 percent of which are in all likelihood unrelated to H1N1 – 9,820 people have actually died from H1N1 from April through November.

That would still, according to their own statistics stating that the flu kills 36,000 Americans a year, put us squarely in the middle of the mildest flu season in recent memory.

Meanwhile, the CDC's own data states that flu activity is continuing to fall across the United States, with only 11 states still reporting widespread flu activity as of mid-December.

Yet, they are still touting the H1N1 vaccine as the best way to protect again st this "pandemic" virus.

Well, as the word continues to get out that swine flu is another "pandemic" that never was … ranking right up there with the bird flu hoax back in 2005 … it looks as though the CDC is going to have a heck of a lot of surplus H1N1 vaccines on their hands.

So now they are stating that supplies of H1N1 vaccine are increasing and many places have opened up vaccination to anyone who wants it. Fortunately, many do not.

But the U.S. federal government has contracts to purchase 250 million doses of swine flu vaccine, which may explain why the Los Angeles Times recently reported that:

"Health officials' biggest fear now is that, with the perception that the pandemic is waning, many people will decide they don't need the vaccine."

That the swine flu is "waning" is not a perception, it's a fact, but Health and Human Services Secretary Kathleen Sebelius is not giving up on selling those shots, either. She stated in a news conference:

"We have a wonderful window of opportunity to prevent or lessen a third wave."

A third wave?

Excuse me, but we're still waiting for the first and second to show up!

So it appears the WHO and governments around the world are going to keep pushing their H1N1 vaccines through the winter and into spring, even though swine flu cases are dwindling and are nowhere near what you would call a true, dangerous pandemic.

The latest news confirms that H1N1 peaked in October.

In Britain, health authorities' original worst-case scenario – which said as many as 65,000 could die from H1N1 – has twice been revised down and the prediction is now for around 1,000 deaths. This is way below their average annual toll of 4,000 to 8,000 deaths from seasonal flu.

And the National Institute for Health and Welfare in Finland actually removed swine flu from a list of diseases considered dangerous to the public – and that was back in July!

So I have just one further sentiment I'd like to say to the media and health officials in the United States who are still trying to perpetuate the swine flu myth:

… It's time to let it go now – the jig is up.

Italy: the new influenza is a bluff?

Wiadomosci.onet, 3 January 2010
http://wiadomosci.onet.pl/2104314,12,wlochy_nowa_grypa_to_blef,item.html (deleted)
https://web.archive.org/web/20100322233933/http://www.theflucase.com/index.php?option=com_content&view=article&id=2451%3Aitalian-parliament-to-investigate-fraudulent-h1n1-vaccine-contracts&catid=1%3Alatest-news&Itemid=64&lang=en

(Polish Press Agency) For the initiation of parliamentary investigation into the mass purchase of a new influenza vaccines in Italy, opted the Club's head of the ruling People of Freedom Party in the Senate, Maurizio Gasparri.

In his opinion behind the decision to buy millions of vaccines are powerful pharmaceutical companies. The coalition politician, quoted by the Ansa agency, noted that type A/H1N1 flu turned out to be similar to the seasonal and usually mild.

Meanwhile – he noted - huge stocks of vaccines were bought, which were not used. In this way, Gasparri referred to the reports that only 1 in 70 doses were used, because the vast majority of Italians did not take the possibility of inoculation.

It's hard not to think about speculative maneuvers on a global dimension by unscrupulous pharmaceutical multinationals concerns, powerful enough to influence the information that, with its alarmist tone, serves those sharks - said senator Gasparri.

He added: - They won't get away with the illegal profits. - We must determine whether the person who earned without a reason, can return the profits accumulated through the lies – said the Italian politician.

The Italian health ministry planned to immunize 40 percent of the population against the new flu. According to the press about 200 million euro has been spent on vaccines. But so far approximately 800 thousand people got immunised. Influenza type A sickened about 4 million people, but because of complications caused by other serious diseases and chronic ailments, 193 people died.

ЦЕНТР ТИБЕТСКОЙ МЕДИЦИНЫ

Виктор Орёл

Не вдохнуть «мёртвый дух»

Центр Тибетской Медицины, 7 января 2010
http://www.kunpendelek.ru/library/westmed/information/corruption/

Так некогда звучало это выражение в сказках, написанное в первом лице единственного числа. «Живой дух» придавал главному герою сказки силищу неимоверную, а «мёртвый» - вызывал моментальную смерть.

Напоминание о сказке вызвало название книги «Не вдохните зла», написанной известным американским исследователем, писателем-документалистом Стивеном Квейлом («Breathe No Evil» by Steven Quayle). Около 35 лет Стивен посвятил изучению вопросов истории, политики, экономики, религии и современных научных достижений. В своих исследованиях Квейл находит взаимосвязь между всеми, вышеназванными аспектами и доказывает их влияние на направление развития современной науки и прогресса.

Из всей этой обширной темы, основанной на связях политики с экономикой, истории и на сложных переплетениях причин и обстоятельств, хотелось бы вновь заострить внимание на аспекте свиного гриппа H1N1. В этом материале исследования Стивена Квейла будут взяты за основу, но также будут использованы и другие источники, продолжающие расследование внезапного возникновения пандемии.

Это исследования авторов из Южной Африки (Майка Талленгера), Австралии (Эдрю Девье), США (Ричарда Долана, Джима Маррса, Даррела Симса), членов ЦКЗ (U.S. Center for Disease Control and Prevention), а также журналистов из США - Джорджа Нури, Алекса Джонса и других.

Прошла (как считают одни) и спала (как считают другие) волна так называемого свиного гриппа H1N1. Международные СМИ, большая часть которых, скрывая своё лицо от стыда в ворохе архивов собственных изданий, не хотели затрагивать тему. Возможно, потому что не знали, о чём писать или не получили необходимый минимум информации, а может и не считали эту тему достойной внимания.

Так или иначе, когда паника улеглась, все облегчённо вытерли пот со лба. С одной стороны, их можно понять: ни один редактор не взял бы на себя ответственность писать о всемирной биологической диверсии против человечества, не имея на руках доказательств. И кто бы поверил в то, что некая тайная организация собирается намеренно уничтожить семь восьмых населения планеты, потому что им так захотелось, так сказать «с жира бесятся».

По логике вещей, вся эта история с диверсией не совсем вяжется, и в нормальной голове не укладывается. Ведь, если разделить весь мир на отравителей и отравливаемых, то первых со всеми причастными к ним (федералы, полиция, армия, учёные, их семьи и родственники) должно быть много, чтобы справиться с пятью миллиардами, подлежащими отравлению.

Только одних отравителей миллионов триста наберётся. И на всю эту братию нужно, по крайней мере, в два раза больше рабов оставить, чтобы обеспечивали новых руководителей планеты и всю их армию сельскохозяйственными продуктами, полезными ископаемыми и промышленными товарами.

С другой стороны, если бы человечество слегка приоткрыло своё воображение, а не зацикливалось на стандартных жизненных клише, и представило себе, что это возможно, то надо было бы объединить силы всего прогрессивного человечества и вместе со СМИ действительно «бить тревогу». История преподносит немало примеров, когда информации, переданной даже самыми надёжными источниками, не верили. Один из таких примеров – предупреждение Советского Правительства о намерении немцев напасть на Советский Союз.

В ситуации с пандемией свиного гриппа обстановка была и по сей день остаётся более сложной и запутанной, чем в примере с началом Великой Отечественной войны.

Во-первых, ни в самом начале, когда группа американских фармацевтических компаний ошибочно или намеренно совершила диверсию против восемнадцати европейских стран, ни в конце, когда свиной грипп распространился по всему миру, американские СМИ фактически не дали ни капли правдивой или полезной информации.

Во-вторых, из-за того, что в ходе расследования международной копенгагенской следственной группой стало известно о получении взяток высшими чинами некоторых европейских правительств от фармацевтов, было потеряно доверие к информации, поступавшей из правительственных источников.

В-третьих, после того, как американский доктор Ленард Горовиц подал официальное заявление в ФБР, документально обвинив верхушку ВОЗ в соучастии и пособничестве диверсантам, стало невозможно полагаться и на её статистику.

Вспышки свиного гриппа действительно были. Во всём мире достаточно свидетельств компетентных врачей и учёных. Невозможно, однако, было определить, сколько и от какого вида гриппа, на самом деле, умерло людей, особенно, когда политики ряда европейских и восточно-европейских стран поняли, что на пандемии можно заработать не меньше, чем на войне и сами решили воспользоваться шумихой и «урвать лакомый кусок пирога».

Так кому же верить?!

Одни СМИ тихо подчинились своим правительствам и, опубликовав статьи, написанные чуть ли не под диктовку политиков, завалили читателей дезинформацией и посеяли ненужную панику. Другие - взяли позицию нейтралитета и не проронили ни слова, мол, не наша тема. А остальные, решив «плыть по течению», поставили в свои издания статьи центральных газет и журналов, не изменив ни строчки.

Сама Америка осталась в стороне, потому что ни шумихи, ни присутствия свиного гриппа в ней не наблюдалось. Конечно, осенью отдельные, единичные издательства СМИ упоминали о возможном присутствии свиного гриппа «там и здесь», иногда даже назывались конкретные населённые пункты, в которых, якобы обнаружен случай-другой, но было ли это правдой? Ни в одном штате или даже районе Америки карантин объявлен не был. Границу с Мексикой - изначальным очагом свиного гриппа - никто не закрывал. Школы и другие учебные заведения работали в обычном режиме, международные авиарейсы вылетали за пределы страны без задержки на карантин. Единственное, что вызвало массовое обсуждение американцев, были два вопроса: насколько надёжна вакцина H1N1 и почему её нет в продаже в достаточном количестве?

Прошло время. Америка по своим внутренним причинам начала самостоятельное расследование пандемии. И нельзя сказать, что расследование пандемии и причин её возникновения пошло, «как по маслу», без препонов и трудностей. Однако надо отдать должное Америке в том, что если она за что-то берётся, то делает это тщательно и профессионально.

Одним из первых вопросов, который поставили перед собой исследователи, учёные, журналисты и правоохранительные органы: «Был ли на самом деле распространён свиной грипп?»

Существует три основные версии происшедшего. Американские врачи-микробиологи, выступившие в прессе, подтверждают изначальный факт присутствия свиного гриппа, искусственно подмешанного в вакцину H1N1. Этот же факт подтверждают врачи многих стран мира, имевшие доступ к вакцине.

Версия 1. Однако, пойманные за руку в самом начале диверсии фармацевты, могли получить указание от организаторов диверсии приостановить массовое распространение отравленной вакцины, так как поняли, что фактор массовости уже не сработает, утерян фактор внезапности. Даже после одного, двух миллионов смертных случаев следствие легко выйдет на зачинщиков диверсии, и их идея мирового господства провалится, так и не воплотившись в жизнь.

Версия 2 претендует на то, что организаторы диверсии не планировали массового распространения заражённой вакцины на этот раз. Её распространяли выборочно, используя страны третьего мира для того, чтобы проверить, насколько эффективно и быстро она работает, и какие могут понадобиться доработки. Для этой цели Украину могли выбрать (или выбрали?) основным испытательным полигоном.

Основанием для сказанного послужил короткий телерепортаж, отснятый и прокомментированный 7-м каналом телевидения Лос-Анджелеса. Журналистка телеканала прокомментировала буквально следующее:

«13 августа в деловом центре Лос-Анджелеса был арестован гражданин Израиля Джозеф Моше. Он пытался силой пройти на популярное ток-шоу, которое транслировалось из федерального здания города. Моше заявил охранникам здания, что он агент Моссада, микробиолог, и у него есть важная информация о том, что фармацевтическая компания Бакстер в Украине производит бактериологическое оружие вместо вакцины против свиного гриппа. Его заявление слышали сразу несколько охранников и присутствовавших на входе свидетелей. Однако охранники решили, что человек на ходу выдумал историю, чтобы пройти на популярное шоу и вызвали спецподразделение полиции SWAT Team. Моше был задержан и немедленно отправлен в Израильское посольство. Полиция и подоспевшие ранее сотрудники ФБР не позволили Джозефу Моше общаться с американскими журналистами».

Сноска, сохранённая мною (http://www.youtube.com/watch?v=6_7QqYwTDqQ&NR=1), оказалась бесполезной, так как видеоматериал об аресте Джозефа Моше был убран с YouTube. Однако удалось найти фотографию из американской газеты, где сохранился изначальный текст американской тележурналистки 7-го канала.

Я также обратился к другому печатному источнику, перепечатавшему телекомментарий в оригинальном виде. Однако, к своему удивлению, обнаружил в статье абсолютно новый текст, которого раньше на странице данного источника не было. В новом тексте говорилось о том, что Моше подошёл к охранникам здания и начал произносить угрозы в адрес Белого Дома. Читатели, владеющие английским языком, могут сравнить текст сноски – http://www.huffingtonpost.com/2009/08/14/man-suspected-of-making-t_n_259330.html - с текстом между фотографиями.

Бакстер на Украине

Baxter Ukraine, 29 Beresnyakovskaya st. 02098 Kiev. Phone: +38 044 4962410

Ниже показана копия логотипа с контактным адресом и телефоном компании Бакстер на Украине. Разночтение в текстах и убранный с YouTube репортаж могут являться косвенными доказательствами того, что кому-то не хотелось, чтобы эта информация сохранилась в первозданном виде для широкого круга читателей.

Версия 3 заключается во мнении, что отравленная вакцина против свиного гриппа (в этот раз) вообще ни на ком не применялась. Был какой-то другой вирус, характер которого установить не удалось. Некоторые врачи придерживаются мнения, что распространение отравленной H1N1 было бы не так просто остановить, и факт её применения неизбежно стал бы явным.

У сторонников каждой версии есть один общий знаменатель: организаторам этой скандальной акции необходимо было на практике увидеть и изучить реакцию мировой общественности, а также убедить её в том, что вакцина безвредна. Пример: H1N1, применённая на американских, британских и австралийских беременных женщинах и детях, не вызвала рецидивов и смертных случаев. Кроме того, американские СМИ широко осветили тот факт, что 2800 американских добровольцев получили прививку, и она способствовала выздоровлению.

Большинством исследователей и врачей этот факт был воспринят, как некий политический фарс, потому что все врачи, проводившие наблюдение за добровольцами, оказались контрактниками Министерства Обороны США, и «посторонние», нейтральные врачи не имели доступа ни к диагнозам «добровольцев», ни к тому, какие именно прививки им кололи. Ведь вместо вакцины H1N1 им могли ввести обыкновенное плацебо, либо вакцину от обыкновенного гриппа.

Исследователей, учёных и обыкновенных обывателей, внимательно следящих за событиями, интересует, зачем нужно было так широко и навязчиво рекламировать по Америке акцию с добровольцами? Уж, не для того ли, чтобы выработать у американцев условный рефлекс: «вакцина H1N1 – это хорошо»?

Исследователи темы писатели/журналисты Стивен Квейл и Майк Талленгер, радиожурналисты Джорж Нури, Алекс Джонс и Глен Бек, писатели-исследователи Ричард Долан и Даррел Симс единодушно считают, что акция с добровольцами была проведена именно с целью успокоить общественность и внушить американцам, что вакцина - это хорошо. Вся эта группа исследователей темы свиного гриппа придерживается твёрдого мнения, что шумиха 2009 года - это только «репетиция перед большим концертом» с рекламой положительных эффектов вакцины и низкими цифрами общей смертности от свиного гриппа (благодаря вакцине) по сравнению со средней цифрой смертности в полмиллиона от ежегодного обыкновенного гриппа.

Можно разделять или не разделять высказанную выше точку зрения, которая, так или иначе не совсем доказана. Однако, не бесполезно знать альтернативную точку зрения, которая в будущем могла бы оказаться востребованной.

Стоило ли поднимать шумиху, если учёные и врачи знали заранее, что свиной грипп проходит в более лёгкой форме, чем обыкновенный? Зачем тогда нужно было поднимать столько крика вокруг необходимости вакцинации? И ещё: почему во многих странах, включая Америку, ощущалась острая нехватка вакцины H1N1? Уж не потому ли, что огромная партия уже произведённой отравленной вакцины на этот раз просто не понадобилась?

Нехватка вакцины в Америке - это нереально. Каждый американец знает, что в Америке не бывает дефицита. Если возникает нехватка чего-либо, то деньги решают проблему со скоростью мановения волшебной палочки. Так что же получается, что фармацевтические компании сами себе враги и отказываются от прибыли? Или, может быть, они знают, что в 2010 году на законсервированной где-то на секретных военных складах отравленной вакцине заработают в сто раз больше?

Пока эти вопросы остаются без ответа. Но расследование продолжается.

Цена служения злу

В поле зрения расследования попали факты гибели/смерти при странных обстоятельствах самых знающих и знаменитых микробиологов Америки и других стран. Стивен Квейл скрупулёзно собрал список 102-х микробиологов, погибших и умерших с 2001 года по конец ноября 2009-го, и проанализировал причины их смерти. Похоже, что из 102-х микробиологов только четыре, возможно, умерли своей смертью.

Группа русских микробиологов - специалистов по определению и сортировке ДНК, погибла в авиакатастрофе над Чёрным морем при перелёте из Израиля. Самолёт был сбит украинской ракетой (по заявлению Министра Обороны Украины) случайно.

Майкл Патрик Кайли (*Michael Patrick Kiley*) доктор, профессор - американский «Энштейн» в микробиологии, один из ведущих микробиологов в мире. Долгие годы преподавал микробиологию и химию в Ейльском университете. Один из основных разработчиков программы биозащиты при Министерстве Обороны Канады. Последние годы работал в военной лаборатории в городе Гальвестон, Техас вместе с Робертом Шоупом(Robert Shope). Шоуп и Кайли собрали уникальную коллекцию из пяти тысяч редчайших вирусов. Оба учёных знали формулы практически всех антидотов против существующих естественных и искусственно модифицированных вирусов. Кайли (62 года) и Шоуп (74 года) скончались в январе 2004 года с разницей в пять дней. Незадолго до смерти Роберт Шоуп публично объявил о том, что нашёл формулу эффективного лекарства от СПИДа
(http://www.rense.com/general48/moredead.htm).

Роберт Лесли Бергофф (*Robert Leslie Burghoff,* 45 лет) - микробиолог, был сбит на стоянке возле лаборатории белым микроавтобусом, который скрылся. Преступник не найден.

Майкл Перич, 46 лет (*Michael Perich*), по определению коллег - звезда микробиологии из West Nile Research Laboratories, погиб в автомобильной катастрофе.

Доктор Уайли(*Dr. Wiley*) - микробиолог, был похищен возле своей лаборатории, найден мёртвым через пять месяцев после исчезновения. К его груди была привязана бомба.

Однофамилец - один из самых выдающихся учёных по микробиологии Дон Уайли, 57 лет (Don Wiley) был сбит в своём автомобиле. Грузовик почти столкнул автомобиль с моста. Позже тело Дона Уайли обнаружили в трёхстах километрах южнее от места аварии распятого на дереве.

Кэролин Коффи, 28 лет (Caroline Cjffey) была найдена с перерезанным горлом в нескольких местах. Её муж был тяжело ранен, дом сожжён.

Доктор Роберт Шварц, 57 лет, зверски зарублен мечом у себя в загородном доме.

Доктор Сет Ван Нгуен, 44 лет, Австралия, найден мёртвым в промышленном холодильнике.

Доктор Владимир Пасечник был похищен из своего загородного дама в Англии и позже найден мёртвым... (http://www.stevequayle.com/dead_scientists/UpdatedDeadScientists.html)

Кому и зачем нужна смерть учёных? Ведь убийства этих специалистов в разных странах никак не похожи на почерк неких «народных мстителей», разозлившихся на учёных за то, что те прямо или косвенно были причастны к изобретению биологического оружия. Скорее наоборот, явно просматривается почерк спецслужб, получивших неограниченные полномочия от лиц наивысшего уровня.

Ни одно из преступлений против микробиологов раскрыто не было, а вскрытия якобы умерших естественной смертью производились либо специально назначенным медперсоналом, либо под строгой опёкой секретных агентов военных ведомств и ЦРУ, и медицинские заключения, видимо, писались под их диктовку.

Американские исследователи, журналисты и учёные, занимающиеся расследованием отравленной вакцины H1N1, единодушно пришли к неутешительному для человечества выводу: организаторы пандемии 2009 года пытаются организованно и методично избавиться от людей, способных помочь планете в критический момент.

Можно, конечно, предположить, что все микробиологи вместе или по одиночке осознали, какое страшное оружие они создали. Их начала мучить совесть, и они решили публично признаться в содеянном, за что и лишились жизни.

Но важнее всего осознать, что многие из ныне покойных были уникальными в своём роде и единственными, кто знали антидоты (противоядия) от своих жутких и опасных для человечества изобретений. Хочется ещё раз подчеркнуть слово единственными, потому что если «бактериологический демон» вырвется из сейфов секретных лабораторий, остановить его будет некому! Это обстоятельство не может не волновать здравомыслящих людей.

Crèvecœur

Jean-Jacques Crevecoeur

Il y va de Notre Vie, de Notre Liberté, de Notre Souveraineté.
Le temps presse ! Mettez-vous debout, de Grâce

Changementclimatique, 7/9 Janvier 2010
http://changementclimatique.over-blog.com/article-message-du-7-janvier-de-j-j-crevecoeur-42601866.html

Montréal, le 7 janvier 2010

Madame, Monsieur,

Chers amis,

C'est devenu une tradition que je nourris jalousement depuis des années. Dans l'hémisphère Nord, le solstice d'hiver marque la période où nos nuits sont les plus longues (aux alentours de 16 heures à Bruxelles, Paris ou Montréal) et les jours les plus courts. Pour moi, c'est un rendez-vous annuel que la Nature m'offre pour prendre le temps de méditer, de tirer les enseignements de l'année qui s'achève et de faire le bilan. Depuis des années, j'ai décidé de fuir toutes ces fêtes bruyantes et superficielles pour m'offrir une retraite, souvent accompagné de celle que j'aime ou de quelques amis particulièrement chers.

2009 : finalement, une excellente année !

Cette année 2009 se termine pour moi avec un sentiment que je n'ai jamais connu. Le sentiment qu'après les événements que nous avons vécus, rien ne sera plus jamais comme avant. Vous me direz que cette année fut une année difficile, douloureuse, révoltante, répugnante, en bref, une année de merde ! Oui, c'est un point de vue. Mais je voudrais citer cette phrase célèbre de Richard Bach (né en 1936), tirée de «Illusions ou le Messie récalcitrant »: « ce que la chenille appelle la fin du Monde, le Maître l'appelle le papillon ».

Car, bien sûr que de notre point de vue de chenilles, il y aurait de quoi désespérer de l'Humanité (qu'il s'agisse des peuples moutons inconscients ou des dirigeants corrompus et cyniques). Et je ne vous cache pas qu'à quelques reprises, j'ai, moi aussi, été pris par la tristesse et le découragement. Mais en prenant un peu de recul et de hauteur, en regardant cette vie sur Terre comme une grande pièce de théâtre où le but du jeu est d'évoluer en conscience grâce aux événements que nous vivons sur cette scène, la perspective devient alors extraordinairement positive.

Démonstration

Depuis des dizaines d'années, nous n'étions qu'un faible pourcentage a être convaincus que le système mondial était devenu une machine à broyer les individus et les peuples au profit d'une élite minoritaire qui concentre de plus en plus de richesses dans des mains de moins en moins nombreuses. Jusqu'à présent, nous n'étions qu'une minorité à dénoncer les mensonges, les corruptions, les collusions, les complots ourdis par les gouvernements et les instances supranationales (comme l'ONU, l'OMS, le FMI, la FAO) contre leurs propres citoyens ou les citoyens du Monde. Chaque fois que nous pointions du doigt une loi, un décret, un accord en démontrant qu'une fois de plus, c'était une partie de notre liberté et de notre souveraineté (individuelle ou collective) qui était

bafouée et piétinée, nous nous faisions traiter de conspirationnistes, de révisionnistes, de théoriciens du complot, d'anarchistes d'extrême gauche, de sectes, d'agitateurs dangereux, et j'en passe (vous compléterez la liste vous-même !).

Le changement extraordinaire que 2009 nous a offert, c'est que cette machine à broyer s'est emballée, croyant atteindre bientôt son but ultime : le pouvoir absolu. Et trop sûre d'elle, cette machine a accéléré la cadence pour réaliser son but, en multipliant les mensonges, les falsifications, les manipulations, à l'échelle planétaire. C'est vrai que le directeur de la propagande d'Hitler, Joseph Goebbels, disait déjà à l'époque : «Plus le mensonge est gros, plus ça passe !» À voir ce qui s'est passé en 2009, il faut croire qu'il se trompait.

Le voile se lève sur le dossier de la vaccination

Dans le dossier de la grippe H1N1, une majorité d'individus a compris qu'il y avait quelque chose de louche dans la gestion de cette soi-disant crise. Et les centaines de millions de dollars ou d'euros investis pour diffuser la propagande pro-vaccinale n'ont pas réussi à convaincre les gens qu'ils devaient se faire vacciner. Au contraire, ces efforts propagandistes ont eu l'effet inverse. Des millions de personnes ont reçu des informations qu'ils n'auraient jamais reçues autrement ; à présent, nombreuses sont les personnes qui sont devenus conscientes qu'un vaccin, ça peut être dangereux ! Par ailleurs, de plus en plus de gens se sont rendu compte que la corruption existe au sein de l'OMS et chez les responsables de santé publique. À cet égard, il est intéressant de noter que pas moins de six pays, à ma connaissance, ont lancé (ou vont lancer) des demandes d'enquêtes pour corruption dans ce dossier:

- la Russie, par la voix d'Igor Barinov, qui a même menacé de se retirer de l'OMS à cause de la corruption qui y règne (voir :

=> https://web.archive.org/web/20100112031743/http://planeteattitude.ning.com/forum/topics/la-russie-lance-un-serieux
Newsru.com (28-11-2009) https://www.newsru.com/russia/27nov2009/vozz.html

- la Hollande, qui a lancé une enquête contre Albert Osterhaus, l'expert-clé numéro un auprès de l'OMS dans le dossier pandémie et qui a gagné des centaines de millions d'euros personnellement grâce au déclenchement de cette alerte à la pandémie (voir : => F. William Engdahl. OMS: le «pape de la grippe A» accusé de corruption; https://web.archive.org/web/20091228104431/www.voltairenet.org/article163315.html

- l'Italie, qui a exigé une enquête pour corruption (voir :

=>https://web.archive.org/web/20100220012925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2630%3Awill-italys-class-action-lawsuit-be-the-first-of-many&catid=41%3Ahighlighted-news&Itemid=105&lang=en

- la France, par la voix de certains parlementaires de l'opposition (voir :

=> https://web.archive.org/web/20100111130216/http://www.tdg.ch/depeches/people/h1n1-gouvernement-francais-critique-gestion-vaccins

- ***le Comité* santé du Parlement européen**, présidé par le docteur Wolgang Wodarg, qui a l'unanimité, a exigé une enquête sur la corruption au sein de l'OMS (voir : => L'OMS est-elle soumise aux industries pharmaceutiques? NBiou, 22 December 2009.

https://web.archive.org/web/20100101223802/http://www.nbiou.com/science-et-sante/loms-est-elle-soumise-aux-industries-pharmaceutiques/

- la Pologne, qui, par la voix de sa ministre de la Santé, *Ewa Kopacz* et de son premier ministre, a refusé de commander et d'imposer des vaccins à sa population (voir: => Ministre de la santé polonaise sur le vaccin H1N1. – 5 November 2009; https://www.youtube.com/watch?v=XOecrY1JIUQ

À noter aussi que Roselyne Bachelot a été convoquée (voir le texte complet de la demande en référé sur http://www.politiquedevie.net/index.htm) devant le tribunal de grande instance de Paris (TGI) ce lundi 4 janvier, pour répondre à une plainte de tentative d'empoisonnement (voir :

Roselyne Bachelot assignée en référé le 4 janvier 2010 au TGI de Paris par Marc Vercoutère/Cri-Vie et Christian Cotten/Politique de Vie. – Politique de Vie, 19 décembre 2009 - https://www.politiquedevie.net/index.htm

Roselyne Bachelot hier au Tribunal: C'est parti! – Francoise Blanche, 5 Janvier 2010;

https://web.archive.org/web/20100110063922/http://francoiseblanche.hautetfort.com/archive/2010/01/05/roselyne-bachelot-hier-au-tribunal-c-est-parti.html

etc.

This applies to our life, our freedom, our sovereignty.
Time is running out!

The Flu Case, 7/10 January 2010 // The Flu Case, 10 January 2010
https://web.archive.org/web/20100315181956/http://www.theflucase.com/index.php?option=com_content&view=article&id=2514%3Aqnothing-will-ever-be-the-same-againq-jean-jacques-crevecoeur-reflects-on-the-swine-flu-scam-translated-by-carolyn-dunning&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Stand up! I beg you.

Dear Madam, Dear Sir,
Dear friends,
It has become a tradition that I have cherished jealously for years. In the Northern Hemisphere, the winter solstice marks the time when our nights are longer (around 16 hours in Brussels, Paris or Montreal) and the days are shortest. For me it is an annual event that nature offers me to take time to meditate, to learn from the past year and take stock. For years, I have decided to escape all these noisy, superficial parties to offer myself a retreat, often accompanied by the woman I love or some particularly dear friends.

2009: Finally, a great year!
The year 2009 ended for me with a feeling I've ever known. The feeling that after the events we have experienced, nothing will ever be the same again. You may say that this year was difficult, painful, disgusting, repulsive, in short, a year of shit! Yes, this is a point of view. But let me quote the famous words of Richard Bach (born 1936), extracted from "Illusions or the Reluctant Messiah": "what the caterpillar calls the end of the World, the Master calls the butterfly."

Because, of course from our point of view as caterpillars, there would be enough to despair of Humanity (whether we are mindless sheep or corrupt, cynical leaders). And I will not deny that several times I, too, have been submerged by sadness and discouragement. But by taking a step back and upwards to view life on Earth as a great stage where the goal of the game is to evolve according to our conscience thanks to events that we live on this stage, the prospect then becomes overwhelmingly positive.

Proof. For decades, only a small percentage of us has been convinced that the global system has become a machine to crush people and peoples for the benefit of an elite minority who concentrate more and more wealth in fewer and fewer hands. So far, we were a minority denouncing the lies, corruption, collusion and conspiracy hatched by governments and supranational bodies (like the UN, WHO, IMF, FAO) against their own citizens or citizens of the World. Whenever we pointed our finger at a law, decree, agreement, demonstrating once again that a part of our freedom and our sovereignty (individual or collective) had been scorned and trampled, we were called conspirers, revisionists, conspiracy theorists, extreme left anarchists, sects, dangerous agitators, and so on ...

The extraordinary change that 2009 has given us is that this crushing machine was turned on, in the belief that it would soon reach its ultimate goal: absolute power. And too sure of itself, this machine accelerated pace to achieve its goal, increasing the lies, falsifications, manipulations, all over the planet. It is true that the director of the Hitler's propaganda, Joseph Goebbels, once said at the time: "The bigger the lie, the better it works!" Seeing what happened in 2009, we must believe he was mistaken.

The veil is lifting off the immunization file

In the case of influenza H1N1, a majority of people understood that there was something fishy in the management of this so-called crisis. And the hundreds of millions of dollars or euros invested to disseminate pro-vaccine propaganda failed to convince people that they should be vaccinated. Instead, these propagandist efforts backfired. Millions of people received information that they would never have received otherwise, and now, many people have become aware that a vaccine can be dangerous! Furthermore, more and more people have realized that corruption exists within the WHO and among public health officials. In this connection it is interesting to note that no less than six countries, to my knowledge, have launched (or will start) applications for investigations into corruption in this file:

Russia, through the voice of Igor Barinov, who even threatened to withdraw from the WHO because of the corruption that prevails;

=> https://web.archive.org/web/20100112031743/http://planeteattitude.ning.com/forum/topics/la-russie-lance-un-serieux
Newsru.com (28-11-2009) https://www.newsru.com/russia/27nov2009/vozz.html

Holland, who has launched an investigation against Albert Osterhaus, the key-expert number one to the WHO pandemic dossier who has earned hundreds of millions of euros personally with the outbreak of the pandemic alert: => F. William Engdahl. OMS: le «pape de la grippe A» accusé de corruption
=> https://web.archive.org/web/20091228104431/www.voltairenet.org/article163315.html

Italy, who demanded an investigation for corruption:

=>https://web.archive.org/web/20100220012925/http://www.theflucase.com/index.php?option=com_content&view=article&id=2630%3Awill-italys-class-action-lawsuit-be-the-first-of-many&catid=41%3Ahighlighted-news&Itemid=105&lang=en

France, through the voice of certain parliamentary members of the opposition:

=> https://web.archive.org/web/20100111130216/http://www.tdg.ch/depeches/people/h1n1-gouvernement-francais-critique-gestion-vaccins

The European Parliament Health Committee, presided by Dr. Wolgang Wodarg, who unanimously demanded an investigation into the corruption within the WHO:

=> L'OMS est-elle soumise aux industries pharmaceutiques? NBiou, 22 December 2009.
https://web.archive.org/web/20100101223802/http://www.nbiou.com/science-et-sante/loms-est-elle-soumise-aux-industries-pharmaceutiques/

Poland, which, by the voice of his health minister, *Ewa Kopacz* and his prime minister, has refused to order or impose vaccines for its population. => Ministre de la santé polonaise sur le vaccin H1N1. – 5 November 2009; https://www.youtube.com/watch?v=XOecrY1JIUQ

Note also that Roselyne Bachelot was summoned before the tribunal de grande instance de Paris (TGI) on Monday January 4, in response to a complaint of attempted poisoning:

Roselyne Bachelot assignée en référé le 4 janvier 2010 au TGI de Paris par Marc Vercoutère/Cri-Vie et Christian Cotten/Politique de Vie. – Politique de Vie, 19 décembre 2009 - https://www.politiquedevie.net/index.htm

Roselyne Bachelot hier au Tribunal: C'est parti! – Francoise Blanche, 5 Janvier 2010;
https://web.archive.org/web/20100110063922/http://francoiseblanche.hautetfort.com/archive/2010/01/05/roselyne-bachelot-hier-au-tribunal-c-est-parti.html

But curiously, have you heard about it on TV???

What is great is that all these complaints come from elected politicians (mostly members or ministers). Difficult to call those people conspirators! Or sects! In nine months, WHO and public health officials have furthered the cause of anti-vaccine more than vaccines critics have in decades (at the same time, fortunately, these pioneers have worked to inform us and to prepare the ground for this massive awareness!). So thank you to people like Sylvie Simon, Michel Georget, Raymond Hauglustaine Marc Vercoutère Christian Tal Schaller, Jean-Marie Mora, Jacques Viau and many others, for having alerted us long ago to the futility and danger of vaccines. But thank you also to Margaret Chan (Director General of WHO), Albert Osterhaus, Alain Poirier, Roselyne Bachelot, Laurette Onkelinx, Bruno Lina, experts and all the corrupt leaders of drug companies: without you we would have taken another thirty years to achieve the same result of awareness about vaccines and corruption in the medical and pharmaceutical field.

Which just goes to show, once again, that shadow and light cooperate together to uplift and edify humanity's conscience! Let us never forget that!

THE FLU CASE

"The Citizens Have Won", Says Dr Marc Girard: Victory in Swine Flu Information War made possible by Internet

The Flu Case, 8 January 2010, 12:08
https://web.archive.org/web/20100112082934/http://www.theflucase.com/index.php?option=com_content&view=article&id=2510:qthe-citizens-have-wonq-says-dr-marc-girard-victory-in-swine-flu-information-war-made-possible-by-internet&catid=41:highlighted-news&Itemid=105&lang=en

French doctor and author of a book on the swine flu scam, Marc Girard, has declared victory in the information battle in Europe surrounding the swine flu vaccine following the decision by the French government to cancel 50 million doses and abandon the vaccine centers under intense political pressure.

Some other key turning points in the campaign were:

*the decision by the German army in September to refuse to take the toxic Baxter Celvapan jab forcing Baxter to drop mercury and adjuvants at the last moment when seeking EU approval for its vaccine and so triggering a storm of protest inside Germany about the two classes of vaccines with and without adjuvants.

*protests by Belgium citizens groups stopping a parliamentary law allowing forced vaccination to go through.

*the announcement by the Polish Health Minister and family doctor Ewa Kopacz that she would order the inadequately tested jab for Poland

*the legal action by Marc Vercoutere and Christian Cotton that forced French Health Minister Roselyne Bachelot to start to account, through her lawyer, in a Paris court on January 4th for the swine flu campaign irregularities.

"In the flu affair, by the sole force of the internet and an unprecedented majority, the citizens have won: against the lobbies supported by the large media, and in spite of the objective collusion of all the politicans - including those who are today calling for a commission of inquiry. The time has already come to think about the time after the flu and to reflect on the factors that allowed such a scandal possible."

"Dans l'affaire de la grippe, par la seule force d'internet et à une majorité sans précédent, les citoyens ont gagné: contre les lobbies soutenus par tous les grands médias, et malgré la collusion objective de tous les politiques – incluant ceux qui réclament aujourd'hui une commission d'enquête. Il est déjà temps de penser l'après-grippe et de réfléchir aux facteurs qui ont rendu possible un tel scandale. Réalisée dans des conditions techniques précaires imposées par une situation que tout le monde connaît, la vidéo qui suit vise à susciter une réflexion citoyenne sur la question centrale des conflits d'intérêts. ... Bonne écoute – bonne réflexion … Marc Girard"

=> http://www.rolandsimion.org/spip.php?article108

However, while we, in Europe, have beyond a doubt achieved a fantastic victory, much remains to be done to stop the swine flu jabs being sent to developing countries, among other things.

Also, we need to start legal actions and insist on parliamentary inquries to identify those responsible for this scam.

Since this is the same international corporate crime syndicate organised around the Bilderbergs that is also responsible for Codex Alimentatarius, GMO foods, poisoning us through water and other means, as well as for the financial crisis and instigating numerous false flag terrorist attacks and wars (Afghanistan, Iraq and now Yemen), there is a unique opportunity to deal with a multitude of problems by systematically dismantling the power structure of this group.

Jean-Jacques Crevecoeur

Jean-Jacques Crevecoeur

What awaits us in 2010?

The Flu Case, 10 January 2010

https://web.archive.org/web/20100315181956/http://www.theflucase.com/index.php?option=com_content&view=article&id=2514%3Aqnothing-will-ever-be-the-same-againq-jean-jacques-crevecoeur-reflects-on-the-swine-flu-scam-translated-by-carolyn-dunning&catid=41%3Ahighlighted-news&Itemid=105&lang=en
http://changementclimatique.over-blog.com/article-message-du-7-janvier-de-j-j-crevecoeur-42601866.html

Now, what awaits us in 2010? Will I still take the risk of making predictions for 2010? Well yes, although I recognize that exercise is dangerous and risky. For, since my retirement from public life, I have never stopped reviewing documents related to this famous influenza H1N1. What are the facts that have caught my attention? There have been many, here is a summary:

Margaret Chan, General Director for the WHO, announced that the pandemic would last at least until 2011 (ref: L'OMS ne veut pas crier victoire avant 2011. – L'OBS, 29 December 2009;
https://web.archive.org/web/20160205063338/http://tempsreel.nouvelobs.com/la-grippe-a/20091229.OBS2023/l-oms-ne-veut-pas-crier-victoire-avant-2011.html

Ukraine experienced an epidemic of extremely deadly lung disease (death occurring 24 hours after onset) in November 2009. According to the autopsies performed on the corpses of victims, the symptoms were different from those of influenza and the virus that attacked the lungs was different from the H1N1 virus, but by combining with it, became extremely deadly (ref: Yashchenko A. Ukraine: Nouveau virus découvert, mortel pour les systèmes immunitaires affaiblis. – New of Tomorrow, 13/17 Novembre 2009
https://web.archive.org/web/20091121062319/http://newsoftomorrow.org/spip.php?article6802Unian:
https://web.archive.org/web/20091119024614/http://www.unian.net/rus/news/news-346721.html

But what is disturbing about the case in Ukraine is that two months beforehand (in Warsaw, Poland on 29th and 30th September, 2009), Interpol had proposed to six of Central and Eastern European countries a drill *simulating a bioterrorist attack against the Ukraine*, an attack in which the terrorists' modus operandi was to spread a virus of pneumonic plague by air ;

=> International Bioterrorism Table Top Exercise: Warsaw, Poland, 29-30 September 2009
https://web.archive.org/web/20091110084341/http://www.interpol.int/Public/BioTerrorism/tabletop/default.asp

Two months later, thousands of testimonies from the people of Ukraine reported that planes had flown at low altitude during the night, a few days before the outbreak of the deadly epidemic first describes as pneumonic plague. A coincidence?

Dr. Taubenberger, whom I spoke about in several of my lectures, is the head of the Laboratory of Molecular Pathology in the American Armed Forces. It was he who in 2004 removed lung tissue from the corpse of an Inuit, who had died in 1918 of the Spanish flu, to resurrect and recombine the deadly strain of the famous pandemic flu with the help of laboratory CDC (Center for Disease Control). What I am saying is anything but Internet gossip: this work was the subject of several scientific publications

- in *Nature* (Taubenberger J. Characterization of the 1918 influenza virus polymerase genes. Nature, 2005, 437, pp 889-893) and
https://www.nature.com/scitable/content/characterization-of-the-1918-influenza-virus-polymerase-54873/
- in *Science* (Tumpey T. Characterization of the reconstructed 1918 Spanish influenza pandemic virus. Science, 2005, 310, pp 77-80). https://pubmed.ncbi.nlm.nih.gov/16210530/

One can already find it suspicious that the Armed Forces and the CDC should invest substantial resources to recombine an extinct virus responsible for the deaths of 20 to 60 million people;

This same professor Taubenberger has just released the results of the autopsies he performed on the first casualties of the H1N1 flu, in the region of New York, between May and July 2009. Two questions came to my mind: why give this man the privilege of carrying out autopsies on the first victims of the new flu, when this geographic area was neither under his jurisdiction nor part of his normal duties? And why did he wait until late November to make public its findings on observations made in May? Especially when his conclusions showed that the victims had not died from the flu (oh, really?), but a lung disease which is very similar to what the Ukrainians are dying from now!!!

=> New York Autopsies Show 2009 H1N1 Influenza Virus Damages Entire Airway. – NIH, 7 December 2009. https://www.nih.gov/news-events/news-releases/new-york-autopsies-show-2009-h1n1-influenza-virus-damages-entire-airway

L'Ukraine aurait-elle été le terrain de test d'une contamination à plus large échelle, pour plus tard ?). Had the Ukraine been the testing ground for later contamination on a larger scale?

WHO continues to recommend ***Tamiflu*** as a way to fight against influenza and flu symptoms. Roselyne Bachelot, has dutifully recommended the systematic prescription of this useless, dangerous and deadly poison, for any person suffering from flu-like symptoms or influenza (see:

=> (09.12.09) https://web.archive.org/web/20100107232943/http://www.formindep.org/IMG/pdf/Grippe_A-H1N1-v_prescription_d-antiviraux-2.pdf

When you know that Tamiflu has not been proved efficacious – see the articles about Tamiflu:

See: Les Dangers du Tamiflu: https://web.archive.org/web/20100130102252/http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=category&layout=blog&id=117&Itemid=155

One can question the motivation of such a measure. But when we know in addition that Tamiflu often causes within hours super infection and acute respiratory distress leading to death (see: (05.01.06) https://web.archive.org/web/20081114004021/http://www.agriculture-environnement.fr/spip.php?article56

... it is reasonable to question the criminal intent of this measure (see: C'est le Tamiflu qui tue, pas la grippe! (06.12.09) https://web.archive.org/web/20091212233000/http://newsoftomorrow.org/spip.php?article6968

Since then I have came across an in vitro study which explains that the antiviral has the effect of boosting the virulence of H1N1 (see: Lin X, et al. Oseltamivir boosts 2009 H1N1 virus infectivity *in vitro*. Biochem Biophys Res Commun. 2009 Dec 25;390(4):1305-8. https://pubmed.ncbi.nlm.nih.gov/19879239/

Based on this, I am convinced that these so-called new types of flu victims (those that the virus does not usually touch) *were rather victims simply of Tamiflu*. And that's why we've been told that the flu attacked young and healthy adults!

Bills are under consideration in several countries in the world (including the United States, Great Britain and others) to allow governments to censor or ban subversive websites (17.12.09) https://web.archive.org/web/20091221001722/http://www.infowars.net/articles/december2009/171209Internet.htm

The company *Verichip* announced it had won the race for a patent, to bring to market a microchip which could be implanted in the body and whose function was to detect the presence of the H1N1 virus in the body. This announcement is dated September 21, 2009: VeriChip Corporation Granted Exclusive License to Patents Used in Virus Triage Detection System for H1N1 Virus, 21 September 2009; https://web.archive.org/web/20090924225211/http://www.verichipcorp.com/092109.html

Since then, the firm has taken the name of *Positive ID* (to make us forget its sinister reputation for transforming us into micro-chipped cattle) and is preparing to expand its range of services in the medical field) and is preparing to expand its range of services in the medical field (see: 03.12.29) https://web.archive.org/web/20101206072801/http://www.bnet.com/blog/drug-business/positiveid-deal-advances-use-of-microchip-implants-in-florida-health-system/3647

What can we expect in the coming months?

Based on the above information, different scenarios are possible. To imagine them, just put yourself in the shoes of those who orchestrated the staging of this pseudo-epidemic. If I was the mastermind of this case, given my failure to enforce the vaccination to the entire population, I would go about things as follows:

- Firstly, ensure no leakage is relayed by the mainstream media about the *side effects of vaccines*. This is to reassure the non-vaccinated population in the countries of the northern hemisphere, as well as developing countries and countries in the Southern Hemisphere. It would be very bad for trade if rumours of deaths and disabilities came to the ears of people in these countries, before they themselves are vaccinated;

- At the same time, ensure faster passing laws permitting *censorship of subversive websites*. Meanwhile, the old methods of intimidation and death threats may still be applied (they were used by the DCRI (Central Directorate of Internal Intelligence) in France against two websites, who both spread essential information against the H1N1 vaccination campaign: www.artemisia-college.org and www.spreadthetruth.fr

- Continue to *communicate regularly about the dangers and deaths* from influenza H1N1, so as to maintaining the fear of the flu (which could become as virulent and deadly as Spanish flu - note that the argument was already used in 1976 at the first alert for swine influenza and for the bird flu alert in 2004). Continue to mention the deaths from influenza H1N1, so as to instil in the public mind that the flu is a deadly disease (thereby making people forget that many diseases are much more deadly than the flu, even in the West);

- Continue *talking about a third pandemic wave*, a fourth and fifth wave, of a pandemic peak, finally, all the vocabulary needed to justify preventive action and press releases;

- Recommend the use of *Tamiflu*, to increase the chances of *killing people with ordinary flu symptoms*. It's good for statistics, and good for sales of vaccines, too! Going on the experience of Canada, 400 deaths attributed to influenza H1N1 convinced 15 million Canadians to be vaccinated. That makes 37,500 vaccinated for each death! One understands better why each death was so hyped the media;

- Next, *artificially cause outbreaks of influenza*, but this time much more virulent, inspired by the Ukrainian experience. Causing some outbreaks with the new virus strain, spread through the air or water, would create a state of the art panic. Suggestion: take advantage of major international gatherings to conduct biological and bacteriological attacks: first target: the Winter Olympics in Vancouver (Canada) in February 2010. Second target: World Football Cup in South Africa in June-July 2010. And perhaps other targets to be determined if needed. That should motivate the most reluctant to be vaccinated

- Once a real pandemic has been installed, convince the entire population of the need for a *chip for detecting the H1N1 virus* to prevent its spread from one country to another. Thus, those who wish to leave a country will be forced to wear the chip produced by Positive ID (formerly Verichip) so that customs can check if they are carriers or not the deadly virus. To kill two birds with one stone and accelerate security procedures at airports, propose a chip implanted with elements of their identity and criminal record for registering the same people. Let us not forget that at any moment dangerous terrorists can blow up the plane we could be taking (except that they, even when they are listed by the CIA, pass security checks imposed on us and which we find a drag!);

- The presence of this chip will allow authorities to completely monitor the immunization program for each individual (the famous *vaccine tracking* Roselyne Bachelot was so intent on setting up). In other words, to move around, it will soon be absolutely necessary to be in order as regards vaccination. As websites denouncing the dangers and uselessness of vaccines will not be there to warn people, it will become easier to convince the population to be vaccinated against all sorts of diseases, arguing that the cost of vaccine is less than the cost of treating a cancer (I have heard Dr. Poirier make this argument to justify the price of the vaccine against HPV).

- One could imagine a deal with the insured, either they participate in a vaccination program in a cooperative manner, and they can continue to benefit from social security, or they refuse vaccination,

and in this case, *they are no longer covered for their Free health care for illness* (this is already required in France for cancer patients who refuse chemotherapy: OK, no chemo, but then, no cover for health care costs);

- And finally, thanks to this program where vaccination will gradually be widespread, the *fertility of the population* will have dropped drastically to the point of becoming largely sterile. This will solve the problem of world overpopulation, in one generation, without having to resort to genocide (strategy which is a bit too showy and shocking). That is why it is absolutely imperative to maintain squalene as an adjuvant in vaccines because its presence interferes strongly with the production of steroids, our sex hormones.

This is the program I would set up if I was the mastermind of this case.
Now, don't make me say what I haven't said. I haven't said this will happen. But I say *it's a possible scenario* that could arise logically from the facts cited above. In any case, I shall be particularly attentive to what happens in Vancouver in a few weeks. Because I strongly question the reasons why Stephen Harper (Prime Minister of Canada) has extended the working sessions of parliament from 25 January to early March (after the Olympics). No observer, no lawyer, has understood the intention behind this totally unjustifiable measure. It is not because the Olympics are going to take place in a country that parliament should stop meetings and their work! Unless a bioterrorist attack in the very middle of the games obliges a select committee to take action by declaring a health emergency, without democratic debate, since the parliament would be missing! I'm not saying this is the Prime Minister's intention. But thanks to time and experience, for as long as I've been observing all these power games, this is the kind of twisted plan I can imagine world leaders have.

What should we do in 2010? Whether the catastrophic and diabolical scenario I describe above happens or not is to me irrelevant.

- What is important to remember is that everything indicates, through the announcements of public health officials, that *they will continue trying to convince us that we are facing a pandemic*, while common sense proves that there never was a pandemic (12,000 dead in eight months, whereas seasonal influenza which has never fired any emergency program causes 250,000 to 500,000 annually). At this point, remember that I predicted 13,000 deaths by December 31, 2009, in my e-mail No. 6 dated October 13, 2009. => https://web.archive.org/web/20091018044210/http://www.jean-jacques-crevecoeur.com/index.php?option=com_content&view=article&id=105:courriel-6&catid=65:grippe-a-h1n1&Itemid=98

Once again, I was accurate!

- What is also important to remember is that the probability we will get more and more vaccines is far from zero.
- What is important to note, finally, is that behind the false attacks of September 11, behind false origins of global warming, behind the false threat of a pandemic, the same security logic is at work: the aim **to** *restrict more and more our freedoms* of choice, opinion, travel, information, expression, assembly, etc… And the likelihood of us all being chipped in a few years time is one of the most plausible scenarios, when one sees the convergence of a whole series of technological innovations occurring. I recall that almost all our ID cards are now endowed with a RFID chip, our identification card, driver's license, Medicare card, bank card, credit card, etc… From there to transferring information from these different chips into a single chip implanted in the body, there is only one step, one that our leaders are willing to take.

If we do not want such a world, we only have a few months to transform this great awakening of consciousness caused by the events of 2009 to implement concrete actions. If we want to counteract the eventual totalitarian tendencies of the global elite, we must focus our priorities on the following:
· continue personal research for information and learn to decipher the information that the media give us, so as to understand the scenarios that are being staged behind our backs;

· seek alternative sources of information to better understand the logic behind the apparent events;
· form citizen alliances in each city, to coordinate activities for information and training, but also to challenge people with political duties to initiate legal action and to organize protests and non-violent acts of civil disobedience;
· put pressure on each elected politician in our region and our country so that corruption and conflicts of interest are charged and convicted;
· put pressure on each elected politician in our region and our country to demand that our country permanently withdraws from all the international bodies who have stolen our sovereignty (beginning with WHO, the European Community or NAFTA and NATO);
· become, each and every one of us, disseminators of information in our immediate environment (co-workers, families, neighbours, friends). For if we do not gather a critical mass of knowledgeable people, the next attack of so-called avian or so-called pneumonic plague will put us in a minority position within a frightened flock face to governmental actions and manoeuvres by the WHO.

In fact, for our individual freedom (selfish motivation), we can no longer afford to help others to open their eyes (altruistic motivation). *In other words, we can not save ourselves alone.* And this is the last good news the events of have triggered: to reclaim our freedoms and our individual sovereignty, we are obliged to rebuild the social fabric and networks of solidarity that have been carefully unravelled over the past fifty years. Without these alliances which must be rebuilt between us, between neighbours and colleagues, we are condemned to live in fear and helplessness.

Let us never forget that the motto of the dictators of the Roman Empire was: *divide et impera*, divide and conquer. *It is because we are so divided* that it is possible today for a leader to lead, for a security guard to impose idiotic measures to which we all submit, for the medical association to threaten doctors with exclusion, etc.. When there are ten thousand of us saying no to a ban, what will the mayor of our city be able to do? Put all of us in jail? The prisons are already so full!

Nor should we forget what was said by Benjamin Franklin (1706 - 1790), writer, philosopher and diplomat, who was co-editor and a signatory of the Declaration of Independence United States of America in 1776: "Those who would give up essential liberty to purchase a little temporary safety, deserve neither liberty nor safety." I do not think any sentence best describes the choice which faces us now. Because we still have choices, even if dictatorship is already at work in our world. We have little time to act, but we there is still time. We have the choice to permanently abandon the illusion of security offered to us by our puppet governments and reclaim our essential freedom. Or to let ourselves be lead by this movement which seems inevitable, to enter into the "Brave New World" (book by Aldous Huxley in 1923 and which is extraordinarily pertinent today! I read it again just before Christmas. What a shock!).

Nor should we forget the famous statement of the German philosopher, Georg Hegel (1770 - 1831), the father of dialectical thinking: “When a slave dies, the master disappears”. In other words, the Masters of the World can only exist and be maintained if we give them the power to wield power over us. In this regard, I invite you all to reflect on the extraordinary power of a simple refusal, a simple “NO”. Roselyne Bachelot (France) and Alain Poirier (Quebec) were at a loss to see their vaccination centres desperately empty. And if people had kept their televisions switched off, if they had stopped listened to the media taking advantage of the slightest death to feed their fear of death, if they had they been better informed and trained, vaccination centres would have stayed permanently empty.

That's why I shall take up my pilgrim's staff again, from the beginning of March, in Europe and in Quebec, to educate, inform and train all those who wish, but also to help to create the citizens committees desired.. I am convinced that this action is absolutely necessary, because the more people are informed and aware, the less they will fall into the traps of misinformation and manipulation. And the more chances we will have to emptying power of its substance.

It is my hope that many of you will respond to my invitation.

And that 2010 will be the year we regain control over our own sovereignty, our liberty and our lives.

More than ever, we must stand, aware and awake. But together!!!

Sincerely and fraternally, Jean-Jacques Crevecoeur

Jean-Jacques
Crèvecœur

"Nothing will ever be the same again"
Jean-Jacques Crevecoeur reflects on the Swine Flu Scam
(Translated by Carolyn Dunning)

The Flu Case, 10 January 2010
https://web.archive.org/web/20100315181956/http://www.theflucase.com/index.php?option=com_content&view=article&id=2514%3Aqnothing-will-ever-be-the-same-againq-jean-jacques-crevecoeur-reflects-on-the-swine-flu-scam-translated-by-carolyn-dunning&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Scientist Jean-Jacques Crevecoeur believes nothing will ever be the same again after the swine flu vaccine scam.

The scandal is unprecedented. But the response has been unprecedented too.

All around the world, people are waking up to the corruption of governments, the mainstream media and the pharamceutical companies.

What used to be ridiculed as "conspiracy theories" are increasingly being recognised to be fact-based issues that need to be investigated by parliaments.

People are more aware today than ever before that their national governments do not represent them or their interests, but march in lock step to increase the profits and power of an international corporate crime syndicate, which is organised around groups Bilderbergs – attended by top ranking Freemasons – , and which seeks to expand their sphere of influence at the expense of the freedom and prosperity of rest of the population.

Crevecoeur says, 2009 has finished off an "excellent year".

He warns, though, we are not out of danger yet.

The same international corporate crime syndicate behind the swine flu and the climate change scam as well as the financial meltdown continues to pursue their plans for a one-world totalitarian government with a parallel drastic reduction in the global population.

While removing these people from power might not be a sufficient condition to restore good government, it is a necessary condition, and we can accomplish their removal in 2010 by insisting that the law and parliaments do their job and bring the perpetrators of the swine flu vaccine crime to justice.

The Guardian

Simon Jenkins

Swine flu was as elusive as WMD
The real threat is mad scientist syndrome

The Guardian, 14 January 2010, 20:30 GMT
https://www.theguardian.com/commentisfree/2010/jan/14/swine-flu-elusive-as-wmd

Remember the warnings of 65,000 dead? Health chiefs should admit they were wrong – yet again – about a global pandemic.

Let me recap. Six months ago I reviewed the latest bit of terrorism to emerge from the government's Cobra bunker, courtesy of Alan Johnson, home secretary.
=> Cobra: The UK's emergencies team. – BBC News, 8 July, 2005, 09:43 GMT 10:43 UK
https://web.archive.org/web/20060113101517/http://news.bbc.co.uk/1/hi/uk_politics/4663369.stm

Swine flu was allegedly ravaging the nation. The BBC was intoning nightly statistics on what "could" happen as "the deadly virus" took hold. The chief medical officer, Sir Liam Donaldson, bandied about any figure that came into his head, settling on "65,000 could die", peaking at 350 corpses a day.
Bowcott O. Swine flu could kill 65,000 in UK, warns chief medical officer. – The Guardian, 16 July 2009
=> https://web.archive.org/web/20091204145645/http://www.guardian.co.uk/world/2009/jul/16/swine-flu-pandemic-warning-helpline

Donaldson knew exactly what would happen. The media went berserk. The World Health Organisation declared a "six-level alert" so as to "prepare the world for an imminent attack". The happy-go-lucky virologist, John Oxford, said half the population could be infected, and that his lowest estimate was 6,000 dead.
=> Simon Jenkins. Swine flu? A panic stoked in order to posture and spend. - The Guardian, 29 April 2009.
https://web.archive.org/web/20090827001405/http://www.guardian.co.uk/commentisfree/2009/apr/29/swine-flu-mexico-uk-media1

The "Andromeda strain" was stalking the earth, and its first victims were clearly scientists. Drugs were frantically stockpiled and key workers identified as vital to be saved for humanity's future. Cobra alerted the army. Morgues were told to stand ready. The Green party blamed intensive pig farming. The Guardian listed "the top 10 plague books".

If anyone dared question this drivel, they were dismissed by Donaldson as "extremists". When people started reporting swine flu to be even milder than ordinary flu, he accused them of complacency and told them to "wait for next winter". He was already buying 32m masks and spending more than £1bn on Tamiflu and vaccines.
Smith R, Britten N. and Cockcroft L. Swine flu: NHS orders 32m face masks. – The Telegraph, 29 April 2009.
https://web.archive.org/web/20100116120438/http://www.telegraph.co.uk/health/swine-flu/5239353/Swine-flu-NHS-orders-32m-face-masks.html

Surgeries refused entry to those with flu symptoms, referring them to a government "hotline" where prescription drugs were ordered to be made available without examination or doctor's note. Who knows how many died of undiagnosed illness as a result? Lines were instantly jammed. It was pure, systematic government-induced panic – in which I accept that the media played its joyful part.

This week the authorities admitted that, far from a winter upturn in swine flu, there has been a slump. From 100,000 a week at the peak, there were just 12,000 last week. After the coldest winter

for decades, when deaths might be expected to rise, the rate is below that of seasonal flu. In the UK, 360 people have died under its influence, most with prior "non-flu" conditions. Swine flu is not nice – I have had it – but bears no relation to the government hysteria.

I accept that anyone can make a mistake, and authority has some duty to err on the side of caution. As Alastair Campbell implied on Tuesday, Iraq might have had weapons of mass destruction, so Blair was right to go to war just in case. But it is reasonable to ask, as the Chilcot inquiry is doing, why precaution on such a colossal and potentially destructive scale was justified when those who questioned the need for it have since been proved right. Is anyone asking about flu?

Swine flu is not the first time we have suffered this nonsense. I have a stack of predictions by senior scientists on BSE/CJD in 1995. It would "lead to 136,000 deaths" – a spurious exactitude used to convey plausibility – and "could infect up to 10 million Britons".

=> Radford T. CJD: the news improves, but the mystery remains. – The Guardian, 10 August 2000
https://web.archive.org/web/20100126162552/http://www.guardian.co.uk/news/2000/aug/10/food.foodanddrink

This led to an obscene £5bn campaign of cattle destruction and compensation. When the prediction proved wildly wrong, the government excused itself with a classic Rumsfeld-ism: "The absence of evidence is not the evidence of absence."

This was followed by SARS 2003, a "panic gripping the world". The World Health Organisation declared that "One in four Britons could die". The medical doom-monger, Dr Patrick Dixon, said that Sars had "a 25% chance of killing tens of millions", whatever that meant. The madcap Tory health spokesman, Liam Fox, demanded the arrest and quarantining of all recent travellers from Asia, including 30,000 Asian students. In the event, some 800 people died with Sars worldwide, against 21,000 who died in Britain in the seasonal flu epidemic of 1999/2000.

Undaunted, within a year the same alarmists were at work on avian flu. With now habitual hyperbole, Donaldson predicted 50,000 deaths, with "an upper limit", graciously conceded, of 750,000. When one dead swan slumped on a beach in Scotland, BBC reporters went crazy as inspectors stumbled through the seaweed, clad in anti-nuclear armour. Within a year the horror had passed. The global mortality was put at 262, with not one death in Britain. Another fiasco was brushed under the carpet.

The Blair government, and now Brown's, have proved adept at using scare politics to divert attention from other troubles. During foot-and-mouth Blair was quick to don a yellow jumpsuit for photographers and intone as if he alone stood between an illness (that is in fact harmless to humans) and armageddon. This time the swine flu coincided with two other "mystery diseases", MRSA and C-difficile, which killed 10,000 Britons in 2007 alone. But those deaths lay squarely at the doors of unclean NHS hospitals. Hence there were no scary stories or predictions about them from Donaldson.

Donaldson and his eager virologists will doubtless stick loyally to their predictions since it is "too early to be complacent". His allies at the BBC did their bit on Wednesday with a Horizon programme that turned a serious study of virology into grotesque scaremongering, with solemn music and voices crying, "there's no escape", "this could take a devilish turn", and "we don't even know how many viruses there are!" Children writhed in agony from smallpox.

Mad scientist syndrome is rampant. Had these scares been disseminated by a private firm, a local authority or a newspaper (as was anti-MMR), they would be damned from on high with demands that heads roll. As it is, the government's Scientific Advisory Group for Emergencies sails gaily on, still graced by the presence of Sir Roy Anderson, who happens also to draw a six-figure salary as a non-executive director of GlaxoSmithKline, which made hundreds of millions from the government's panic. Anderson, and GSK, vigorously deny any conflict of interest.

=> Professor Sir Roy M Anderson FRS, FMedSci, Theoretical Epidemiology. I recently completed a 3 year secondment to the Ministry of Defense as Chief Scientific Adviser and returned to the department as Professor of Infectious Disease Epidemiology in October 2007.
https://web.archive.org/web/20100108060936/http://www1.imperial.ac.uk/medicine/people/roy.anderson/

The Council of Europe's head of health, Wolfgang Wodarg, is one of the few who have dared blow the whistle on the links between "Big Pharma" and national and supranational agencies. He this week persuaded the council to stage a debate on the "enormous gains" made by GSK and others from the swine flu pandemic. He seeks details of relations between the companies and the WHO, given that stockpile contracts kick in the moment that organisation uses the word "pandemic". It did so for the first time last year, with reckless alacrity.

I am not aware of the WHO or the General Medical Council or any of the medical colleges investigating these matters, or any check on conflicts of interest of government doctors who work for drugs companies. I am not aware of any Whitehall or Commons committee, any National Audit Office or competition inquiry into the supply of these drugs. All I know is that a huge amount of health money, time and effort was last year diverted from possibly critical therapies into what looked from the start to be yet more terror virology.

This is why people are ever more sceptical of scientists. Why should they believe what "experts" say when they can be so wrong and with such impunity? Weapons of mass destruction, lethal viruses, nuclear radiation, global warming … why should we believe a word of it? And it is a short step from don't believe to don't care.

THE GLOBE AND MAIL | OPINIONS

Richard Schabas, Neil Rau

How the WHO overshot

The Globe and Mail, 19 January 2010, 4:47PM EST
https://web.archive.org/web/20100121112245/http://www.theglobeandmail.com/news/opinions/how-the-who-overshot-on-h1n1/article1436739/

The dust is now settling on the H1N1 "pandemic." After all the ballyhoo, the impact of H1N1 was not very different from that of a typical seasonal flu. There were more young people sick but a lot fewer older people sick and no health-care crisis or economic or social collapse.

Some European politicians are alleging that pressure from drug companies led the World Health Organization to overshoot. Indeed, pharmaceutical and medical supply companies heavily profited. But, despite the appeal of a conspiracy theory, we believe the fundamental error was a rigid adherence to pre-existing pandemic plans.

Overshoot #1: Definition of a Pandemic

The power of words is enormous. Much of the worldwide overreaction to H1N1 can be traced to the WHO's zeal to declare a "pandemic." Just before the new H1N1 was identified, the WHO made a subtle but important change in its own definition of "pandemic." It dropped the key requirements that a pandemic virus had to be completely novel – an antigenic shift – and cause widespread and severe disease. These were characteristics of previous pandemics.

Almost immediately, as luck had it, a virus appeared that fit the new pandemic definition – but not the old one. The difference turned out to be crucial. Most of the older population had been exposed to a similar virus that circulated for many years before 1957 and were protected from the new H1N1. As a result, the people most vulnerable to severe disease were largely spared.

This pattern was obvious from the start, when the number of deaths in Mexico was far lower than the tens of thousands predicted by pandemic plans. Ignoring the rapidly accumulating contrary evidence, the WHO took the position it had to adhere to its new definition. Once a pandemic was declared, there was no turning back. On WHO instructions, all countries dutifully activated their pandemic plans.

Overshoot #2: Everyone 'Needs' Vaccine

World pandemic plans, which are designed to respond to catastrophes, called for mass immunization. These plans were followed religiously, even as H1N1 proved far milder than expected. Moreover, by early October, it was obvious that the vaccine would not arrive until the peak of the outbreak and then, initially, in small amounts. This called for a change in plan. The focus for immunization needed to shift exclusively to those at high risk – specifically, people with serious underlying chronic diseases.

The "worried well" needed to hear the bad news that they would not get the vaccine in time and the good news that they really didn't need it. Instead, our public health leadership wanted to have it both ways. They terrorized the public with exaggerations and misinformation, then tried to limit clinics to a high-risk minority. Chaos ensued.

Overshoot #3: Carry on Regardless

The H1N1 outbreak peaked in October, and disease rates dropped off rapidly in North America. Any benefit from immunizing healthy people had virtually vanished by mid-November, the very time when the vaccine became readily available to all. Speculation about a serious “third wave” is fading fast, as high population levels of immunity make it implausible.

Instead of sharing the good news – the danger has come and gone for otherwise healthy people – the current risk is exaggerated to justify ongoing futile vaccination efforts directed at the worried well.

Total deaths worldwide from H1N1 probably will end up lower than from typical seasonal flu. Yet, the WHO still labels this a moderate pandemic and has no plans to downgrade or simply call it off.

To be fair, a modicum of pandemic planning served a good purpose during the WHO's initial response. The WHO quickly moved into Mexico to gather information. International laboratory co-operation led to rapid identification of the H1N1 virus. Surveillance capabilities were enhanced worldwide, and countries quickly detected H1N1 in their midst. The impossibility of containment was quickly acknowledged, and futile travel advisories were discouraged. Vaccine development was started quickly.

It was once said that no plan survives the first five minutes of any battle. What this means, of course, is that any plan can be quickly superseded by events. The good public health leader, like the good general, needs to put more value on utilizing new information and less on simply following orders. This is the real lesson of H1N1.

Mike Adams

H1N1 swine flu hoax falls apart at the seams

Natural News, 20 January 2010
https://www.naturalnews.com/027984_swine_flu_vaccines.html

The great swine flu hoax of 2009 is now falling apart at the seams as one country after another unloads hundreds of millions of doses of unused swine flu vaccines. No informed person wants the injection anymore, and the entire fear-based campaign to promote the vaccines has now been exposed as outright quackery and propaganda.

Even doctors are now calling the pandemic a complete hoax. As reported on FoxNews, Dr. Wolfgang Wodarg, a leading health authority in Europe, says that drug companies "organized a 'campaign of panic' to put pressure on the World Health Organization (WHO) to declare a pandemic. He believes it is 'one of the greatest medicine scandals of the century,' and he has called for an inquiry."
H1N1 Flu Is a False Pandemic, Health Expert Claims. – Fox News, 11 January 2010
https://web.archive.org/web/20100114051851/http://www.foxnews.com/story/0,2933,582749,00.html

H1N1 swine flu was never dangerous, and it never should have been escalated to a level-six pandemic in the first place. It was all a big marketing scam whose purpose was to simply *sell vaccines*. (And the CDC and WHO were in on it...)

And it worked! Big Pharma made out with billions of dollars in profits for a *useless vaccine* that's now being dumped by the truck load. These vaccines were, of course, paid for with taxpayer dollars, making the Great Swine Flu Hoax of 2009 nothing more than an elaborate financial scam whose goal was to transfer wealth from the People to the shareholders of Big Pharma.

In just the fourth quarter of 2009, GlaxoSmithKline shipped $1.4 billion worth of vaccines.
Greece halts purchases of H1N1 flu vaccines. – Reuters, 19 January 2010.
https://web.archive.org/web/20100123031951/https://www.reuters.com/article/idUSLDE60I0RI20100119/

That's $1.4 billion worth of taxpayer dollars, by the way. Dollars that could have been spent on nutrition or real health education. $1.4 billion worth of free vitamin D supplements would have done far more to protect public health than vaccines could ever hope to accomplish.

A bailout for Big Pharma

Wall Street hucksters have nothing on Big Pharma, the CDC and the WHO, all of which conspired to mislead the public and generate irrational fear in order to make money selling people vaccine shots they never needed in the first place.

The drug companies raked in billions of dollars in revenues while providing a product that offered absolutely no net reduction in mortality. In fact, as the long-term side effects of the vaccines remain unknown, it could turn out that the vaccines actually result in a net *increase* in mortality.

Meanwhile, countless people were harmed by the swine flu vaccine frenzy (it's "countless" because nobody's counting). In addition to those who were nearly paralyzed after receiving the vaccine shots,

grade school staffers in Massachusetts who lined up to receive swine flu vaccine shots were instead *injected with insulin.* (Insulin injections can put you into a coma.)
=> https://www.washingtonpost.com/wp-dyn/content/article/2010/01/19/AR2010011903366.html - deleted

The school sent a letter home to staffers and parents blaming the mishap on the school nurse. But if they weren't injecting people with a useless vaccine for a non-pandemic, none of this would have happened in the first place. (Editor's note: The press originally reported this story as "children" being injected with insulin, but they later changed their report to "staffers." This paragraph has been updated to reflect that change.)

Total swine flu deaths for 2009 were far lower than the number of deaths from regular seasonal flu. And yet it turns out that thousands of Americans who died from the swine flu had been previously injected with the vaccines. => See: Adams M. Thousands of Americans died from H1N1 even after receiving vaccine shots. – Natural News, 17 January 2010; https://www.naturalnews.com/027956_H1N1_vaccine_CDC.html

In fact, according to calculations derived from official CDC estimates, *thousands of vaccinated Americans died from swine flu anyway.* The vaccines, it seems, don't really work after all. You're just as safe doing nothing.

Actually, getting the vaccine may *harm* your health. Outspoken Dr. Wodarg even says that the full extent of the damage from the insufficiently-tested vaccines may not be known for years. "The vaccine developed by Novartis was produced in a bioreactor from cancerous cells, a technique that had never been used until now," he says.

Just what we need, huh? Cancer cells being injected into the population as part of a vaccine campaign.

Cancelling vaccine orders

The Swine Flu hoax has fizzled out, and countries like Greece, France and the UK have cancelled orders for vaccines that they now realize won't be needed.

But even the fizzling of this hoax doesn't mean it was a failure from the point of view of Big Pharma.
=> Hirschler B, Glaxo shipped $1.4 bln of H1N1 vaccine in Q4. – Reuters, 15 January 2010.
https://web.archive.org/web/20100124123933/https://www.reuters.com/article/idUSLDE60E1SU20100115/?type=marketsNews
=> Wilkinson E. Talks to offload swine flu vaccine under way. BBC News, 8 January 2010.
http://news.bbc.co.uk/2/hi/health/8448080.stm

The swine flu hoax was a huge success not only for drug company profits, but also for certain influential individuals including Dr Julie Gerberding, former head of the CDC who has now accepted a high-paying job as the president of Merck's global vaccine operations.
Adams M. Former head of CDC lands lucrative job as president of Merck vaccine division. – Natural News, 22 December 2009. https://www.naturalnews.com/027789_Dr_Julie_Gerberding_Merck.html

One minute you're running the CDC, warning the country about a pandemic while urging everybody to get vaccinated, and the next minute you're running the for-profit vaccine division of the world's largest drug company. Amazing how that works, huh?

We called it right

I called much of this months ago in my popular hip-hop song, "Don't Inject Me" which you can listen to here: => Adams M. Don't Inject Me. – Natural News, 23 August 2009.
https://www.naturalnews.com/Dont_Inject_Me_The_Swine_Flu_Vaccine_Song.html

Or watch on YouTube here: http://www.youtube.com/watch?v=EiXmw5a9kiM - deleted
=> https://web.archive.org/web/20170301170731/https://www.youtube.com/watch?v=EiXmw5a9kiM

As I stated in the song lyrics, which were written in early August, 2009:
The truth is outrageous
Don't you know the drug companies made this flu
Don't you know the swine flu is made by man

Pharmaceutical scam
It's all part of the Big Brother population plan
They don't want you to see the remedies
you can stop influenza with vitamin D for free
Herbal medicine is all that you need
But they can't charge a fifty dollar fee
Unless
They inject you
The big drug companies are makin' a killing
Collectin' the billions and gettin' away like a James Bond villain
Cuz' they're willin' to do almost anything
Just to make money with the flu vaccine

Many clueless critics thought this song was some sort of outrageous conspiracy rant at the time. Turns out it was a spot-on prediction of the truth behind *The Great Swine Flu hoax of 2009*.

THE FLU CASE

Why WHO must lower its pandemic level immediately

The Flu Case, 27 January 2010

https://web.archive.org/web/20100220013100/http://www.theflucase.com/index.php?option=com_content&view=article&id=2638%3Awhy-who-must-lower-its-pandemic-level-immediately&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO's flu chief Dr Fukuda yesterday announced at the hearing at the Council of Europe that WHO intended to keep the pandemic emergency level at 6 for another two years. This must not be allowed to happen.

Crucially, a declaration of a pandemic level 6 emergency triggers the application of a completely new set of standards for the approval of drugs and vaccines.

Under the pretext of having to tackle a pandemic emergency, drugs and vaccines can be given to people even though there are no clinical studies proving they are safe and effective under special EMEA guidelines.

This is not allowed when a disease is not declared formally to be a pandemic disease. These new and "emergency" standards came into force in June when WHO declared a pandemic emergency level 6, and they are the only reason why the swine flu vaccines were allowed onto the market.

The swine flu vaccines have not been tested for safety or efficacy. There are no data on their impact on children or pregnant women and only limited data on their impact on adults mainly from the pharmaceutical companies. They contain the adjuvant squalene known to cause autoimmune and other diseases in US and UK vets.

The only clinical studies of these vaccines are being carried out right now by pharmaceutical companies. GlaxoSmithKline is carrying out a clinical study in the UK on Pandemrix, but few details are available.

Also, Tamiflu which has passed ist selll buy date can be sold as long as a pandemic level 6 emergency is in force.

In addition, a pandemic level 6 declaration allows pharmaceutical companies to claim immunity.

The declaration creates a wild west when it comes to approving drugs at a time when US researchers are developing vaccines that can be made using plants and given as pills.

This cannot be allowed to continue for 2 more years.

In addition, the declaration of a pandemic level 6 significantly increases the power of WHO over national governments.

France came within days of full scale martial law in December: a secretive crisis committee set up in Paris to manage the pandemic was under the ultimate authority of WHO. But it was only one of many countries.

US President Barack Obama declared a national emergency over the swine flu on October 23rd, opening the door to semi martial law.

As long as pandemic declaration 6 continues to be in force, these special crisis committees under the direction of WHO and the UN continue to have extraordinary powers to intervene in the public health services, military and law enforcement.

WHO cannot be allowed to consolidate its grip on the functions of national government over the next to years behind close doors. If it does, WHO (and the corporate interests that control it) have an incentive for creating another crisis, just so it can use ist new power.

Niko Kyriakou

Swine Flu Didn't Fly

Truth Out, 28 January 2010
https://truthout.org/articles/swine-flu-didnt-fly/

For makers of the swine flu vaccine, 2009 was a year to remember. By June, CSL Limited's profits rose 63 percent above 2008 levels, while in the third quarter of 2009 - just about the time H1N1 contracts picked up steam - GlaxoSmithKine enjoyed a 30 percent jump in earnings to $2.19 billion. Roche, the maker of Tamiflu, which prevents H1N1, saw second quarter profits leap to 12 times what they were in that quarter of 2008. But in 2010, drug companies may get their comeuppance.

On Tuesday, the Council of Europe launched an investigation into whether the World Health Organization (WHO) "faked" the swine flu pandemic to boost profits for vaccine manufacturers. The inquiry, held in Strasbourg, France, vindicates a worldwide movement of insiders, experts and elected officials who accuse the United Nations organization of misleading the world into buying millions of unnecessary vaccines.

"I have never heard such a worldwide echo to a health political action," said Dr. Wolfgang Wodarg, an epidemiologist who formerly led the health committee for the Council of Europe, at Tuesday's hearing.

Also present was Dr. Ulrich Keil, director of the WHO's Collaborating Centre for Epidemiology. Keil hammered his own organization and WHO flu chief, Dr. Keiji Fukuda, for "producing angst campaigns."

"With SARS, with avian flu, always the predictions are wrong ... Why don't we learn from history?" Keil asked. "It [swine flu] produced a lot of turmoil in the pubic and was completely exaggerated " exaggerated" in contrast with all the really important matters we have to deal with in public health."

Last year the WHO predicted that H1N1 could infect two billion and claim hundreds of thousands of lives, while President Obama's science advisers said the outbreak could infect up to 120 million Americans and kill 90,000.

But in the end, H1N1 turned out to be one of the milder flu strains on record. The type-A influenza is confirmed to have taken around 14,000 lives worldwide, according to WHO numbers from January 22. The CDC said in December confirmed US deaths had reached 4,000, although it recently estimated that due to underreporting, the true death toll could be as high as 16,500 - a tragic sum, but less than half of what the CDC attributes to seasonal flu-related illness. In most of the northern hemisphere, hog flu has been on the decline for some ten straight weeks. New transmissions are largely contained to North Africa and South Asia, according to the WHO.

Throughout 2009, the WHO and domestic health agencies around the globe ignored mounting signs that swine flu wasn't much of a killer, choosing instead to man the war bugles at full volume. The result was that governments poured tens of billions of dollars into vaccines. The US alone has spent $2 billion on the drugs and has allocated $7.5 billion in supplemental spending for H1N1 preparedness.

Now that the disease has petered out ahead of schedule, however, countries are stuck with millions of unused doses. French and German governments have had to cancel millions of orders of the vaccines due to falling demand and late-breaking news that European health authorities had recommended twice the necessary dosage. The CDC has dealt with the glut in another way. It now says all Americans should go and get the shot – a shift from its earlier recommendation that at-risk groups such as the young, sick, pregnant and nurses seek injections first. But why should everyone get a shot when that the disease appears to be over?

On January 22, the WHO issued a statement calling allegations that it irresponsibly stoked H1N1 fears, "scientifically wrong and historically incorrect." The statement defends figures the WHO publicized on transmission rates, mortality and the virulence of swine flu.

"The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible. We welcome any legitimate review process that can improve our work."

Previously, the WHO had offered scant response to allegations of corruption, but deigned to defend itself after the Council of Europe meeting was announced. At the hearing, the WHO's flu director, Dr. Fukuda, denied the accusations against the WHO. "Let me state clearly for the record - the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry."

The public meeting to examine accusations against WHO was set up by the Parliamentary Assembly of the Council of Europe (PACE), which represents 800 million people in 47 countries.

=> see: http://assembly.coe.int/CommitteeDocs/2010/20100119_HearingProgrammeSOC.pdf

Established by various European nations in 1949 to promote human rights and the democratic rule of law, the Council's January 26 meeting involved WHO officials, European drug makers and medical experts. PACE's findings are expected to be announced January 29 and will likely be followed by an in-depth study and recommendations to European governments.

The PACE hearing is the latest in a series of investigations into the WHO's propriety, which also includes a 2009 Danish Parliamentary inspection of links between WHO expert, Albert Osterhaus, and makers of the swine flu drugs. Russian lawmaker Igor Barinov has also started an inquiry into the WHO's ties to H1N1 drug makers.

Similar critiques have been leveled at domestic health authorities as well, which generally took their cues on how to deal with swine flu from the WHO.

In France, Health Minister Roselyne Bachelot was forced to a Paris court on January 4 over swine flu campaign irregularities - including ordering millions of unnecessary vaccine doses. Demonstrations over statistical improprieties have taken place in Scotland and Canada.

Inquiries into WHO misdoing are likely to plunge deep into the statistical methods for data collection, however, it takes no expertise to see that health agencies' data about H1N1 was wildly misleading.

For example, a study released December 7 by the Harvard School of Public Health found that the CDC predicted that H1N1 mortality rates would be 80 to 500 times higher than they turned out to be - with the WHO doing only slightly better. The CDC also overshot the likelihood that pig flu causes serious illness by seven to nine times, the study found. Another study, done by the CDC itself and published in the New England Journal of Medicine on December 31, found that swine flu was far more difficult to transmit that it had initially claimed. See: =>

[NEJM, 2009, Dec 31, 361: 2619-2627] => https://www.nejm.org/doi/full/10.1056/NEJMoa0905498

The larger question begged by health agencies' bad data and the media's dutiful reporting of it is this: if fears are overstated every time there's a flu outbreak, when the public really does need a vaccine, who will believe the boys who cried wolf?

Should the European Council's investigations conclude that the WHO deliberately incited H1N1 paranoia to help drug makers, it could spark reform of how infectious diseases are handled. The paramount questions experts will try to address are how dangerous a disease must become before a global vaccination campaign is advised, and when a disease should truly qualify as a "pandemic".

Proof of direct corruption may be difficult for the Council to establish, but the string of clues which points to this corruption - as befits the trail of a wild pig - is not hard to follow.

Pandemic or Just Plain Panic?

Swine flu took center stage in June of 2009, when the WHO declared H1N1 the first "pandemic" in 42 years. It was this label that caught the eye of every health authority from Tampa to Timbuktu, and which revved drug company engines. But to do it, the WHO had to redefine the word.

One month after swine flu appeared in April, the WHO rewrote the definition of "pandemic." Under the new meaning, a pandemic does not need to cause high numbers of death or illness.

=> M. Teppone. The Historical and Epidemiological Events ... doi:10.20944/preprints202309.1179.v2

A month after changing the definition, with just 144 people dead from H1N1, the flu was given the WHO's highest threat classification: a "stage-six pandemic alert." By comparison, the mildest 20th century pandemic killed a million people.

Before the change, the WHO had classified a pandemic as a disease that has "simultaneous epidemics worldwide with enormous numbers of deaths and illness." After the alteration, the organization's web site stated, "Pandemics can be either mild or severe in the illness and death they cause." In May, WHO spokesperson Natalie Boudou told CNN that the original definition was an error.

On Tuesday, the WHO's Fukuda backed that assertion, saying, "Severe death has never been part of WHO's pandemic [definition] - in earlier discussions it is often pointed out that severity may be high, but it has also been pointed out that they can be very low."

Moving ahead, Fukuda said his organization "will definitely consider whether we can define things better." Some participants wondered why the WHO hasn't already come up with a better definition, since complaints about the change have poured in from all sides.

The Associated Press reported on May 19, 2009, "China, Britain, Japan and other countries urged the World Health Organization on Monday to be very cautious about declaring the arrival of a swine flu pandemic, fearing that a premature announcement could cause worldwide panic and confusion."

Peter Gross, an infectious disease specialist with the Hackensack University Medical Center in New Jersey wrote that the WHO's new definition was fuzzy and might incite ill-founded panic. His September editorial in the British Medical Journal echoed epidemiologist Tom Jefferson. Jefferson, formerly a general practitioner in the British Army, who has worked for the well-respected Cochrane Collaboration for 15 years, asked in July, "Don't you think there's something noteworthy about the fact that the WHO has changed its definition of pandemic?"

"The WHO and public health officials, virologists and the pharmaceutical companies ... They've built this machine around the impending pandemic," Jefferson told Der Spiegel, a German magazine with a weekly circulation of one million. "And there's a lot of money involved, and influence, and careers, and entire institutions! And all it took was one of these influenza viruses to mutate to start the machine grinding."

The opinion given by Dr. Wodarg at Tuesday's meeting is that the definition change was designed to boost vaccine sales. "There is no other explanation for what happened. Which reasons could lead to those [WHO] decisions? I don't find any other explanation. It's not for health. And who profits? Why else would you change the definition?"

Yet, the WHO stands by its decision to label H1N1 a pandemic, citing geographic spread and the virus' novelty as its primary reasons. Critics however, say the redefinition wasn't based on science.

Critics say what was needed was not a frightful label, but hard scientific data to show how many people were getting swine flu.

"Rational scientific independent advice should be supreme, but there was an imperative behind this which was a financial one. I think what we need is evidence from industry that is more science-based," said Paul Flynn, a parliamentary representative in the UK, who presented at the Council of Europe's hearing.

Hard scientific data on how many people were getting swine flu might have been derived through rigorous testing, but on July 16, the WHO quit tracking cases of infection and told governments they should stop testing for individual cases, ostensibly because the speed of H1N1's spread had already been confirmed.

Following that advice, in mid-2009, the CDC decided laboratory tests to confirm whether patients had H1N1 were no longer necessary, and advised doctors to save resources and stop conducting them. A CBS news investigation found "overwhelming" evidence that despite the inflammatory estimations of the CDC, very few flu cases could truly be attributed to H1N1.

In response to questions about the CBS story, CDC media spokesman Jeff Dimond said, "We, as a matter of policy, do not comment on stories by other publications."

As of July 24, the CDC has used a statistical multiplier to come up with its total count of H1N1 cases – meaning it inflates confirmed cases using estimates about the number of infected people who never go to the doctor or are never tested during visits. In mid-December, using this model, CDC approximated that as many as 80 million, or some one in four Americans had gotten swine flu. But with no flu-strain tests to crosscheck, virtually anything that looks like a bad cold could end up in that total.

The Sky Is Falling ... Again

Considering the WHO's and the CDC's abysmal track record foreseeing the severity of flu outbreaks, it's surprising so many doctors bought their story. But then, early on, it was natural to suspect a nightmare scenario: a repeat of the Spanish flu.

Swine flu looks a lot like Spanish flu, which began in pigs and killed between 40 and 100 million people from 1918 to 1919. H1N1 shows three of the key traits which made the Spanish flu so dangerous: our immune systems aren't used to the virus, which is a new mutation; the flu can be passed from human to human; and, it has triggered immune responses in young people, not just the vulnerable elderly, according to Dr. Dawn Motyka, a vaccination expert in Santa Cruz, California.

Despite apparent similarities between the two flu's, a cursory look at history should have made the medical community more skeptical.

Characteristics akin to Spanish flu also sparked vaccination campaigns during the last two flu pandemics in 1957 and 1968, but neither of these outbreaks turned out to be major killers. The 1976 US swine flu epidemic - which refers to a domestic disease that kills a relatively high number of people - killed just one person. The hurried vaccine rollout however, killed 30 and cost the government $500 million in today's money. It also led hundreds more people to contract the crippling Guillian-Barre syndrome.

The trend toward overestimated contagions continued with SARS, the 2002-2003 respiratory disease. Nail-biting projections led the world to spend $80 billion to stop an emergence that ultimately killed 800 people and made 8,000 sick. In 2005, avian, or bird flu, cost the US government a billion dollars in vaccines and billions more in preparation for future outbreaks. The WHO warned it could kill 150 million people, yet the Hitchcockesque ailment felled just 250 people worldwide.

Perhaps, doctors went along with the sloppily-conceived H1N1 vaccination campaign because they tend to see vaccines as the single greatest lifesaver in modern medicine. The general medical view is that administering vaccines is a wise precaution, especially when dealing with a disease that

could mutate into a mass killer. But critics say this concern has to be balanced against the loss of public confidence in health authorities should a disease end up a blowout, the risk of side-effects in recipients of scantily tested drugs and the enormous cost of vaccines.

In retrospect, more doctors acknowledge that swine flu was oversold. The Intelligence firm Synovate released a survey of physicians on January 26, 2010, which found that 61 percent of all physicians in the UK, France, Germany, Italy, Spain, US, China, Taiwan and India felt the media over dramatized the H1N1 pandemic.

Corruption in Health Organizations?

Critics of the WHO say they promoted bad data to help drug makers get rich selling vaccines. This attack implies drug makers have a network of influence within the decision-making structure of the organization, a suggestion various officials confirm.

One high-level, long-term WHO employee, who preferred to remain anonymous for job security, described the WHO as follows: "WHO is infested by corruption. There is big corruption, like the management of H1N1, and there is small corruption; and between the big and the small corruption there is [corruption] in all imaginable forms. Unfortunately, it's not only the WHO."

Similar comments have come from other WHO insiders, such as William Aldis, a retired senior official who worked on the bird flu crisis. In a Huffington Post article from September 24, Aldis characterized the WHO's handling of swine flu in the following way:

"I am concerned WHO's communications is corrupted by the fact they push the buttons in the public's brains that will raise the most funds. That is incompatible with what the organization should be doing: serving the public with technically correct factual information, pure and simple."

Aldis Louise Voller, a journalist at the Danish Daily Information newspaper, has reported that pharmaceutical companies are present at meetings of WHO experts, and that purportedly independent scientists hired by the WHO are also consultants to the drug companies that make the vaccines.

=> https://www.information.dk/udland/2009/11/staerk-lobbyisme-bag-who-beslutning-massevaccination?lst_cntrb

On Tuesday, WHO’s Fukuda insisted that its swine flu scientists’ were not tainted by their private sector associations. The reason, he said, is that before each meeting, scientists are asked to declare all possible conflicts of interest. “These documents are gone over and examined. If there is some potential conflict of interest we go back and talk with them.”

While the WHO was initially set up to rely on funding from UN member countries, in recent years, this source has been rapidly overtaken by "voluntary contributions," which are provided by the private sector, national governments and NGOs. According to the WHO's 2008-2009 budget, $958 million was supplied by the UN, while three times as much - $3.2 billion - came from voluntary donations.

The WHO reports that only around 1 percent of these voluntary contributions come from the private sector, but the real total of private influence may be obscured. For example, companies can donate to foundations or NGOs which support their interests, thereby concealing the source of their contributions. According to internal WHO emails received by the British Medical Journal and described in a February 17, 2007, article, Benedetto Saraceno, the director of the WHO's department of mental health and substance abuse, advised a patient group to accept money from GlaxoSmithKline and then pass it on to the WHO in order to mask the money's origins.

Dr. Wodarg told the Council of Europe Tuesday that there has been dissent ever since the shift toward public-private partnership began in earnest in 2001.

"Already then there were very critical voices against the influence. [WHO's] administration is made of people not well paid who can't fight against the pay of people in and from the industry - they are simply swept aside ... [private] influence is rampant and that is why we can't understand why the WHO we used to love ... has become unrecognizable to us."

Journalist and author William Engdahl has made it his mission to focus on one WHO expert in particular, Dr. Albert Osterhaus. Osterhaus sat on the WHO's Strategic Advisory Group of Experts (SAGE), which made strategic decisions regarding swine flu. Osterhaus is linked to "every major virus panic of the past decade, from the mysterious SARS ... [to] publicizing dangers of what he claimed was H5N1 Avian Flu," and even to swine flu, Engdahl reported.

On October 16, Science magazine said this about Osterhaus:

"For the past 6 months, one could barely switch on the television in the Netherlands without seeing the face of famed virus hunter Albert Osterhaus talking about the swine flu pandemic. Or so it has seemed. Osterhaus, who runs an internationally renowned virus lab at Erasmus Medical Center, has been Mr. Flu. But last week, his reputation took a nosedive after it was alleged that he has been stoking pandemic fears to promote his own business interests in vaccine development."

=> https://www.science.org/doi/full/10.1126/science.326_350b

A Science blog from November 3 said Osterhaus had emerged from the investigation unscathed.

Russian lawmaker, Igor Barinov, chairman of the Duma Health Committee, recently launched an investigation into corrupt relations between the WHO and the pharmaceutical industry. If the investigation confirms allegations against the WHO, Barinov said Russia should withdraw from the WHO.

A similar scheme for potential corruption is present at the CDC. On June 8, just a few days before the WHO declared swine flu a pandemic, the CDC was taken over by Dr. Thomas Frieden. Prior, Frieden had been the top health official in New York City and worked overseas for the WHO. In both capacities, he was an active proponent of mass vaccinations against tuberculosis. Under Frieden's direction, the CDC announced a hefty vaccine-based response to the virus and outlined a distribution effort that some doctors say constitutes the largest vaccine experiment ever on pregnant women.

The former CDC director, Dr. Julie Gerberding, was hired by Merck in December to serve as president of the vaccine department. While in charge of the CDC, Gerberding came under intense criticism for bonuses she gave to employees who worked closely with her. And during the Bush presidency, Gerberding oversaw a drastic, multi-year revamping process at the CDC in which dozens of the organization's most respected experts quit their jobs.

The Washington Post reported on August 31, 2004, that a number of CDC officials thought the restructuring plan was "part of a larger administration effort to politicize science." In one organizational shift, vaccine safety was moved out of the domain of the National Immunization Program.

Robert A. Keegan, a high-level official, circulated a memo among the CDC's top leaders in which he revealed that employees who disagreed with official data had been "cowed into silence," the Post reported on March 6, 2005. Margaret Scarlett, who spent 15 years in the Centers' AIDS program before leaving in 2001, was quoted as saying, "Political ideology is being substituted for science."

A possible source of monetary influence by drug makers is the CDC Foundation, a nonprofit organization, which raises money for the CDC's efforts through private donations. Whatever the means, clearly the capacity and incentive for drug makers to lean on science are enormous.

Pandemic Profit

All US contracts for H1N1 vaccines went to just five companies: CSL Limited, Novartis, Sanofi Pasteur, GlaxoSmithKline and MedImmune. All five also produced shots for either SARS or avian flu. When the response to swine flu took full flight in the second and third quarters of 2009, these firms' earnings skyrocketed. But according to British MP, Paul Flynn, that was part of the drug makers' plan. Prior to winning any contracts, drug makers invested $4 billion in preparations for swine flu, he said. That investment may have gone to developing and patenting new, super-fast methods to create vaccines, such as using a bioreactor to grow viruses, said Dr. Wodarg. These patents were key to drug industry profits, since companies can charge much more for patented drugs than unpatented ones, Wodarg said.

"If you have a patent you can monopolize ... and this is what industry did: Invented a fast way to produce vaccines and had it patented, which is much more expensive ... The alternative is not to have vaccines patented ... By decentralizing the production you could be as fast and you wouldn't have this small way you have to pass negotiating with one enterprise that has monopoly, or with four enterprises. It's the economic dimension of the problem which we have to have in mind as we consider how this all happened."

Food and drug agencies in Canada, the UK, France, the US, and elsewhere guaranteed vaccine manufacturers that they would be shielded from any lawsuits connected to the vaccines. This enabled companies to fast track the testing process, reducing some trials to as little as five days.

Wodarg has also voiced concern that the hastily developed vaccines are not entirely safe. He is a fierce opponent of adjuvanted vaccines, which contain a kind of immune booster shown to produce autoimmune responses in some children. Adjuvanted vaccines were sold in parts of Europe and Canada, but are banned in the US.

The private research group, Markets and Markets, estimated that the global H1N1 vaccine market will be worth over $7 billion a year by 2011.

Such incredible profits have sparked a wider shift in medicine from care to profit, according to Marcia Angell M.D., former editor in chief of The New England Journal of Medicine and a senior lecturer at Harvard Medical School.

"Over the past two decades the pharmaceutical industry has moved very far from its original high purpose of discovering and producing useful new drugs. Now primarily a marketing machine to sell drugs of dubious benefit, this industry uses its wealth and power to co-opt every institution that might stand in its way, including the US Congress, the FDA, academic medical centers, and the medical profession itself."

Angell wrote a book called "The Truth About the Drug Companies: How They Deceive Us and What to Do About It." She reported that the drug industry spent around 14 percent of sales profits on research and development in 2000, while spending closer to 35 percent on "marketing and administration." How that expenditure breaks down is not public knowledge, but 35 percent comes out to a lot of money.

See: Charatan F. The Truth About the Drug Companies: How they deceive us and what to do about it. BMJ. 2004 Oct 9;329(7470):862. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC521592/

In 2002, just ten drug companies in the Fortune 500 made more profits than all the other 490 companies put together, according to Angell. Pfizer, GlaxoSmithKline and Merck alone made $287 billion in 2007, according to the 2008 Pharma Report by IMS, a market intelligence firm.

In the words of Alyaksandr Lukashenka, president of the eastern European country Belarus, who spoke on Radio Free Europe last December: "I know very well what is going on in this super-corrupt, gangster circle of medicine producers. Today, [pharmaceutical companies] squeal like swine; tomorrow, perhaps, they'll purr like cats or moo like cows."

Dud Vaccines for Dud Diseases?

Perhaps the most sinister thing about the swine flu fluke is not that the disease has turned out to be a dud, but that the drugs themselves may be duds as well.

The Atlantic magazine ran a piece last November entitled, "Does the Vaccine Matter?" which concluded that medical data showing flu vaccines don't work has been squashed.

The Atlantic piece cites a rigorous study done by the Group Health Research Center in Seattle, which found seasonal flu vaccines to be ineffective. The study was marginalized to a little-read journal, The Atlantic said.

The December issue of The Lancet cites a master study which reviewed all previous flu vaccine studies. The report found, in the final assessment, no evidence that flu vaccines prevent death in children 2 and under - and advises they not be vaccinated.

As Dr. Wodarg put it: "*Our children are vaccinated unnecessarily with the new vaccine*. Scientifically this is a very big error and they don't deserve our trust when they go on like this."

But perhaps the oddest study concerning flu shots was done in Canada. The paper is still under peer review, yet the results were apparently leaked. According to a September 30 article in The Globe and Mail, the study found that Canadians who received last year's seasonal flu vaccine were twice as likely to get swine flu this year. =>

https://web.archive.org/web/20100406062751/http://www.theglobeandmail.com/news/technology/science/study-prompts-provinces-to-rethink-flu-plan/article1303330/

Well-respected researchers Dr. Gaston de Serres of Laval University and Dr. Danuta Skowronski of the British Columbia Centre led the major study for Disease Control. Ethan Rubinstein, who leads the adult infectious diseases department at the University of Manitoba, said the study has "a large number of authors, all of them excellent and credible researchers," and added that the "solid" research drew on a huge sample size of around 12 million people.

[This study was published only after pandemic was over and considered to be a fake pandemic]

=> Janjua NZ, Skowronski DM, et al. Seasonal influenza vaccine and increased risk of pandemic A/H1N1-related illness: first detection of the association in British Columbia, Canada. Clin Infect Dis. 2010 Nov 1;51(9):1017-27. doi: 10.1086/656586. https://pubmed.ncbi.nlm.nih.gov/20887210/

Scientists have no idea how seasonal flu vaccines and H1N1 might be connected.

One frightening possibility is suggested by the work of one of the most extreme voices in the budding movement of people who question the motives behind the swine flu vaccination plan.

Austrian science journalist Jane Burgermeister is suing the drug company Baxter for allegedly sending out about 160 pounds of seasonal flu vaccines containing bird flu-contaminated vaccine. Baxter's intent, she claims, was to instigate a pandemic. Burgermeister, who formerly wrote for the *British Medical Journal*, *Nature* and *The Scientist*, was recently fired from her job as European correspondent of the *Renewable Energy World* web site. Burgermeister believes she lost her job due to the lawsuit.

H1N1 is composed of flu strains from flu viruses found in birds, humans and pigs from both the US and Europe. One leading theory is that the international pig trade enabled the crossing of strains, but according to a Virology Journal article from November 24, how the H1N1 formed remains a mystery to science. The new strain of swine flu emerged last April, with the first cases found in Mexico. However, it is now widely believed to have spawned at hog farms in the US, the Journal reported. =>

Michael Fumento

Why the WHO Faked a Pandemic

Forbes, 5 February 2010, 4:35 pm EST
https://web.archive.org/web/20201011163656/https://www.forbes.com/2010/02/05/world-health-organization-swine-flu-pandemic-opinions-contributors-michael-fumento.html#4295c65248e8

The World Health Organization has suddenly gone from crying "The sky is falling!" like a cackling Chicken Little to squealing like a stuck pig. The reason: charges that the agency deliberately fomented swine flu hysteria. "The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible," the agency claims on its Web site. A WHO spokesman declined to specify who or what gave this "description," but the primary accuser is hard to ignore.

The Parliamentary Assembly of the Council of Europe (PACE), a human rights watchdog, is publicly investigating the WHO's motives in declaring a pandemic. Indeed, the chairman of its influential health committee, epidemiologist Wolfgang Wodarg, has declared that the "false pandemic" is "one of the greatest medicine scandals of the century."

Even within the agency, the director of the WHO Collaborating Center for Epidemiology in Munster, Germany, Dr. Ulrich Kiel, has essentially labeled the pandemic a hoax. "We are witnessing a gigantic misallocation of resources [$18 billion so far] in terms of public health," he said.

They're right. This wasn't merely overcautiousness or simple misjudgment. The pandemic declaration and all the Klaxon-ringing since reflect sheer dishonesty motivated not by medical concerns but political ones.

Unquestionably, swine flu has proved to be vastly milder than ordinary seasonal flu. It kills at a third to a tenth the rate, according to U.S. Centers for Disease Control and Prevention estimates. Data from other countries like France and Japan indicate it's far tamer than that.

Indeed, judging by what we've seen in New Zealand and Australia (where the epidemics have ended), and by what we're seeing elsewhere in the world, we'll have considerably fewer flu deaths this season than normal. That's because swine flu muscles aside seasonal flu, acting as a sort of inoculation against the far deadlier strain.

Did the WHO have any indicators of this mildness when it declared the pandemic in June?

Absolutely, as I wrote at the time. We were then fully 11 weeks into the outbreak and swine flu had only killed 144 people worldwide--the same number who die of seasonal flu worldwide every few *hours*. (An estimated 250,000 to 500,000 per year by the WHO's own numbers.) The *mildest* pandemics of the 20th century killed at least a million people.

But how could the organization declare a pandemic when its own official definition required "simultaneous epidemics worldwide with enormous numbers of deaths and illness." Severity – that is, the number of deaths – is crucial, because every year flu causes "a global spread of disease."

Easy. In May, in what it admitted was a direct response to the outbreak of swine flu the month before, WHO promulgated a new definition matched to swine flu that simply eliminated severity as a factor. You could now have a pandemic with zero deaths.

Under fire, the organization is boldly lying about the change, to which anybody with an Internet connection can attest. In a mid-January virtual conference WHO swine flu chief Keiji Fukuda stated: "Did WHO change its definition of a pandemic? The answer is no: WHO did not change its definition." Two weeks later at a PACE conference he insisted: "Having severe deaths has never been part of the WHO definition."

They did it; but why?

In part, it was CYA for the WHO. The agency was losing credibility over the refusal of avian flu H5N1 to go pandemic and kill as many as 150 million people worldwide, as its "flu czar" had predicted in 2005.

Around the world nations heeded the warnings and spent vast sums developing vaccines and making other preparations. So when swine flu conveniently trotted in, the WHO essentially crossed out "avian," inserted "swine," and WHO Director-General Margaret Chan arrogantly boasted, "The world can now reap the benefits of investments over the last five years in pandemic preparedness."

But there's more than bureaucratic self-interest at work here. Bizarrely enough, the WHO has also exploited its phony pandemic to push a hard left political agenda.

In a September speech WHO Director-General Chan said "ministers of health" should take advantage of the "devastating impact" swine flu will have on poorer nations to get out the message that "changes in the functioning of the global economy" are needed to "distribute wealth on the basis of" values "like community, solidarity, equity and social justice." She further declared it should be used as a weapon against "international policies and systems that govern financial markets, economies, commerce, trade and foreign affairs."

Chan's dream now lies in tatters. All the WHO has done, says PACE's Wodart, is to destroy "much of the credibility that they should have, which is invaluable to us if there's a future scare that might turn out to be a killer on a large scale."

Как ВОЗ инсценировала пандемию «свиного гриппа»

Перевод статьи

Michael Fumento. Why The WHO Faked A Pandemic. – Forbes, 5 February 2010

https://redko-da-metko.ru/2021/05/09/kak-voz-inszenirovala-pandemiu-svinogo-grippa/

Всемирная Организация Здравоохранения внезапно перестала кричать: «небо падает!» – как кудахчущая курица. Причина: обвинения в том, что ведомство намеренно разжигало истерию вокруг свиного гриппа. [в 2009-2010 гг]

«Мир переживает настоящую пандемию. Описание его как подделки является неправильным и безответственным», – говорится в заявлении агентства на его веб-сайте.

Представитель ВОЗ отказался уточнить, кто или что дал это «описание», но главного обвинителя трудно игнорировать.

Парламентская ассамблея Совета Европы (ПАСЕ), наблюдатель за соблюдением прав человека, публично расследует мотивы ВОЗ, объявившей пандемию.

Действительно, председатель его влиятельного комитета по здравоохранению, эпидемиолог Вольфганг Водарг, заявил, что «ложная пандемия «является» одним из величайших медицинских скандалов века»

Даже в рамках агентства директор сотрудничающего центра ВОЗ по эпидемиологии в Мюнстере, Германия, д-р Ульрих Киль, по существу, назвал пандемию мистификацией [свиного гриппа].

«Мы наблюдаем гигантское нерациональное распределение ресурсов (на момент 2010 года – 18 миллиардов долларов) с точки зрения общественного здравоохранения», – сказал он.

Они правы. Это была не просто чрезмерная осторожность или просто неверное суждение. Декларация о пандемии и все сигналы опасности с тех пор отражают нечестность, мотивированную не медицинскими соображениями, а политическими мотивами

Бесспорно, свиной грипп оказался значительно мягче обычного сезонного гриппа. По оценкам американских Центров по контролю и профилактике заболеваний, он убивает от трети до десятой части населения.

Данные из других стран, таких как Франция и Япония, указывают на то, что он гораздо более опасен.

Действительно, судя по тому, что мы видели в Новой Зеландии и Австралии (где эпидемии закончились), и по тому, что мы видим в других частях мира, у нас будет значительно меньше смертей от гриппа в этом сезоне, чем обычно.

Это потому, что свиные гриппозные вирусы находятся в стороне от сезонного гриппа, действуя как своего рода прививка против гораздо более смертоносного штамма.

Были ли у ВОЗ какие-либо признаки легкого течения данного заболевания, когда она объявила пандемию в июне?

Абсолютно, как я тогда и писал . В то время мы были на 11 неделе вспышки, и свиной грипп убил только 144 человека во всем мире – то же самое число, которое умирает от сезонного гриппа во всем мире каждые несколько часов

(По оценкам ВОЗ, от 250 000 до 500 000 человек в год.) Самые мягкие пандемии 20-го века унесли жизни по меньшей мере миллион человек.

Но как организация могла объявить пандемию, когда ее собственное официальное определение требовало «одновременных эпидемий во всем мире с огромным числом смертей и болезней»

Серьезность – то есть количество смертей – имеет решающее значение, потому что каждый год грипп вызывает глобальное распространение болезни

Легко. В мае, в том, что она признала, было прямым ответом на вспышку свиного гриппа месяцем ранее, ВОЗ обнародовала новое определение, соответствующее свиному гриппу, которое просто устранило тяжесть как фактор. Теперь у вас может быть пандемия с нулевой смертностью. Как так?

В середине января на виртуальной конференции ВОЗ по свиному гриппу глава Кэйдзи Фукуда заявил: «изменила ли ВОЗ свое определение пандемии?

Ответ отрицательный: кто не изменил своего определения. Две недели спустя на конференции ПАСЕ он настаивал: «наличие тяжелых смертей никогда не было частью определения ВОЗю

Они сделали это, но зачем?

Агентство теряло доверие из-за отказа птичьего гриппа H5N1 (по прогнозам) перейти в пандемию и убить до 150 миллионов человек во всем мире, как и предсказывал его «царь гриппа» [глава ВОЗ] в 2005 году.

Страны всего мира прислушались к этим предостережениям и потратили огромные суммы на разработку вакцин и других препаратов. Поэтому, когда свиным гриппом удобно было воспользоваться.

ВОЗ по существу вычеркнула «птичий», вставила «свиной», и генеральный директор ВОЗ Маргарет Чен высокомерно похвасталась: «мир теперь может пожинать плоды инвестиций за последние пять лет в обеспечение готовности к пандемии.»

Но тут дело не только в бюрократическом эгоизме. Как ни странно, ВОЗ также использовала свою фальшивую пандемию для продвижения жесткой левой политической повестки дня.

В сентябре выступление генерального директора ВОЗ Чан сказала, что свиной грипп следует использовать в качестве оружия против «международной политики и систем, которые управляют финансовыми рынками, экономикой, торговлей и иностранными делами»ю

Мечта Чан теперь в клочьях. Все, что сделал ВОЗ, говорит Уодарт Пейса, – это разрушила «большую часть доверия, которое они должны были иметь, что бесценно для нас, если есть будущий страх, который может оказаться убийцей в больших масштабах.

Special Investigation: The men who made a killing out of Swine Flu while we wasted £1bn and were exposed to harmful drugs

Daily Mail, 6 February 2010, 2:15 AM
http://www.dailymail.co.uk/news/article-1248878/SPECIAL-INVESTIGATION-The-men-killing-swine-flue-wasted-1bn-exposed-harmful-drugs.html#

Only in her bedroom can Samantha Millard find some relief from the almost constant pain that racks her skeletal frame.

Her blistered skin is so sore that she has to moisturise it up to ten times a day, and her eyes are so painful and her vision so blurred that she can barely see. The 19-year- old cannot read or watch TV. Instead, she closes two pairs of curtains to block out the light, lies down on her bed and listens to the radio hour after hour. So much for the teenager's dreams of becoming an air hostess. For Samantha, even going to the shops with her mother is a journey too far. Samantha's probems started in December when she started to feel under the weather, called her GP's surgery and was told to ring the NHS swine flu helpline. Samantha did as she was bid and, after a brief chat on the phone, was diagnosed as suffering from the H1N1 virus.

As is government policy, she was prescribed the anti-viral drug Tamiflu, and her mother collected it for her. But just three tablets into the course, Samantha suffered an horrific allergic reaction to the medication. She spent four weeks in hospital and has only recently returned home, but has been told it could be months, even years, before she recovers fully. As if what Samantha experienced were not bad enough, her story has a final sting in the tail.

Tests carried out while she was in hospital showed that she didn't have swine flu at all and so shouldn't have been prescribed Tamiflu in the first place. 'When we were told that, I couldn't believe it,' says her mother Debbie. 'I went to pick up the Tamiflu and gave it to her - and it nearly killed her. And she didn't even need it.' The anger felt by Samantha and her family is intense. And while their experience is an extreme one, they are not alone in believing that they are the victims of one of the biggest medical scandals of modern times.

For since Christmas, the numbers estimated to have contracted the virus have been falling and now stand at fewer than 5,000 a week. During the outbreak's peak, late last summer, the figure was 100,000. The rate of GP consultations for flu-like illness is now around 12 per 100,000 – lower than normal for this time of year.

Ten months after the first cases of swine flu were identified in Mexico City, British health chiefs this week said that the NHS 24-hour flu helpline would close next Thursday – essentially heralding the end of the pandemic. However, there is a growing feeling that the threat posed by swine flu was grossly exaggerated. Further, the contention is that this exaggeration was deliberate and was stoked by the pharmaceutical companies that stood to cash in on a world desperate for their drugs.

Here in Britain, the Chief Medical Officer, no less, predicted that 65,000 people could die of the virus, putting the very fabric of society at risk. The Government, desperate to be seen to be doing something, responded in a way that has become alltoofamiliar: pouring out taxpayers' money.

In all, the British Government spent £1billion stockpiling anti-viral drugs such as Tamiflu and ordering enough vaccines to give two doses to every man, woman and child.

At the same time, normal medical procedures were abandoned so that call centre workers - unqualified and often very young – could diagnose the sick and dole out medication. But the Doomsday scenario predicted never unfolded. In fact, just 411 people in the UK have so far died as a result of swine flu. Of them, roughly 80 per cent had underlying health problems. That means that fewer than 100 people have been killed by swine flu alone. While each of those deaths is, of course, a tragedy, the question must be asked: how many other people's health has suffered, and will suffer, because of this diversion of funds and energy?

What also should not be underestimated is the stress and strain placed on families as they were left to decide whether to treat their sick children with powerful antivirals, with all their potential side-effects.

The same goes for the untested vaccine which was targeted, in particular, at pregnant women and young children.

The sense of relief that the H1N1 virus seems not to have been as virulent as was first feared is fast evaporating. In its place is a sense of betrayal and real concern that the next time a similar virus strikes, formerly trusting citizens will be far less willing to do as they are told.

So, what went wrong? First, we need to examine the role of the National Pandemic Flu Service (NPFS). More commonly known as the swine flu hotline, it was launched last July as the frontline in the Government's battle against the virus.

Designed to take pressure off GPs and prevent the spread of the bug, the service was responsible for ' diagnosing' the illness and dispensing anti-virals. Of those who contacted the NPFS between its launch and January 12 this year, 1,748,866 people were authorised to receive the anti-viral Tamiflu. Of this number, more than 1,125,000 patients went on to collect their free prescriptions.

A further 15,000 courses of Relenza, the alternative treatmentfor pregnant women, were also handed out.

Separately, the Government also embarked on a mass vaccination programme which saw 4.25 million people receive the jab. At first sight, the figures make impressive reading. But they have come at that huge £1billion cost. The money was spent primarily on purchasing the anti-virals and vaccines – and, make no mistake, they bought more than enough to go around.

Responding to warnings that 350 people could die every day in Britain, it is understood that 33 million courses of Tamiflu were purchased. Most of those remain unused. At the same time, between 90 million and 120 million doses of the vaccine were stockpiled. (It was initially believed that two jabs would be needed to provide protection – something that was subsequently disproved.) In other words, the amount of Tamiflu doled out and the amount of vaccines administered is dwarfed by the amount that stands unused. As a result, the Government is now desperately trying to renegotiate orders with suppliers, or to sell it cheap to Third World countries, and so recoup some of the money spent.

The Government argues that it is easy to be wise with hindsight and that all it was doing was following scientific advice. Further, it claims that if it had done nothing, then more people would have died.

But already experts are pointing to the experience of Poland, the only country in Europe which didn't inoculate against swine flu. There, some 150 people died from the disease – out of a population of 40 million. In December, its prime minister, Donald Tusk, said Poland had the rare 'courage' to refuse a vaccine that he believed had not undergone sufficient testing.

Contrast that with the reaction of the British government.

Last summer, Britain had effectively crowned itself Europe's swine flu capital. Indeed, such was the perception abroad of the problem that in 2009 foreign visitor numbers dropped by 5 per cent. But whether Britain was, in fact, any worse hit than elsewhere is unclear. Research suggests that as many as eight out of ten people diagnosed as suffering from swine flu by the hotline did not have it. That means that more than 800,000 of the one million-plus packets of Tamiflu – which cost around £15 each – were given out needlessly.

Further, doubt has also been cast onto the effectiveness of the Tamiflu anti-virals in treating the H1N1 virus.

While extreme adverse reactions to it, such as those suffered by Samantha, are rare – her case is being investigated by makers Roche – studies have claimed that it only marginally shortens the length of the illness.

Also, what nobody knows is how many patients suffering from potentially fatal illnesses such as pneumonia were misdiagnosed, so missing out on more appropriate treatment. In fact, scientists are now reporting that swine flu is only one-tenth as virulent as ordinary flu.

So who was to blame for all this? ***The finger is being pointed directly*** *at the World Health Organisation*, which stands accused of announcing 'a false pandemic' in June last year.

What was not widely known at the time was that in the spring, the WHO had softened its criteria for defining a pandemic. Instead of the requirement that pandemic strains should cause 'enormous morbidity and death', henceforth all that would be required for 'pandemic status' was ' sustained' transmission in at least two different parts of the world at the same time.

Critics now claim that the drug companies manipulated the WHO into downgrading its criteria for a pandemic so they could cash in on an outbreak. It is alleged that they were desperate to recoup costs, having invested some £2.5 billion developing vaccines to deal with the bird flu pandemic in 2007, which, as it transpired, never happened.

These accusations form the basis of an inquiry being conducted by the Strasbourg-based human-rights group, the Council of Europe.

Dr Wolfgang Wodarg is a former president of the council's Health Committee and is adamant that the world was misled. 'WHO advised us falsely,' he says. 'They raised a false alarm. It was stated that this was a flu that could threaten humanity.' Also giving evidence, Professor Ulrich Keil, a WHO adviser on heart disease, said the decision had led to a 'gigantic misallocation' of health budgets. 'We know the great killers include hypertension, smoking and high cholesterol,' he said. 'Despite this, governments instead wasted huge amounts of money by investing in pandemic scenarios whose evidence base is weak.'

Labour MP Paul Flynn believes the questions raised are legitimate ones: 'We need to know who is making the assessment of risk. Is it based on rational, independent epidemiological evidence, or is it influenced by the pharmaceutical industry for their own purposes?

'The main concern is that the drugs companies and the vaccine manufacturers have their tentacles in every area where decisions are taken – that includes the WHO, governments, civil service, and even charities. 'The overwhelming view now,' says Flynn, 'is that the scare was grossly exaggerated.'

In all, it is estimated that the companies behind the vaccines and anti-virals will scoop a £4 billion windfall from the pandemic. GlaxoSmithKline has revealed that sales of its vaccine reached £835 million in the fourth quarter of 2009. Sales of the drug Relenza have also earned it hundreds of millions of pounds. In the same period, Novartis notched up vaccine sales of more than £800 million, the vast majority coming from H1N1 sales. Meanwhile, drugs firm Roche reported an 8 per cent rise in annual sales last year, helped by sales of the swine flu drug Tamiflu, with profits up 14 per cent to £8.89billion.

These companies vehemently deny having influenced the way in which the swine flu pandemic was managed.

And the WHO is unapologetic. 'Let me state clearly for the record – the influenza pandemic policies and responses recommended and taken by WHO were not improperly influenced by the pharmaceutical industry,' said Dr Keiji Fukuda, the WHO's top flu expert.

'We do not wait until (these outbreaks) have developed and we see that lots of people are dying. What we try to do is take preventive actions. If we are successful, no one will die, no one will notice anything.'

Further, scientists warn that it is far too early to say that the threat from the H1N1 virus is over. They warn that a subsequent wave could strike, with more devastating impact.

For this reason, they are insisting that people continue to be vaccinated.

'When the virus returns in the 2010 flu season, those who develop complications or die will be doing so from a vaccinepreventable disease,' insists the Chief Medical Officer, Professor Sir Liam Donaldson.

But with a growing perception that the scientists have cried wolf one too many times, the fear is that people will be less inclined to follow such advice.

And in Britain there is a nagging worry that when it comes to managing a crisis, the Government simply cannot be relied upon.

This view is captured in a letter in a national newspaper written by a certain Gordon Stockley of Chester.

In January, as Britain ground to a halt in the snow, he summed up the feelings of many: 'You report that the country has grossly overstocked on swine flu medication. What a pity those responsible were not also in charge of ordering road salt.'

A rare moment of levity after what, for many, has been a worry-filled winter.

Daan de Wit
Translated by Ben Kearney
WHO plays dubious role in Swine flu pandemic

Deep Journal, 6 February 2010
http://deepjournal.com/p/43/a/en/2540.html

On June 11, 2009 Margaret Chan, the Director-General of the WHO, declared the Swine Flu a pandemic. That's the highest phase – phase 6. It's the first worldwide flu pandemic in 41 years. 'Swine flu will be biggest pandemic ever, warns world health chief'. She also said: 'Based on past experience, this pandemic will be with us for some months, if not years, to come'. Chan's June 11th declaration is one that comes with great consequences.

The declaration of phase six means that emergency procedures are put into motion which bypass established systems designed to safeguard the public health. The result of this is described in part six of this DeepJournal series on the Swine Flu. Conclusion: the vaccine is being tested while being administered to the public. The definition of what a pandemic is, is therefore of great import.

WHO alters definition of pandemic

In her June 11th declaration Chan said that she had come to her decision to declare a pandemic because 'on the basis of available evidence, and these expert assessments of the evidence, the scientific criteria for an influenza pandemic have been met'. What she didn't say was that the WHO had previously adjusted the criteria for a pandemic downward. In May the headline of a small Reuters article read: 'WHO rethinks criteria for Phase 6 pandemic flu'.

What's clear is that in 2005 it was still necessary for a new influenza subtype to surface before it could satisfy the criterium for a pandemic. Since May of 2009, it is sufficient for an influenza virus to mutate relative to the original subtype. 'Under the new meaning, a pandemic does not need to cause high numbers of death or illness', writes Truthout. 'A month after changing the definition, with just 144 people dead from H1N1, the flu was given the WHO's highest threat classification: a "stage-six pandemic alert." => http://deepjournal.com/p/43/a/en/2527.html By comparison, the mildest 20th century pandemic killed a million people'.

Epidemiologist Tom Jefferson says on Swedish television: 'What they [WHO] have done, is that they have taken out the part that referred to simultaneous outbreaks, high morbidity - that is a very high number of severe cases - and mortality.
=> https://web.archive.org/web/20090901031548/https://www.infowars.com/scientist-tells-swedish-tv-who-pandemic-criteria-lowered-to-benefit-big-pharma/
So now, this 2009 definition, could very well fit seasonal influenza. So I don't understand what the difference is anymore. The new definition lowers the threshold. It makes [it into] a pandemic now and possibly a pandemic going on for some time'. Phase six is still in effect to this day . Jefferson goes on to say: 'And it obviously favours those who have to sell products'.
=>https://web.archive.org/web/20051124003932/https://www.who.int/csr/disease/avian_influenza/phase/en/index.html
The new classification has implications for the future, for 'according to the new definition, almost any influenza virus that mutates from the original subtype (a process known as "drift") would qualify as a pandemic strain if it spread readily from human to human'. The meaning of the term 'pandemic' has been considerably deflated by the new criterium. It's a cosmetic change that in practice is making a big difference.

WHO income streams

With an influential organization such as the WHO, independence is crucial. It's therefore justifiable to examine its sources of income. From an extensive article in the weekly Austrian magazine Profil it's evident that in 1998, the majority of the WHO's income came from governments. After the WHO entered into 'partnerships' in 2004, most of the money came from 'voluntary contributions', some of those of course coming from industry. According to last year's budget, those contributions amount to 2.3 billion euros, and that amount is about three times as much as what the countries of the UN contribute. Profil: 'The vaccine producers were invited - naturally - to all of the discussions on the pandemic'. =>

https://web.archive.org/web/20091102112547/https://www.profil.at/articles/0944/560/254615/schwindel-schweinegrippe-ist-aufregung-coup-pharmaindustrie

Big words, small numbers

'Every year an average of between 200 to 1000 people die from complications of the flu [in The Netherlands]', reports the Dutch National Institute for Public Health and the Environment. The institute made it known as early as December 24th of 2009 that the Swine Flu epidemic was over.

=>https://web.archive.org/web/20091226165729/https://nos.nl/artikel/124994-epidemie-mexicaanse-griep-voorbij.html

In The Netherlands, no more than 51 people died from it, of whom most were already sick when they contracted the flu. Worldwide the Swine Flu claimed 14,000 lives, according to the WHO.

=> https://web.archive.org/web/20100128025616/http://www.who.int/csr/disease/swineflu/coe_hearing/en/index.html

Journalist William Engdahl writes that that number is probably on the high side: 'The WHO, it turns out, lumps its statistics for flu deaths together with those from pneumonia, a completely separate and far more common illness and a far larger cause of death, in a disease classification it calls "Influenza and Pneumonia (J09-J18)."

=> https://www.globalresearch.ca/flying-pigs-saga-continued-who-admits-no-deadly-mutation-of-h1n1-swine-flu/15447

Epidemiologist Tom Jefferson adds to this the subtle distinction that only 'approximately 7 percent of influenza-like illness cases are caused by influenza viruses'.

=>https://www.spiegel.de/international/world/interview-with-epidemiologist-tom-jefferson-a-whole-industry-is-waiting-for-a-pandemic-a-637119.html

Margaret Chan said recently: 'The days when health officials could issue advice, based on the very best medical and scientific data, and expect populations to comply, may be fading'.

=>https://web.archive.org/web/20100414133052/http://www.who.int/dg/speeches/2010/executive_board_126_20100118/en/index.html

stern.de

Eine Milliarde durch den Schornstein gepfiffen

Stern.de, 9 Februar 2010, 09:20 Uhr
https://web.archive.org/web/20100211015315/http://www.stern.de/gesundheit/schweinegrippe-eine-milliarde-durch-den-schornstein-gepfiffen-1541954.html

Die Schweinegrippe ist vorbei und fast vergessen. Es gibt allerdings noch viel aufzuarbeiten, kritisiert der Epidemiologe Ulrich Keil. "Alle paar Jahre werden wir mit Epidemien geängstigt", sagt er im stern.de-Interview. "Dabei sind die großen Killer andere."

Zur Person Ulrich Keil ist Medizinprofessor an der Universität Münster und Leiter des dort angesiedelten "WHO Collaborating Centre for Epidemiology and Prevention of Cardiovascular and other Chronic Diseases". In einer Sitzung des Europarates kritisierte er das Vorgehen der WHO im Zusammenhang mit der Schweinegrippe scharf.

Herr Keil, der Hype um die Schweinegrippe ist vorbei. Können wir die Sache nun abhaken?
Nein. Bei dieser Geschichte gibt es noch viel aufzuarbeiten. Die Anhörung im Europarat war ein erster richtiger Schritt, doch es müssen noch weitere auch auf nationaler Ebene folgen.

Sie haben auf einer Sitzung des Europarates zum Thema Schweinegrippe der WHO vorgeworfen, die Angst vor H1N1 geschürt zu haben. Warum?
Alle paar Jahre werden wir mit Epidemien geängstigt. 2002/03 war es Sars, 2005/06 kam die Vogelgrippe. Jedesmal wurden große Angstkampagnen inszeniert. Bis jetzt waren das alles regionale Epidemien, die sich nur sehr begrenzt ausgebreitet haben. Weltweit erkrankten an der Vogelgrippe nur etwa 350 Menschen. Dennoch diente sie als Modell einer Pandemie. Auch bei der Schweinegrippe haben Virologen schnell Angst verbreitet, da das Virus in seiner Gefährlichkeit dem der Spanischen Grippe ähnlich sei. Der Vergleich war allerdings falsch. Damals war es eine gänzlich andere Situation. Das Virus traf auf eine durch den ersten Weltkrieg geschwächte, unterernährte Bevölkerung. Seit 1840 nimmt die Lebenserwartung in der westlichen Welt pro Dekade um zweieinhalb Jahre zu. Die letzte große Grippeepidemie in Deutschland, die sich auf die Lebenserwartung ausgewirkt hat, war 1968.

Heißt das, als gut ernährte und versorgte Menschen in der westlichen Welt müssen wir uns vor einem Pandemie-Virus gar nicht fürchten?
Dass uns nie wieder eine schwere Pandemie treffen wird, kann natürlich niemand vorhersagen. Wichtig ist aber, die größeren Abwehrkräfte der Menschen, sprich ihre Resistenz zu beachten. Die großen Killer sind in Wahrheit heute andere: chronische Erkrankungen wie Bluthochdruck oder Diabetes oder ungesundes Verhalten, wie falsche Ernährung, Rauchen oder zu wenig Bewegung. Ärgerlich ist ja: An allen Ecken und Enden fehlt uns Geld im Gesundheitssystem und dann wird bei der Schweinegrippe eine Milliarde oder mehr durch den Schornstein gepfiffen.

Wer hat falsch gehandelt?
Die WHO und die nationalen Institutionen hätte umschwenken müssen, als klar war, dass die Grippe auf der südlichen Hemisphäre im Winter einen milden Verlauf nimmt. Das war ein deutliches Zeichen, dass keine Killerpandemie droht. Stattdessen hatte man schon zuvor die Definition der

Pandemie geändert. Nicht mehr der Schweregrad sondern allein die Verbreitung eines Virus zählt nun. Ketzerisch gefragt: Wird die WHO dann im kommenden Jahr auch Schnupfen zur Pandemie erklären und dagegen impfen wollen?

Was hat die Ausrufung der Pandemie für die Verträge bedeutet, die zwischen den Regierungen und der Pharmaindustrie schon bestanden?

Ganz einfach: Die Ausrufung der Stufe sechs des Pandemieplanes durch die WHO hat die zwischen Regierungen und Pharmaindustrie bestehenden Verträge in Kraft gesetzt. Die Impfkampagne konnte anlaufen.

Warum hat die WHO so gehandelt?

Ich will die WHO nicht verunglimpfen, denn sie hat große Verdienste, zum Beispiel bei der Ausrottung der Pocken oder der fast vollständigen Ausrottung der Kinderlähmung. Bei der Schweinegrippe glaube ich, dass sie unter Druck gesetzt wurde. Ich kenne die WHO seit 1973. Viele leitende Stellen waren damals mit Leuten aus dem ehemaligen Ostblock besetzt, die von der Industrie nichts wissen wollten. Bis 1990 war die Organisation von Industrieinteressen daher fast vollkommen frei. Danach erfolgte eine starke Öffnung hin zur Industrie.

Bleiben die Alarmstufe und die Pandemiedefinition eigentlich jetzt so bestehen?

Das wurde in Straßburg debattiert. Die WHO hat in dieser Hinsicht bis jetzt nichts zurückgenommen - weder bei der Pandemiedefinition noch bei der Alarmstufe. Letztere soll noch zwei Jahre bestehen bleiben. Ich bin der Meinung, dass man den Pandemiealarm schon längst hätte zurückstufen müssen. Alles andere ist absurd.

Schweinegrippe in Deutschland Dem Robert-Koch-Institut zufolge sind mittlerweile ungefähr 220.000 Fälle von Schweinegrippe in Deutschland bekannt, 186 Neuerkrankungen kamen in der vierten Kalenderwoche 2010 dazu. Der Anstieg ist damit modert. Insgesamt wurden 216 Todesfälle im Zusammenhang mit H1N1 gemeldet. Bis Jahresende ließen sich laut Paul-Ehrlich-Institut 7,5 Prozent der Bevölkerung älter als 14 Jahre gegen H1N1 impfen. Für 30 Prozent hatten die deutschen Behörden Impfstoff eingekauft.

Wie hätte die WHO reagieren müssen, nachdem erkennbar war, dass die Schweinegrippe in den meisten Fällen mild verläuft?

Vor allem hätte man in die ursprünglichen Pandemiepläne Kontrollmechanismen einbauen müssen, die garantiert hätten, dass bei einem milden Verlauf der Erkrankung Alarmstufen zurückgefahren worden wären. Den Verlauf zu beobachten und die Gefahr abzuschätzen, ist auch die Aufgabe guter Infektionsepidemiologen und der Landesbehörden. Sie hätten eingestehen müssen: Wir haben übertrieben, es verläuft nicht so schlimm, eine riesige Impfkampagne brauchen wir nicht.

Was hat die Aktion den deutschen Steuerzahler gekostet?

Die Steuerzahler beziehungsweise die gesetzliche Krankenversicherung mindestens eine Milliarde. Aus meiner Sicht sogar mehr. In Straßburg wurde auch besprochen, dass die Industrie insgesamt für Entwicklung und Herstellung der Impfstoffe vier Milliarden ausgegeben und wohl 18 Milliarden Umsatz weltweit gemacht hat.

Warum hat man sich in Deutschland auf diese Verträge überhaupt eingelassen?

Es ist hart zu sagen, aber in den Ministerien war teilweise zu wenig Sachverstand am Werk. Das waren Knebelverträge, die Industrie hat den Staat dabei über den Tisch gezogen. Vertraglich war zugesichert, dass 50 Millionen Dosen abgenommen werden müssen, für die Nebenwirkungen und eventuelle Risiken bestand allerdings keine Haftung. Nun wird generös gesagt, dass die Länder nur Impfstoffe für 34 Millionen kaufen müssen. Im Prinzip hat sich die Industrie trotzdem schadlos gehalten.

Allerdings braucht man die Industrie ja auch.

Ja. Als Gegner der Tabakindustrie habe ich immer gesagt, dass diese Industrie etwas anderes ist als die pharmazeutische Industrie. Die Tabakindustrie produziert ein Produkt, das in jeder Menge die Menschen schädigt. Die Pharmaindustrie macht auch viel Gutes, wir brauchen sie und sie ist eine Säule unseres Gesundheitswesens. Die Impfstoffproduktion in staatliche Hand zurückzugeben, ist kaum möglich. Fachleute befürchten nicht zu Unrecht, dass dann auch die Innovation auf der Strecke bliebe. Allerdings muss die Pharmaindustrie strengeren Regeln unterworfen werden. Es ist zum Beispiel ein Skandal, dass diese Industrie ein Vielfaches ihres Forschungsetats in Werbung und Marketing steckt.

Wer soll die Industrie denn an die Kandare nehmen?

Die große Schwierigkeit auf diesem Gebiet ist es, unabhängige Gutachter zu bekommen. Von Studentenbeinen an ist in der Medizin der Einfluss der pharmazeutischen Industrie und der Geräteindustrie unverkennbar. Daher sind unabhängige Institutionen wie das Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesen so wichtig. Es ist allerdings zu befürchten, dass dessen Stand unter der neuen Regierung nicht gerade gestärkt wird. Problematisch ist bei der Schweinegrippe leider auch die Arroganz mancher Fachleute. Man argumentiert, dass es so kompliziert ist, dass die lieben Leute es gar nicht verstehen können.

Aber die lieben Leute haben mit den Füßen abgestimmt.

Ja. Die Bevölkerung hat sich zum Glück nicht täuschen lassen. Die Leute haben gemerkt, dass es sich bei der Schweinegrippe um keine gravierende Krankheit handelt. Es ist ja auch falsch, die Menschen für dumm zu verkaufen. Es ist Aufgabe von Wissenschaftlern, die Fakten auch Laien verständlich und ohne Interessenkonflikte darzustellen.

Dann erklären Sie doch bitte, ob die beschworene gefährliche Mutation des H1N1-Virus noch droht?

Das sehe ich nicht. Eine so gravierende Mutation erfolgt ja nicht auf einen Schlag, das geht in mehreren Stufen. Ansonsten würde das auch bedeuten, dass sie mit einem Mal mit dem alten Impfstoff nichts mehr anfangen können. Das bestreiten aber Institutionen wie das Robert-Koch- oder das Paul-Ehrlich-Institut. Gleichzeitig verweisen sie gerade auf die gefährliche Mutation als Grund für die Pandemieimpfung. Da muss man die Logik einmal hinterfragen. Für mich sieht es jedenfalls so aus, als ob wir die Schweinegrippe überstanden haben. Auf der südlichen Hemisphäre ist sie sehr mild verlaufen und auch bisher nicht in einer zweiten Welle wiedergekommen.

WHO scientist demands investigations at national level into swine flu scam

The Flu Case, 9 February 2010, 12:42
https://web.archive.org/web/20100220013542/http://www.theflucase.com/index.php?option=com_content&view=article&id=2718%3Awho-scientist-demands-investigations-at-national-level-into-swine-flu-scam&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Dr Ulrich Keil from the University of Münster and Director of a WHO centre, said that investigations should be opened into the role of national governments in the swine flu scam in a hard-hitting interview with the German magazine Stern.

=> https://web.archive.org/web/20100211015315/http://www.stern.de/gesundheit/schweinegrippe-eine-milliarde-durch-den-schornstein-gepfiffen-1541954.html

Keil, who participated in a Council of Europe Parliamentary Assembly hearing on WHO's declaration of a pandemic emergency over the mild swine flu, said that mechanisms should have

built into pandemic management plans to stop an emergency declaration that triggered a mass vaccination campaign with potentially dangerous jabs being made over a mild infections.

He criticised national infectious disease monitoring bodies as well as WHO for exaggerating the danger of the swine flu.

"Luckily , people didn't let themselves be taken in. People noticed the swine flu is not a serious illness. It is a mistake to think people are stupid. It is the job of scientitsts to make facts comprehensible to lay people and without conflicts of interest," he said.

In addition, he said WHO's plan to keep the world on a pandemic level six emergency for another two years in spite of the evidence there is no pandemic "absurd" and said the pandemic level should have been reduced "long ago."

"A lot more needs to be done to get to the bottom this story. The hearing in the Council of Europe was an first, correct step, but others must follow on a national level," Keil said.

If a lethal pandemic were ever to emerge, the best defence would be strenghtening people's immune system (vitamins etc), he said, gently side-lining the role of vaccines altogether.

He said that the real killer diseases of today are not pandemics, but chronic illnesses such as high blood pressure, diabetes or illnesses that come from a poor diet, smoking or too little exercise.

Also, he said that "a billion euros or more has gone up in smoke" for the swine flu, money sorely needed for other treatments at a time when the health system is suffering from underfunding.

Keil said that it had become clear early on that no lethal mutation had remained mild in the southern hemisphere in winter. Furthermore, if the swine flu virus did undergo a significant mutation to become lethal, the vaccines would be useless, undermining WHO's argument.

"You have to ask about the logic," he said.

Keil called for stronger regulation of the pharmaceutical industry, noting ist influence on governments and acdemia the lack of independent scientists.

He called it a scandal such a high proportion of ist revenue is spent on marketing and advertising.

The issue of whether bribes, off-shore bank accounts and other financial inducements have been given to officials to get them to go along with the swine flu scam has been spotlighted by the investigation into the activities of Dutch virologist Albert Osterhaus.

Keil focussed on the fact that pharmaceutical companies would still be paid for 34 million swine flu vaccines under current agreements, boosting vaccine manufacturer earnings.

The WHO scientists said WHO had opened ist doors to industry from 1990, leading to a massive influence on the organisation by the pharma lobby.

Keil attributed the relative lack of influence industry had on WHO up until then to the fact that many leading positions were held by people in the former eastern bloc, who had little interest in close contact with industry.

He criticised the current government for ist role in undermining independent institutes.

Keil's interview is sure to add to the pressure to mount a full investigation in Germany into the swine flu scandal.

A parliamentary inquiry has already been launched in France.

THE FLU CASE

Husband of health minister who signed Austrian pandemic plan embroiled in bribery scandal

The Flu Case, 9 February 2010, 12:46
https://web.archive.org/web/20100220013547/http://www.theflucase.com/index.php?option=com_content&view=article&id=2719%3Ahusband-of-health-minister-who-signed-austrian-pandemic-plan-embroiled-in-bribery-scandal&catid=1%3Alatest-news&Itemid=64&lang=en

Austrian Count Alfons Mensdorff-Pouilly was granted bail by a UK court after former minister John Gummer gave the judge a note vouching for his good character and after paying a 1 million pounds.

The unexpected leniency of a UK court has fuelled speculation in the Austrian media that charges of bribery in connection with BAE systems will also be dropped against Mensdorff-Pouilly in Austria.

Mensdorff-Pouilly is the husband of Maria Rauch-Kallat, the health minister who signed Austria's pandemic plan in 2006 allowing for forced vaccination with untested and potentially harmful vaccines.

John Gummer supports bail plea by Count Alfons Mensdorff-Pouilly on BAE charge
Alex Spence, Legal Correspondent
Times Online

John Gummer, the former Conservative minister, yesterday supported a bail request by an Austrian aristocrat accused of funnelling millions of pounds in bribes to foreign officials on behalf of BAE Systems, the defence group.

Lawyers acting for Count Alfons Mensdorff-Pouilly, who is accused by the Serious Fraud Office (SFO) of arranging payments to win lucrative contracts for fighter jets, said that Mr Gummer, the former Agriculture Minister and Environment Secretary, had written a letter to the court vouching for their client.

Count Mensdorff-Pouilly, 56, a resident of Luisig, Austria, faces a single charge of conspiracy to corrupt. Yesterday at Westminster Magistrates' Court, he was granted £1 million bail and ordered to remain in London.

Although the letter's author was not identified in court, Michael Hatchwell, Count Mensdorff-Pouilly's solicitor, said that Mr Gummer was a long-time acquaintance of Count Mensdorff-Pouilly and had vouched for him.

Formularbeginn
Formularende

Mr Gummer, who famously tried to feed his daughter a burger to convince people that British beef was safe from BSE, could not be reached for comment last night. His relationship to Count Mensdorff-Pouilly is unclear.

Count Mensdorff-Pouilly, the first person prosecuted by the SFO in its long inquiry into alleged corruption in BAE, was charged last Friday. He appeared in court yesterday, after a week in Pentonville Prison, unshaven and wearing a grey tracksuit. The SFO alleges that between 2002 and 2008, the count arranged or offered bribes to officials in Austria, the Czech Republic and Hungary to try to secure fighter jet contracts for BAE. Patrick Gibbs, QC, for the count, said that the claims are "denied wholesale".

Senior District Judge Workman gave bail subject to a £500,000 surety and a £500,000 security deposit.

The count owns Dalnaglar Castle, Perthshire. His wife, Maria RauchKallat, was a health minister in Austria.

THE FLU CASE

[Jean-Jacques Crevecoeur]

We must prepare for another round of forced vaccinations, argues Jean-Jacques Crevecoeur

The Flu Case, 3 May 2010, 11:50
https://web.archive.org/web/20100517152640/http://www.theflucase.com/index.php?option=com_content&view=article&id=3377%3Awe-must-prepare-for-another-round-of-forced-vaccinations-argues-jean-jacques-crevecoeur&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Canadian Jean-Jacques Crevecoeur argues that another attempt to trigger a pandemic event, this time *using a hybrid swine flu and bird flu virus*, as well as forced mass vaccinations could come suddenly.

In February 2009, Baxter contaminated 72 kilos of seasonal vaccine material with the live bird flu virus – which was supplied by WHO – and so nearly triggered a global pandemic if the material had not been discovered by a Czech lab worker, according to the Times of India.

Because Baxter adheres to biosafety level 3 standards in its lab in Orth an der Donua, Austria, an accidental contamination can be virtually ruled out.

Just a few weeks later, in April, the swine flu virus appeared in Mexico City and was used as pretext by WHO to move the entire world to pandemic emergency level 6.

Under the current national pandemic plans, people can be forced to take a vaccine when an emergency level 6 is declared by WHO. Not to take the vaccine counts as a criminal offence and deadly force can be used by the police on criminal suspects.

We are still on pandemic emergency level 6 today.

WHO has said it intends to keep the emergency for two more years in spite of the fact that an inquiry by the Council of Europe Parliamentary Assembly has concluded there is no justifiction for this pandemic emergency level 6 declaration and for mass vaccinations because of the mild swine flu.

That means, all of the people in the USA, Mexico, Canada, Europe, India, Australia, South America, Africa continue to live in a state of emergency that allows the police to force vaccinate us in an "emergency".

Creveceour gives a number of reasons why he thinks the world could be facing another attempt to trigger a pandemic and carry out mass forced vaccinations:

"Why since late February, have several experts told us that the next pandemic (expected this fall) will see the arrival of a new virus, resulting from the hybridization of the avian influenza virus (H5N1 - highly virulent) and swine flu (H1N1 – highly contagious). How do they know?

Why did the French Ministry of Health ask Professor Bruno Lina (leader pf a biology laboratory in Lyon - France, advisor for Roselyne Bachelot and the WHO) to stop all ongoing work in order to focus on the hybridization of H5N1 and H1N1?

Why in Poland , where the courageous Minister of Health refused to order any vaccine, was the official number of victims of H1N1 2,6 deaths per million inhabitants, whereas in Canada , the figure is 12 deaths per million inhabitants?

Why, in Europe, did the vaccine manufactured by Glaxo-Smith-Kline have more side effects reported by millions of people (reference) than in Canada , although it was exactly the same vaccine, same composition and same dosage? Are they hiding things from us here in Canada ? (reference)

How is it that no-one has questioned the real reason for the explosion in the number of patients and deaths in emergency wards last February, while Canada holds the world record for vaccination rates?

Why did no-one in Quebec come out and demonstrate in the street when they announced that we would have to pay for emergency health care and that we would have to pay in addition, a tax of 200 $ per person (reference) to support the efforts of public health, while Health Canada (Santé Canada) has squandered our money on unnecessary, dangerous and deadly vaccines, and that the provincial and federal governments have made, this fall, a gift of 60 million dollars to Glaxo-Smith-Kline to support them in their modernization efforts?

Why has Dr. Wakefield (a famous English gastroenterologist interviewed in the documentary «Silence, we're vaccinating») just been convicted and removed from the medical association, when he had not only established a link between the MMR vaccine and autism, but had also relieved and cured hundreds of children suffering from autism? (reference)

Why were the articles by this same doctor removed from the archives of the newspaper in which he had published them (The Lancet), twelve years afterwards, when his work had been validated by panels of independent experts before publication?

Why did no doctor warn parents of the mortal danger posed by the vaccine against whooping cough (pertussis)? Why do they hide from us that 70 % of sudden infant death syndrome (the third cause of death of children between 1 and 1 year) occur three weeks after vaccination against whooping cough (pertussis)? Why?

Why don't they tell us that the mercury present in vaccines causes irreversible neurological damage, making the acquisition of cognitive and intellectual skills much more difficult? Why does no-one establish a connection between the progressive degeneration of children and the increases in the vaccination schedule? (reference)

Why do they persist in presenting the vaccine against HPV as a miracle cure against cervical cancer, while no study has shown the world its ability to reduce this cancer, which accounts for only one percent of deaths from cancer among women? Why do they hide from us the hundreds of deaths and many adverse effects of an expensive and totally unnecessary vaccine, while it is consistently being imposed on our children's schools from the age of 10?"

To this list can be added

Why was half the government of the only country to refuse the vaccine – Poland – just wiped out in an engineered air crash?

Already, the "new" Polish establishment has issued pro vaccine signals.

This is a translation of part of Crevecour's letter from French by Carolyn Dunning:

Source : http://www.newsoftomorrow.org/spip.php?article7958

"On 25th April 2010, we mark the first and sad anniversary of the beginning of the swine flu pandemic alert, renamed the Mexican flu, then the influenza A H1N1 The corrupt "experts" in the World Health Organisation promised us a holocaust worse than in 1918! And the puppets in Canada-Health (Santé-Canada) sought throughout the Fall to terrorize us, telling us that 25-35% of Quebec 's population would be affected by the dreaded virus.

A year later, you certainly don't want to hear any more about it. And I understand you. Me too, I want to be left in peace by this charade that has cost Canada (that is to say, us the taxpayers) more

than one billion dollars. I want to return to what has always fascinated me, namely health, balance and fluidity.

However, whether we like it or not, the WHO is still taking us for utter idiots by denying the evidence of its state of corruption (see reference), but in addition, we are told that American health authorities and laboratories are accelerating the development of new techniques for vaccine production based on cancerous cell cultures (look forward to an explosion of cancers in the coming years) and based on the technique of genetic recombination (look forward to degenerate GMO human beings!) (see reference).

When you have read these two short articles, you will understand that we cannot take this information lightly. Because if we do nothing, this mandatory vaccination that we have narrowly escaped will come back and hit us much faster than we imagine, and without letting people launch warnings to alert the population this time …

I do not deny that I am extremely concerned and worried about what is going on. In this context, it is hard not to ask questions…

Why since late February, have several experts told us that the next pandemic (expected this fall) will see the arrival of a new virus, resulting from the hybridization of the avian influenza virus (H5N1 - highly virulent) and swine flu (H1N1 – highly contagious). How do they know?

Why did the French Ministry of Health ask Professor Bruno Lina (leader pf a biology laboratory in Lyon - France, advisor for Roselyne Bachelot and the WHO) to stop all ongoing work in order to focus on the hybridization of H5N1 and H1N1?

Why in Poland, where the courageous Minister of Health refused to order any vaccine, was the official number of victims of H1N1 2,6 deaths per million inhabitants, whereas in Canada, the figure is 12 deaths per million inhabitants?

Why, in Europe, did the vaccine manufactured by Glaxo-Smith-Kline have more side effects reported by millions of people (reference) than in Canada , although it was exactly the same vaccine, same composition and same dosage? Are they hiding things from us here in Canada ? (reference)

How is it that no-one has questioned the real reason for the explosion in the number of patients and deaths in emergency wards last February, while Canada holds the world record for vaccination rates?

Why did no-one in Quebec come out and demonstrate in the street when they announced that we would have to pay for emergency health care and that we would have to pay in addition, a tax of 200 $ per person (reference) to support the efforts of public health, while Health Canada (Santé Canada) has squandered our money on unnecessary, dangerous and deadly vaccines, and that the provincial and federal governments have made, this fall, a gift of 60 million dollars to Glaxo-Smith-Kline to support them in their modernization efforts?

Why has Dr. Wakefield (a famous English gastroenterologist interviewed in the documentary «Silence, we're vaccinating») just been convicted and removed from the medical association, when he had not only established a link between the MMR vaccine and autism, but had also relieved and cured hundreds of children suffering from autism? (reference)

Why were the articles by this same doctor removed from the archives of the newspaper in which he had published them (The Lancet), twelve years afterwards, when his work had been validated by panels of independent experts before publication?

Why did no doctor warn parents of the mortal danger posed by the vaccine against whooping cough (pertussis)? Why do they hide from us that 70 % of sudden infant death syndrome (the third cause of death of children between 1 and 1 year) occur three weeks after vaccination against whooping cough (pertussis)? Why do they hide from us the hundreds of deaths and many adverse effects of an expensive and totally unnecessary vaccine, while it is consistently being imposed on our children's schools from the age of 10?

If you want answers to these questions (with all the scientific references), and many others, I invite you to participate in two activities that we have prepared, my wife and I.

I now specify that the information we will give during this conference and on the training session day is new, compared to what we sent last fall during our lecture tour, in the thick of the battle against the H1N1 vaccination.

We have organised these activities because, more than ever, complete and independent information is our only weapon to counter propaganda and disinformation perpetrated by Canada-Health (Santé-Canada) OFFICIALS.

More than ever, Quebec will need people like you to relay information that will protect them from these highly toxic poisons when the new campaign of fear befalls us.

Read this information and sign up quickly. We will hold these lectures and these days only once, in Montreal and Quebec."

Let us stand up and be aware, more than ever!

Jean-Jacques Crèvecœur

Billions wasted on swine flu pandemic that never came.
How did the World Health Organisation get its prediction of a 7.5 million death toll so wrong?

The Independent, 16 May 2010
https://www.independent.co.uk/life-style/health-and-families/health-news/billions-wasted-on-swine-flu-pandemic-that-never-came-1974579.html

Schoolgirls in Cairo were given masks to wear to protect them against swine flu last October

The spectre of plague stalked the world last year with its constant companion, fear. Schools and stadiums were closed in Mexico, tourists from Egypt to Singapore were quarantined, and the surgical mask became a universal fashion accessory across Asia. Yet predictions that the global death toll from swine flu could reach 7.5 million were well off the mark. At most, the virus killed 14,000 people, and some of those had pre-existing conditions or had been infected by other dangerous bugs as well. Against a background death toll from seasonal flu of up to 500,000, the new H1N1 strain was invisible.

Professor Ulrich Keil, a World Health Organisation (WHO) adviser on heart disease, said the decision to declare a pandemic had led to a "gigantic misallocation" of health budgets. "We know the great killers are hypertension, smoking, high cholesterol, high body mass index, physical inactivity and low fruit and vegetable intake," he told the Council of Europe. Yet governments "instead wasted huge amounts of money by investing in pandemic scenarios whose evidence base is weak".

The suspicion that the response to the outbreak was an unnecessary panic has been spreading since the virus slipped from the front pages. Even the WHO, the UN body that first punched the big red button, may be having doubts. An external committee has been set up to review its reaction and will deliver an interim report this week, though at the moment no bombshells are expected.

The WHO faces two main charges. **The first** is that between the first cases of H1N1 being reported in March and the declaration of a full, phase 6 pandemic by its director-general, Dr Margaret Chan, in June, the organisation changed its definition of a pandemic. Critics say the old definition required that a virus result in "enormous numbers of deaths and illness". The new definition applies only if the virus is new, if it spreads easily between people, and if the population has little or no immunity to it. A bug that causes a mild case of the sniffles could qualify.

A spokesman for the organisation insists there has been no change at all – that the old definition was an error on a single web page about bird flu, the last great influenza scare. But Peter Doshi, a doctoral candidate at MIT whose thesis is on science, politics and influenza policy, argued in a paper in the British Medical Journal in September that the old definition had been widely applied by the WHO since at least 2003.

The second charge, prominently made by Dr Wolfgang Wodarg, the former head of health at the Council of Europe, is that the WHO is unduly influenced by the drugs industry, which stood to make a fortune from selling anti-virals and vaccines. The Swiss giant Novartis, for example, saw its profits jump by nearly a third in the first quarter of this year to $2.95 bn, much of it from delivering swine flu vaccines ordered last year. Debate rages over allegations that some experts who recommended the pandemic be declared, have links to drugs companies, although this has been denied. But critics note that it's hard to become an expert in the field without having some funding from big pharmaceutical companies.

Others say that the problem is due to the spread of false assumptions. Most people think, for example, that when they have flu symptoms they must have influenza. But Dr Tom Jenkins of the Cochrane Collaboration, which reviews the evidence for various medical treatments, notes that more than 200 agents can cause flu-like illnesses. Only 7.5 to 15 per cent of cases are actually influenza. Anti-viral drugs and vaccines are aimed just at this group. "To stop one new case of H1N1, you'd have to inoculate 100 people," says Dr Jenkins. "or you could get four people to wash their hands." Masks work too, he says, and so does sending people home from work if they have symptoms.

The usual justification for the massive response to H1N1 is that no one wants a repeat of the 1918 pandemic, which killed an estimated 50 million people. But scientists are not even sure if that plague was caused by influenza at all. The virus was not discovered until 1933. And outbreaks since then have been much milder.

The last time H1N1 showed up was in 1976, at a US army base. Washington ordered the immunisation of 40 million Americans before it discovered that it had only one death from the flu but hundreds of cases of severe side-effects to the vaccine. A review headed by Dr Harvey Fineberg put much of the blame on the "influenza fraternity", arguing that expert panels tend towards "group think" and should be backed up by independent scientific advice. Dr Fineberg is now chairman of the WHO's external committee evaluating its response to the 2009 outbreak whose final report next May could well lead to a radical rethink of the world's reaction to new viruses.

Imogen Foulkes

WHO faces questions over swine flu policy

BBC, 20 May 2010
https://www.bbc.com/news/10128604

As the 193 member states of the World Health Organization meet in Geneva, questions over the body's handling of the H1N1 swine flu pandemic are high on the agenda.

Some medical experts doubt whether this was really a pandemic at all.

For several years before swine flu first surfaced in Mexico in April 2009, WHO officials had been warning that a global influenza pandemic was simply a matter of time.

After major pandemics in 1918, 1957 and 1968, many flu experts believed another one was imminent. Though the recent H5N1 bird flu virus had not developed the ability to spread easily among humans, it raised concerns that a new virus might do so.

"We have seen 40 to 50 million people die in a year in previous pandemics," explained Keiji Fukuda, who is the WHO's assistant director general, and its special adviser on pandemic influenza.
"These are huge numbers. Our job is to get people prepared, it's a huge challenge."

So, even before swine flu emerged, the WHO supported member states in drawing up pandemic plans, including buying antiviral drugs, preparing mass vaccination campaigns, and developing procedures for banning public gatherings and closing schools.

By the time swine flu broke out, many countries had already introduced the plans, and some industrialised nations had even signed pre-contracts with the pharmaceutical companies to buy vaccines.

'Mild flu'

But even as the pandemic plans were put into action, doubts had begun to surface. Dr Wolfgang Wodarg, a German doctor and former member of parliament, had been watching the spread of swine flu in Mexico City, and was puzzled at the reaction of the WHO.

"What we experienced in Mexico City was a very mild flu," he explained, "which did not kill more than usual - which killed even less people than usual.
"This was suddenly, a fast-spreading mild flu, a pandemic. But this is not the definition of a pandemic I learned, which has to be severe, with a much higher than usual death rate."

Others also had questions. Tom Jefferson, a researcher for the international Cochrane Centre, the world's leading independent assessor of medical interventions and medical research, claims that the WHO changed the definition of what a pandemic actually was just weeks before it declared one on 11 June last year.

"On 1 May the WHO's global pandemic website had the old definition of an influenza pandemic, which included very large numbers of cases, complications and deaths," he said.
"By 4 May that definition had disappeared and what remained was simply a new virus which spreads rapidly and infects very many people."

Dr Jefferson also believes that the WHO advice put emphasis on the use of vaccines and antivirals, ahead of effective and inexpensive measures like hand-washing.

'Potential pressure'

The WHO has struggled to offer clear answers on the question of its definition of a pandemic, partly because of its policy of keeping the identity and the deliberations of its pandemic emergency advisory committee secret.

The only known member of the committee is its chairman, Australian flu specialist John MacKenzie.

WHO spokesman Gregory Hartl said names of those on the sitting committee had not been made public because of the potential "for bringing undue pressure on them when they are making decisions which have societal and economic impacts".

The lack of transparency in its decision making process, together with the WHO's advice to countries to begin widespread vaccination against swine flu, has led some observers to suspect undue influence from the pharmaceutical industry.

Looking at the balance sheets of the pharmaceutical companies it is clear that many did make a healthy profit out of swine flu. Vaccine producer Novartis, for example, posted an 8% jump in profit in 2009.

The company's annual report cites swine flu vaccine sales as a major reason for the increase - though such a profit is, of course, not proof of any undue influence by the firm.

European enquiry

These medical products have cost national health budgets billions. France, for example, spent over 600m euros ($739m, £515m) on 94 million doses of vaccine, most of which have not been used.

"Who benefited from what happened?" asked British Labour Member of Parliament Paul Flynn. "Really the only people to benefit were the pharmaceutical companies. I'm not saying I'm drawing any firm conclusions, but there are legitimate questions here."

Mr Flynn and a number of other European politicians have launched an official inquiry into the pandemic at the Council of Europe. A key question will be whether the pharmaceutical companies, which had invested around $4bn in developing the swine flu vaccine, had supporters inside the emergency committee, who then put pressure on the WHO to declare a pandemic.

But Andrin Oswald, head of vaccine production at Novartis, says he does not think the company's influence is "too great". He says company officials interact in a "natural process" with the WHO, which supplies the firm with the virus for the vaccine. – "I don't think that is influencing, that is working together to ensure that we do something that is reasonable for public health."

He adds that any pressure over swine flu came from governments desperate to buy the vaccine, rather than from producers keen to sell it. – "We received phone calls from government ministers," he recalled, "telling us to ship them more vaccine, and quicker. Some even threatened us that if we did not do so it might affect our future business in that particular country."

Pandemic planning

Governments, of course, were under pressure to buy the vaccine because the WHO had declared swine flu to be a full "Phase 6" pandemic.

Here again, the WHO's decision is questioned, from a somewhat surprising source – Dr. Klaus Stoehr, who until three years ago was in charge of the WHO's pandemic preparedness, and the man who drew up the influenza plans.

"The pandemic planning I was involved with was always based on a severe public health event," he explained. "Moving to Phase 6 meant that we wanted governments… to kick in their plans whether they thought it was urgent or not."

"I personally think that moving to Phase 6 that early was, in hindsight, not needed."

Dr Stoehr believes that, over the course of last summer, after a Phase 6 pandemic was declared, the WHO failed to read the signs about swine flu coming from the southern hemisphere winter.

"In July and August the Australia and New Zealand national influenza centres were indicating the southern hemisphere outbreak was mild," he said. – "Virologists, myself included, thought well, it's not so likely that this virus will become more severe."

"At the end of August the WHO website was still calling the virus severe. I personally would have thought there could have been more assessments, and more advice to governments."

The WHO has now launched its own review of its handling of the pandemic, a review the organisation claims is independent.

"The World Health Organization has done wonderful work over the years in eliminating diseases," insisted British MP Paul Flynn. "It's a body we all greatly respect, and we need it."

"The great danger now is that the trust in the organisation has been undermined, and that will help no-one."

Zeiten Schrift

Bevölkerungsreduktion: Lauert in der Spritze der Tod?

Zeiten Schrift, 2010, Quartal 1, N 65
https://www.zeitenschrift.com/artikel/bevoelkerungsreduktion-lauert-in-der-spritze-der-tod

Seuchen können in kurzer Zeit mehr Menschen dahinraffen als Krieg und Hunger. Was, wenn man sich dies zunutze machen würde? Werden Impfungen benutzt, um die Menschheit zu dezimieren?

Szenen wie aus einem Katastrophenfilm: In der Hauptstadt Kiew getrauen sich viele Menschen nur noch mit Mundschutz auf die Straße. Präsident Juschtschenko läßt für das ganze Land den Notstand ausrufen, denn neun Regionen der Ukraine sind bereits unter Quarantäne gestellt: Öffentliche Veranstaltungen und Gottesdienste dürfen nicht mehr abgehalten werden, Gesichtsmasken sind Pflicht. Es sollen rund eine halbe Million Menschen erkrankt sein. Dreihundert sind bereits gestorben, inoffiziell spricht man sogar von dreitausend Toten. Die Ukraine ist fest im Griff der Schweinegrippe.

Die Bilder, welche im Oktober 2009 über die Fernsehschirme flackern, sind bizarr. Man weiß nicht recht, was man davon halten soll. Ist es bloß ein geschmackloser Versuch politischer Kontrahenten, mit der Hysterie um die nachweislich harmlose Schweinegrippe Wahlkampf zu machen?

Die Massenmedien sahen in den Meldungen aus der Ukraine keine Knüllerstorys, bei denen man unbedingt genauer hinschauen mußte. Erstaunlich, hätte man hier doch Stoff gehabt, die so exzessiv herbeigeschriebene Schweinegrippegefahr zu untermauern. Eine Ausnahme ist die *Daily Mail.* Die britische Zeitung zitierte einen Arzt aus der westlichen Ukraine: „Bei zwei Todesopfern haben wir eine Obduktion gemacht und sahen, daß ihre Lungen schwarz wie Kohle waren. Es sah aus, als wären sie verbrannt. Das ist erschreckend."

Virologen vor Ort befürchteten, mit einem gefährlich mutierten Schweinegrippe- oder bis dahin unbekannten Grippevirus konfrontiert zu sein. Deshalb wurden Virusproben in ein Londoner Speziallabor geschickt, wo man sie analysierte. Auf eine abschließende Veröffentlichung der Resultate wartet die Öffentlichkeit bis heute.

Szenenwechsel in die Ukraine. Zeitpunkt: 30. Oktober 2009, die Pandemie wütet. Ort: der Desniansko Distrikt in der Hauptstadt Kiew. Dort häufen sich Augenzeugenberichte, wonach kleine Flugzeuge Chemtrails[1] versprühen. Angeblich sollen sie der Schweinegrippe entgegenwirken. Doch die Regierung dementiert. Man habe keinem einzigen Flugzeug die Erlaubnis für einen Flug über die Stadt gegeben. Viele Anwohner behaupten jedoch, das versprühte Zeug habe wie Hühnermist gestunken und bei manchen Menschen zu heftigen Hautausschlägen geführt.

Vorahnungen oder Insiderwissen?

Blenden wir einige Wochen weiter zurück in ein mehrere tausend Kilometer entferntes Aufnahmestudio des amerikanischen Radiosenders *Republic Broadcasting.* Am 11. August 2009 hatte Radiomoderator Dr. True Ott einen höchst merkwürdigen Telefonanruf mitten in seine Live-Sendung erhalten. Darin klärte ein gewisser Joseph Moshe die erstaunten Radiohörer darüber auf, daß er ein Mikrobiologe sei und hochbrisante Beweise besitze, die er einem Staatsanwalt übergeben wolle. Es gehe um einen verunreinigten H1N1-Schweinegrippeimpfstoff, den das amerikanische Pharmaunternehmen Baxter in der Ukraine herstelle. Dabei handle es sich in Tat und Wahrheit um

eine als Impfung getarnte biologische Waffe. Zu diesem Zweck, so Moshe weiter, habe man der Impfung ein Adjuvans (Zusatzstoff) beigemischt, der das Immunsystem schwächen solle und RNA-Bestandteile jenes Virus enthalte, das 1918 die *Spanische Grippe* mit Millionen von Toten verursachte. Der Anrufer kündigte an, daß es in der Ukraine in naher Zukunft zum Ausbruch einer Seuche kommen werde.

Die tatsächliche Identität dieses in Kalifornien lebenden Joseph Moshe ist bis heute nicht zweifelsfrei geklärt. Manche behaupten, es handle sich dabei um den israelischen Professor Moshe bar-Joseph, was jedoch mehr als fragwürdig ist. Ganz sicher wurde der ominöse Mann jedoch am Abend des 13. August 2009 vom FBI vor laufenden Fernsehkameras verhaftet.

Nach seiner Ankündigung, das Weiße Haus informieren und sämtliche Fakten der Öffentlichkeit zugänglich machen zu wollen, flüchtete Moshe nämlich mit einem roten *VW Beetle* quer durch Los Angeles in Richtung des israelischen Konsulats. Dieses erreichte er aber nicht, weil die Bundespolizei und ein Bombenräumungskommando mit gepanzerten Wagen sein Auto einkeilten. Mikrowellen-waffen setzten die Elektronik des VWs und Moshes Handy lahm, anschließend nebelten die Polizisten ihn mit Tränengas ein, ein ferngesteuerter Roboter zerschlug das Autofenster, man versprühte mehrere Dosen Pfefferspray, versetzte Moshe mit einem *Taser* Elektroschocks und zerrte den Mann schließlich unsanft ins Freie – alles zu sehen auf dem Internetportal *Youtube* (Stichwort „Westwood Standoff“).

Was anschließend mit Joseph Moshe geschah, ist nicht bekannt. Manche spekulieren, er sei in ein Flugzeug gesetzt und nach Israel ausgeflogen worden. Als offizielle Begründung für die Verhaftung bemühten die Behörden einmal mehr die Angst vor dem Terrorismus: Joseph Moshe sei ein Verrückter, der gedroht habe, ein Bombenattentat auf das Weiße Haus zu verüben.

Baxters Beinahe-Katastrophe

Für die von Moshe vorgebrachten Anschuldigungen gegen *Baxter* gibt es keine offiziellen Beweise. Doch es ist nicht das erste Mal, daß der US-Pharmariese in das Kreuzfeuer der Kritik gerät. So sollen seinen Blutkonserven in der Vergangenheit Aidsviren beigemischt worden sein. Auch das läßt sich nicht beweisen. Ganz anders war es bei der Panne, welche *Baxter* im Winter 2008/09 im firmeneigenen biomedizinischen Forschungslabor in Orth an der Donau verursachte. Dort produziert die österreichische Tochterfirma *Baxter AG* „experimentelles Virus-Material“, darunter auch H3N2-Grippeviren. Mit diesen Erregern stellt Baxter dann in Tschechien einen Influenza-Impfstoff gegen die ganz normale saisonale Grippe her. So weit so gut.

Doch vor einem Jahr hätte Baxter um ein Haar eine Katastrophe ausgelöst. Damals ließ der Konzern über die österreichische Firma *Avir Green Hills Biotechnology* insgesamt 72 Kilogramm experimentellen Grippeimpfstoff an 16 verschiedene Labors in Deutschland, Slowenien und Tschechien ausliefern. Zum Glück entschied man sich in einem tschechischen Labor, den Impfstoff nochmals an einem Dutzend Frettchen zu testen – und siehe da: sie starben allesamt, obwohl die Tiere gar nicht an der saisonalen Grippe erkranken können. So stellte sich heraus, daß die für Frettchen völlig harmlosen H3N2-Grippeviren aus unerklärlichen Gründen mit dem aggressiven und *nicht deklarierten Vogelgrippevirus H5N1* versetzt waren. Noch schlimmer: Diese Viren hatte man nicht abgetötet, wie das normalerweise bei einem Impfstoff der Fall ist, sondern sie waren *aktiv!*

Im Klartext: Hätte man diesen einen Tierversuch unterlassen, so wären womöglich Zehntausende von Menschen in ganz Europa mit einer sehr gefährlichen Krankheit angesteckt worden – weil man ihnen mit einer normalen Grippeimpfung gleichzeitig lebende Vogelgrippeviren ins Blut gespritzt hätte!

Baxter entschuldigte sich und sprach von einem „gravierenden Irrtum“. Doch Experten sind geschockt, daß eine solch katastrophale Panne überhaupt geschehen konnte. Denn die für ein Hochsicherheitslabor geltenden Richtlinien sollten genau dies verhindern.

Die vier betroffenen EU-Staaten leiteten Untersuchungen gegen *Baxter* ein, welche man bei der Weltgesundheitsorganisation „genau beobachtete“. Immerhin war es die WHO gewesen, die diesen gefährlichen Vogelgrippe-Virusstamm überhaupt erst an *Baxter* geliefert hatte. Abgesehen von einer Geldstrafe kam der Pharma-Multi glimpflich davon. Österreich behandelte den Vorfall beispielsweise nicht als Verstoß gegen die Sicherheitsvorschriften im Umgang mit bioaktiven Stoffen, sondern lediglich als Verstoß gegen Veterinärvorschriften – und schickte zur Inspektion einen Amts-Tierarzt ins *Baxter*-Labor.

Dabei hätte dieser „gravierende Irrtum“ eine neuartige Seuche auslösen können. Das Mischen von zwei genetisch verwandten Virenstämmen nennt man in der Fachsprache „Virus-Reassortment“. Es ist sehr gefährlich: Treffen zwei verschiedene Viren gleichzeitig auf dieselbe Wirtszelle, können daraus neue Superviren entstehen, gegen die Vögel, Tiere oder Menschen noch keine Antikörper gebildet haben, weshalb sie ihnen schutzlos ausgeliefert sind. Im vorliegenden Fall hätte die verseuchte Grippeimpfung von Baxter in den geimpften Personen zu einem neuartigen Virus führen können, das die hohe Ansteckungsgefahr des harmlosen Schweinegrippevirus mit der viel tödlicheren Aggressivität des nur schwer übertragbaren Vogelgrippevirus in sich vereint. Dann hätte die WHO weit mehr Grund gehabt, eine globale Pandemie auszurufen!

Sterben – leicht gemacht

Wer will’s ihm also verdenken, wenn der *Nation of Islam*-Führer Louis Farrakhan seinen afroamerikanischen Mitbürgern rät, sich unter keinen Umständen gegen die Schweinegrippe[2] impfen zu lassen? Sie sei nämlich, so der Bürgerrechtler, ein Werkzeug zur Bevölkerungsreduktion. Am 18. Oktober 2009 rief Farrakhan während einer Versammlung in Memphis in die Menge: „Die Erde kann keine sechseinhalb Milliarden Menschen verkraften. Was soll man also tun? – So viele wie möglich töten! Wir müssen eine Wissenschaft entwickeln, die Menschen umbringt und es dann so ausschauen läßt, als wären sie an einer Krankheit gestorben.“

Tatsächlich können selbst herkömmliche Impfungen bereits diverse Möglichkeiten zum Sterben bieten – auch ohne das Additiv einer „Verschwörung“. Additive, Adjuvantien oder auf gut deutsch Zusatzstoffe sind nämlich ein Hauptproblem der Impfungen. Diese Wirkstoffverstärker und Konservierungsmittel enthalten häufig Aluminium und vor allem Quecksilber. Beide Metalle vergiften den Körper auf vielfältige Weise. So kann das Adjuvans *Squalen* Autoimmunkrankheiten wie beispielsweise das Golfkriegssyndrom auslösen. Und das in allen Schweinegrippe-Impfstoffen Deutschlands enthaltene *Thiomersal* (oder *Thimerosal*) besteht zur Hälfte aus reinem Quecksilber. Es ist das giftigste nichtradioaktive Element auf Erden und selbst in kleinsten Mengen krebserregend.

Zudem enthalten moderne Impfstoffe sogenannte Nanopartikel.[3] Welche (Neben-)Wirkungen solch winzigste Teilchen auf den Organismus haben können, weiß noch niemand so genau. Fest steht jedoch, daß Stoffe in Nanogröße plötzlich ganz andere Eigenschaften aufweisen.

Ende des Artikelauszugs „Bevölkerungsreduktion: Lauert in der Spritze der Tod?“

Ein französischer Forscher warnt explizit vor den neuen Schweinegrippe-Impfstoffen, welche langfristig „eine Gesundheitskatastrophe auslösen“ könnten. Warum immer mehr Experten so besorgt sind, erfahren Sie im vollständigen Artikel. Dort gehen wir auch der Frage nach, ob Regierungen und die weltbesten Wissenschaftler tatsächlich daran arbeiten, im Labor geschaffene Killerviren auf die Menschheit loszulassen. Offizielle Dokumente, die lange Jahre der Geheimhaltung unterlagen, sowie die Aussagen diverser Forscher und Politiker sprechen Bände. Da lohnt es sich auch, die Umstände rund um das Auftreten der Aidskrankheit genauer unter die Lupe zu nehmen. Besonders, wenn man liest, was ein hochdekorierter amerikanischer Wissenschaftler im Jahr 2006 während eines Vortrages erklärte, der bezeichnenderweise unter Ausschluß der Öffentlichkeit stattfand.

Und trotz allem haben diese Leute die Rechnung ohne den Wirt gemacht, denn eine höhere kosmische Intelligenz – man kann von „Gott“ – hält die Zügel nach wie vor in der Hand. So gibt es Hoffnung für die Welt und zudem einfache Regeln, wie sich jedermann selbst erfolgreich um die eigene Gesundheit kümmern kann.

Евгений Черных

Как нас обманывали ужастиком «свиной грипп»

Комсомольская Правда, 10 июня 2010, 6:00
https://www.kp.ru/daily/24505.3/656620/
https://www.supotnitskiy.ru/stat/stat71.htm

\

Ровно год назад ВОЗ объявила первую в XXI веке пандемию. Санкционировав самую крупную в истории мировой медицины аферу, принесшую организаторам миллиарды.

Тогда мы внезапно очутились как бы в другом мире, точнее, в хлеву, по которому загулял загадочный вирус, истребляя все живое. Так, по крайней мере, это выглядело на экранах ТВ.

Бежали люди в респираторах, звучали жуткие цифры погибших. Голливуд отдыхал! Массовый психоз подогревали наши и чужеземные академики, эксперты ВОЗ, стращая сотнями миллионов грядущих жертв.

Зря Обама Укололся

"Комсомольская правда" провела свое расследование и уже в июне опубликовала цикл статей, что нас попросту разводят, это финансовый пузырь.

В сентябре "Комсомолка" вновь поставила вопрос ребром: "Зачем разводят большое свинство вокруг свиного гриппа".

Увы, никакой реакции официальной российской эпидемиологии не последовало. Наоборот, ее представители, вторя ВОЗ, повылезли на все телеканалы и пафосно обещали новую "испанку", спасение от которой - только поголовная вакцинация и разработанные ими пилюли.

Эти деятели успели получить на "чудо-вакцину" от правительства РФ 4 миллиарда рублей. Выбили бы и больше, да пандемия-кормилица, к их огорчению, рассосалась сама по себе. Под нажимом общественного мнения ВОЗ с прискорбием признала, что ужасный H1N1 "значительно менее смертоносен", чем уже циркулирующие вирусы гриппа. За год по всему миру он унес 14 тысяч человек. "Обычный грипп" без всяких пандемий и церемоний забирает до полумиллиона жизней ежегодно.

Теперь в среде западных политиков открыто заговорили о свинской афере. Ведь у них и без гриппа головы болят: куда сплавить сотни миллионов ампул ненужной вакцины – в бедные страны или на свалку? При любом раскладе - расходы. Это антигриппозному чудо-средству тамифлю продлили срок годности с 2 до 5-7 лет. Вакцины так долго не живут. Только в США невостребовано 138 миллионов доз! Обманутый "экспертами" ВОЗ Обама зря кололся всей семьей перед телекамерой!

Евросоюз в январе начал следствие о сговоре фармацевтов и медиков. В апреле ВОЗ объявила о внутреннем служебном расследовании. Но мы не дождемся громких скандалов, отставок, тем более суда. Слишком большие деньги на кону. По подсчетам банка JP Morgan, фармацевты только на вакцинах заработали более 7 миллиардов евро! Плюс лекарства, прочие средства, те же марлевые повязки. Если и накажут, то стрелочников. Не уподобится же ВОЗ унтер-офицерской вдове, не станет сама себя сечь. Хотя в большой игре она лишь девочка на побегушках у транснациональных фармкомпаний и сильных мира сего.

В России вообще никакого следствия по этой афере не ведется. И все опозорившиеся псевдоэксперты, чиновники, деятели РАМН, директора НИИ остаются на своих местах и делают вид, что ничего и не было вовсе. И не они мелькали на телеэкранах, каждый раз привирая цифры погибших во время пандемии гриппа 1918-1920 гг., доведя их до 100 млн. И не они выкрикивали названия неизвестных ранее препаратов, которые надо поедать срочно россиянам, чтобы выжить. И не они за месяц героически создавали вакцину от "смертельного вируса", которой реально предполагалось привить десятки миллионов наших граждан, включая детей, беременных женщин и ВИЧ-инфицированных. Это же чудовищно! Но по сей день мы наблюдаем глухое молчание официальных структур.

Пожалуй, единственный из отечественных ученых, кто с первых дней не побоялся открыто называть ту кампанию свинством, бывший военный микробиолог **Михаил Супотницкий**.

- *Михаил Васильевич, а стоит ли ворошить прошлое, хоть и совсем недавнее? Ведь про новоявленную пандемию уже напрочь забыли.*

- Стоит. Механизм таких манипуляций сознанием больших масс населения должен быть понятен самому населению. Иначе нам наверняка подготовят более изощренную аферу. Вновь разведут и простых граждан и руководство страны. Свиной грипп, увы, не первая дезинформация мирового масштаба по эпидемиям. Старт им дали еще в 1979 году, приписав вспышку сибирской язвы в Свердловске "выбросу" с "советского военного объекта".

В интересах геополитических противников России западные, а потом и отдельные наши СМИ развернули большую кампанию якобы против "советского биологического оружия". Как только наш институт в Екатеринбурге был "реформирован", то и кампания по его дискредитации заглохла. Еще более массовой дезой стала кампания борьбы с биотерроризмом. Но и она сгинула в небытие после нападения США на Ирак 29 марта 2003 г. На следующий же день ее свернули! Лишние накладные расходы на лживых писак деловым людям не нужны!

- *После ввода войск США в Ирак и "поднялся" вирус H5N1 как глобальная угроза человечеству. Чтобы отвлечь общественное мнение от незаконного вторжения? Ведь биооружия у Саддама так и не нашли.*

- Плевали они на "общественное мнение" тогда, и плюют на него сегодня. Так нащупывался новый механизм глобальных финансовых афер, теперь, правда, под "соусом" борьбы с новой пандемией. Для специалистов-эпидемиологов было все прозрачно с тем вирусом с самого начала кампании. Эпизоотии птичьего гриппа хорошо изучены, а сам вирус уже много лет используется для конструирования вакцин против гриппа исключительно с одной целью - чтобы они были безопасными. Но то, что вирус H5N1 не имеет эпидемического значения, так как между людьми не передается, никакого значения для кампании по отъему денег у населения не имело. Значение имели только телевизионные картинки.

- *Зато "распилили" миллиарды! Птичий грипп хотя бы трепыхался лет 5. Его свиной брат кончил еще позорнее.*

- Темпы нарастают, плюс жадность и безнаказанность. И года не прошло (а если быть точнее, нас кошмарили с 25 апреля по середину декабря 2009 года), как он канул в небытие вместе с деньгами "на вакцину". Как лампочку выключили.

Не Привился? Сразу В Морг!

- *Михаил Васильевич, объясните с научной точки зрения анатомию обмана. С чего началась свинская ложь*?

- С утверждения, что появился "новый вирус" и теперь нам грозит пандемия "испанки", еще более ужасная, чем в начале XX века.

- *В чем здесь подвох*?

- Тут не только подвох, но еще и профанация эпидемиологии как науки. Само появление "нового вируса" не вызывает эпидемии, это, извините, прописная истина классической эпи-

демиологии. И ее следовало бы знать академикам Львову и Киселеву, так много "светившимся" на свинской псевдопандемии. Будь то вирус, вызывающий грипп с его ничтожной смертностью, либо лихорадку Эбола со смертностью до 90% всех заболевших, это без разницы; вызвать пандемию самостоятельно он не может. Наделать бед "новичок" способен лишь в том случае, когда в наличии вся эпидемическая триада:

1) источник вируса (т. е. произошла глобальная активизация природных очагов вируса),

2) сформировались механизмы его передачи из этих очагов в популяции людей, и

3) образовались достаточно большие восприимчивые к вирусу популяции людей.

Эта триада известна уже лет сто. Да и сам "новый" свиной вирус пандемически распространялся на планете еще до 1940-х гг., а в Японии вызывал отдельные вспышки до середины прошлого века.

- *А "свиная" вспышка на военной базе США в 1976 году? Тогда решили привить поголовно американцев, но слишком много осложнений выявилось от вакцины. И смертей. Вакцинацию срочно прекратили.*

- Тот конфуз никого ничему не научил. Дело не только в пренебрежении деятелей ВОЗ к имеющимся знаниям о развитии эпидемий гриппа. Ради наживы в ход пошли откровенные приемы ведения информационной войны и даже научные подлоги. Вирус объявили не только "новым", но и "высокопатогенным". Эта профанация сбрасывалась с трибуны ВОЗ, радостно подхватывалась нашими "деятелями науки" и их обслугой.

- Не понял "высокопатогенного" юмора? Академики же так говорили!

- Если так скажет студент-медик на экзамене по микробиологии, ему снизят оценку. Патогенность - способность микроорганизма вызывать болезнь. А вот мерой патогенности является вирулентность. Сравниваем два штамма вируса. Одного нужно 1000 частиц, чтобы вызвать болезнь у человека, второго - всего 100. Второй - "более вирулентный". Поэтому правильно было в отношении вируса "свиного гриппа", вызывающего болезнь у людей, говорить "высоковирулентный" или "более вирулентный", и то применительно к конкретным его штаммам. Но смысл этого термина знают только специалисты. А "пато-", как составная часть сложных слов, дает много ассоциаций в сознании обывателя.

- *Первое, что приходит на ум – патологоанатом в морге*!

- На это и рассчитывали. Такой примитивный прием информационного воздействия срабатывает только при многократном повторении. Но его одного не хватило бы для организации аферы. Было объявлено и тысячи раз повторено, и даже прочно вбито в мозг не только обывателям, но и медикам, что все прежние пандемии гриппа вызывались некой комбинацией вирусов "птичьего гриппа" и "человеческого" (можете поискать такие заявления в интернете). В том числе страшная пандемия 1918-1920-х гг. И вот-вот вновь произойдет образование новой комбинации вирусов. Тогда новой "испанки" не избежать. Но дело тут в том, что геном вируса, вызвавшего "испанку", был расшифрован американскими военными учеными еще в 1996 г. И эти ученые хорошо понимали, что такое "научная репутация". "Комбинацией" вирусов "птичьего" и "человечьего гриппа" в геноме вируса, вызвавшего "испанку", даже не пахло. Вопреки всем мифам оказалось, что он менее опасен, чем вирусы гриппа, циркулирующие сегодня. Эти данные были опубликованы.

- *Но кто знает ныне про эту расшифровку генома? Да и кто понимает*?

- Про саму же "испанку" все слышали! Не случайно ВОЗ в конце прошлого века официально завысила число ее жертв с 20 до 50 миллионов. Чтобы было чем пугать планету. Готовились! А наши академики подняли аж до 100 миллионов.

- Ну, а чтобы еще больше нагнать страха на население и заставить "уколоться", заинтересованные лица запустили хитрую словесную игру. Придумали никогда не существовавший "вирус сезонного гриппа" и объявили его "человеческим".

Затем отдельные "эксперты", "деятели науки" и чиновники, СМИ подхватили главную мысль – в дополнение к неопасному человеческому вирусу "сезонного гриппа" появился

новый "высокопатогенный вирус" свиного гриппа H1N1. Хотите остаться в живых – прививайтесь от "высокопатогенного H1N1", а не хотите, погибайте от него же. Так и "промывала" всем нам мозги с апреля по декабрь дружная стая фарцы от науки. "Промывали" нагло, вплоть до полного смывания извилин у некоторых обывателей, что потом сами и показывали на экранах телевизоров.

- *И наверняка ржали, глядя, как запуганный народ метался по аптекам*.

- Так было от чего метаться! Панические настроения в ряде городов России и Украины оказались очень большими, но это отдельная тема для специалистов по информационной войне. В действительности же три десятка лет в России среди людей поддерживаются несколько антигенных разновидностей вируса гриппа типа А H1N1, типов В и С. Еще одна разновидность H1N1 ничего не меняла в этом раскладе. Но это еще не все. Якобы "высокопатогенному" H1N1 придумали несуществующую эпидемиологию. Оказывается, этот "высокопатогенный" H1N1 обладает невероятной даже для вируса натуральной оспы способностью передаваться между людьми.

Помню, академик РАМН Львов на пресс-конференции 28.04.09 г. вещал: "Появится в этом зале больной свиным гриппом, все здесь присутствующие заболеют!" Я тогда по простоте своей недоумевал, как такое может быть в принципе? Даже если этот вирус будет переведен в аэрозоль, то его распространение будет зависеть не от его "патогенности", а от размера частиц аэрозоля, направления воздушных потоков и т. п. Больной гриппом выделяет при кашле и чихании частички мокроты в диапазоне размеров 50-200 микрон, а они сразу оседают на пол. Но, видимо, и законы физики на "высокопатогенный" H1N1 не действуют!

- *Против него даже выставили санитарные кордоны в аэропортах. Но вирус H1N1 все же проник в Россию. Просочился, мерзавец. И как повел себя*?

- Плохо! Для репутации академика Львова, разумеется. Первые больные прибыли из разных стран. Из отпусков. В самолетах, в аэропортах, своих домах, на работе они контактировали с сотнями людей, а в больницах с врачами и другими пациентами. Но, вопреки авторитетному Львову, контактеры "свиным гриппом" не заболевали. Осенью появились больные, которые сами никуда не выезжали, и с выезжавшими не контактировали. Как же они умудрились заболеть"свиным гриппом", господин Львов? Постепенно накопились данные кропотливых эпидемиологических исследований. В густонаселенном Китае изучили сотни контактов приехавших больных "свиным гриппом", и опять среди контактеров не было выявлено гриппозных.

- *Любопытно, в прежние века, когда вместо самолетов, поездов, машин были телеги да сани, грипп как распространялся*?

- Точно так же, без всякой связи с транспортными потоками и их интенсивностью, почти одновременно в разных странах объявлялся. И эпидемии бушевали. Вот бы задуматься нашим "светилам науки", медицинским чиновникам о реальных механизмах поддержания вируса гриппа в природе и его проникновения в человеческие популяции! Но в эпидемиологии гриппа ложь уже давно стала принципом.

- *Еще нас пугали, что H1N1 может мутировать. А если, не дай бог, свиной, птичий и сезонный человечий сольются в единый супервирус, тогда всем кирдык*.

- Да, этот мифический вирус и стал основной "разводкой" для населения, и одновременно позорным столбом для многих "деятелей" российской науки и покровительствующих им чиновников. Страшная "свинья без пятачка на курьих ножках" не может появиться в принципе. Давайте обратимся к достоверным фактам из эпидемиологии гриппа. Вирус "птичьего гриппа" между людьми не передается. Встречается он среди людей очень редко, скорее всего, в его природных очагах в виде небольших вспышек. Это уже перечеркивает все дальнейшие усилия природы по созданию "супервируса" на его основе. Но и вирус "свиного гриппа" тоже имеет весьма сомнительный потенциал для распространения среди людей, также вызывая только вспышки. А вируса "сезонного гриппа" вообще не существует как нечто конкретного - это просто сленг. Под этим термином специалистами понимается масса всяких вирусов гриппа

А-, В- и С-серотипов, вызывающих вспышки среди людей в осенне-зимний период. Поэтому вместе им всем трем не сойтись, как бы они сами не старались.

- *То есть уже смело можно умножать этот вариант событий на ноль и закрыть тему*?

- Можно умножать последовательно на несколько нулей, что мы и сделаем, но лучше медикам объяснить подробней. Это толкование событий - эпидемиология по глобусу, и не более. Возьмем карманный глобус и представим на нем невероятное - все эти вирусы ("сезонного", "свиного" и "птичьего" гриппов), как существующие, так и несуществующие, все же как-то собрались вместе и вызвали инфекцию у какого-то "смешивающего сосуда" - отдельного несчастного человека, свиньи или птицы. И ни один из этих "смешивающих сосудов" ранее не встречался ни с одним из "смешивающихся вирусов" по отдельности и не имеет к нему иммунитета.

- *Такой "смешивающий сосуд" для вирусов может свалиться только с Луны*.

- Вы правы, из всех составляющих этого процесса Луна достоверно существует. Но на карманном глобусе и усилием алчной воли, без нее можно обойтись. Дальше нужно взять глобус побольше и попытаться на нем представить, каким образом попадут на один континент, т. е. в одну и ту же клетку вирусы, совершенно разные по специфическому взаимодействию с клеточными рецепторами, причем часть из вирусов, обычно рисуемых на таких гипотетических схемах, просто не существует. Но, предположим, и это произошло. А далее начинается еще более интересная картография. Глобус, даже самый большой, уже не подходит, нужен план местности с изображением отдельных домов. Вирусы гриппа, имеющие разную биологию, должны одновременно сбросить с себя белковую оболочку и начать реплицироваться (т. е. увеличивать количество своих РНК-копий) в присутствии РНК друг друга с одинаковой скоростью при том, что репликазы (ферменты, запускающие этот процесс) у них будут разными. Потом что-то должно их заставить поменяться участками своего генетического материала. И не случайным образом, а так, что бы получился, как вы думаете, кто?

- *Он самый, несуществующий "высокопатогенный вирус"*!

- Правильно! Он, родной! В экспериментальных условиях и то для получения вакцин, для обмена генетическим материалом между вирусами используют специальные культуры тканей, но в природе процессы обмена генетическим материалом должны произойти в не предназначенных для них клетках.

- *То есть опять все умножается на ноль*!

- Нули только на дисплее калькулятора все одинаковые! Предположим, что образовался реассортант, показанный на схеме, намалеванной одним из сотрудников НИИ гриппа. Это - единичное событие. Но оно случилось - "высокопатогенный вирус" "свиного гриппа" "смешался" с таким же "высокопатогенным" вирусом "птичьего гриппа", да еще с вирусом "сезонного". Образовался тот самый "ужас", вызывающий "испанку", который обычно лепится в головах пильщиков бюджетных средств.

- *Этот "ужас", свинья без пятачка и на куриных ножках, хоть полетит*?

- Не дальше пределов клетки, где образовался. Что бы он "полетел" дальше, в "смешивающем сосуде" должен заработать механизм, отделяющий "зерна от плевел", т. е. новый "высокопатогенный" вирус, от "старого", ни на что не годного в плане пиления бюджетных средств. В экспериментальных условиях генетики обычно вводят селективные метки в разные вирусы, а потом по ним в культурах клеток отбирают их реассортанты. Но какие преимущества у образовавшегося полудохлого реассортанта перед бурно размножающимися в "смешивающем сосуде" исходными вирусами? Но по сложившейся в эпидемиологии гриппа традиции, берем все недостающее " с потолка". Предположим, появился еще быстрее размножающийся вирус, обладающий большей вирулентностью, чем его предшественники. Для уже инфицированного тремя вирусами "смешивающего сосуда", это означает быструю смерть вместе со всеми вирусами.

- *И все же давайте представим, что "свиноптах" состоялся.*

- Мы уже столько раз умножали все на ноль. Тогда представьте себе толстую свинью на курьих ножках. Выживет она в природе? Вот также и у "свиноптичьечеловеческого вируса" возникнет множество проблем в плане передачи от одного хозяина к другому. Спите спокойно.

- Еще один хитрый прием, на мой непрофессиональный взгляд - статистика. В России усиленно педалировали исключительно свиной грипп, выискивая каждого заболевшего! Поштучно! Общая же эпидемическая обстановка покрывалась туманом процентов в сравнении с прошлым годом. Осенью я пытался узнать, сколько же россиян болеет обычным гриппом. Никто не ответил. "Комсомолка" вынуждена была публично заявить: "В России скрывают правду о сезонном гриппе!" Видимо, в интересах тех, кто занимался производством и реализацией "свинских" вакцин. Через 5 дней упомянутая в статье министр Голикова сообщила полную статистику заболеваемости сезонным гриппом и ОРЗ. Свиной грипп на том фоне был каплей в море.

- Уже в сентябре было ясно, что "пандемия провалилась", так как обычно настоящие пандемии гриппа начинаются летом. Фарс со статистикой требовался для дальнейшего нагнетания паники перед "страшным и ужасным" H1N1. Это название повторяли как заклинание: "H1N1, H1N1, H1N1"! Пусть народ помчится на прививки, в аптеки за резко подорожавшими лекарствами. Авось правительство, видя размах бедствия, выделит новые миллиарды на вакцины и пилюли.

- *Вы с подозрением по-прежнему относитесь к вакцинам против гриппа*?

- Теперь с еще большим подозрением. Во время прошлых пандемий ученые на практике убедились, что вакцинациями контролировать грипп не удается. Даже идеальными вакцинами, а не теми, что спешно "лепили" прошлым летом. К тому же, если реальный механизм возникновения пандемий гриппа до сих пор не ясен, откуда тогда такая ясность в борьбе с ними - "создадим вакцину и покончим"? Мистификаторы пандемии "свиного гриппа" нас пытались убедить в том, что если появились у вакцинированного человека антитела к вирусу, то это значит, он от этого вируса уже защищен. Помните, как "гоняли" по разным телеканалам сюжеты из НИИ гриппа, где как сводки с фронта нам сообщали, что еще у одного подопытного появились антитела?

- *Помню*!

- Наличие антител к вирусу не говорит о наличии иммунитета к нему. Антитела бывают разными, в том числе и такими, которые усиливают инфекционность вируса (феномен антителозависимого усиления инфекции). Когда они такие кадры показывают, то думают, что никто и ничего не знает о механизмах иммунных реакций. Это не только профанация иммунологии, но еще и полное неуважение к ученому люду, занимавшемуся разработкой реальных вакцин к действительно опасным микроорганизмам. Это плевок в лицо всем нам, кто работал или работает практически в этой области.

Чтобы вести себя так "отвязано", нужно:

1) ощущать вообще полную безнаказанность;

2) обладать какой-то душевной тупостью.

Академики Забыли о Репутации

- *Ясно, что наши академики в этой афере - лишь рыбы-прилипалы.*

- Да, инициатива раскручивания псевдопандемии не их. Но они должны были сказать премьер-министру (раз их спрашивают!), что ситуация не представляет опасности, а не пользоваться ею в не очень прозрачных целях.

- За птичьей аферой проглядывал клюв вашингтонского ястреба Рамсфелда, бывшего министра обороны США, который и напал на нефтеносный Ирак по заказу "нефтяника" Буша. По совместительству - фармацевт. Это его фирма изобрела супер-лекарство тамифлю (скорее, слямзила у австралийцев идею). И с каждой проданной по миру упаковки имеет процент.

Патент у них до 2016 года. В компаньонах у этого фармацевта были другие сильные мира сего. А собирал миллиарды на борьбу с птичьим гриппом, призывал глав государств и правительств закупать стратегические запасы тамифлю глава Всемирного банка Вулфовиц, соратник и бывший подчиненный Рамсфелда. Чьи уши торчат за свинской аферой?

- Я не знаю, не вникал в этот вопрос. Меня интересует экология вируса гриппа. Возможно уши одни и те же.

- *Почему именно грипп в конце концов выбран для планетных афер? Ведь сначала были попытки развести нас на коровьем бешенстве, атипичной пневмонии, еще каких-то экзотических болезнях. Остановились на банальном гриппе. Им разводят не только нас, рядовых граждан, бегающих по аптекам, прививочным центрам, но и королей, президентов, премьеров, выделяющих деньги большие на вакцины, лекарства. Обама прививается публично всей семьей, Путин спрашивает в мурманской аптеке не сердечные лекарства, действительно нужные народу, а арбидол. Все дело в массовости, сезонности заболевания? Потому проще напугать?*

- ОРЗ болеют еще более массово. Я думаю, что ежегодная вакцинация против гриппа еще и стереотип поведения, вырабатываемый у людей с детства. Просто никогда раньше так цинично вакцинацию не проводили. Подведем итоги. Все разговоры о том, что достаточно появиться "новому вирусу" и возникнет ужасная пандемия - псевдонаучный треп, рассчитанный на клиповое сознание, сформированное голливудскими фильмами. Без формирования всей эпидемической триады (источник вируса, механизм передачи и восприимчивая популяция) не будет даже отдельных локальных вспышек гриппа. Когда к этой глобальной трепотне в конце апреля 2009 г. присоединились "светила" российской эпидемической науки, уже было ясно, что "свиной грипп" не распространяется из одного какого-то очага, где он якобы образовался из сезонного, птичьего и свиного; и что он не является новым. К тому же он не образует цепочек, характерных для воздушно-капельной передачи вируса между людьми. Уже в мае было понятно, что эта "пандемия" представляет собой серию независимых друг от друга, но синхронно возникающих вспышек, где свиньи и люди заражаются из какого-то другого источника. В этих нестыковках заключались колоссальные возможности для совершения научных открытий и разработки прорывных идей в эпидемиологии не только гриппа, но и многих других инфекций, для возбудителей которых не установлены первичные природные резервуары (источники вируса) и не очерчены территории их природных очагов.

- *Но "заинтересованные лица" предпочли "взять наличными", свели все к вакцине и в конечном итоге опозорились, поскольку свиной грипп исчез еще до начала массовой вакцинации. И сами они исчезли с "голубых экранов".*

- Опозорились? В глазах кого? Нас? Серой запуганной массы, которой с 1991 года манипулируют как хотят, а теперь еще и прививают чохом от пустышки "высокопатогенного вируса" пустышкой-вакциной, сляпанной за месяц? Да они смеются над нами! Будет такая возможность, повторят все снова. И на "голубые экраны" опять полезут сплоченной стаей. Станут опять выть и лгать, выть и лгать с утра до вечера о грядущей "испанке", даже не поинтересовавшись, чем на самом деле была та пандемия. Зато одно "открытие" все же можно сформулировать в ходе изучения этой аферы - "пандемии гриппа прекращаются не в результате массовой вакцинации, а сразу после выделения денег на вакцинацию".

- *Надо это "открытие" вписать в учебники по эпидемиологии.*

- Хуже всего то, что такими акциями в массовое сознание вписывается цинизм и недоверие к научной медицине. Уже пошли разговоры, что раз нет свиного гриппа, то и ВИЧ/СПИД-пандемию придумали фармацевтические компании; что вакцинации вообще не нужны, никакие, и т. п. К сожалению, в России во время "птичьей" аферы, и "свинской" не нашлось в среде политиков, известных ученых и чиновников высокого ранга никого, кто бы реально оценил обстановку и дал верный прогноз ее развития для правительства и успокоил народ. И еще не оказалось такого понятия, как "научная репутация". Если бы оно существовало, то в отставку должны были уйти многие деятели еще времен страшилки "птичьего гриппа", вроде

директоров НИИ гриппа Киселева, НИИ вирусологии Львова. И нас бы не "развели" повторно на "свином гриппе" уже избитыми мошенническими приемами типа: "Вот появится новый вирус и начнется испанка"

- Одного из этих "гриппозных академиков" глава Роспотребнадзора Онищенко даже назвал в сердцах информационным террористом. Жаль, что этим и закончилось. С террористами надо поступать соответственно. Ведь покуда они сидят на своих высоких теплых местах, мы действительно не защищены ни от новых эпидемических афер, ни от новых эпидемий.

- Вы правы. Я, как рядовой ученый, смотрел всегда на наш эпидемиологический "Олимп" снизу вверх. Но вот наступил момент, когда этот "Олимп", кстати, существующий на наши налоги, должен был продемонстрировать обоснованность своего бытия. Любая эпидемия - момент истины. И что мы увидели в реальности на его вершине? Банальность и некомпетентность! Птичий грипп перейдет в "испанку"; затем свиной перейдет в "испанку" и т. д. Да еще: "Дайте денег на вакцину"! Любая появись инфекция, ход мысли будет одним и тем же: "Дайте денег на вакцину! А то …". Далее занавес! И с этим багажом идей в эпидемиологии мы вступили в XXI век!

- Меня вот что еще беспокоит. Отсутствие у академического сообщества интереса к реальным проблемам гриппа очень опасно для всех нас, граждан России. Не только незнание механизмов, по которым развилась "испанка", но и принципиальный отказ от такого знания делают нас ее заложниками. И новые вирусы, их мутанты будут ни при чем. "Старые" могут вернуться, мало не покажется.

- Не исключено. Напомню: нашествию чумы в XIV столетии, известной нам под названием "черной смерти", предшествовало похолодание и вулканическая активность в Европе. - Ага, в Исландии как раз вулкан проснулся! - Анализ исторических источников показывает, что любое изменение климата, как в сторону потепления, так и похолодания, приводит к активизации эпидемий. Поэтому нам нужно изучать реальную эпидемиологию, а не выдумывать ее. Я хочу подчеркнуть для молодых ученых - эпидемиология сегодня находится на пороге больших открытий, особенно в области природной очаговости возбудителей опасных инфекций. В России, к счастью, есть научные коллективы, развивающие смелые идеи в этой области. Поэтому держитесь подальше от закаленных деятелей "биотерроризма", "птичьего гриппа", "свинячего" и т. п. зловонных отрыжек из 1990-х гг. Спешите делать научные открытия, пока их не сделали другие.

- Михаил Васильевич! Поскольку ваши прогнозы обычно подтверждаются реальным развитием событий, какая следующая профанация в российской науке лопнет в ближайшем будущем?

- ВИЧ-вакцина.

Михаил Супотницкий

Влад Гринкевич

A/H1N1: страшная угроза или великая афера?

РИА, Новости, 11 июня 2010, 13:03
https://ria.ru/20100611/245076874.html

Год назад, 11 июня 2009 года, Всемирная организация здравоохранения (ВОЗ) объявила о пандемии вируса A/H1N1 или «свиного гриппа», самому вирусу медики присвоили высшую - шестую - степень опасности. Это была первая пандемия за последние 40 лет. С тех пор «свиной грипп» унес жизни более 18 тыс. человек из 213 стран мира. Однако спустя год после объявления пандемии, чиновников ВОЗ обвиняют в коррупции и фактическом лоббировании интересов фармацевтических компаний, которым паника принесла немалую прибыль.

Появление нового штамма гриппа зафиксировали в самом начале 2009 года. Ситуация резко накалилась в апреле, после сообщения о первой жертве A/H1N1. В мае 2009-го, еще до объявления о пандемии, власти Гонконга объявили в стране чрезвычайную ситуацию. Была проведена чуть ли не войсковая операция по блокированию гостиницы, в которой проживала туристка, заболевшая «свиным гриппом». Пример оказался заразительным - после заявления ВОЗ о начале пандемии Белый дом назвал «свиной грипп» национальной угрозой для США, а президент Барак Обама ввел чрезвычайное положение.

Главной жертвой паники вокруг нового вируса стала мировая экономика. Конечно, ВОЗ призывала государства не закрывать границы, уверяла, что употребление правильно приготовленной свинины не несет опасности для здоровья. Эксперты Продовольственной и сельскохозяйственной организации ООН (ФАО), впрочем, сообщали, что не нашли связи между заражением людей A/H1N1 и употреблением свинины, а ВТО даже распространила специально заявление, мол, угроза вируса не может считаться оправданием для ограничений на ввоз свинины. Тем не менее, четырнадцать стран, включая Россию, ограничили импорт свинины, а власти Египта спровоцировали крестьянские бунты, объявив об уничтожении поголовья свиней. Помимо фермеров убытки подсчитывали туроператоры и авиаперевозчики – опасаясь болезни, многие предпочли отложить зарубежные поездки.

Впрочем, кое-кому паника вокруг вируса A/H1N1 пошла впрок - на продаже антивирусных препаратов фармацевтические компании заработали порядка $10 млрд. Это и стало причиной разговоров о том, что никакой особой опасности не было, а вся история с новым штаммом была своеобразной антикризисной программой фармакологов. А что, ведь верно, пока большинство отраслей страдало от кризиса, фармацевтические предприятия наращивали производство. Только в России продажи рекомендованных ВОЗ антивирусных препаратов по итогам 2009 года увеличились в 10 раз.

Подозрения возникли еще в прошлом году. В ноябре 2009-го датская газета *Information* обратила внимание на тот факт, что «триумфальное шествие» нового вируса странным образом совпало со слиянием двух фармацевтических гигантов - швейцарской Hoffman-La Roche и американской Genentech. Журналисты предположили, что пандемия может на деле оказаться грандиозной коррупционной аферой. Но первым о коррупции заговорил председатель подкомитета по здравоохранению комитета по социальным вопросам, здравоохранению и семье ПАСЕ Вольфганг Водарг. Чиновник так и сказал - никакого «свиного гриппа» не существует, есть лишь форма обычного сезонного гриппа, а паника вокруг него раздувается в интересах фармацевтических компаний.

Косвенно этот тезис подтвердила и министр здравоохранения и социального развития РФ Татьяна Голикова. Желая успокоить россиян, г-жа Голикова привела в ноябре прошлого года статистику, согласно которой смертность от нового вируса не превышает смертность от обычного гриппа. За девять месяцев 2008 года от сезонного гриппа погибло 484 человека, за девять месяцев 2009-го - 439 человек, а ситуация с заболеваемостью в целом почти не отличается от сезонной.

Словом, было над чем задуматься. И вот в начале этой недели ПАСЕ начала расследование всех обстоятельств возникновения пандемии A/H1N1. На первом заседании был представлен доклад, согласно которому оснований для объявления высшего уровня опасности не было, а ВОЗ намеренно нагнетала панику. Вдобавок обращается внимание на тот факт, что некоторые эксперты ВОЗ одновременно являются сотрудниками фармацевтических компаний, производящих среди прочего и вакцины от свиного гриппа.

Стоит ли говорить, что представители ВОЗ все обвинения в свой адрес категорически отрицают. Генеральный директор организации Маргарет Чен на днях заявила, что коммерческие интересы «ни на одну секунду» не влияли на ее решения, все формальные признаки пандемии налицо, а число жертв «свиного гриппа» продолжает расти. Но в том, что вирус A/H1N1 способен убивать, никто и не сомневался. Вопрос лишь в масштабах угрозы - самый обычный грипп ежегодно убивает от 200 тыс. до 500 тыс. человек, а жертвами «свиного» стали менее 20 тыс. Выгода фармацевтов очевидна.

И все же нет однозначного ответа на вопрос, оправдана ли была паника вокруг вируса A/H1N1. По итогам года медицинские службы многих стран действительно зафиксировали аномальное число заболевших гриппом и ОРВИ. Поэтому ВОЗ, несмотря на звучащие обвинения, не спешит заявлять об отмене пандемии. Кстати на этой неделе и главный санитарный врач России Геннадий Онищенко также заявил, что пандемия свиного гриппа продолжается. Что ж, возможно, расследование, предпринятое ПАСЕ, даст в конечном счете ответ, стало человечество жертвой опасной болезни или хитрой аферы, провернутой совместно международными чиновниками и акулами фармацевтического бизнеса.

THE FLU CASE

Assemblée Nationale

Commission d'enquête sur la manière dont a été programmée, expliquée et gérée la campagne de vaccination contre la grippe A(H1N1)

Audition du Dr Marc Girard, mercredi 09/06/10, à 19h15

The Flu Case, 11 June 2010

https://web.archive.org/web/20100814170701/http://www.theflucase.com/index.php?option=com_content&view=article&id=3708%3Amarc-girard-fiercely-critical-of-swine-flu-jab-campaign-in-french-inquiry-testimony-french&catid=1%3Alatest-news&Itemid=64&lang=en

Monsieur le Président, Monsieur le Rapporteur, Mesdames et Messieurs les Députés,

A quel titre vais-je me présenter devant vous ? Simplement à celui de pouvoir documenter avoir introduit dans le débat public la quasi-totalité des éléments qui ont alimenté la légitime défiance de nos concitoyens quant à la gestion de la grippe porcine par les autorités. Dès le 28 avril 2009, lors d'une intervention sur la chaîne France 24 (PJ 1), j'ai avancé les arguments suivants :

1. on n'a aucune preuve que ce nouveau virus soit très virulent ;
2. les antiviraux comme Tamiflu n'ont pas donné de preuve d'efficacité et posent d'importants problèmes de tolérance, tandis qu'une stratégie de vaccination n'est pas nécessairement appropriée non plus ;
3. l'information sur cette pseudo pandémie correspond à une « rhétorique d'intimidation»;
4. cette rhétorique d'intimidation s'inscrit dans une continuité historique de mystifications similaires, qui met notamment en jeu les conflits d'intérêts des experts impliqués;
5. «à qui ça profite ?». S'enrichissant chaque fois des données de l'expérience, mes interventions ultérieures sont notamment revenues sur L'art de créer des alertes en santé publique (24/05/09) et les dangers de Tamiflu);[1] dès le 26/08, dans une interview à France-Soir, j'ai soulevé la question grave de la régularité du processus d'AMM; le 01/09, j'ai fait connaître au public les résultats convergents des évaluations Cochrane sur le manque de preuves quant à l'intérêt des vaccins antigrippaux en général.[2]

Puis, durant des semaines, j'ai également été le seul à citer le rapport public d'évaluation rédigé par l'EMEA – l'Agence européenne du médicament – pour contredire la réassurance des autorités sanitaires quant à la normalité du processus de développement ayant justifié l'autorisation des nouveaux vaccins.[3]

Début octobre 2009, enfin, j'ai publié un livre[4] replongeant le scandale de la grippe H1N1 dans un contexte bien plus large – historique, sociologique, épistémologique et politique, notamment. A l'évidence, les frontières ont bougé, avec cette histoire : c'est la première fois qu'un débat de fond sur les vaccinations a pu sortir de l'éternelle guerre de religions entre les pro- et les antivaccins. Tous mes correspondants, qu'ils viennent des Académies, des instances ordinales, de la médecine militaire ou même des pastoriens m'en attribuent le mérite : je le dis sans forfanterie, mais avec gravité – et une conscience renouvelée de ce qu'il en coûte pour se dresser initialement seul contre tous.

Pour comprendre, il est utile de rappeler brièvement au terme de quel processus je suis tombé dans la marmite des vaccins. Consultant pour l'industrie pharmaceutique, estimé et confortablement rémunéré par les leaders du marché, n'ayant aucun intérêt personnel à me brouiller avec mes meilleurs clients qui s'appelaient à l'époque Pfizer, GSK, Aventis, Novartis, Roche, j'ai été chargé par la justice française, au tout début des années 2000, d'expertiser les grandes affaires de santé publique

impliquant des médicaments, notamment celle concernant la vaccination contre l'hépatite B. Par rapport à une profession alors fortement contrainte par une réglementation pointilleuse, j'ai alors découvert le secteur vaccinal comme une sorte de sédiment de pratiques pharmaceutiques dont je n'envisageais même pas qu'elles pussent encore exister – comme illustré rapidement par cette récente offre d'emploi d'un leader du secteur qui ne craint pas d'assumer que pour diriger le développement d'un projet vaccinal «une compréhension [je ne dis pas: une expertise] des aspects cliniques de l'infectiologie – virologie, immunologie, microbiologie – serait très utile, mais pas essentielle» (PJ2)… Ce précédent me permet aussi de revenir sur les allégations de mes collègues experts qui justifient leur discrétion sur leurs liens d'intérêts par le fait que ceux-ci n'altèreraient en rien leur indépendance:[5] l'évolution de mon chiffre d'affaire réalisé avec l'industrie pharmaceutique (PJ3) illustre clairement, je crois, qu'il faut bien du courage – ou de la témérité – quand on veut garder son indépendance en dépit de ces liens.[6,7]

La question qui vous est posée aujourd'hui n'est pas de savoir comment les Français réagiront lors de la «prochaine» pandémie – en validant implicitement du même coup la mystification (désormais confirmée par la toute récente enquête du British Medical Journal[8]) qui a consisté à faire accroire que nous venions d'en traverser une. Car cette pseudo-pandémie s'est fondée sur une triple exagération:

1. Exagération du nombre de personnes touchées, quand il est parfaitement établi aujourd'hui que lorsque la pandémie a été déclarée, moins de 5% des personnes répertoriées comme atteintes étaient effectivement positives pour le test du virus[9] et que, par la suite, le délire des chiffres a été alimenté par des critères sémiologiques dont l'indigence saute aux yeux du moins professionnel: fièvre à 38°C, toux… Tous les Français ont vu des gamines la goutte au nez sortir de chez leur médecin paniqué avec une pile de masques et du Tamiflu ; on a également vu des diagnostics par téléphone…

2. Exagération de la virulence du virus, avec des critères d'imputabilité des décès extraordinairement lâches et – en contradiction avec la réglementation pharmacovigilante en vigueur – un refus systématique de considérer que les décès après prescription de Tamiflu aient pu correspondre à une toxicité de ce médicament;[10]

3. Exagération médiatique, évidemment : ai-je besoin d'illustrer ? L'autre fausse question, ce serait d'examiner comment protéger nos concitoyens des sectes. Via mon site d'une part et au cours d'un cycle de conférences d'autre part, j'ai récemment discuté avec énormément de gens. L'argumentaire antivaccinaliste – qui n'avait quasiment intéressé personne jusqu'à présent – a effectivement été examiné par des millions de Français indûment alertés: tout le monde s'est rendu compte de son indigence, de telle sorte qu'il n'est pas excessif de soutenir que même s'ils surfent naïvement sur la vague, jamais les antivaccinalistes n'ont été aussi décrédibilisés qu'aujourd'hui. Dans une démocratie, quand 80% des citoyens se sont prononcés sans ambiguïté, ils méritent mieux qu'une inquiétude condescendante quant à leur capacité à faire les bons choix: les Français ont été admirables dans leur résistance à la désinformation.

La question n'est pas non plus de pointer les incompétences avec une sélectivité partisane. Certes, il y a des « Diafoirus d'internet », mais les experts consultés par le ministère ont été répétitivement démentis par les faits, et les virologues, par exemple, n'ont jamais craint de se prononcer avec assertivité sur des questions de santé publique qui dépassait clairement leur compétence. C'est aussi l'occasion de se demander s'il est encore acceptable que, dans un grand pays comme la France, la direction de l'Institut de veille sanitaire soit confiée à quelqu'un avec qui j'entretiens des liens professionnels a priori paisibles depuis 25 ans, mais dont il est facile de documenter qu'elle n'a strictement ni les titres, ni les travaux justifiant une telle responsabilité. Permettez-moi donc de vous proposer un critère de crédibilité expertale dont je vous garantis qu'il ne vous laissera jamais dans la peine. Le bon expert, c'est celui dont on peut se passer: celui qui saura exprimer les problèmes technico-scientifiques d'une façon qui vous permettra de vous réapproprier les éléments du débat dans l'ordre de votre propre compétence. Vous êtes des politiques; laissez-moi illustrer par quelques exemples la façon dont vous pourriez reprendre en mains la situation.

1. Vous avez voté l'art. L.4113-13 du Code de la santé publique et qui fait obligation à tout professionnel de santé s'exprimant dans la presse de faire préalablement état de ses liens d'intérêts: jugez-vous normal que de tous les experts concernés que vous avez auditionnés jusqu'à présent, aucun ne se soit spontanément plié à cette disposition que vous avez pourtant voulue?

2. Jugez-vous décent que la politique préventive du gouvernement ait été justifiée par le «principe de précaution», quand la loi Barnier que vous avez votée en 1995 stipule sans ambiguïté que les mesures prises en son nom doivent l'être «à un coût économiquement acceptable»?

3. Vous avez inclus le code de déontologie médicale dans les dispositions du code de la santé : jugez-vous normal que les Français aient reçu de leur ministre une circulaire leur certifiant que le vaccin était sûr malgré les allégations contraires de l'EMEA – en contradiction, par conséquent, avec le principe déontologique sacré du consentement informé? Pour conclure cette brève présentation, permettez-moi de d'ouvrir deux pistes de réflexion: l'un concernant le médicament et la santé publique, l'autre la politique. Dans la vie d'un médicament, la phase de développement est incontournable. C'est le seul moment où l'on peut soumettre le nouveau produit à des évaluations contraintes par un minimum de rigueur: contrôle du processus de fabrication, tests chez l'animal, essais cliniques, etc. Même si ces exigences peuvent être contournées, elles ne sauraient en aucun cas être remplacées par une promesse de pharmacovigilance une fois le produit sur le marché. En l'espèce, alors que l'EMEA reconnaissait sans fard que le rapport bénéfice/risque n'avait pu être évalué au cours du développement, l'administration sanitaire ne rougit pas de clamer, une fois le produit sur le marché, que les données de la pharmacovigilance «ne modifient en rien» le rapport bénéfice/risque du produit, lequel n'avait justement pas été évalué: c'est dire, avec un parfait cynisme, que ce rapport bénéfice/risque n'a été et ne sera jamais évalué et que ces produits, pour lesquels on a un temps envisagé une obligation vaccinale, sont proprement défectueux au sens légal du terme. Or, cette séquence – développement bâclé sur la fallacieuse promesse d'une pharmacovigilance qui ne viendra jamais – est exactement celle qui sous-tend la proposition de directive modifiant la directive 2001/83/CE qui est actuellement en discussion à Bruxelles: ce projet est proprement effrayant, et la récente histoire des vaccins contre la grippe porcine est l'éloquent prélude de la caricature technicoréglementaire que les lobbies pharmaceutiques cherchent désormais à mettre en place.

5. Ces allégations sont d'ailleurs en contradiction avec la quasi-totalité des nombreux travaux disponibles sur le sujet, notamment ceux qui mettent en jeu les déterminants parfois subtils de « l'effet de financement » (« funding effect »). Il est utile, également, de rectifier ceux (la minorité, d'ailleurs) qui tentent de s'en sortir en évoquant l'erreur – humaine et toujours possible : lorsqu'elle n'est pas aléatoire et qu'elle joue systématiquement dans le même sens (en l'occurrence : l'intérêt bien compris des sponsors), l'erreur est constitutive d'un biais.
6. Et si recevoir de l'argent de l'industrie pharmaceutique est un gage d'excellence – comme mes collègues, une fois démasqués, voudraient le faire accroire – il faudra bien que mes ex-clients justifient le contraste entre cette prospérité ancienne et la situation actuelle, quand rien n'indique que dans l'entre temps, j'ai basculé dans l'incompétence…
7. Cette expérience personnelle est tout à fait compatible avec une récente étude du NEJM (2010 ; 362 : 1832-9) montrant le pouvoir de représailles que peut exercer l'industrie pharmaceutique sur ceux qui ont dénoncé leurs pratiques même dans un pays comme les USA où les « lanceurs d'alerte » (whistleblowers) sont normalement très protégés par la loi.

LE DEVOIR

Richard Gendron, Pierre Biron, Marc Zaffran

Pseudo-pandémie d'A(H1N1) – Alarmisme et gaspillage de fonds publics

Le'Devoir, 12 Juin 2010
https://www.ledevoir.com/opinion/idees/290727/pseudo-pandemie-d-a-h1n1-alarmisme-et-gaspillage-de-fonds-publics

Il y a eu le 11 septembre 2001. Comme un écho à cette date fatidique, le 11 juin 2009, la peur prenait un nouveau visage: celui du virus A(H1N1). Il y a eu un an hier, l'Organisation mondiale de la santé (OMS) élevait au niveau maximum son état d'alerte à ce qu'elle considérait comme une pandémie mondiale.

Plusieurs scientifiques, surtout en Europe, ont sévèrement critiqué cet alarmisme: l'ancien patron de la Croix-Rouge française, Marc Gentilini, a parlé d'une «pandémie de l'indécence». Plus récemment, la gestion de ce dossier par l'OMS a été durement critiquée dans un éditorial publié dans le British Medical Journal et dans un rapport déposé le 4 juin dernier à l'Assemblée parlementaire du Conseil de l'Europe. En présentant ce rapport, le député britannique Paul Flynn a affirmé que «cette pandémie n'a jamais vraiment existé».

Nous sommes d'accord avec cette affirmation et nous croyons qu'il est important de faire l'autopsie de cette pseudo-pandémie.

Une pandémie de la peur

Au Québec, on a eu droit à une pandémie de la peur, surtout après le décès d'un jeune Ontarien porteur du virus. En l'absence d'autopsie chez le jeune garçon en question, il était irresponsable de laisser entendre que c'était l'A(H1N1) qui avait causé ce décès.

Inquiets, de nombreux parents et enfants ont envahi les urgences des hôpitaux: la situation était telle que, quelques jours plus tard, les urgentologues de Sainte-Justine et du Children's Hospital publiaient un communiqué conjoint dans lequel ils déploraient ce qu'ils ont appelé «la psychose du H1N1» en spécifiant que «les gens doivent comprendre que c'est un microbe relativement bénin» (Le Devoir, 30 octobre 2009).

Relativement bénin, en effet: avant même le début de la campagne de vaccination, des centaines de milliers de Québécois ont été en contact avec le virus A(H1N1) 2009 et ont développé naturellement des anticorps qui les ont protégés et qui les protégeront contre ce virus s'il est encore présent à l'automne 2010, ici ou ailleurs dans le monde. La campagne massive de vaccination, à laquelle ont participé plus de quatre millions de Québécois, est arrivée trop tard, a coûté cher et n'était pas justifiée scientifiquement.

«Dispersion» n'égale pas «pandémie»

Si on ne se fie qu'à la dispersion géographique des virus pour définir une pandémie mondiale, on peut dire qu'il y a annuellement plusieurs pandémies de divers types d'influenza. Cependant, «virus» n'est pas équivalent à «maladie», et dispersion du virus n'égale pas «pandémie». Entre le virus et la maladie, il y a la capacité du système immunitaire des gens à composer avec le virus: dans le cas de l'A(H1N1), les données dont on disposait, à la fin de l'été 2009, permettaient d'affirmer que la très grande majorité des gens n'avaient rien à craindre de ce virus.

En mai 2009, cependant, l'OMS avait adopté un nouveau système de catégorisation des pandémies basé sur le critère de dispersion géographique et mettant de côté le critère de virulence (maladies graves, décès). C'est sur cette base que, le 11 juin 2009, l'OMS déclenchait une alerte planétaire en annonçant qu'on était en situation de «pandémie mondiale» d'A(H1N1): ce que l'OMS n'a pas dit, toutefois, c'est que, si elle avait appliqué sa nouvelle grille de catégorisation aux années antérieures, elle aurait dû déclarer une pandémie d'A(H1N1) ou d'A(H3N2) chaque année!

Il aurait été plus logique et fidèle à la tradition médicale de conserver dans la définition une référence à un nombre inhabituellement élevé de personnes très malades ou décédées. Selon ce critère, on n'avait pas affaire à une pandémie en 2009, mais bien à une épidémie comparable à l'épidémie de grippe saisonnière, et ce, même si le virus s'est répandu plus rapidement.

Un virus relativement bénin

Armées de plans de pandémies conçus pour des virus beaucoup plus dangereux et confondant «principe de précaution» et «précipitation», les autorités de santé publique ont commandé aux compagnies pharmaceutiques des centaines de millions de doses de vaccins.

Dans la plupart des pays, seule une minorité parmi les populations visées a choisi de se faire vacciner: aux États-Unis, c'est 25 % de la population; en France et dans le reste de l'Europe, c'est 10 % ou moins. À peu près partout, y compris au Québec, le vaccin est arrivé trop tard, en même temps ou après la «deuxième vague» de la pseudo-pandémie. Ce fut un énorme gaspillage de fonds publics.

Facile de critiquer après coup, disent certains. «On ne savait pas avant», ajouteront-ils. C'est faux. En août 2009, on disposait de chiffres démontrant clairement que l'épidémie d'A(H1N1) 2009, en Australie, était d'une sévérité comparable à la grippe saisonnière. Durant notre été, c'était l'hiver là-bas, la saison de la grippe; l'épidémie d'A(H1N1) 2009 n'y avait pas pris une ampleur catastrophique, et ce, soulignons-le, malgré l'absence de vaccins contre la nouvelle forme de H1N1. À la fin de l'été 2009, «on savait» donc que c'était une fausse alerte.

Ce n'était pas une pandémie, mais une épidémie de grippe susceptible d'affecter certaines catégories de gens qu'on aurait pu cibler et sensibiliser à des mesures d'hygiène, en attendant qu'un vaccin soit prêt. On aurait pu prendre au Québec la décision de ne faire qu'une campagne de vaccination pour les personnes à risque et éviter un coûteux détournement de ressources financières et humaines: la vaccination de masse a privé le système de santé québécois d'une partie de son personnel qui a été affectée à la vaccination au détriment de soins jugés moins urgents. Les coûts associés à ce détournement seront-ils jamais évalués? [...]

La bactérie Clostridium difficile

Au printemps et à l'automne 2009, la grande majorité des Québécois infectés par le virus A(H1N1) ne s'en sont pas rendu compte ou, s'ils ont eu la grippe, ils sont passés à travers sans complications. Chez moins de la moitié de 1 % des personnes infectées, une hospitalisation temporaire a été requise: il y a eu 2483 cas hospitalisés au Québec entre le 30 août 2009 et le 9 février 2010. Parmi ceux-ci, 360 ont nécessité des soins intensifs et 82 sont décédés. L'âge moyen des décès était de 60 ans. On a identifié des conditions sous-jacentes (cardiopathie, maladie pulmonaire, etc.) chez 80 des personnes décédées: au final, du 30 août au 9 février, il y a eu au Québec deux cas de décès imputés à l'A(H1N1) sans identification d'une condition sous-jacente.

Pendant la même période, il y a eu quatre fois plus de décès, dans les hôpitaux québécois, des suites d'une infection par la bactérie C. difficile. En 2008-2009, en effet, le chiffre officiel est de 457 décès imputables à cette bactérie. Les médias en parlaient-ils chaque jour? Non. Pourtant, avec des taux d'environ 60 décès par million de personnes, cela correspond à quatre fois le taux de décès imputés à l'A(H1N1) en 2009. Si les autorités de santé publique du Québec avaient fait mention de tous les décès qui se sont produits dans les hôpitaux à l'automne 2009, cela aurait pu être instructif. Sur une base hebdomadaire, on aurait eu droit à des chiffres comme ceux-ci: «Cette semaine, on

rapporte dans les hôpitaux 300 décès attribués au cancer, six décès attribués à la bactérie C. difficile et deux décès attribués au virus A(H1N1) 2009.» Vu comme ça – c'est-à-dire sous l'angle de la réalité, – l'A(H1N1) fait moins peur.

Les autorités de santé publique nous informaient-elles, en 2008 ou 2007, de tous les décès qui se produisaient au Québec chez des gens infectés par les virus de la grippe saisonnière? Bien sûr que non, car on ne faisait pas systématiquement des prélèvements et on ne tenait pas des statistiques aussi précises qu'avec l'A(H1N1) 2009.

Médiatisation indécente

Selon la firme Influence Communications, le poids médias de cette grippe fut en 2009 de 6,7 % au Québec, de 2,4 % au Canada et de 1,4 % dans l'ensemble de 159 pays. Presque 7 % des nouvelles, pendant un an, c'est énorme et sans précédent dans le domaine de la santé!

On a eu droit à une médiatisation indécente de la mort de toute personne infectée par l'A(H1N1) 2009, comme s'il s'agissait du seul agent infectieux en circulation au Québec. On a assisté à une psychose collective qui a été alimentée par la Direction de la santé publique, qui tenait à la réussite de sa mégacampagne de vaccination. Les médias, pour la plupart, ont agi comme des amplificateurs d'une perception du risque totalement déformée: c'était comme si la mort venait d'être inventée!

L'influence de l'industrie pharmaceutique

Espérons qu'à l'avenir les autorités sauront garder leur calme et leur objectivité scientifique lorsqu'une nouvelle forme d'influenza se pointera le bout des antigènes: avant de signer de juteux contrats avec les fabricants de vaccins, les autorités devraient se montrer plus critiques envers le discours de certains scientifiques dont les recherches sont financées par l'industrie. Lorsque l'analyse de la situation est biaisée, l'invocation du principe de précaution est irrecevable. On ne peut pas justifier n'importe quoi, à n'importe quel prix, en invoquant l'idée de prudence.

Si on en juge par le rapport déposé récemment au Conseil de l'Europe, il est clair qu'au sein de l'OMS, certains conseillers étaient en situation de conflit d'intérêts. Nous ne pensons pas que les autorités sanitaires québécoises et canadiennes soient vaccinées contre ce genre d'influence. Il s'agit là d'un phénomène qui a pris, ces dernières années, une réelle ampleur... pandémique!

There was also no new Subtype

BMJ, 29 June / 3 July, 2010, V 341, p. 8
doi: 10.1136/bmj.c3460. PMID: 20587571

Cohen and Carter state that the World Health Organization changed the definition of an influenza pandemic by excludisg reference to the words "with enormous numbers of deaths and illness".[1] However, WHO also dropped the requirement for a new subtype, meaning that many seasonal flu viruses could be classified as pandemic influenza. Online web archives show that the WHO website had the erased definition from at least January 2003 to July 2008.[2]

New seroprevalence studies show that substantial proportions of socшуен had pre-existing protective antibodies across age groups. A government study estimatesthat 1.26 million New Zealanders, or 29%, were immune to the pandemic Influenza virus by March 2010.[3]

About 480,000 people had some immunity before the 2009 pandemic wave, mostly in the older age groups. An additional 780,000 were estimated to have been infected during 2009. The highest rate of infection during 2009 was in school age children (one in three). Almost half of those infected showed no obvious symptoms. Overall, 14% of New Zealand schoolchildren had pre-existing antibodies to the 2009 H1N1 virus.

According to the WHO guidelines in effect when the 2009 H1N1 influenza virus was identified in the United States in April 2009, a pandemic would not have been declared. It was not a new subtype, it was not causing enormous numbers of deaths and illness, and a significant rumber of people had already been exposed to an immunogenically similar virus. That only one vaccination was required for all but young children is another sign that this was not an immunogenetically new virus.

WHO and pandemic flu. Time for change, WHO

BMJ, 29 June / 3 July, 2010, V 341, p. 8
doi: 10.1136/bmj.c3461. PMID: 20587572

The World Health Organdatioa has long term relationships with the pharmaceutical Industry and even conceives of industry as a "partner".[1] Now Cohen and Carter show that WHO chose not to disclose financial conflicts of Interest among industry sponsored widens guiding Its influenza policy.[2] In her reply Margaret Chan. WHO's director-general, writes: "At no time, not forone second, did commercial interests enter my decision making".[3] This self evaluation is irrelevant and misses the point: that transparent declarations of Interest are crucial to allow others to decide for themselves.

Chan's dismissal of concerns over the scientific integrity of policy making at WOO is familiar. Our 2009 Cochrane review of influenza antivirals,[4] alongside a BM/-Channel4 investigation,[5] showed substantial publication bias, inconsistencies across different versions of the same dataset, and the presence of ghost and guest authors of a key study.

But WHO dismissed our review as inapplicable to pandemic HlN1;[6] seemingly ignoring that these drugs are licensed forall subtypes of influenza A and B (and the 2009 Ht N1 virus is simply a new influenza A virus).

Pim Kon

GlaxoSmithKline UK responds

BMJ, 29 June 2010, V 341 / 3 July, 2010, V 341, p. 8
DOI: 10.1136/bmj.c3464; PMID: 20587574

Cohen and Carter explore whether the World Health Organization should have taken advice from experts who had declarable financial and research ties with pharmaceutical companies producing antIvirals and influenza vaccines. including GlaxoSmithKline (GSK).[1] Can experts provide advice on public health issues such as pandemic flu, as well as help to develop medicines and vaccines for these same health issues?

It is understandable that WHO and research based pharmaceutical companies would seek the sameworld experts for their respective purposes. Indeed, expertise could be compromised if those that have worked wkh industry are not able to advise on public health issues. Similarly, without outside advice the development of drugs to meet patients' needs and address public health issues would not be possible.

To help manage the potential conflict of interest highlighted by Cohen and Carter, disclosure of financial relationships with industry is clearly important. We agree that transparency over the relationships between industry and healthcare professionals is a must.[2]

GSKwas one of many organisations that responded to the global public health challenge of the pandemic. There was never any attempt to influence WHO or the experts involved in the pandemic process. As WHO has acknowledged, the collaboration needed to deal with the pandemic flu threatwas governed by stringent international health regulations and rigorous safeguards to help manage potential conflicts of interest.

No one can workin Isolation when it comes to preparing fora flo pandemic. Only through working together. with the appropriate governance and codes of practice, can responses to public health challenges such as that presented by H1N1 be developed.

Another question for GSK

The relation between the declaration of a pandemic and the activation of pandemic vaccine contracts came under considerable attention recently. In the *BMJ* Cohen and Carter wrote, "It was the declaring of the pandemic that triggered the contracts,"[1] but *Nature* reports that this is false.[2]

This should not be a matter of interpretation. GlaxoSmithKline (GSK) spokesman Stephen Rea informed the Associated Press in June 2009 of pre-existing contracts it held with countries including Britain, France, and Belgium, contracts that GSK would be obliged to fulfil should a pandemic be declared.[3] It therefore seems that Cohen and Carter are correct. The Associated Press, however, does not provide us with a direct quote from GSK.

Pim Kon, GSK UK medical director, has clarified GSK's position on suggestions that the company ever attempted to influence WHO or experts involved in the pandemic process.[4] Could Dr Kon also clarify the nature of pre-existing pandemic influenza vaccine contracts to help set the record

Keeping citizens in the loop

Jane Burgermeister

Kafkaesque interrogation at Vienna court: Are the Baxter charges behind this?

The WatchDog // BirdFlu666, 12 August 2010
https://waterpressure.wordpress.com/2010/08/12/w-h-o-wines-invented-flu-corruption-scandal-explodes-jane-burgermeister-reports-on-her-court-case/

Judges are supposed to make their decisions on the basis of evidence, documents and facts,
But in the court Döbling in Vienna, this is clearly not a requirement.

An email from an unknown person appeared to be set to be the basis of the decision to appoint a legal guardian and strip me of all my civic rights at top speed when I went at 10 am this morning to the court in Döbling, Vienna, for my interrogation by judge Dr Hannes Winge.

I was told the interview would probably last only 15 minutes and not to bother bringing any documents along as they were all.

To my surprise, Dr Winge's first question to me in his spacious office was about an email from a person I have never heard of called "Christina Braun", writing apparently about my role in the swine flu pandemic. He clearly wanted to focus on this email from this Christina Braun and seemed intent on appointing a legal guardian for me without delay, even asking me to name a representative. I refused because the whole procedure is not justified by the law.

He seemed to have absolutely knowledge at all or even the slightest interest in the copies of the appeals I had handed in one month ago with documents proving that Judge Michaela Lauer's reasons for appointing a legal guardian in connection with my Dad's inheritance are all false even though this should have been the focus of our interview.

A copy lay on his desk. But the pristine pages betrayed that they had come straight out of the photocopy machine and had lain untouched ever since – and that even though Dr Winge is making such a weighty decision about my future and is supposed to be studying the evidence.

I had to insist that Dr Winge look at the proof, documents, bills, emails and evidence that Judge Lauer is pushing to appoint a legal guardian for me on the basis of false accusations and in order to bury evidence of her corruption.

In the end, I had to spend two hours in the office as I laid out all the evidence to Dr Winge – evidence so strong he could not ignore it. At some point, even the most capricious justice system has to take account of reality.

Dr Winge graciously agreed at the end to look at the files and study the evidence. Foolish me! I had been under the impression the examination of evidence also happened before the interview – and not only after. He said he would need about a month and would then make his decision about whether to drop the case or not.

I pointed out to him that he would have to give reasons for his decision and that the reasons had to have some basis in facts and that appointing legal guardians etc for me just to silence me is actually a criminal offence.

Instead of a fair hearing , Dr Winge appeared to wish to discuss only an irrelevant email from a person I have never heard of and to move forward to appoint a legal guardian immediately.

That remainds of the fake criminal charges created by the corruption state prosecutor Katja Wallenschewksi out of letters of protest about my persecution by Heiner Lohmann and Christine Cote.

It seems any, "false flag" email or criminal charges will serve as a happy excuse not to look at the facts at hand and to continue with framing me.

I have to ask myself: why is the Austrian government so desperate to silence me? Why do they risk such a scandal to strip me of my rights? Anyone who reads the appeals and criminal charges on the internet can see that the accusations made against me are trivial or lies.

Being stripped of your civil rights because you allegedly have not done things like pay the insurance of your Dad's house when you have the bill proving you paid — and when it was the job of the Judge Lauer and solicitor Hutz anyway to do this is the first place — is like a black, black comedy. Knowing you could be detained forever because Judge Lauer falsely claims I "made ever new demands for the evaluation of various properties" is like a twist in a Stephen King novel.

What the judge says about me amounts to defamation.

One reason the Austrian government could be so deseperate to remove me is because the Council of Europe report by UK MP Paul Flynn on the swine flu pandemic hype is set to be debated in the Austrian parliament, along with all other parliaments in Europe, in the next session. Also, 220 MEPs demanded an investigation into the swine flu at the European Parliament, though this has been blocked for now.
v
Maybe the Austrian govenrment fears that the upcoming debate will highlight once more the incident where 72 kilos of seasonal flu was contaminated by Baxter in February 2009 in Orth an der Donau. Because the deadly bird flu virus has to be kept in a biosecurity level 3 lab, an accidental contamination can be virtually ruled out. The material was sent to 16 labs in four countries. Only an alert lab technician in the Czech Republic detected the virus after testing it on ferrets.

I filed charges against Baxter on April 8th after there was no meaningful investigation by the authorities. A vet was sent to inspect the lab. The state prosecutor did start an investigation which was dropped in September 2009.

Baxter could have sparked a global bird flu pandemic, triggering mass vaccinations, in Februrary 2009. These pandemic vaccinations can even be made compulsory under the pandemic level 6 declaration by WHO, that it finally revoked just two days before my hearing.

***A few days after I filed charges, the swine flu mysteriously appeared in Mexico*.**

That the swine flu virus was hyped by WHO and by the pharamceutical companies for profit has been confirmed, in the meantime, by evidence presented reports by the Council of Europe and studies such as have appeared in the British Medical Journal.

It could well be that Baxter and the international corporate crime syndicate that I accused of deliberately starting a pandemic for profit in April 2009 is feeling less confident about ist ability to withstand scrutiny.

Only about 3% to 4% of the Austrians took the swine flu vaccine in spite of the gigantic media hype and the exhortations of the health minister Alois Stöger. About 40% take the seasonal flu shot every year as a matter of routine. The authorities clearly anticipated that 60% to 70% would take the swine flu shot.

But the Austrians did not believe the hype. And the government must be worried about its ability to give its spin to the whole swine flu pandemic and Baxter bird flu incident.

As pharamceutical companies and government gear up for unprecedented vaccine campaigns, any scrutiny of the Baxter's contamination in February 2009 may be seen as a increasingly big threat.

Indeed, if Baxter were ever convicted in a court of law of deliberately attempting to start a global bird flu pandemic, it could well deal a death blow to the whole pharmaceutical industry and vaccine complex around the world.

Getting rid of me though a legal guardianship under false and trivial accusations and also by framing me by fake criminal charges may seem a better option given the possible repercussions of a substantial investigation into Baxter.

The sheer amount of publicity my case is getting will, however, make it impossible for them to remove me. The legal basis is non-existant and there is only so much caprice and eccentricity a justice system can allow itself in the age of the internet before it discredits itself totally in the eyes of the general public.

As soon as the court guardianship is dropped, I can and will file for compensation because this unjustified legal guardianship actually boils down to an attempt at an illegal detention and the silencing of a whistleblower.

The longer this drags on before it is finally laid to rest as it must finally be, the higher my compensation claims can be and the more publicity this case will generate.

The Baxter case is once more already in the spotlight along with the corruption of the Austrian justice system that failed to investigate the contamination of 72 kilos of seasonal flu vaccine material with the bird f u virus that could potentially have endangered people all around the globe.

On a personal note, the last few weeks have made me understand what the word "Kafkaseque" and "surreal" really means. Being hounded by a malevolent state is no joke at all.

Nightmarish as this time has been, I have been overwhelmed by the amount of support I have had from people all over the world.

I don't have time to answer all the emails; alas, as the likes of Dr Winge force me to go on filing documents etc, though I try to answer as many emails as I can. But the support of so many people, also from Switzerland and from We Are Change Austria, has been truly amazing, and I feel humbled and grateful to have experienced so much generosity, kindess and good will from so many people around the world.

A requiem for the phantom pandemic

The WHO declares an end to the swine flu crisis that never materialized

The Philadelphia Inquirer (Philadelphia, PA), 20 August 2010, 181st, N 81, p. A23
https://www.newspapers.com/image/200896606/?terms=%22with%20enormous%20numbers%20of%20deaths%20and%20illness%22&match=1

Hallelujah, the disaster has been averted! The World Health Organization last week declared the H1N1 swine flu pandemic over. Except for one little thing: It never happened. That is, the WHO had no business labeling it a "pandemic." It did so purely for its own interests, wreaking worldwide havoc.

In April 2009, WHO flu czar Keiji Fukuda declared that we could be facing a contagion on the order of the Spanish flu of 1918-19, and the United Nations soon concurred. Spanish flu killed about 50 million worldwide and 675,000 in the United States.

Yet, with the "pandemic" over, here's the final toll: "Over 18,449" people have died worldwide, says the WHO. By comparison, garden-variety seasonal flu normally kills 250,000 to 500,000 annually. The mildest pandemic of the 20th century killed a mil-lion people worldwide.

The Centers for Disease Control and Prevention estimates that the United States had about 12,500 swine flu deaths, or a third of the usual number of fatalities from seasonal flu. But other countries' figures suggest the U.S. estimate is still much too high. The United Kingdom, for example, estimates only 457 H1N1 deaths, or a fifth of the death rate indicated by the CDC.

So how does the WHO explain the fact that you're still alive to read this? We were "just plain lucky," shrugs Director-General Margaret Chan. That's really the best she could do – or felt she needed to do.

In fact, there was never a need for luck or alarm. Just two days after Fukuda's Spanish flu comparison, I wrote of a "porcine panic." I went on to reiterate in many more articles that flu fears were being over-blown: When the WHO made the pandemic official, for example, I noted that swine flu had killed only 144 people worldwide in 11 weeks, fewer than die each day from ordinary flu. If I knew the outbreak was being exaggerated, then the WHO and others knew or should have known.

The previous definition of *influenza pandemic* required "several, simultaneous epidemics worldwide with enormous numbers of deaths and illness." But the agency wanted an H1N1 pandemic – badly. It had lost credibility for sounding the alarm for five years about H5N1 avian flu, described as a "when, not if' pandemic that could kill hundreds of millions.

So when swine flu trotted in, the WHO re-wrote its definition to say pandemics "can be either mild or severe." That renders the term meaningless, because seasonal flu always causes "simultaneous epidemics worldwide."

This gave license to others to treat swine flu as a pandemic in the commonly accepted sense of the term. Thus, last August, the President's Council of Advisors on Science and Technology forecast a "plausible" scenario of 30,000 to 90,000 U.S. deaths. In the Washington Post, author John Barry predicted more than 89,000 American deaths.

This was obviously nonsense. We already had information from all over the world showing swine flu to be vastly milder than the seasonal variety. A New York City estimate suggested that seasonal flu was 10 to 40 times deadlier than swine flu. In Australia, with the epidemic already well under way and no vaccine generally available, people were dying at a lower rate than normal. In October, U.S. health officials launched a campaign to panic parents into getting their children inoculated, prompting such headlines as "CDC shocker: swine flu killing young people at record rate." This was inexcusably cruel: Not only were officials exaggerating a tiny risk; they were doing so when a vaccine wasn't widely available.

Today, with incredible chutzpah, the WHO even denies that it rewrote the definition of *pandemic.* "Having severe deaths has never been part of the WHO definition," Fukuda said. So what if references to the changed definition are all over the Web, including in the WHO archive? It's like Paris Hilton denying the existence of her sex tape.

Meanwhile, the world has wasted billions of dollars that could have been spent on diseases like tuberculosis, which each year kills 70 times as many people as swine flu did, according to the WHO. Now add in the "crying wolf" factor, which means many people will ignore public-health warnings when a truly nasty disease comes along, and you'll see how much damage was done by the swine flu disinformation campaign.

Польша не будет покупать вакцину от A/H1N1, пока не доказана ее безопасность

Фокус, 3 ноября 2009, 12:20
https://focus.ua/ukraine/76560

Польские власти не планируют закупать вакцину от так называемого свиного гриппа (A/H1N1), пока не будут завершены исследования ее неопасности для человеческого организма.

Об этом заявила министр здравоохранения Ева Копач после заседания эпидемиологического комитета вчера вечером.

"Не будем проводить прививку людям плацебо, будем базироваться не на сплетнях, а на результатах клинических исследований", - отметила министр.

Копач подчеркнула, что польское правительство сейчас ведет переговоры о возможной покупке вакцин с тремя фирмами, отметив, что ни одна из них не завершила необходимые клинические исследования.

Кроме этого, до сих пор неизвестно, хватит ли для защиты от вируса одноразовой прививки или ее надо будет проводить дважды.

Копач сказала, что польские власти выступают за то, чтобы прививка от A/H1N1 была введена в свободное обращение, что сделало бы возможной ее покупку непосредственно гражданами, а не только правительствами стран, как есть сегодня.

Как передает УНИАН, министр заверила, что в случае подтверждения неопасности прививки польское правительство успеет купить ее к пику возможной эпидемии, которая может иметь место с января по март 2010 года.

Копач отметила, что немецкое правительство закупило 50 миллионов доз, из которых из-за низкой заинтересованности прививками использовано только 10 млн. Министр также заверила, что польские власти имеют необходимое оборудование и лекарства для того, чтобы не допустить эпидемии в Польше.

Она отказалась озвучить данные о запасах лекарств, которые имеет в своем распоряжении правительство, заметив только, что на лекарственных складах (из которых лекарства попадают в аптеки) есть 150 тысяч доз "Тамифлю" и 38 тысяч "Релензе".

Копач подчеркнула, что лекарство "Тамифлю" умышленно не были переданы в аптечное обращение в Польше, поскольку его использование при более легких заболеваниях гриппа привело бы к тому, что в случае сложной формы лекарства уже не подействуют.

Ранее сообщалось, что польское Министерство здравоохранения считает намного опаснее A/H1N1 вирус обычного сезонного гриппа, призывая поляков проводить прививку собственно от него.

В 38-миллионной Польше в последнее время не зафиксировано роста заболеваний вирусными инфекциями, из-за которых в западных областях Украины заболели свыше 250 тысяч человек, из которых 71 умер.

Polish Vice Health Minister Adam Fronczak
in Parlliament on swine flu (AH1N1) vaccine deaths and issues

Polish Parlliament, 5 November 2009
https://www.youtube.com/watch?v=nXqEWl07olk&list=PL579700CA87CC3B5D&index=10

Polish Vice Health Minister on swine flu vaccine (AH1N1). Here's a script of what he says:

It was said here that WHO and Eurpean Comminssion recommends the AH1N1 vaccines. Yes, it is true. But the responsibility lies with Health Ministry of every country in terms of health security of given country. And now we have a situation where in one country that bought a very large amount of vaccines... *2 people dies of AH1N1 and 4 people died in few hours after vaccine injection, allegedly of post-vaccinational complications*.

Isn't that a signal for Health Minister, doesn't it trigger an alert?

Great Britain widely allows vaccines that contain adjuvants containing mercury, for all social groups: so called risk groups and for the whole society.

But other countries with their pandemic comitees say: 'Stop to this vaccines. We do not allow neither the children up to 18 years of age nor pregnant women to be vaccinated with this jab!' This is only 1000-2000km away! It is the same European community, same philosophy but so different points of view!

Polish Health Minister [Eva Kopacz], a family doctor, tells Parliament she will not allow use of untested swine flu jabs: reveals secret contracts violate the law

The Flu Case, 5 November 2009, 11:59
https://web.archive.org/web/20100106085046/http://www.theflucase.com/index.php?option=com_content&view=article&id=1618%3Aupdate-polish-health-minister-a-family-doctor-tells-parliament-she-will-not-allow-use-of-untested-swine-flu-jabs-reveals-secret-contracts-violate-the-law&catid=41%3Ahighlig

The Polish Health Minister Eva Kopacz today told Parliament during a heated debate on the swine flu vaccination that she, as a qualified family doctor with more than 20 year of experience, will not authorise the use of untested vaccines on millions of people in Poland when there is inadequate information about the safety of the jabs.

She said the secret contract that the Polish government was supposed to sign with pharmaceutical companies had more than 20 clauses which are against the law.

Kopacz noted that governments in Western Europe had signed secret agreements with pharmaceutical companies, but suggested that the prosperity of the people of Poland was more important to her than the profits of Big Pharma.

She noted that there are three vaccines proposed for Poland with different types of adjuvants and was concerned that these vaccines were all being treated as if they were the same.

In addition, she observed that only 13 % of the people in Germany want to take the swine flu jab even though 5 times more people in Germany take the regular flu shot than in Poland, and asked why the Germans are so unwilling to take the jab.

She said there was secrecy surrounding the contents of the vaccines. There is no information about the amount of adjuvants in the vaccinesm, she added.

Furthermore, the family doctor and Health Minister said there is absolutely no information about the side effects of the swine flu jab. The pharmaceutical companies did not want to take responsibilty for the jab.

Also, she said that trials for the swine flu jab were being conducted on a relatively small number of healthy people and that these were not adequate for her to recommend the jab.

Moreover, Kopacz said that the regular flu was much more common and dangerous than the swine flu - and yet no pandemic had been declared over the seasonal flu.

Why is there such a panic about the swine flu virus? She asked.

Kopacz said that the Polish people can tell the difference between objective facts and the truth and lies.

She noted that all 193 people who allegedly had the swine flu in Poland had survived.

Finally, she called on the people of Poland to show their support for her as she comes under growing pressure from the pushers of the "swine flu" jab to give the people the dangerous and untested jab.

Polish Prime Minister:
Donald Tusk, pressured by EC on swine flu (AH1N1) vaccines

Польша единственная отказалась от импорта вакцин против гриппа A/H1N1

Фармацевтический вестник, 14 января 2010, 00:00
https://pharmvestnik.ru/content/news/17506.html

Решение об отказе от импорта вакцины на фоне предупреждений о распространении вируса кажется весьма странным. Но польское правительство поступило именно так, и Польша стала единственной страной в своем роде.

Как объяснили власти, подобное решение принято из-за сомнений в безопасности вакцин и недоверия к производящим их фармацевтическим компаниям, в чем их стараются переубедить международные эксперты.

Как бы то ни было, премьер-министр Польши Дональд Туск и министр здравоохранения страны Ева Копач получили широкую поддержку населения. Даже несмотря на то, что грипп A/H1N1 унес жизни 145 человек, многие поляки рассматривают отказ от вакцин как вызов фармацевтическим компаниям, которые, по их мнению, продают неапробированные вакцины.

Кроме того, в стране проходит массовая кампания против вакцинации. Как заявил премьер-министр, Польша проявила мужество, отказавшись от вакцин, которые, по его мнению, не прошли соответствующие испытания. «Мы приняли это решение исключительно в интересах пациентов и налогоплательщиков», - сказал он.

Из официальных лиц против действий правительства выступил только омбудсмен Януш Кочановски. Мнения врачей разделились, некоторые из них критикуют решение об отказе от закупки вакцин. «У пациента должно быть право выбора», – заявил один из врачей.

POLSKIE RADIO DLA ZAGRANICY ▶ thenews.pl

Poland praised for anti-swine flu strategy

Polskie Radio, 31 March 2010, 06:37
https://web.archive.org/web/20100403020128/http://www.thenews.pl/national/artykul128545_poland-praised-for-anti-swine-flu-strategy-.html

The Council of Europe has praised Poland's Health Minister Ewa Kopacz for her strategy against the swine flu virus.

The council's Committee on Social, Health and Family Affairs said that the Health Ministry's decision not to order any A/H1N1 vaccines, in spite of pressure from pharmaceutical companies and health organizations, was correct.

Ewa Kopacz (right) who went to Paris to explain her government's response to the flu virus - which the World Health Organisation was wrongly predicting would turn into a full blown pandemic across Europe - said that Poland had considered buying an anti-flu vaccine but terms proposed by pharmaceutical companies were unacceptable.

Poland's Health Minister said that thanks to the anti-swine flu strategy adopted in Poland fewer fatal cases of the virus were reported and the virus was less virulent than in other countries.

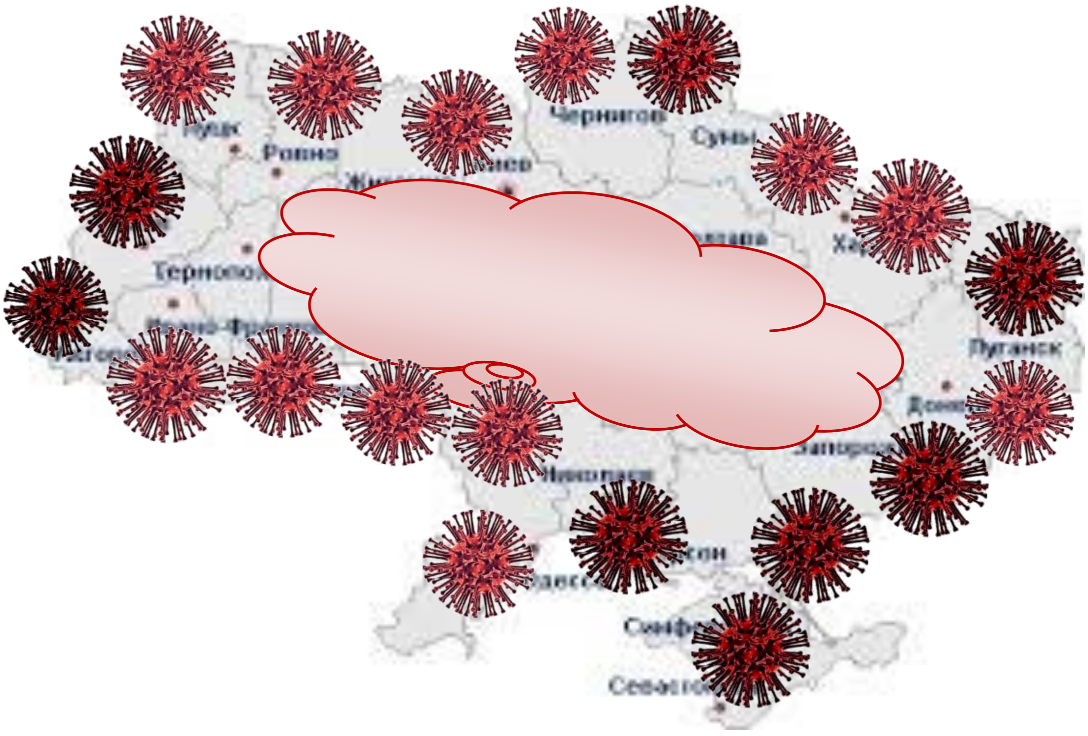
Paul Flynn, who wrote the Council of Europe report, called the decision "an act of courage" and stressed that other countries spent millions of euro on vaccines.

Former head of the French Red Cross Prof. Marc Gentilini said that Poland can serve as an example of how to handle the threat of an A/H1N1 pandemic.

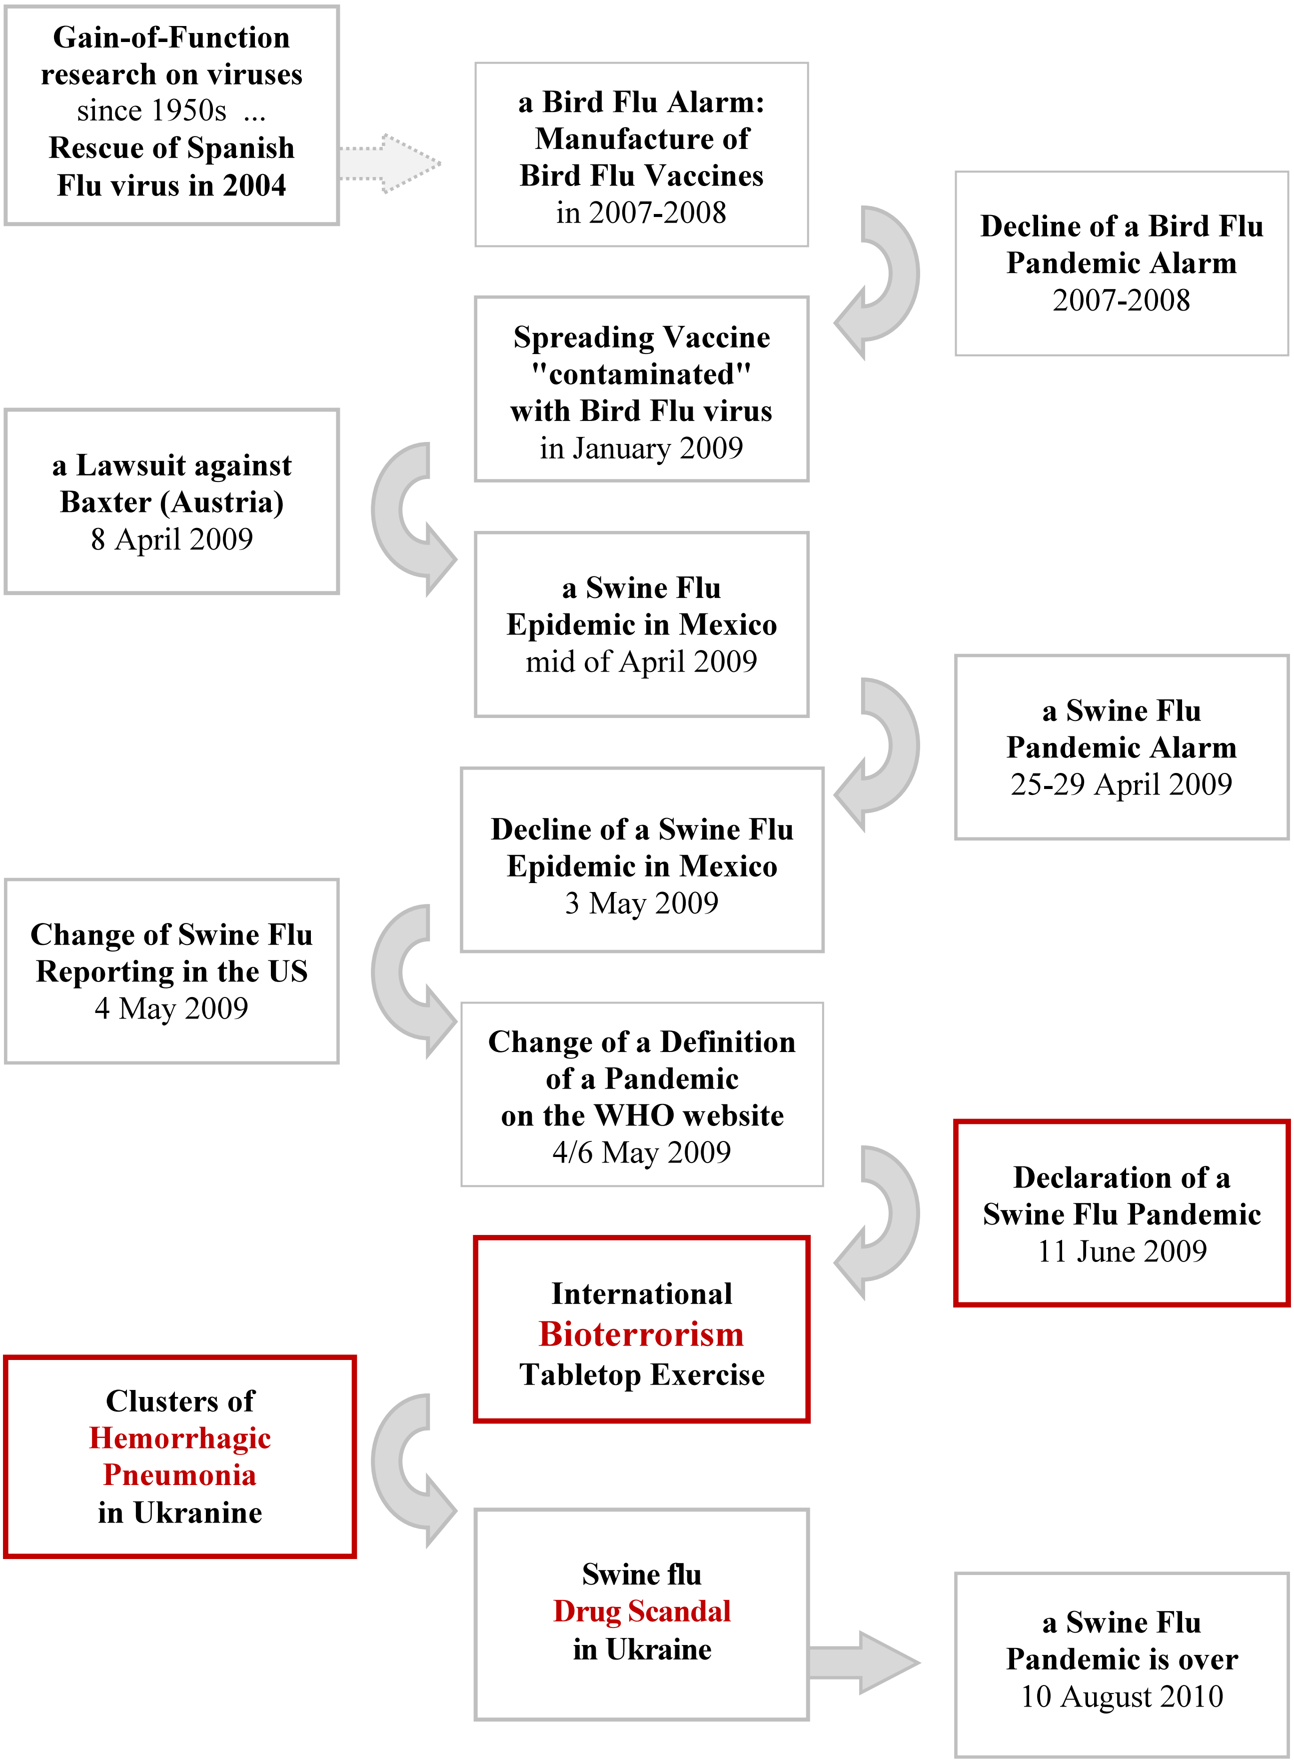
The Health Ministry's decision not to buy anti-flu vaccines was fiercely criticized in Poland during the outbreak. Ombudsman Janusz Kochanowski even threatened to sue Ewa Kopacz over the government's policy.

Chapter 12

Pandemic Attack against Ukraine



Roadmap
of the Swine Flu Pandemic



International Bioterrorism Tabletop Exercise

Interpol, Warsaw, Poland, 29-30 September 2009
https://web.archive.org/web/20091110084341/http://www.interpol.int/Public/BioTerrorism/tabletop/default.asp

In September 2009, senior law enforcement officials, health care professionals and experts from international organizations joined their forces to confront a chilling crisis – the plague had just been unleashed on their countries by unknown evildoers.

A fictional scenario with a serious aim

Fortunately, this terrifying situation was a scenario under control, and the civilian authorities were all participants in a Tabletop Exercise on Preventing Bioterrorism hosted by INTERPOL. This exercise simulated a global bioterrorism attack and its aftermath. Participants in the Black Death scenario were faced with a fictional, intentional plague attack involving countries from their region, with the exercise designed to assist them in identifying critical co-operation and co-ordination issues which could hinder a quick and successful response to such an attack in real life.

The idea behind this exercise, the third in a series organized by INTERPOL, has been described by the Organization's Secretary General, Ronald K. Noble, as "helping focus our joint understanding of the role and responsibility of each of us – police, health care professionals, experts – in response to a bioterrorism incident, as well as identifying possible gaps or redundancies so that we can draw lessons from them."

Inter-agency co-operation in Central and Eastern Europe

Organized by the INTERPOL Bioterrorism Unit, this third edition of the event took place from 29-30 September in Warsaw, Poland. Participants in the workshop numbered 27 from six Central and Eastern European countries (Belarus, Czech Republic, Finland, Poland, Slovakia, Ukraine), as well as 15 participants from international organizations such as Europol, the UN Office for Disarmament Affairs (UNODA), the World Health Organization (WHO), the European Centre for Disease Control, the European Commission (Directorate General for Health and Consumer Affairs and Directorate General for Justice, Freedom and Security), the Organization for Security and Co-operation in Europe and the Commonwealth of Independent States (CIS).

A wide range of INTERPOL initiatives

The tabletop exercise is the latest in a series of initiatives launched by INTERPOL since the creation of its Bioterrorism Prevention programme. INTERPOL has worked ceaselessly since 2005 to heighten its member countries' awareness of the dangers of bioterrorism and to enhance their preparedness for a bioterrorist attack. The Bioterrorism Prevention Programme has co-ordinated a series of events, starting with the Global Conference on Preventing Bioterrorism in March 2005; regional workshops in Africa, South America, Europe and Asia; train-the-trainer sessions all over the world; and practical tabletop exercises such as the one outlined above.

"Joseph Moshe (Moshe is the man's middle name) is a bio-scientist. He works (worked?) for a unit within Mossad. He is an Israeli citizen.

The Secret Service was not the agency involved in the surveillance of Moshe at his home in California. This was done by the FBI, who had orders to detain him, or "bring him in."

Moshe did not send a threat to the White House. Rather, he communicated that he intended to go public with information he had regarding the flu vaccine that is being prepared by Baxter Labs, an Austrian company.

The information is this: *The vaccine is being manufactured in Ukraine. It is not a vaccine at all, but rather an engineered genetically mutated bio-weapon meant to cause sickness and death. Moshe informed the White House he intended to go public with this information*. When he became aware that the FBI was about to detain him, he packed some belongings in his car and set out for the Israeli consulate, located in close proximity to the federal building where the standoff took place. FBI pursuit kept him from reaching his destination.

Mounted on top of the large black vehicle was a microwave weapon which fried the electronics in Moshe's car as well as any communication devices he had which might have been used to contact the media or others who could help him.

Moshe did not suffer the same effects of the gas and pepper spray that others would have because he had built up an immunity to such weapons as a by-product of his Mossad training.

Moshe was not handcuffed because he was not placed under arrest. After leaving police or FBI custody, he returned to Israel, where he is at this time.

The information comes from one of my confidential sources. I have reason to believe it is accurate. If I receive more information, I will post it."

Swine flu fears on rise after numerous deaths

Kyiv Post, 29 October 2009, 22:27
https://web.archive.org/web/20091102053244/https://www.kyivpost.com/news/nation/detail/51513/

The Health Ministry is trying to identify the deadly virus that has killed at least 30 people in western Ukraine so far.

An unknown virus is afflicting thousands in western Ukraine, according to health authorities who say at least 30 people have died this month alone from the mysterious ailment. The death toll is expected to grow higher soon.

As of Oct. 29, Ukraine's Health Ministry had not yet determined whether the recent deaths are related to the global outbreak of the H1N1 "swine flu" virus, but they admitted to sending more than 1,200 doses of Tamiflu, the antiviral drug used to treat H1N1, to western Ukraine.

Thus far, there have been only two confirmed cases of swine flu in Ukraine, according to health officials, who have expressed confidence that the country is ready to combat the virus should an outbreak occur. But fears about the possible onset of a swine flu pandemic in Ukraine increased on Oct. 27 after media reported that a man from Zakarpattya Oblast had died of swine flu complications. The diagnosis has not been confirmed.

"Ukraine's Health Ministry has convened an emergency team to identify the virus and identify measures to prevent it from spreading," Health Minister Vasyl Knyazevych said on Oct. 29 during a cabinet meeting.

"Specialists on the team are working around the clock and we are confident that we will be able to identify the cause [of the deaths] on Monday or Tuesday next week and announce preventative measures," Knyazevych said.

"Some 10 people have perished in Ternopil Oblast, and several in the Lviv and Ivano-Frankivsk oblasts," Deputy Health Minister Oleksandr Bilovol said a day earlier during a press conference in Kyiv. He added that all victims were less than 45 years of age.

"The individuals died of viral pneumonia, the cause of which we have not yet determined," said Bilovol, adding that health officials are awaiting the results of laboratory tests. "According to our data, the number of deaths due to viral pneumonia is a little higher than last year."

More than 6,000 people in Ukraine died of pneumonia in 2008, according to Health Ministry statistics, with 400 fatalities registered in the Ternopil, Lviv and Ivano-Frankivsk oblasts.

Bilovol said during the press conference that 34 individuals of the 160 patients currently afflicted are in critical condition. He said that most of the people who died waited too long – one week – before seeking medical assistance.

Health officials say they will need several days to determine whether the cases are, indeed, swine flu. In neighboring Russia, meanwhile, the H1N1 virus is definitely making the rounds. Since June, about 1,300 cases of H1N1 have been registered in Russia by health officials, who have urged people not to panic.

"Two women are believed to have died of the influenza A/H1N1 virus," a spokesman for eastern Siberia's Chita region said on Oct. 27, adding that official confirmation of the causes of death would only be available in 21 days.

As of Oct. 29, the number of patients in the region diagnosed with swine flu grew to 251, according to Natalya Zhdanova, deputy governor of Chita region. She said seven patients were critically ill.

Ukraine has set up a laboratory that can test for the H1N1 virus and more test kits are planned to be purchased. Ukraine's strategy has been to contain the H1N1 virus and impede its spread among the population by surveillance in airports and train stations.

The H1N1 virus is not usually deadly, but spreads more quickly than usual flu because it's a new virus against which people have not yet built immunity.

According to the World Health Organization, 2 percent of patients sick with H1N1 come to hospitals with complications. People with lung and heart conditions, diabetes, obesity, pregnant women, elderly and very young children are in the high-risk groups.

U.S. President Barack Obama on Oct. 25 declared a national emergency as the estimated number of swine flu cases topped one million. During a visit to Ukraine weeks ago, U.S. health officials urged their Ukrainian counterparts to boost preparations for combating a possible H1N1 epidemic, warning that it's only a matter of time before the country would be hit. Experts have also expressed concern about the ability of Ukraine's dilapidated and under-financed health system to contain a serious outbreak.

Татьяна Ивженко

Украину охватила эпидемия опасной болезни
В Киеве люди штурмом брали аптеки

Независимая Газета, 2 ноября 2009, 00:00
https://www.ng.ru/cis/2009-11-02/1_epidemia.html

Сегодня в Украину приедет делегация Всемирной организации здравоохранения (ВОЗ), которая проведет свои исследования по эпидемии. Официальные лица в Киеве утверждают, что случаи так называемого калифорнийского гриппа – A/H1N1 – единичны и большинство граждан болеют обычной ОРВИ. Однако это не объясняет чрезвычайно высокие показатели смертности. В стране стремительно распространяются слухи о том, что неизвестная болезнь, вспыхнувшая в Западной Украине, – это легочная чума.

В минувшую среду стало известно, что первая неделя эпидемии унесла жизни 7 человек, в четверг было зарегистрировано уже больше 20 жертв болезни, в пятницу – 30, к субботе – около 40. Начавшись в трех западноукраинских областях, болезнь за несколько дней распространилась на шесть соседних областей.

Позавчера был зарегистрирован первый случай смерти в Одесской области. Врачи сообщили о продвижении эпидемии на восток страны. В Украине началась паника. В конце прошлой недели в Киеве люди штурмом брали аптеки. Там, где еще можно было купить какие-либо средства от простуды и гриппа, очереди выходили на улицу. В какие-то аптеки покупателей перестали впускать – ничего не осталось. По наблюдениям корреспондента «НГ», киевляне запасались лекарствами впрок. На выездах из Киева образовались пробки: все пытались вывезти детей. Столичные санитарные службы утверждали, что на прошлой неделе в городе заболели свыше 10 тыс. человек, но ни у кого не был выявлен вирус A/H1N1. Однако эпидемиологический порог может быть пройден на этой неделе, предупреждают медики.

Во Львове, где свирепствует болезнь, в отличие от Киева признаков паники нет, заверили «НГ» западноукраинские журналисты. Они говорят, правда, львовяне стараются лишний раз не выходить на улицу: в городе тихо и пустынно.

Президент и премьер-министр Украины по отдельности побывали в эпицентре эпидемии. В субботу Юлия Тимошенко в обращении к народу признала, что в стране свыше 150 тыс. больных (на момент подписания номера в печать – уже 200 тыс. - «НГ»), но выявлено менее двух десятков случаев заражения калифорнийским гриппом. Тем не менее правительство объявило на территории Украины третий, наивысший уровень угрозы эпидемии. Во всех учебных и дошкольных заведениях введен трехнедельный карантин, действует запрет на массовые мероприятия.

Глава правительства призвала граждан сохранять спокойствие и сообщила, что с понедельника контрольные службы начнут проверку всех аптек. «Мы будем контролировать не только наличие пакетов первой необходимости, но и цены, которые должны оставаться на уровне прошлой недели», – сообщила премьер, уточнив, что нарушители распоряжения будут лишены

лицензий. Правительство попросило помощи у международных организаций и выделило деньги для закупки лекарств, аппаратов искусственного дыхания и других средств, необходимых в сложившейся ситуации. С четверга в районы эпидемии направляются закупленные ранее запасы медикаментов из госрезерва.

Впрочем, как выяснилось, в Украине и до эпидемии не было препарата, который считается наиболее эффективным для лечения калифорнийского гриппа. В пятницу таблетки, содержащие озельтамивир, можно было купить в отдельных интернет-аптеках, но цена взлетела примерно с 10 долл. до 100 долл. К вечеру телефоны интернет-продавцов не отвечали. Зато харьковская фармацевтическая компания объявила о готовности начать производство препарата.

Правительство пока не сообщало о намерении закупить именно это средство. Депутат Инна Богословская, намеревающаяся баллотироваться в президенты, заявила в ходе одной из телепрограмм, что власть не пытается завезти в страну этот препарат, поскольку скрывает реальную картину. По ее словам, в Украине началась эпидемия легочной чумы. Об этом Богословской якобы рассказали врачи в нескольких западноукраинских областях, где она побывала. Врачи в Киеве тоже сообщили «НГ», что в медицинских кругах обсуждается этот вопрос. Медики отмечают, что по клиническому течению болезнь, способная за три дня уничтожить легкие человека, не напоминает ОРВИ и, в частности, грипп.

Представители власти опровергают эту информацию. Секретарь Совета нацбезопасности и обороны Раиса Богатырева, врач по образованию, признала, что одной из причин паники стало замалчивание ситуации: «Только 27 октября начали обрабатывать данные, хотя люди умирали ранее, начиная с 12 октября надо было бить тревогу – это все правда». Однако Богатырева утверждает, что легочной чумы в стране нет: «Я абсолютно четко говорю, что идентифицирован именно вирус A/H1N1. Сейчас уже 16 случаев». Юлия Тимошенко добавила, что ситуация осложнилась из-за того, что распространение калифорнийского гриппа совпало с массовым заболеванием обычной ОРВИ.

Побывав в ближайшей детской поликлинике, корреспондент «НГ» выяснила, что анализы на выявление возбудителя болезни массово не делают даже сейчас и врачи устанавливают диагноз по внешним признакам. Поэтому точность официальных данных может подлежать сомнению. Министр здравоохранения Украины Василий Князевич сказал «НГ», что об эпидемии объявили только сейчас, поскольку ранее не было оснований: «Известно, что для официального объявления эпидемии нужно было получить результаты лабораторных исследований. В эпидемиологии действуют свои правила, нравится это кому-либо или нет». Он также официально опроверг слухи: «Хочу категорически заявить, что никакой легочной чумы в Украине нет, никакие самолеты не распыляют над городами дезсредства. Это не более чем буйная фантазия любителей сенсаций. Очень жаль, что подогревают подобные сплетни и отдельные политики».

Полную ясность в ситуацию, видимо, внесет делегация ВОЗ. По итогам визита власти, как ожидается, сформулируют четкие просьбы к тем 12 странам, которые предложили помощь в преодолении эпидемии. Не дожидаясь действий светских властей, все православные храмы Украины вчера совершили специальное богослужение – «Молебное пение во время губительного поветрия и смертоносныя заразы». // Киев

THE FLU CASE

Clusters of Hemorrhagic H1N1 Pneumonia in Ukraine

The Flu Case, 7 November 2009

https://web.archive.org/web/20100102035426/http://theflucase.com/index.php?option=com_content&view=article&id=1673%3Aclusters-of-hemorrhagic-h1n1-pneumonia-in-ukraine&catid=1%3Alatest-news&Itemid=64&lang=en

Recombinomics Commentary, 4 November 2009, 11:54
Ivano-Frankivsk Oblast

All the six dead young people had symptoms of severe hemmorhagic pneumonia. The disease starts slowly, with temperature rising to 37.2 - 37.3 degrees, slight cough and pain in joints. Nasal catarrh developed at the end of the second or third day. Autopsy revealed that the lungs were soaked with blood, the oblast chief specialist said.

The above comments are from an early story describing cases in Ukraine. The clustering of hemorrhagic cases raised concerns. The concern was increased by anecdotal reports citing a high frequency of such cases in Lviv (see map). The recent WHO announcement that they were initially focusing of severe acute respiratory illness in Lviv also increased concerns.

Hemorrhagic pneumonia was also observed in the 1918 pandemic and was thought to be linked to cytokine storm. Consequently, those with robust immune systems (previously health young adults) disproportionately died, which has also been seen in the current outbreak (Mexico, US, and worldwide). However, the cases in Ukraine appear to be clustered, raising concerns that the virus has changed.

However, the change may be minor, since the current H1N1 has produced the above symptoms in earlier cases. More severe cases may be linked to a higher viral load, which could be linked to minor genetic changes, or simply due to concentration of virus in schools. In the US the spread of the virus has been linked to school openings, which lead to an explosion of cases and subsequent student deaths. However, now there are increases in fatalities in teachers and administrators, increasing concerns worldwide.

In Ukraine, weather changes and heating issues may have led to a surge in cases, and increased concentrations of virus could have produced conditions favoring high viral loads and increased cytokine storms.

Samples have been sent to Mill Hill, and sequence data should be released shortly. Similarly, investigations on hemorrhagic pneumonia in lviv should help resolve the mechanism for the high concentration of such cases in western Ukraine.

However, H1N1 spread in Kiev has been noted, and other countries such as Belarus have announced additional H1N1 suspect or confirmed fatalities.

Sequence analysis of these cases and an update on the frequency of hemorrhagic pneumonia in Ukraine and worldwide would be useful.

Свиной грипп к белорусам не пристает

Deutsche Welle, 19 июня 2009, 01:46
https://www.dw.com/ru/%D1%81%D0%B2%D0%B8%D0%BD%D0%BE%D0%B9-%D0%B3%D1%80%D0%B8%D0%BF%D0%BF-%D0%BA-%D0%B1%D0%B5%D0%BB%D0%BE%D1%80%D1%83%D1%81%D0%B0%D0%BC-%D0%BD%D0%B5-%D0%BF%D1%80%D0%B8%D1%81%D1%82%D0%B0%D0%B5%D1%82/a-4408240

В Беларуси случаи заболеваний свиным гриппом пока не зафиксированы. Однако медики принимают превентивные меры, чтобы не допустить возможное проникновение в страну эпидемии.

До сих пор в Беларуси случаев заболевания свиным гриппом зафиксировано не было. Правда, медики приписывать себе каких-либо заслуг за это не спешат, объясняя, что ничего экстраординарного они в деле предупреждения распространения болезни не предпринимают. Сотрудники медучреждений просто принимают необходимые в таких случаях превентивные меры. И надеются, что эпидемия до Беларуси не доберется.

Превентивные меры

По словам врача-терапевта одного из минских медицинских центров Людмилы Карась, медики к встрече со свиным гриппом в плане информированности готовы. По лечебным учреждениям разосланы приказы, в которых указан алгоритм действий. Но реальной угрозы нет, и случаев обращения пациентов за помощью пока не было.

Вместе с тем, как отметила главный эпидемиолог Беларуси Инна Карабан, никаких оригинальных рецептов по предупреждению свиного гриппа в стране не изобреталось. Мероприятия в Беларуси проводятся такие же, как во всех странах - это мониторинг состояния заболеваемости вирусными инфекциями, мониторинг состояния здоровья пассажиров в аэропортах и на железнодорожных санитарно-карантинных пунктах. Кроме того, создан запас лекарственных препаратов, дезинфекционных и других средств.

Но, несмотря на нынешнее благополучие, белорусские медики продолжают надеяться на то, что в скором времени в мире вакцина против свиного гриппа все-таки будет изобретена. И тогда страна также сможет ее закупить.

И для сезонного гриппа – не сезон

Хотя на сегодняшний день особой необходимости в такой вакцине в стране нет. Единственная гражданка Беларуси, заболевшая новой разновидностью гриппа, была госпитализирована в конце мая в Москве. Она прибыла туда из Чехии и собиралась улететь в Италию без посещения родины. А потому непосредственно в Беларуси, по словам Инны Карабан, случаев заболевания нет. И подозрений на заболевание тоже не было выявлено.

По признанию главного эпидемиолога страны, единственный вид эпидемии, которая периодически выбивает белорусов из колеи – это сезонный грипп. Но и для этой болезни сейчас еще не сезон.

ДЕЛОВАЯ ГАЗЕТА

Лукашенко:
Раньше весь мир кукарекал, а теперь завизжал по-свинячьи

РИА Новости, 5 ноября 2009, 19:37
https://vz.ru/news/2009/11/5/345638.html
https://lb.ua/news/2009/11/05/13277_lukashenko_kukarekal_ves_mir_t.html

Президент Белоруссии Александр Лукашенко на встрече с президентом Украины Виктором Ющенко заявил, что именно производители лекарств спровоцировали панику вокруг гриппа A/H1N1.

«Вы знаете, я знаю, что происходит в этой суперкоррумпированной среде, бандитской среде торговли и производства лекарствами», - отметил Лукашенко.

«Давайте говорить откровенно - давно мы перестали кукарекать по поводу «птичьего» гриппа. Кукарекал весь мир. Наверное, все уже продали (лекарства), что касается птичьего гриппа, теперь завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим? Ну, неужели вы не понимаете, что происходит?», - заметил Лукашенко.

В подтверждение своих слов он привел пример белорусской статистики: «В 2008 году, когда еще ничего не пищало свиным гриппом», от пневмонии умер 21 человек, в этом году - 19, из которых у 6 нашли подозрение на свиной грипп. «Это факты, которые фальсифицировать нельзя», - отметил он.

«Этот грипп, пусть даже свинячий, - это не чума и холера, которые неизлечимы, он абсолютно излечим», - заявил президент Белоруссии.

По его словам, он никогда не думал, что ему как президенту придется обсуждать тему гриппа на таком высоком уровне. Поскольку, по его мнению, этим должны заниматься профессионалы. Он подчеркнул, что сегодня медикам приходится бороться не только с самим заболеванием, но и с ажиотажем вокруг него.

Лукашенко призвал население не поддаваться паническим настроениям, но и не заниматься самолечением.

«Человек серьезно заболел и начинает лечится малиной, вареньем лечится - когда уже поздно и до сорока температура, вместо того чтобы пройти в больницу», - отметил он.

«Мы в состоянии сами справиться, и Украина справится. Не надо бояться, нагнетать ситуацию и обстановку», - заявил Лукашенко, передает УНИАН.

Александр Лукашенко: «Вы что, не понимаете, что происходит?»

Русская Линия, 11 ноября 2009
http://rusk.ru/newsdata.php?idar=185823

Президент Белоруссии призвал не поддаваться искусственному ажиотажу вокруг «свиного гриппа»…

Причина искусственного ажиотажа вокруг «свиного гриппа» лежит в коммерческой сфере, сказал президент Белоруссии Александр Лукашенко, комментируя истерию, охватившую Украину в связи с объявленной там в конце октября эпидемией гриппа, сообщает РИА «Новости».

«Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьегоЭ гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по-свинячьи. А завтра, наверное, замурлыкаем или замычим. Вы что, не понимаете, что происходит?» – сказал Лукашенко на совместной с президентом Украины Виктором Ющенко пресс-конференции в Киеве.

По мнению белорусского лидера, «этот грипп, пусть даже свинячий, – это не чума и холера, он вполне излечим», а ажиотаж только мешает в борьбе с болезнью. «Медикам приходится бороться не только с самим заболеванием, но и с ажиотажем», – заявил А.Лукашенко.

В то же время, президент Белоруссии отметил, что этот ажиотаж выгоден производителям лекарств и торговцам. «Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производстве и торговле лекарствами», – подчеркнул он.

«Есть у нас марлевый завод, надо будут марлевые повязки – будем с Виктором Андреевичем вместе там штамповать и развозить. Только вы покупайте», – пошутил Лукашенко, добавив, что через неделю марлевые повязки украинцам уже не понадобятся. Лукашенко выразил уверенность в том, что и Белоруссия, и Украина вполне в состоянии справиться с проблемой «свиного гриппа». «Не надо бояться, нагнетать ситуацию и обстановку», – резюмировал белорусский лидер. // *Русская линия*

AFN

Свиной грипп – одна из крупнейших афер нашего времени?

AFN, 26 ноября 2009, 15:37
https://www.afn.by/news/i/128018

Пандемия свиного гриппа может оказаться самой грандиозной коррупционной аферой нашего времени. К такому выводу пришли журналисты датской газеты *Information*, изучившие связи экспертов Всемирной организации здравоохранения (ВОЗ) с ведущими мировыми фармацевтическими компаниями, обогатившимися на продаже препаратов против этой болезни. Выяснилось, например, что многие ученые, заседающие в различных комитетах ВОЗ, тщательно скрывают тот факт, что они получают деньги от фирм-гигантов мировой фармакологии, пишет газета "Новые известия".

Издание отмечает, что на фоне глобального экономического кризиса благодаря панике, охватившей мир в связи с пандемией свиного гриппа, фармацевтические заводы работают в четыре смены, мощностей не хватает.

Между тем на данный момент по официальной статистике, жертвами гриппа A/H1N1 стали 6 тыс. человек, в то время как средняя ежегодная смертность во время эпидемий "традиционных" разновидностей гриппа достигает полумиллиона.

Причина гипертрофированной реакции мира на не столь уж опасный свиной грипп, как считают опрошенные датской газетой специалисты, заключается в успешной пиар-кампании, проведенной экспертами ВОЗ. Некоторые из них в прямом смысле состоят на службе у производителей вакцины.

ВОЗ объявила свиной грипп пандемией под давлением группы советников этой организации во главе с голландским доктором Альбертом Остенхаусом. Сейчас правительство Нидерландов проводит экстренное расследование его деятельности, поскольку стало известно, что он получает зарплату в нескольких компаниях, производящих вакцину против свиного гриппа.

Многие другие советники ВОЗ, потребовавшие объявления свиного гриппа пандемией, также являются платными советниками фармацевтических гигантов Roche, RW Johnson, SmithKline и Beecham Glaxo Wellcome, получивших львиную долю заказов на изготовление вакцин. Итогом давления этих экспертов стала резолюция ВОЗ от 7 июля этого года, давшая старт невиданной кампании массовой вакцинации, отмечает газета.

Между тем спикер ВОЗ Грегори Хэртл, комментируя статью в Information, заметил, что невозможно отказаться от услуг ведущих мировых специалистов лишь на том основании, что они финансово заинтересованы в продвижении той или иной стратегии борьбы с различными заболеваниями.

Геннадия Онищенко:
«ВОЗ выступает в роли маркетингового отдела фирмы *Ля Роше*»

Интервью Руководителя Роспотребнадзора
Геннадия Григорьевича Онищенко

«Грипп А, H1N1, Калифорния/04/2009»

«Эхо Москвы», программа «В круге СВЕТА», 5 мая 2009
(стенограмма – https://46cge.rospotrebnadzor.ru/txt/4588)
Интервью целиком см. в разделе ' Criticism of WHO '

Гость: Руководитель Федеральной службы по надзору в сфере защиты прав потребителей и благополучия человека. Геннадий Григорьевич Онищенко

Ведущая: *Светлана Сорокина*

С. Сорокина: Здравствуйте, здравствуйте. Это программа «В круге СВЕТА». Сегодня в студии работаю я, Светлана Сорокина. И я сразу представлю вам моего собеседника. Это Геннадий Онищенко. Здравствуйте, Геннадий Григорьевич.

Г. Онищенко: Здравствуйте.

...

Г. Онищенко: Ну, на самом деле, его истинное название изначальное было – грипп А, H1N1, Калифорния, 04 2009. Это самое исконное, самое правильное его название. Потому что гриппов H1N1 по меньшей мере несколько тысяч уже было. За всю нашу совместную и неоднозначную историю сосуществования гриппа H1N1…

...

Г. Онищенко: Это была хорошо спланированная тогда информационная диверсия.

...

И наша *любимая ВОЗ*, которая является средоточием всего положительного, что есть у здравоохранения на этой планете, *выступает в роли маркетингового отдела фирмы «Ля Роше»*, которая совершенно случайно оказалась в той же Швейцарии, в том же городе Женева. Ну разве так можно?

...

С. Сорокина: Но близко к нему. Вопросы. Вот пишут о том, что где взять этот самый тамифлю, и еще реленса какой-то упоминают. Где это взять в аптеках?

Г. Онищенко: Так, первое – брать нигде не надо. Я вам просто настоятельно рекомендую – *не обогащайте на этом этапе наш фармацевтический бизнес*.

Information

Intensified lobbying for WHO decision on mass vaccination

Information, 16 November 2009
https://www.information.dk/udland/2009/11/staerk-lobbyisme-bag-who-beslutning-massevaccination?lst_cntrb

Several of the WHO's influenza advisors are paid by the pharmaceutical industry. The industry thus helped to influence the decision that influenza A is a pandemic – and that a vaccine is necessary. Since then, the same companies have received vaccine orders worth up to DKK 55 billion.

On 11 June 2009, WHO Director-General Margaret Chan declared swine flu a pandemic. This meant a huge financial gain for the pharmaceutical industry. Many member states - including Denmark - have contracts with the large pharmaceutical companies and are therefore obliged to buy vaccines in the event of a pandemic.

The investment bank JP Morgan estimates that the pharmaceutical industry will receive vaccine orders worth up to DKK 55 billion this year. A large part of that turnover is due to the WHO's decision.

However, many of the apparently impartial researchers that the WHO uses are paid by the companies that produce the vaccines. The many dual roles are problematic, believes Professor T**om Jefferson**, an epidemiologist at the Cochrane Center in Rome: "It is worrying that many of the members of WHO's committees sign themselves with other titles, even though they actually represent the pharmaceutical industry," he says to Information.

One of the experts in the WHO special H1N1 advisory group, Dr. **Albert Ostenhaus**, has just become an item on the Dutch government's agenda. The government has called a crisis meeting because it has emerged in an article in Science that Albert Ostenhaus has financial interests in several pharmaceutical companies. At the same time, Dr. Albert Ostenhaus in Holland known as 'Dr. Flu' because he promotes vaccine as the solution to epidemics.

Dr. **Frederick Hayden** is an external expert in WHO's council SAGE (Strategiz Advisory Group of Experts), which advises WHO on vaccines. He appears in the official papers as an influenza research coordinator from the anonymous-sounding 'The Welcome Trust' in London. But in a Google search it appears that Dr. Hayden has many other employers. He is, among other things, 'paid consultant' to pharmaceutical companies Roche, RW Johnson, SmithKline Beecham and Glaxo Wellcome.

Dr. **Arnold Monto**, who also appears as an invited expert on SAGE's member list, is a paid consultant for the companies MedImmune, which produces inhalable influenza vaccine, Glaxo Wellcome and ViroPharma. On SAGE's list, he is listed only as head of a department at the University of Michigan.

In addition to the experts in SAGE, several of the major vaccine manufacturers such as GlaxoSmith Kline, Novartis and Baxter also sit as 'observers' when SAGE holds a meeting at the WHO:

"It's a great collection of people," says specialist in community medicine, and former employee at Aarhus University Mauri Johansson. "After all, there are more pharmaceutical industry people in the room than there are decision-makers. It shows everything about the commingling that is going on. They are called 'observers'. But one can wonder that they have to be present at all,' says Mauri Johansson.

He believes that this makes it difficult to see what is up and down:

"There is a blanket of medicine lobby in the WHO, and it has been going on like this for a long time. It is difficult to discern what is in the industry's interest and what is factual information, he says.

In the minutes of a SAGE meeting, which was held on 7 July, it is stated, among other things, that: "It will probably be necessary to give two doses of vaccine to ensure protection," although several researchers have pointed out that a single vaccine should be enough. In the minutes of the meeting, it is also recommended that all employees in the health sector and all pregnant women should be vaccinated. In addition, it is noted that there is a need for "a better understanding of the global vaccine demand" and the member states "are encouraged to consider the use of vaccine as part of their pandemic preparedness."

Mysterious recommendations

Tom Jefferson from Cochrane has also encountered mysterious recommendations from the WHO:

"In the WHO's latest recommendations on the control of pandemic influenza, masks and frequent hand washing are mentioned twice. Vaccines and antivirals, on the other hand, are mentioned 24 and 18 times. Why would an international public health organization emphasize a much more expensive intervention such as vaccines and medicine when it has not been proven that they work?' he says and emphasizes that handwashing is the only thing that is certain to have an effect.

Wolf Dieter Ludwig, who is head of the pharmaceutical commission of the German Medical Association, has no doubts about what has happened: "The authorities have fallen for a campaign by the pharmaceutical companies, which aims to make money from a non-existent threat," he says to Der Spiegel.

According to **Tom Jefferson**, the result should be that the WHO committee splits up:

"The advisers must be separated from WHO decision-makers and from those who evaluate WHO recommendations. It must be two separate processes. And then we must ensure that no one can get away with not disclosing their conflicts of interest,' he says.

Something to contribute

Spokesman for the WHO, **Gregory Härtl**, believes that it is quite natural that the pharmaceutical industry participates in the WHO's meetings. "Everyone has something to contribute to this process - the industry and NGOs and professional participants - so we can gather all the information. They cannot vote, they have no influence on the outcome, and they can only speak when asked. When we have to make vaccine recommendations, we need knowledge about what is needed to produce a vaccine. Only the manufacturer has that knowledge.'

- **Frederick Hayden** and Alfred Monto attended the July 7 meeting as experts from a university, but they are both paid by the pharmaceutical industry. Information about their financial affiliations is just not publicly available under WHO auspices. Why not?

"All experts must sign a declaration of their conflicts of interest, so that we are aware of their background. But then again, Frederick Hayden is the best influenza virologist in the world, so if you want to know how a flu behaves, you ask Fred Hayden. Regardless of what else he does. That is why there is a difference between observers and participants.'

- But why is the financial information not shared with the public?

"I'm not sure why we don't publish it... I can't answer that for you."

- If researchers from the WHO warn millions of people about a life-threatening pandemic and recommend a vaccine, in which it turns out that he has a financial interest. Will this have any consequences under the auspices of the WHO?

"I don't know... WHO has a system that guarantees independence. We are aware that we do not let anything or anyone influence us'.

- Will the WHO continue not to disclose the financial interests of medical experts?

"I will not comment on that... it is possible that we will look at a code for the publication of financial information, but I cannot promise anything."

Swine flu pandemic is yet another conspiracy
Danish media

Russia Tuday, 25 November 2009
https://www.youtube.com/watch?v=XFLHbXqSEVQ

Danish journalists claim that the World Health Organization and drug companies producing the swine flu vaccine are in partnership, and that the true nature of their relationship is shrouded in mystery.

"What we do know is that the pharmaceutical companies are present at the meetings of WHO expert groups, but what we don't know is what they talk about. And another thing is that scientists who appear to be independent are also hired consultants working for the same pharmaceutical companies who produce the vaccines," says *Louise Voller*, a journalist at the Danish Daily Information newspaper.

НОВЫЕ ИЗВЕСТИЯ 25.11.09 среда

Алексей Смирнов,
Стокгольм

Агенты Вливания:
Инициаторы всемирной борьбы со свиным гриппом уличены в подозрительных связях

Новые Известия, 25 Ноября 2009
https://web.archive.org/web/20091129002407/http://www.newizv.ru/news/2009-11-25/117889/

Пандемия свиного гриппа, как уже не раз писали «НИ», может оказаться самой грандиозной коррупционной аферой нашего времени. Во всяком случае, огромная коммерческая составляющая в ней уже очевидна. К такому же выводу пришли датские журналисты, изучившие связи экспертов Всемирной организации здравоохранения (ВОЗ) с ведущими мировыми фармацевтическими компаниями, обогатившимися на продаже препаратов против этой болезни. Выяснилось, например, что многие ученые, заседающие в различных комитетах ВОЗ, тщательно скрывают тот факт, что они получают деньги от фирм-гигантов мировой фармакологии.

По данным международного инвестиционного банка JP Morgan, фармацевтическая промышленность мира заработает в этом году на продаже вакцин против коварного вируса A/H1N1 более 7 млрд. евро. Ведущие западные страны заказали в нескольких компаниях дозы, которых должно хватить либо на все население (по этому пути пошла Австралия), либо на треть (Германия и ряд других государств– членов ЕС). Народ чихает и температурит, а заводы по производству пилюль работают в четыре смены, не ощущая всемирного экономического кризиса: заказы громоздятся штабелями, мощностей не хватает. Впервые за долгие годы паника пандемии смела защитные барьеры ЕС. В виде исключения вакцина была допущена для использования без проведения достаточного количества клинических и лабораторных испытаний.

Оправдана ли такая горячка? Все большее число специалистов задаются этим вопросом, сравнивая статистику смертности от вируса свиного гриппа и его «обычных» разновидностей, каждую осень начинающих свое победное шествие по планете. До сих пор, по данным ВОЗ, жертвами A/H1N1 стали 6 тыс. человек, в то время как средняя ежегодная смертность во время эпидемий «традиционных» разновидностей гриппа достигает полумиллиона.

Причина гипертрофированной реакции мира на не столь уж опасный свиной грипп, как считают опрошенные датской газетой Information специалисты, заключается в успешной пиар-кампании, проведенной экспертами ВОЗ. Некоторые из них в прямом смысле состоят на службе у производителей вакцины.

«Вызывает беспокойство, что многие ученые, заседающие в различных комитетах ВОЗ, представляются независимыми экспертами, тщательно скрывая тот факт, что они получают деньги от фармацевтических компаний», – заявил журналистам профессор эпидемиологии Том Джеферссон, работающий в исследовательском центре Cochrane Center в Риме.

ВОЗ объявила свиной грипп пандемией под давлением группы советников этой организации во главе с голландским доктором Альбертом Остенхаусом, получившим прозвище «Доктор флю» (по названию препарата «Тамифлю»), поскольку он вел активную пропаганду в ВОЗ и западных СМИ в пользу массовой вакцинации населения. Сейчас правительство Нидерландов проводит экстренное расследование деятельности этого «доктора Пилюлькина», поскольку стало известно, что он получает зарплату в нескольких компаниях, производящих вакцину против свиного гриппа. Сидят «на двух стульях», подобно Остенхаусу, и многие другие советники ВОЗ, потребовавшие объявления свиного гриппа пандемией. Они не любят афишировать, что являются платными советниками фармацевтических гигантов Roche, RW Johnson, SmithKline и Beecham Glaxo Wellcome, получивших львиную долю заказов на изготовление вакцин. Итогом давления этих экспертов стала резолюция ВОЗ от 7 июля этого года, давшая старт невиданной кампании массовой вакцинации.

«ВОЗ выступает по меньшей мере со странными рекомендациями, – утверждает профессор Том Джеферссон. – Обычные меры гигиены дают куда больший эффект, чем эти малоизученные вакцины, и в то же время ВОЗ упоминает использование масок и тщательное мытье рук как средство борьбы со свиным гриппом всего дважды в своих документах. О вакцинах и других лекарственных препаратах говорится 42 раза!» Д-р Джеферссон и ряд его коллег считают, что платных советников фармацевтических компаний следует удалить из числа лиц, дающих рекомендации ВОЗ, однако сама эта организация не спешит проводить подобную реформу. Спикер ВОЗ Грегори Хэртл, комментируя статью в Information, заметил, что невозможно отказаться от услуг ведущих мировых специалистов лишь на том основании, что они финансово заинтересованы в продвижении той или иной стратегии борьбы с различными заболеваниями.

Надо заметить, что коррумпированность сферы фармакологии уже не первый год стала предметом обсуждения западных СМИ. Несколько лет назад бывший редактор медицинского журнала The New England Journal of Medicine Марчи Энжелл и швед Петер Фрост, бывший вице-директор фармакологической компании Pfizer, в серии статей и книге-исследовании The Whistleblower показали изнутри жизнь «медицинской мафии». По их утверждению, фармакологические компании лишь 11–14 % бюджета тратят на исследования, зато на пиар у них уходит 36% всех средств. Значительная часть денег оседает в карманах врачей, ученых и на счетах различных организаций, работающих в сфере здравоохранения. Доходность фармацевтической отрасли составляет 25%. Больше прибыли приносят лишь торговля оружием и секс-индустрия.

НОВОСТИ

Ирада Зейналова

Пандемия нового гриппа может оказаться грандиозной мистификацией

1TV.ru, 26 ноября 2009, 21:08
https://www.1tv.ru/news/2009-11-26/155681-pandemiya_novogo_grippa_mozhet_okazatsya_grandioznoy_mistifikatsiey

В мире сейчас разгорается скандал, в центре которого - Всемирная Организация Здравоохранения. В европейской прессе появились публикации о возможном сговоре экспертов ВОЗ с ведущими фармацевтическими компаниями.

Паника вокруг вируса A(H1N1) позволила производителям препаратов получить баснословные прибыли. Журналисты делают смелые предположения, что объявленная ВОЗ пандемия нового гриппа может оказаться грандиозной мистификацией.

Заводы работают денно и нощно, в четыре смены, производя спасительные лекарства. Объем заказов крупнейших фармацевтических фирм – все население Европы, плюс все население Америки, плюс сотни миллионов доз для Азии и Африки. Паника снесла защитные барьеры Евросоюза - в виде исключения, вакцина допущена беспрекословно в европейские страны без проведения достаточных клинических испытаний.

Питер Палезе, эпидемиолог (США): "Назвать вспышку A(H1N1) пандемией – чисто политическое решение. И его могли принять только на совете ВОЗ. Хочу сказать, что это мобилизирует людей в борьбе с новым вирусом. Вакцина производится и ее доставляют в больницы".

Россия панике не поддалась – здесь специалисты не устают повторять: эпидемии нет, обойдемся без паники. В любом случае, мы предпочитаем проверенные средства.

Татьяна Голикова, министр здравоохранения и социального развития РФ: "Мы не проводили ускоренных испытаний, как, скажем, в США. Плюс, смертность от всех видов гриппа не превышает 600 человек".

Объявленная главой Всемирной Организации Здравоохранения Маргарет Чен глобальная гриппозная угроза стала причиной глобальной истерии.

Маргарет Чен, генеральный директор ВОЗ: "На основании данных, имеющихся у экспертов, и по всем научным критериям, достигнут порог пандемии гриппа. Я таким образом приняла решение поднять уровень угрозы с 5-го на 6-й. Пандемия гриппа-2009 в мире началась".

Аптеки от Бомбея до Лондона оказались в кольце желающих купить профилактические средства, рекомендованные врачами. Когда бесплатные европейские клиники захлебнулись в волне желающих сделать прививку или получить заключение, каким гриппом заболели, частные британские врачи ввели новую услугу: экспресс-прием. 125 фунтов.

Сегодня эксперты задают классический вопрос: кому выгодно? Хотя бы потому, что, по данным датской газеты "Информатон", эксперты ВОЗ параллельно работали на крупнейшие фармацевтические корпорации, на момент появления вируса подтянувшие из-за кризиса пояса.

Утверждается даже, что саму пандемию объявили под давлением голландского доктора Альберта Остенхауза, прозванного Доктор Флю за пропаганду всемирной вакцинации от нового гриппа и при этом числящимся платным советником в нескольких компаниях, производящих саму вакцину.

В краткосрочной перспективе всю индустрию выпуска вакцин будет тянуть на буксире спрос на средства от вируса H1N1.

Еще несколько лет назад редактор влиятельного медицинского журнала американец Марчи Энжелл и швед Петер Рост, бывший вице-директор крупнейшего фармахолдинга, утверждали: любые фармацевтические исследования на Западе ведутся на деньги крупных корпораций, на сами исследования тратится менее 14% бюджета и почти 40% - на информационную поддержку новых лекарств. Значительную часть этих денег получают те, кто публично рекомендует как и от чего лечиться. Цитата: "Прибыль в этой отрасли – 25%. Больше – только у торговли оружием и секс-индустрии".

Марлевая повязка и дезинфицирующая жидкость для рук - этот набор стоит в 15 раз дешевле, чем вакцина; не имеют побочных эффектов и, как говорят врачи, могут уберечь от гриппа почти так же надежно. Тем не менее рекомендация ВОЗ о том, что нужна всеобщая вакцинация, упоминается 43 раза, и лишь дважды говорится, что спастись можно и этими подручными средствами.

Влиятельный британский журнал "Ланцет" отвечает тем, кто скептически относится к качеству новой гриппозной вакцины: ее вкололи группе риска. Осложнения у больных сердечно-сосудистыми заболеваниями и выкидыши у беременных женщин сразу после вакцинации – совпадения.

Шри Дасан, инфекционист: "Что бы ни говорили сейчас, эпидемия существует. Она пошла на спад - 50 тысяч человек в этом месяце в Британии по сравнению с 64 тысячами в октябре. Это все равно значительно выше, чем при сезонном гриппе. Вакцинация нужна. Кто и как при этом зарабатывает – другой вопрос".

Михаил Костинов, доктор медицинских наук, профессор, заведующий лабораторией вакцинопрофилактики и иммунотерапии аллергических заболеваний НИИ вакцины и сыворотки имени Мечникова Российской Академии Медицинских Наук: "Те же компании, которые увеличили стоимость масок где-то в десятки раз, те же, допустим, аптечные пункты, в которых цены растут, – это, конечно, плохо, потому что, я понимаю, что с одной стороны нужно увеличить оборот, чтобы больше лекарств, но цены – конечно, это нечестные люди, нечестные бизнесмены".

Лейтмотив журналистского расследования датской газеты: грипп удачно раскрутили в новостях во всем мире. Итог – 7 миллиардов евро чистой прибыли на одной лишь вакцине.

Постоянно подогреваемый интерес – именно поэтому мадам министр здравоохранения Франции вынуждена была сама уколоться публично и теперь каждую неделю дает пресс-конференции, что там с гриппом. По данным французских газет, количество доз вакцины, закупленной Парижем, превышает население страны.

Врачи уверены, что грипп опасен и лучше переоценить угрозу. С одной стороны, пишет "Дейли Телеграф", каждый четвертый школьник в Британии переболел гриппом A(H1N1), лечился от гриппа обычными средствами и благополучно выздоровел. С другой – только в этом месяце и только в Британии в тяжелом состоянии в больницы попали 530 человек.

Александр Чучалин, директор НИИ пульмонологии РФ, председатель правления МОО "Российское респираторное общество", академик РАМН: "Вы знаете, в чем дело, не надо здесь делать тревогу. Каждый год люди умирают от гриппа. На сегодняшний день мы не располагаем данными, которые говорят, что смертность выше, чем от сезонного гриппа в 2006-2007 годах".

Гриппозное чаепитие в лондонском сквере. Здесь следуют самому простому совету из телевизора: не ждите зимней волны эпидемии, переболейте в легкой форме и живите спокойно. Это просто грипп.

WHO 'Swine Flu Pope' under investigation for gross conflict of interest

Financial Sense Editorials // Voltairenet, 9 December 2009
https://web.archive.org/web/20100106000416/http://financialsense.com/editorials/engdahl/2009/1208.html
https://www.voltairenet.org/article163240.html

The man with the nickname "Dr Flu", Professor Albert Osterhaus, of the Erasmus University in Rotterdam Holland has been named by Dutch media researchers as the person at the center of the worldwide Swine Flu H1N1 Influenza A 2009 pandemic hysteria. Not only is Osterhaus the connecting person in an international network that has been described as the Pharma Mafia, he is THE key advisor to WHO on influenza and is intimately positioned to personally profit from the billions of euros in vaccines allegedly aimed at H1N1.

Earlier this year the Second Chamber of the Netherlands Parliament undertook an investigation into alleged conflicts of interest and financial improprieties of the well-known Dr. Osterhaus. Outside of Holland and the Dutch media, the only note of the sensational investigation into Osterhaus' business affairs came in a tiny note in the respected British magazine, *Science*.

Osterhaus's credentials and expertise in his field were not in question. What is in question, according to a short report published by the journal *Science*, are his links to corporate interests that stand to potentially profit from the swine flu pandemic. *Science* carried the following brief note in its October 16, 2009 issue about Osterhaus:

"For the past 6 months, one could barely switch on the television in the Netherlands without seeing the face of famed virus hunter Albert Osterhaus talking about the swine flu pandemic. Or so it has seemed. Osterhaus, who runs an internationally renowned virus lab at Erasmus Medical Center, has been Mr. Flu. But last week, his reputation took a nosedive after it was alleged that he has been stoking pandemic fears to promote his own business interests in vaccine development. As *Science* went to press, the Dutch House of Representatives had even slated an emergency debate about the matter." [1]

On November 3, 2009 it appeared that Osterhaus emerged with at least the damage somewhat under control. An updated *Science* blog noted, "The House of Representatives of the Netherlands today rejected a motion asking the government to sever all ties with virologist Albert Osterhaus of Erasmus Medical Center in Rotterdam, who had been accused of conflicts of interest in his role as a government adviser. But Dutch health minister Ab Klink, meanwhile, announced a "Sunshine Act" compelling scientists to disclose their financial ties to companies." [2]

The Minister, Ab Klink, reportedly a personal friend of Osterhaus, [3] subsequently issued a statement on the ministry's website, claiming that Osterhaus was but one of many scientific advisers to the ministry on vaccines for H1N1, and that the Ministry "knew" about the financial interests of Osterhaus. [4] Nothing out of the ordinary, merely pursuit of science and public health, so it seemed.

More careful investigation into the Osterhaus Affair suggests that the world-renowned Dutch Virologist may be at the very center of a multi-billion Euro pandemic fraud which has used human beings in effect as human guinea pigs with untested vaccines and in cases now emerging, resulting in deaths or severe bodily paralysis or injury.

The 'Bird Shit Hoax'

Albert Osterhaus is no small fish. He stands at the global nexus of every major virus panic of the past decade from the mysterious SARS deaths in HongKong, where current WHO Director Margaret Chan got her start in her career as a local health official. According to his official bio at the European Commission, Osterhaus was engaged in April 2003, at the height of the panic over SARS (Severe Acquired Respiratory Syndrome) in investigation of the Hong Kong outbreak of respiratory illnesses. The EU report states, "he again showed his skill at moving fast to tackle a serious problem. Within three weeks he had proved that the disease was caused by a newly discovered coronavirus that resides in civet cats, other carnivorous animals or bats." [5]

Then Osterhaus moved on as SARS cases vanished from view, this time publicizing dangers of what he claimed was H5N1 Avian Flu. In 1997 he had already began sounding the alarm following the death in Hong Kong of a three-year-old who Osterhaus learned had had direct contact with birds. Osterhaus went into high gear lobbying across Holland and Europe claiming that a deadly new mutation of avian flu had jumped to humans and that drastic measures were required. He claimed to be the first scientist in the world to show that H5N1 could be transferred into humans. [6]

In a BBC interview in October 2005 on the danger of Avian Flu, Osterhaus declared, "…if the virus manages indeed to, to mutate itself in such a way that it can transmit from human to human, then we have a completely different situation, we might be at the start of the pandemic." He added, "there is a real chance that this virus could be trafficked by the birds all the way to Europe. There is a real risk, but nobody can estimate the risk at this moment, because we haven't done the experiments." [7] It never did manage to mutate, but he was ready to "do the experiments," presumably for a hefty fee.

To bolster his frightening pandemic scenario, Osterhaus and his lab assistants in Rotterdam began assiduously assembling and freezing samples of, well, bird shit, in an attempt to build a more scientific argument. He claimed that at certain times of the year up to 30% of all European birds acted as carriers of the deadly avian virus, H5N1. He also claimed that farmers working with hens and chickens were then exposed. Osterhaus briefed journalists who dutifully noted his alarm. Politicians were alerted. He wrote papers proposing that the far away deaths in Asia from what he termed H5N1 were coming to Europe, presumably on the wings or in the innards of deadly sick infected birds. He claimed that migratory birds were carrying the deadly new disease as far west as Rügen and Ukraine. [8] He conveniently ignored the fact that birds do not migrate east to west but rather north to south.

Osterhaus' Avian Flu alarm campaign really took off in 2003 when a Dutch veterinary doctor became ill and died. Osterhaus claimed the death was from H5N1. He convinced the Dutch government to order slaughter of millions of chickens. Yet no other infected persons died from the alleged H5N1. Osterhaus claimed that that was simply proof of the effectiveness of the preemptive slaughter campaign. [9]

Osterhaus claimed that bird feces were the source, via air bombardment or droppings, onto populations and birds below. That was the vehicle for the spread of the deadly new Asian strain of H5N1 he insisted.

There was only one problem with the now voluminous frozen samples of diverse bird excrement he and his associates had collected and frozen at his institute. There was not one single confirmed example of H5N1 virus found in any of his samples. At a May 2006 Congress of the World Organization for Animal Health (OIE), Osterhaus and his Erasmus colleagues were forced to admit that in testing 100,000 samples of their assiduously saved bird feces, they had discovered not one single case of H5N1 virus. [10]

At a WHO conference in Verona in 2008 titled "Avian influenza at the Human-Animal Interface," in a presentation to scientific colleagues undoubtedly less impressed by appeals to pandemic emotion than the non-scientific public, Osterhaus admitted that "A proper risk assessment of H5N1 as the cause of a new pandemic cannot be made with the currently available information." [11] By then, however, his sights were already firmly on other possible pandemic triggers to focus his vaccination activities.

Swine Flu and WHO corruption

When no mass wave of human deaths from Avian Flu materialized and after Roche, maker of Tamiflu, and GlaxoSmithKline had banked billions of dollars in profits from worldwide government stockpiling of their dangerous and reportedly ineffective antiviral drugs - Tamiflu by Roche and Relenza by GlaxoSmithKline - Osterhaus and other WHO advisers turned to other greener pastures.

By April 2009 their search seemed rewarded as La Gloria, a small Mexican village in Veracruz, reported a case of a small child ill with what had been diagnosed as "Swine Flu" or H1N1. With indecent haste the propaganda apparatus of the World Health Organization in Geneva went into gear with statements from the director-general Dr Margaret Chan, about a possible danger of a global pandemic.

Chan made such irresponsible statements as declaring "a public health emergency of international concern." [12] The further cases of outbreak at La Gloria Mexico were reported on one medical website as, "a ‘strange’ outbreak of acute respiratory infection, which led to bronchial pneumonia in some pediatric cases. According to a local resident, symptoms included fever, severe cough, and large amounts of phlegm." [13]

Notably those were symptoms which would make sense in terms of the proximity of one of the world’s largest pig industrial feeding concentrations at La Gloria owned by Smithfield Farms of the USA. Residents had picketed the Smithfield Farms site in Mexico for months complaining of severe respiratory problems from the fecal waste lagoons. That possible cause of the diseases in La Gloria apparently did not interest Osterhaus and his colleagues advising the WHO. The long-awaited "pandemic" that Osterhaus had predicted ever since his involvement with SARS in the Guandgong Province of China in 2003, was now finally at hand.

On June 11, 2009 Margaret Chan of WHO made the declaration of a Phase 6 "Pandemic Emergency" regarding the spread of H1N1 Influenza. Curiously in announcing it, she noted, "On present evidence, the overwhelming majority of patients experience mild symptoms and make a rapid and full recovery, often in the absence of any form of medical treatment." She then added, "Worldwide, the number of deaths is small…we do not expect to see a sudden and dramatic jump in the number of severe or fatal infections."

It later was learned that Chan acted, following heated debates inside WHO, on the advice of the scientific advisory group of WHO, or SAGE, the Strategic Advisory Group of Experts. One of the members of SAGE at the time and today was Dr. Albert "Mr Flu" Osterhaus.

Not only was Osterhaus in a key position to advocate the panic-inducing WHO "Pandemic emergency" declaration. He was also chairman of the leading private European Scientific Working group on Influenza (ESWI), which describes itself as a "multidisciplinary group of key opinion leaders in influenza [that] aims to combat the impact of epidemic and pandemic influenza." Osterhaus’ ESWI is the vital link as they themselves describe it, "between the World Health Organization (WHO) in Geneva, the Robert Koch Institute in Berlin and the University of Connecticut, USA."

What is more significant about the ESWI is that its work is entirely financed by the same pharma mafia companies that make billions on the pandemic emergency as governments around the world are compelled to buy and stockpile vaccines on declaration of a WHO Pandemic. The funders of ESWI include H1N1 vaccine maker Novartis, Tamiflu distributor, Hofmann-La Roche, Baxter Vaccines, MedImmune, GlaxoSmithKline, Sanofi Pasteur and others.

Not to lose the point, the world-leading virologist, official adviser on H1N1 to the governments of the UK and Holland, Dr Albert Osterhaus, head of the Department of Virology at the Erasmus Medical College of Rotterdam, also sat on the WHO’s elite SAGE and served as chairman at the same time of the pharma industry-sponsored ESWI, which in turn urged dramatic steps to vaccinate the world against the grave danger of a new Pandemic they insisted could rival the feared 1918 Spanish Flu pandemic.

The Wall Street bank, JP Morgan, estimated that in large part as a result of the WHO pandemic decision, the giant pharma firms that also finance Osterhaus' ESWI work, stand to reap some €7.5 to €10 billion in profits. [14]

A fellow member of WHO's SAGE is Dr Frederick Hayden, of Britain's Wellcome Trust and reportedly a close friend of Osterhaus. Hayden also receives money for "advisory" services from Roche and GlaxoSmithKline among other pharma giants involved in producing products related to the H1N1 panic.

Chairman of WHO's SAGE is another British scientist, Prof. David Salisbury of the UK Department of Health. He also heads the WHO H1N1 Advisory Group. Salisbury is a robust defender of the pharma industry. He has been accused by UK citizen health group One Click of covering up the proven links between vaccines and an explosive rise in infant autism as well as links between the vaccine Gardasil and palsy and even death. [15]

Then on September 28, 2009 the same Salisbury stated, "There is a very clear view in the scientific community that there is no risk from the inclusion of Thiomersal." The vaccine being used for H1N1 in Britain is primarily produced by GlaxoSmithKlilne. It contains the mercury preservative Thiomersol. Because of growing evidence that Thiomersol in vaccines might be related to autism in children in the United States, in 1999 the American Academy of Pediatrics and the US Public Health Service called for it to be removed from vaccines. [16]

Yet another SAGE member at WHO with intimate financial ties to the vaccine makers that benefit from SAGE's recommendations to WHO is Dr. Arnold Monto, a paid consultant to vaccine maker MedImmune, Glaxo and ViroPharma.

Even more, the meetings of the "independent" scientists of SAGE are attended by "observers" who include, yes, the very vaccine producers GlaxoSmithKline, Novartis, Baxter and company. One might ask if the SAGE are supposed to be the world's leading experts on flu and vaccines, why they would ask the vaccine makers to sit in.

In the past decade the WHO, in order to boost funds at its disposal entered into what it calls "public private partnerships." Instead of receiving its funds solely from member United Nations governments as its original purpose had been, WHO today receives almost double its normal UN budget in the form of grants and financial support from private industry. The industry? The very drug and vaccine makers who benefit from decisions like the June 2009 H1N1 Pandemic emergency declaration. As the main financiers of the WHO bureaucracy, naturally the Pharma Mafia and their friends receive what has been called "open door red carpet treatment" in Geneva. [17]

In an interview with *Der Spiegel* magazine in Germany, epidemiologist Dr. Tom Jefferson of the Cochrane Collaboration, an organization of independent scientists evaluating all flu related studies, noted the implications of the privatization of WHO and the commercialization of health:

"…one of the extraordinary features of this influenza – and the whole influenza saga – is that there are some people who make predictions year after year, and they get worse and worse. None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all? Nothing. But that doesn't stop these people from always making their predictions. Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur.

Spiegel: Who do you mean? The World Health Organization (WHO)?

Jefferson: The WHO and public health officials, virologists and the pharmaceutical companies. They've built this machine around the impending pandemic. And there's a lot of money involved, and influence, and careers, and entire institutions! And all it took was one of these influenza viruses to mutate to start the machine grinding... [18]

When asked if the WHO had deliberately declared the Pandemic Emergency in order to create a huge market for H1N1 vaccines and drugs, Jefferson replied,

"Don't you think there's something noteworthy about the fact that the WHO has changed its definition of pandemic? The old definition was a new virus, which went around quickly, for which you didn't have immunity, and which created a high morbidity and mortality rate. Now the last two have been dropped, and that's how swine flu has been categorized as a pandemic." [19]

Conveniently enough, the WHO published the new Pandemic definition in April 2009 just in time to allow WHO, on advice of SAGE and others like Albert "Dr Flu" Osterhaus and David Salisbury, to declare the mild cases of flu dubbed H1N1 Influenza A to be declared Pandemic Emergency. [20]

In a relevant footnote, the *Washington Post* on December 8 in an article on the severity, or lack of same, of the world H1N1 "pandemic" reported that, "with the second wave of H1N1 infections having crested in the United States, leading epidemiologists are predicting that the pandemic could end up ranking as the mildest since modern medicine began documenting influenza outbreaks." [21]

Russian Parliamentarian and chairman of the Duma Health Committee, Igor Barinow has called on the Russian Representative to WHO in Geneva to order an official investigation into the growing evidence of massive corruption of the WHO by the pharmaceutical industry. "There are grave accusations of corruption within the WHO," said Barinow. "An international commission of inquiry is urgently required." [22]

Swine flu advisers' ties to drug firms: Five WHO experts linked with vaccine producers

Daily Mail, 13 August 2010, 07:34 BST
https://www.dailymail.co.uk/health/article-1302505/WHO-swine-flu-advisers-ties-drug-firms-Experts-linked-vaccine-producers.html

A third of the experts advising the World Health Organisation about the swine flu pandemic had ties to drugs firms, it has emerged. Five of the 15 specialists who sat on the emergency committee had received funding from pharmaceutical giants, or were linked to them through their research. The revelation will prompt speculation that the 'pandemic' was wildly overestimated and largely fuelled by the drugs industry who stood to benefit from the panic.

Last month it emerged that the Government had squandered more than £1.2 billion tackling swine flu - most of it going towards vaccines following experts' dire predictions that as many as 65,000 Britons would die. In fact the virus claimed just 457 lives - a third of those killed every year by ordinary seasonal flu.

But today it emerged that many of the scientists on the WHO's emergency panel had links with firms including GlaxoSmithKline, who made millions manufacturing swine flu vaccines. It follows revelations by the Daily Mail earlier this year that more than half of the scientists advising the British Government's own taskforce on the pandemic had links to drugs giants.

One of the 15 scientists advising the WHO was British professor N**eil Ferguson -** who last year warned the pandemic would be so bad all schools would need to close. It has since emerged that Professor Ferguson had acted as a consultant for Roche, who makes Tamiflu, as well as GSK Biologicals until 2007.

Professor **Maria Zambon**, who was also on the panel, from UK Health Protection Agency's Centre for Infection, said she received funding from several vaccine makers, including Sanofi, Novartis, CSL, Baxter and GSK. During the outbreak last year Professor Zambon warned that up to a third of school children in Britain had the virus without knowing as they did not have symptoms.

Meanwhile US professor **Arnold Monto** admitted he had done research for GlaxoSmithKline, Baxter, the two firms contracted to make the jabs, as well as Roche, which makes Tamiflu. He had also done work for two other large firms Novartis and Sanofi Pasteur.

Critics warned that there was serious conflict of interest amongst these experts whose advice had led to the waste of vast sums of taxpayer's money. Labour MP Paul Flynn said: 'A year ago, these experts told us the world was facing a grave health emergency. 'On this occasion, regrettably, they got it wrong: their advice led WHO, the EU and national governments to vastly overrate the seriousness of the H1N1 epidemic, wasting large sums of public money and scaring the world unnecessarily.

'With such conflicting pressures, we need to be absolutely certain that the advice of such experts is based on solid scientific evidence and is driven solely by the need to protect public health. The only way to do that is through total transparency.

'When a future pandemic is declared, the public has a right to know, from the outset, who is recommending such a drastic step – as well as any links they may have to the pharmaceutical industry, which stands to profit from such a recommendation.'

Another expert **Nancy Cox**, from the US Centers for Disease Control, admitted she had received funding from the drugs industry group, the International Federation of Pharmaceutical Manufacturers and Associations (IFPMA) for flu vaccine research and work on viruses.

British scientist **John Wood** admitted that his research unit at Britain's National Institute for Biological Standards and Control (NIBSC), had undertaken work for Sanofi Pasteur, CSL, IFPMA, Novartis and Powdermed on influenza vaccine.

The panel were instrumental in advising the WHO to officially declare swine flu as the first pandemic in 40 years last June.

Earlier this year it emerged that 11 of the 20 members of the Scientific Advisory Group for Emergencies, which advised the British Government on swine flu, had done work for the pharmaceutical industry or were linked to it through their universities.

A spokesman for the WHO denied that the experts' work gave rise to a conflict of interest.

Swine flu levels off in Georgia

The Atlanta Journal-Constitution, 26 October 2009, 5:54 p.m.
https://web.archive.org/web/20091029100925/http://www.ajc.com/health/swine-flu-levels-off-174477.html

The swine flu monster seems to be retreating from Georgia – for the time being, as hospitals, health agencies and schools report fewer cases.

But health officials say it's too early to tell if the spate of swine flu has crested, and they worry that another wave may come deeper into the flu season or the spring.

So keep those vaccinations coming, they say. "Yes, we are seeing a decrease" in emergency room patients showing swine flu symptoms, said Ravae Graham, spokeswoman for the state Department of Community Health.

Schools are also seeing less illness in the classroom. "It's leveling off right now," said state Education Department spokesman Matt Cardoza. "We've seen fewer high-percentage absenteeism at schools."

The swine flu, which emerged in April, appeared to peak in Georgia in late September, when 81 Georgians were hospitalized and eight died from the virus in a week. The number dropped to 43 hospitalizations and one death in a week in mid-October, according to DCH figures.

Health officials say people should still obtain the vaccine for swine flu. Limited quantities are being distributed to doctors offices, county health clinics and other health care providers.

Many people say they are disappointed about the spotty availability of swine flu vaccine. The state health agency had initially expected two million doses of vaccine by the end of this month, but, because of lagging national production, now expects half that number. More is expected to follow.

Doctors say it is too early to drop precautions such as frequent hand-washing. "We are still seeing pockets of it," said Cobb County schools spokesman Jay Dillon. "It's too early to say the crisis has passed."

He believes the downturn was helped by schools that pushed to educate kids and families about good flu hygiene.

Georgia's recent decrease in swine flu illness is in tune with a down-tick across the Southeast, according to the Atlanta-based Centers for Disease Control and Prevention. But CDC officials warned that the decrease only arrived in about the past week, so they are hesitant to draw any broad conclusions.

The illness nationally continues to trend upward, the CDC said.

President Barack Obama declared the swine flu a national emergency Saturday. The move provides legal waivers for hospitals and other health providers so they can handle large numbers of sick people.

Swine flu illness has largely centered around children, and health experts had predicted cases would spike after Georgia began its school year in early August. Georgia and the Southeast began the school year several weeks before much of the nation, but officials say it is too early to say the illness peaked here.

Dr. Jim Fortenberry, pediatrician-in-chief at Children’s Healthcare of Atlanta, said the health system saw a "record surge" in patients at the emergency departments with flu symptoms in late August and early September.

Although those numbers have dropped, they remain well above the norm for this time of year.

"We’ve seen some relief but H1N1 is still there and we can’t let our guard down," Fortenberry said.

Emory University set up a dormitory as a voluntary quarantine for students who were sick. During the height of the outbreak about 50 students were there, officials said.

No one is there now, but the college has no immediate plans to shut down the dorm.

SEC and Homeland Security need Web backup, GAO says

Reuters, 26 October 2009 6:53 pm EDT // 27 October 2009, 6:57 am
https://www.reuters.com/article/us-flu-internet-idUSN2620750120091026/

Washington (Reuters) - Securities exchanges have a sound network back-up if a severe pandemic keeps people home and clogging the Internet, but the Homeland Security Department has done little planning, Congressional investigators said on Monday. The department does not even have a plan to start work on the issue, the General Accountability Office said.

But the Homeland Security Department accused the GAO of having unrealistic expectations of how the Internet could be managed if millions began to telework from home at the same time as bored or sick schoolchildren were playing online, sucking up valuable bandwidth.

Experts have for years pointed to the potential problem of Internet access during a severe pandemic, which would be a unique kind of emergency. It would be global, affecting many areas at once, and would last for weeks or months, unlike a disaster such as a hurricane or earthquake.

H1N1 swine flu has been declared a pandemic but is considered a moderate one. Health experts say a worse one – or a worsening of this one – could result in 40 percent absentee rates at work and school at any given time and closed offices, transportation links and other gathering places.

Many companies and government offices hope to keep operations going as much as possible with teleworking using the Internet. Among the many problems posed by this idea, however, is the issue of bandwidth – especially the "last mile" between a user's home and central cable systems.

"Such network congestion could prevent staff from broker-dealers and other securities market participants from teleworking during a pandemic," reads the GAO report, available here. "The Department of Homeland Security is responsible for ensuring that critical telecommunications infrastructure is protected."

Blocking Websites

Private Internet providers might need government authorization to block popular websites, it said, or to reduce residential transmission speeds to make way for commerce. The Financial Services Sector Coordinating Council for Critical Infrastructure Protection and Homeland Security, a group of private-sector firms and financial trade associations, has been working to ensure that trading could continue if big exchanges had to close because of the risk of disease transmission.

"Because the key securities exchanges and clearing organizations generally use proprietary networks that bypass the public Internet, their ability to execute and process trades should not be affected by any congestion," the GAO report reads. However, not all had good plans for critical activities if many of their employees were ill, the report reads. Homeland Security had done even less, it said. "DHS has not developed a strategy to address potential Internet congestion," the report said. It had also not even checked into whether the public or even other federal agencies would cooperate, GAO said.

"The report gives the impression that there is potentially a single solution to Internet congestion that DHS could achieve if it were to develop an appropriate strategy," DHS's Jerald Levine retorted in a letter to the GAO. "An expectation of unlimited Internet access during a pandemic is not realistic," he added.

Freedom of Information: Stalled at CDC and D.C. Government

CBS News, 27 October 2009, 6:05 PM
http://www.cbsnews.com/news/freedom-of-information-stalled-at-cdc-and-dc-government/

In August 2009, CBS News made a simple request of the Centers for Disease Control and Prevention for public documents, e-mails and other materials CDC used to communicate to states the decision to stop testing individual cases of Novel H1N1, or "swine flu." When the public affairs folks at CDC refused to produce the documents and quit responding to my queries altogether, I filed a formal Freedom of Information (FOI) request for the materials. Members of the news media are entitled to expedited access, which I requested, since this was for a pending news report and on an issue of public health and interest.

The Obama administration made a commitment to a "new era of open government," as stated in a presidential memorandum on the Freedom of Information Act (FOIA). On March 19, 2009, Attorney General Eric Holder issued new FOIA guidelines to "restore the public's ability to access information in a timely manner."

Two months after my FOI request, the CDC has yet to produce any of these easily retrievable materials. Sadly, this is of little surprise. This has become standard operating procedure in Washington.

Watch: A CBS News producer asks CDC Director Dr. Thomas Frieden for information on H1N1 testing, Sept. 19

Watch CBS News Videos Online

Today, I received a letter from the CDC Freedom of Information office, which even by the normal baffling standards, borders on the absurd. The letter is to inform me that my request for "expedited" treatment of my FOI request has been denied because CDC has determined the request is "not a matter of widespread and exceptional media and public interest."

CBSNews.com report on H1N1 First, it seems ill advised to allow the responding agency (which often doesn't want the info released) to determine whether an issue is of media and public interest and, therefore, subject to expedited treatment. Further, the CDC may be the only agency on the planet to argue that testing and counting of swine flu cases is "not of widespread and exceptional media and public interest."

CBS News reporting on the topic has been quoted and reproduced internationally by news organizations such as California NPR, radio talk shows and others. [If you believe this matter is of public interest, you can express that view to CDC FOI Officer Lynn Armstrong or Katherine Norris at 404-639-7270 (recording) or 404-639-7395 (fax).]

By way of background, the Freedom of Information Act was a terrific idea intended to expedite release of public information to the public. It was supposed to stop federal agencies from using their power and control to withhold public information from the people who own it. However, in practice, most investigative journalists would probably tell you that the Freedom of Information Act is farcical. Many federal agencies use it to obstruct the delay or release of obviously public information. In short: they put your request (no matter how simple or urgent) at the end of an extremely long, mysterious cue and – if it is ever answered – it is either answered by a letter arguing the public materials can be withheld (therefore requiring an appeal); and/or it is answered months and often years later when the material obviously has lost its news value.

Timeline: The secret history of swine flu

New Scientist, 29 October 2009
https://www.newscientist.com/article/dn18063-timeline-the-secret-history-of-swine-flu/#ixzz6xZkzOrb5

Six months ago, swine flu emerged as a massive threat to global health. It seemed to come out of nowhere, but our timeline explains how the origins of the H1N1 pandemic go back more than a century.

1889

Prior to 1889, the main flu virus circulating in humans has been from the H1 family. But this year, a new strain of H2 flu emerges in Russia and spreads around the world, killing about 1 million people. Afterwards, H2 replaces H1 in humans. Such replacements seem to be a regular feature of flu pandemics.

People born before 1889, who have been exposed to H1 flu, have some immunity to it. This affords them some protection in the deadly H1N1 epidemic of 1918. Those born after 1889 do not have any immunity to H1.

1918

The "Spanish flu" epidemic of 1918 kills at least 50 million people worldwide. It is caused by an H1N1 virus which evolves directly from a bird flu into a human flu.

After a mild wave of infections in the summer, the epidemic goes global: one-third of the population eventually get sick. Although most cases are mild, many sufferers develop a rapidly fatal infection deep in their lungs. People born before 1889 are less susceptible, thanks to their previous exposure to H1N1.

Most deaths are caused by bacterial lung infections that move in after the virus. Modern antibiotics might mean that a re-run of the 1918 pandemic would be less dangerous.

After 1919, the descendants of the H1N1 virus continue to circulate and cause seasonal flu outbreaks in humans – and pigs.

1931

Swine flu is first isolated from a pig in Iowa.

1933

The first human flu virus is isolated at Mill Hill in London. When given to ferrets, it produces a disease whose symptoms are all but identical to the Iowan pig virus. But ferrets that have had the human virus are not fully immune to the pig virus, showing that the two viruses have already started to evolve apart.

1957

An H2N2 virus causes the "Asian" flu pandemic, completely displacing the H1N1 viruses that have been circulating in humans since 1918. The pandemic is fairly mild, killing 1 to 1.5 million people worldwide.

The virus is produced by a reassortment, in which human-adapted H1N1 swaps genes with an H2N2 bird flu. The new H and N surface proteins mean most people do not have antibodies to the virus, allowing it to go pandemic. However, its human-adapted genes mean it is not as lethal to humans as the 1918 virus, which came, with few changes, from birds.

People tend to mount the best immune response to the first kind of flu virus they experience. Because of this, people born before 1957, whose first experience of flu would have been the H1N1 viruses then in circulation, have some immunity to the 2009 H1N1 strain causing the current pandemic. People born after the 1957 pandemic do not have this immunity.

1968

An H3N2 virus causes the "Hong Kong" flu pandemic, which is even milder than the Asian flu, killing an estimated 0.75 million to 1 million people worldwide.

The virus only differs from H2N2 in one of its surface proteins, the H; since many people still have antibodies to the unchanged N2 protein, its effects are less severe. But because H3N2 completely replaces H2N2 in people, no one born since 1968 has any immunity to H2.

1972

Researchers Graham Laver and Robert Webster discover that waterfowl are the natural hosts of influenza viruses. The birds harbour strains unknown in humans that could reassort with human strains and give rise to new human pandemics.

1976

An H1N1 virus jumps from pigs to humans and kills a US army recruit. However the virus does not spread beyond the army base and fizzles out without triggering a pandemic.

Nevertheless, fears of a replay of the 1918 pandemic lead to 48 million people being hastily vaccinated against the swine flu virus. The vaccine is associated with an unusual number of cases of Guillain-Barré syndrome: 532 people get it, and 25 die.

1977

An H1N1 virus appears in north-east China and starts circulating in humans. It causes seasonal flu in every subsequent year. No one knows where it came from, though it looks like an H1N1 that circulated in the Soviet Union in 1950 and some suspect it escaped in a laboratory accident.

The virus causes a mild flu pandemic, which mainly affects people born after H1N1 flu disappeared in 1957. However, the real surprise is that it does not displace the previous, and more virulent, seasonal flu, H3N2. Instead, it continues circulating alongside it.

The antibodies people produce after being infected by this new seasonal H1N1 do not protect against 2009 H1N1. However, infections also trigger another reaction called cell-mediated immunity, in which certain white blood cells target and destroy infected cells. Tests of the 2009 H1N1 pandemic vaccine show that, unlike antibodies, cell-mediated immunity to seasonal H1N1 may help protect against the pandemic virus. This does not prevent disease altogether, but can reduce its severity

1998

The predecessor of the 2009 H1N1 swine flu virus emerges in the US. It is a hybrid of human, bird and swine flu viruses, and by 1999 it is the dominant flu strain in US pigs.

US pig farms try to control it with vaccines, but these attempts are largely ineffective because the virus evolves too rapidly, changing the surface proteins targeted by the vaccine while keeping its internal genes unchanged. The 2009 pandemic virus is a variant on this 1998 flu, and behaves the same way.

2004-2006

H5N1 flu, first identified as a threat to humans in Hong Kong in 1997, spreads from Asia around the world, apparently carried by wild birds. While this "bird flu" proves deadly to humans, killing more than half of its victims, it is kept in check by its inability to spread readily from human to human. H5N1 is also found in pigs in Indonesia, raising fears that it might reassort with other human flu viruses that pigs can harbour.

The threat posed by bird flu leads to the first real efforts to be made at pandemic planning: governments start to stockpile antiviral drugs, and the world's drug companies start doing serious research on pandemic vaccines. These plans are made with the highly lethal H5N1 in mind, meaning that they are not always appropriate for the 2009 pandemic.

2007-2008

Pandemic fears boost spending on flu research. European scientists start organising to track flu in wild birds, Vietnamese scientists find that antibodies from bird flu victims can cure other cases of the virus (a technique used in Hong Kong in 2009), the risk of dying of flu is found to be partly genetic, and it turns out that your mother was right to warn you about catching the flu when it's cold out.

However, Indonesia, where most H5N1 outbreaks are happening, refuses to share samples of the virus, arguing that it will not benefit in return from any vaccines developed as a result. This means scientists cannot monitor the virus's evolution.

But worries about H5N1 subside as it fails to become contagious in people – although virologists continue to warn that it is not the only threatening flu virus out there. Viruses from the H9, H7 and H2 families all give cause for concern.

March 2009

The first cases of a new type of swine flu are reported in California and Texas in late March. Subsequent genetic analysis suggests that it may have started circulating in humans in January.

April 2009

On 27 April, with 900 cases of suspected swine flu reported in Mexico, the World Health Organization (WHO) upgrades the pandemic warning level from 3 to 4 on a six-point scale. Intensive efforts to understand the virus and develop a vaccine begin immediately.

The US government advises against travel to Mexico, although research suggests that travel bans will not stop the virus spreading.

May 2009

Although swine flu seems to be spreading slowly, it is still progressing quickly enough to justify preparing for a pandemic. However, the WHO delays declaring a pandemic, partly because there is not enough evidence that the virus is spreading in the general population outside the Americas, where it originated.

New Scientist reveals that Europe is not testing people with flu symptoms unless they have recently travelled to an affected area in the Americas, or have had close contact with someone who did. As a result, Europe cannot detect spread in the general population. These restrictions may be making the pandemic "invisible" to the monitoring authorities.

As concerns mount, it transpires that many countries are poorly prepared for this scenario and that supplies of H1N1 vaccine cannot be prepared in time to catch the second wave.

June 2009

The UK and other countries change their rules and start testing people who have flu but no North American contacts. Cases of swine flu are soon detected.

On 11 June the WHO officially declares swine flu to be a pandemic. This is the signal for the vaccine industry to start making pandemic vaccine (paid for by governments), rather than conventional flu vaccine (paid for by ordinary health services).

July 2009

Treatment plans are shaken by the discovery of swine flu that is resistant to the antiviral drug Tamiflu and the realisation that the H1N1 vaccine is growing only half as fast as the ordinary flu vaccine.

The US decides to use its standard formulation for flu vaccine, so no new regulatory tests will be needed. This will allow it to authorise pandemic vaccine before September, when a renewed wave

of the pandemic is expected. But this formulation uses a lot of virus, and so reduces the number of doses that can be made.

Researchers discover that the swine flu virus binds far deeper in the lungs than ordinary flu, possibly explaining why it is sometimes fatal. However, the majority of cases are still mild, and it appears that many of the people with severe cases have an underlying health problem – although some of these "problems" are no more remarkable than being overweight, pregnant or unborn.

In the southern hemisphere, where it is winter, swine flu apparently replaces the usual seasonal flu. This suggests that the pandemic virus will displace the two previous seasonal flu strains, as previous pandemics have done. However, after the experience of 1977, when this did not happen, scientists do not rule out the return of H3N2 after the autumn wave of swine flu.

August 2009

A *New Scientist* poll reveals widespread concern about swine flu among public health officials and epidemiologists, many of whom have obtained supplies of antiviral drugs for their own families.

September 2009

Four major vaccine manufacturers report that their swine flu vaccines work with only one shot. This is good news, given that vaccine is in short supply despite researchers' success in finding faster-growing strains. The vaccine's effectiveness suggests there must be pre-existing cell-mediated immunity, possibly because of similarities between the surface proteins on swine flu and the seasonal H1N1 flu that emerged in 1977.

As autumn arrives in the northern hemisphere, experts are on tenterhooks: a particular worry is that swine flu will hybridise with bird flu to create a readily contagious human flu armed with a lethal H5 surface protein. At time of writing, the virus had not become more severe, causing mild disease in most sufferers but making a small number – probably less than 1 per cent – extremely ill.

October 2009

Vaccination programmes begin in the US and Europe, but many healthcare workers are reluctant to have the vaccine, even though it is virtually identical to the seasonal vaccines used in previous years, which have a good safety record.

Production delays also continue to plague the deployment of vaccine. By 22 October, the US has only 27 million doses available, compared with the expected 45 million. Researchers show that this much vaccine will reduce the number of cases in the second wave by less than 6 per cent – but that is still enough to save 2000 lives.

Six months after swine flu first shot to world attention, US President Barack Obama declares the virus a national emergency.

26 November 2009

Dear Mr Dee

Re: H1N1 diagnosis and positive H1N1 laboratory test rates in England

Thank you for your Freedom of Information request dated 29 October 2009 regarding H1N1 diagnosis and positive H1N1 laboratory test rates in England. Under section 1 (1) (a) of the Freedom of Information Act 2000, I can confirm that we do hold some of the information you require.

I have responded to your questions in the order you raised them below.

1. Total number of H1N1 influenza cases in England reported by the UK government in 2009 to date:

I can confirm that the total number of laboratory confirmed cases of H1N1 swine is 15886 (as of 13 November 2009). This is different to the estimated number of cases produced by the statistics unit each week.

2. Number of laboratory tests carried out for suspected H1N1 Influenza in England in 2009 to date:

A total of 70,390 tests were carried out up to Tuesday 10 November 2009 in Regional Microbiology Network Laboratories (RMN) for the H1N1swine virus. An additional 4284 tests were carried out at the Health Protection Agency's Centre for Infections. The HPA does not know how many additional tests may have been carried out in non RMN labs using commercial kits that are not the Colindale polymerase chain reaction (method for detecting small fragments of genetic material). This total figure includes repeat tests on the same patient whereas the confirmed cases figure above is individuals not tests.

2a. Number of these tests that have proved positive for H1N1 influenza

As of 13 November 2009, the Situation Report number was – 15,886.

2b. Number of these tests that have proved positive for a strain of influenza other than H1N1

From 01/01/2009 to 23/11/2009, the Respiratory Virus Unit (RVU) Reference laboratory at Colindale detected the following:

Influenza strain	Total
B	180
H1 Seasonal	63
H3	617

2c. Number of these tests that have proved negative for any type of influenza.

The HPA can only provide the number of tests that were not swine flu positive in RMN labs but not for any type of influenza as requested. The total number of tests that were negative for swine flu is 53,776. 'Labbase' doesn't hold negative data either.

3. The total number of completed questionnaires submitted to the National Flu Pandemic Service in England by telephone and via the www.pandemicflu.direct.gov.uk website since its establishment.

The National Pandemic Flu Service is run by the Department of Health and they have the total number of callers since it began at the end of July.

I can confirm under section 1 (1) (a) of the Freedom of Information Act that the HPA does not hold this information. In accordance with section 16 - *duty to provide advice and assistance* I would suggest that you contact the Department of Health directly to gain this information. =>

https://web.archive.org/web/20091105135700/http://www.dh.gov.uk/en/FreedomOfInformation/index.htm

As for the number of callers/web users with influenza, the Department of Health are not testing these individuals so the total number are not known. At the HPA, we are running a self-sampling scheme, where we are asking a small selection of callers to swab themselves and we test their samples for swine flu and other influenza viruses.

Up until 12 November 2009, the scheme only approached individuals over 16 for self-sampling. Sampling has now been extended to include school-age children (5-15 years) but no results are available for that age group.

So far, we have tested 7,142 National Pandemic Flu Service (NPFS) callers/web users since 3 August 2009; 828 individuals have returned samples that have been unsuitable for testing. Please note that all individuals tested were authorised antivirals and the majority had begun taking their antivirals before sampling. We are unsure as to how this may have affected the results.

3a. The total number of these questionnaires that led to a diagnosis of H1N1 influenza infection

Of the 7,142 samples tested, 1,205 NPFS users have returned samples positive for H1N1v (17%).

3b. The total number of these questionnaires that led to a diagnosis of influenza infection of a strain other than H1N1

Of the 7,142 samples tested, 4 callers/web users have returned samples positive for Seasonal influenza A/H3 (0.06%)

3c. The total number of these questionnaires that did not lead to a diagnosis of any type of influenza.

Of the 7,142 samples tested, 5,933 callers/web users have returned samples negative for influenza (83%). A further 828 samples returned were unsuitable for testing due to contamination.

I hope you have found this information useful, however, if you are dissatisfied with this response and would like a copy of the HPA complaints procedure then please contact Mr George Stafford, Complaints Manager at: Health Protection Agency, 61 Colindale Avenue, London NW9 5EQ.

Please note that you have the right to an independent review by the Information Commissioner's Office if a complaint cannot be resolved through the HPA complaints procedure. The Information Commissioner's Office can be contacted by writing to Information Commissioner's Office, Wycliffe House, Water Lane, Wilmslow, Cheshire SK9 5AF.

Please contact me if you require any further information or assistance.

Yours sincerely
Leigh Kelly
Freedom of Information Officer
Health Protection Agency

ПОТРЕБИТЕЛЕЙ И БЛАГОПОЛУЧИЯ ЧЕЛОВЕКА

Об усилении мероприятий в группах риска в период пандемического распространения гриппа

Роспотребнадзор. Письмо от 1 ноября 2009, № 01/16326-9-23
https://web.archive.org/web/20160622082949/http://www.hippocratic.ru/medtext2/medtext_27102.htm

Федеральная служба по надзору в сфере защиты прав потребителей и благополучия человека информирует, что в ряде субъектов Российской Федерации имеет место широкое распространение пандемичечского гриппа A/H1N1-2009. наиболее неблагополучная ситуация складывается в Забайкальском, Красноярском Хабаровском, Приморском краях, Сахалинской области, г. Москве.

В Российской Федерации зарегистрировано 10 летальных исходов от пандемического гриппа (H1N1) 2009 у лиц от 20 до 53 лет, осложненного пневмониями, из них 8 летальных случаев в Забайкальском крае (в том числе 1 случай гибели беременной женщины), 1 - в г. Москве и 1 - в Красноярском крае.

При проведении эпидрасследований по поводу детальных исходов установлено, что в большинстве случаев имело место позднее обращение заболевших за медицинской помощью (на 3-5 сутки от начала заболевания) при значительном ухудшении состояния, развитии пневмонии и инфекционно-токсического шока.

При оценке тяжести течения заболевания и летальных исходов от гриппа в зарубежных странах, ВОЗ рекомендует обратить особое внимание на группы повышенного риска развития неблагоприятных последствий заболевания гриппом A/H1N1-2009: беременные, лица с имеющимися хроническими заболеваниями, наиболее значимыми из которых являются хронические заболевания легких (включая астму), сердечно-сосудистые заболевания, диабет и сниженный иммунный ответ.

Клиницистам, пациентам и лицам, осуществляющим уход за больными в домашних условиях, следует проявлять особую настороженность в отношении опасных признаков, которые могут свидетельствовать о прогрессировании болезни с переходом в более тяжелую форму (письмо №01/10939-9-32 от 04.08.2009 «О направлении временного методического письма ВОЗ «Пандемический грипп среди беременных женщин»).

В руководящем документе ВОЗ «Подготовка к пандемии гриппа и ответные действия» (от 13.05.2009 №01/6466-9-32) определены 3 степени тяжести оценки пандемии - умеренная, средняя, тяжелая, которые определяются уровнями смертности, заболеваемости и осложнений. Согласно данному документу, ситуацию в Забайкальском крае можно расценивать как тяжелую (3) степень развития пандемии.

Следует отметить, что в настоящее время на территории Российской Федерации отмечается рост заболеваемости гриппом и ОРВИ. Наибольшее число заболевших зарегистрировано в 14 городах и 7 субъектах Российской Федерации - в Санкт-Петербурге, Южно-Сахалинске, Хабаровске, Чите, Калининграде, Абакане, Благовещенске, Якутске, Красноярске, Норильске, Челябинске, Магадане, Мурманске, Москве, в Республиках Хакасия и Коми, Хабаровском и Забайкальском краях, Сахалинской, Амурской и Челябинской областях.

В настоящее время повышение заболеваемости обусловлено преимущественно за счет детей 3-6 лет и особенно школьников 7-14 лет.

Анализ еженедельного мониторинга за циркуляцией вирусов, вызывающих ОРВИ, свидетельствует, что в структуре обследованных заболевших имеет место значительный рост доли гриппа A/H1N1/-2009. // Руководитель – Г.Г. Онищенко

MailOnline

NHS hospitals 'running short of intensive care beds for swine flu patients'

Daily Mail, 2 November 2009, 18:09 GMT
https://www.dailymail.co.uk/news/article-1224580/Hospitals-running-short-beds-swine-flu-patients.html

NHS hospitals are coming under 'a lot of pressure' because of the swine flu pandemic, the Government's chief medical officer warned yesterday.

Sir Liam Donaldson said the shortage of intensive care beds for the most seriously ill patients was a 'concern' at a time when the number of flu cases was rising. His comments came as Government advisors are debating whether to introduce a vaccination programme for all British children aged 10 to 18.

Experts are believed to be in favour of giving the swine flu jab to children by the end of the year. There is growing concern about the impact of swine flu on young adults and children. Figures released last week showed that children under the age of 15 male up a fifth of all swine flu hospital admissions. More than 200 children have been treated in hospital - including 27 who are in critical care.

Overall, the number of new cases in England increased by 50 per cent last week to 78,000. Sir Liam said the number of people affected by swine flu had increased at a slower rate than feared. 'But what we are seeing is that while most people generally get a mild illness, a small proportion of people are getting very serious illnesses,' he told the BBC One Andrew Marr show. 'It's taking them into hospital and a small proportion are dying.

'The good thing about the situation at the moment is we are getting a bit of breathing space with the relatively slow increase in cases to be able to get the vaccine in place.' GPs were 'not under a great deal of pressure', he said.

'But on the hospital side the intensive care beds are under a lot of pressure,' he added. 'We have plans to expand them but that is a concern at the moment - the serious end of the spectrum, the hospitalised patients.'

The Government’s vaccination programme, which began last month, is targeting 11 million health workers and priority patients- including pregnant women and people with asthma and diabetes.

However, people at high risk from swine flu may not get their jabs until mid December. Deliveries of the vaccine to GPs started last week and people in priority groups will begin to get the vaccine in the next few weeks, he added.

Asked about reports that the vaccine programme could be extended to cover under-18s, Sir Liam said: 'We are looking about what to do next when we have enough vaccine to extend it beyond the priority groups. 'We haven't come to any final decisions about that yet.'

Last month the Joint Committee on Vaccination and Immunisation debated whether to extend the programme to under-18s once priority cases have been dealt with.

Professor Peter Openshaw, an expert on respiratory infections at Imperial College London and a member of the committee, told the Sunday Times: 'As increasing quantities of vaccine become available, then the initial recommendations will be extended.

'It depends on the emerging circumstances such as the efficacy and availability of the vaccine and the spread of the virus.'

Scientists believe the virus is more severe in children because they have not been exposed to related outbreaks. The elderly, by contrast, have not suffered as badly.

In the U.S., the jab is offered to everyone aged from six months to 24 years.

The move to protect children is being supported by the Royal College of General Practitioners.

Chairman Steve Field said: 'If there is enough vaccine available, it would be sensible to use it for children, who are the most vulnerable. They have had no previous immunisation or exposure to the virus.'

A spokesman for the Department of Health said: 'The vaccination programme is in its early stages, allowing time to plan for which groups will be offered the vaccine next. A decision has not yet been made.'

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

IBM Knew About Pandemic in 2006

Info Wars, 2 November 2009
https://web.archive.org/web/20091108102954/http://www.infowars.com/ibm-knew-about-pandemic-in-2006/

A document has surfaced revealing IBM was aware of the current H1N1 "pandemic" in 2006. Excerpts from "Services & Global Procurement pan IOT Europe, Pandemic Plan Overview," an official inter-departmental document distributed to upper-level management of IBM in France during 2006 are posted on the Prevent Disease website. The document predicts a 100% chance of a "planned" pandemic occurring within five years.

The document provides more evidence IBM and other large corporations are on the inside track in relation to the manufactured and orchestrated pandemic now unfolding. As Infowars and Prison Planet continue to document, the H1N1 virus is a bioweapon designed to frighten the public and stampede millions of people around the world into taking a vaccine that is a soft kill and eugenics weapon.

In addition, the contrived pandemic is a tool designed to implement martial law and increase government control over populations. The IBM document describes "quarantines"and operational procedures to be taken upon official announcement of the engineered pandemic by the World Health Organization.

"This single document definitively proves there is international, corporate collusion behind the ‘bird/swine flu pandemic’ and the intentional plan to create disease on a worldwide scale," reports Prevent Disease.

IBM worked closely with the Nazis in their mass extermination eugenics program. IBM’s machines and punch cards were used at all stages of the Nazi extermination program. According to author Edwin Black, IBM was involved in virtually every aspect of the Third Reich’s operations.

IBM, the Rockefellers, the Carnegie Institution and other globalist foundations were intimately involved in Germany’s eugenics program. In Mein Kampf, published in 1924, Hitler quoted American eugenic ideology and openly displayed a thorough knowledge of American eugenics. "There is today one state," wrote Hitler, "in which at least weak beginnings toward a better conception [of immigration] are noticeable. Of course, it is not our model German Republic, but the United States."

IBM Internal Document Outlines Knowledge of Planned Pandemic With 100% Certainty

Prevent Disease, 2006

https://web.archive.org/web/20091105095601/http://preventdisease.com/news/09/110209_ibm_internal_doc_reveals_knowledge_pandemic_2006.shtml

"Services & Global Procurement pan IOT Europe, Pandemic Plan Overview,"an official inter-departmental document was distributed to upper-level management of IBM, France in 2006. Disclosed in this secret document was the prediction of a "planned" pandemic described as having a "100% chance of occurring within the next 5 years."

The document also describes "quarantines"and operational procedures to be taken upon the official announcements of the "pandemic"by the World Health Organization. The foreknowledge of such an event could not exist, unless the pandemic was a planned event.

Certainly, this document is the "smoking gun" which demonstrates the current bird/swine flu "pandemic"is an orchestrated event leading to mass vaccinations sponsored by the WHO and UN.

This single document definitively proves there is international, corporate collusion behind the "bird/swine flu pandemic"and the intentional plan to create disease on a worldwide scale.

As evidenced by this document (see below), IBM's primary concerns are focused on maintaining their workforce, even under an official quarantine, and the continuation of sales and services to their clients.

IBM is considered to be one of the most powerful corporations in the world. They and their subsidiaries helped create enabling technologies, step-by-step, from the identification and cataloging programs of the 1930s to the selections of the 1940s which designed complex solutions for Adolf Hitler during this period.

You can apply a simple search at www.ibm.com/us/en/ for additional documents. Query [pandemic 2006] or [pandemic 2005] for dozens of relevant results on pandemic preparedness and planning.

DW Made for minds.

Schweinegrippe auf dem Vormarsch

DW, 2 Novembre 2009

https://www.dw.com/de/schweinegrippe-auf-dem-vormarsch/a-4850220

Derzeit sind bundesweit mehr als 7000 Personen an der "Schweinegrippe" erkrankt. Bislang sind in Deutschland sechs Menschen an dieser neuen Form der Influenza verstorben. Experten rechnen mit steigenden Zahlen.

Es gebe eine dramatische Zunahme der Erkrankungen in Süddeutschland, stellte der Leiter des Instituts für Virologie der Universitätsklinik Bonn, Prof. Christian Drosten, am Montag (02.11.2009) fest. Er gehe davon aus, dass die Grippewelle in etwa fünf bis sechs Wochen über den restlichen Teil des Landes hinwegziehen werde. Das genaue Ausmaß der Infektionen lässt sich nicht feststellen, da aus Kostengründen nicht alle Erkrankten auf die neue Grippe getestet werden könnten.

Todesfall ohne Vorerkrankung

Am Freitagabend war in der Bonner Klinik eine 48 Jahre alte Frau an den Folgen der neuen Influenza verstorben. Sie war die erste Infizierte, die keinerlei Vorerkrankungen aufwies. Dieser Todesfall hat offenbar viele Menschen dazu gebracht, die eigene Impfentscheidung noch einmal zu überdenken.

Auch der Chef des renommierten Robert-Koch-Instituts, Jörg Hacker, äußerte sich besorgt über den Verlauf der Schweinegrippe in Deutschland. Neben steigenden Infektionszahlen rechnet Hacker auch mit weiteren Todesfällen, dabei wertet er den Tod der Bonner Patientin deswegen als Warnsignal, weil sie keine Vorerkrankungen hatte. Im Gegensatz zur ersten, kleinen Welle von Infektionen im Sommer, seien die aktuellen Fälle keine "Mitbringsel" aus Urlaubsländern, sondern Ansteckungen in Deutschland.

Debatte um Impfung

Angesichts dieser Zahlen hat die Debatte um Impfungen neuen Schwung bekommen. Die möglichen Nebenwirkungen (kurzzeitiges Fieber, Reaktionen an der Einstichstelle), so Hacker, stehen in keinem Verhältnis zu den Folgen einer Grippe. Deshalb sei eine Impfung nicht nur für medizinisches Personal, sondern für alle eine geeignete Maßnahme, die Ausbreitung der Schweinegrippe einzudämmen. Zudem wiederholte er die Regeln sich und andere zu schützen: Öfter Händewaschen und bei Husten oder Niesen nicht die Hände, sondern die Armbeuge vor das Gesicht halten.

Ukraine mit Schweinegrippe-Epedemie

Dramatisch ist die Lage in der Ukraine. Dort wurden vorsorglich Schulen und Kindergärten geschlossen und Massenveranstaltungen verboten. Zudem wurde über neun Regionen des Landes eine Quarantäne verhängt. Diese Maßnahmen sind Reaktionen auf drastisch gestiegene Infektions- und Todeszahlen: Die Ukraine meldet 255000 Erkrankungen und 70 Tote. Schwerpunkt der epedemischen Ausbreitung ist vor allem der Westen des Landes um die Stadt Lwiw, dem früheren Lemberg.

Staatschef Viktor Juschtschenko warnte sogar vor Gefahren für die nationale Sicherheit und bat deshalb die benachbarten Länder, die EU und die NATO um Hilfe. Was allerdings das Militärbündnis bei der Bekäampfung der Schweinegrippe leisten könnte, blieb unklar. Offensichtlich denkt der Präsident an Unterstützung bei der Versprühung von Chlor und anderen Chemikalien aus der Luft, um das Virus abzutöten.

Beim Handel mit dem Grippemittel "Tamiflu" ist es in der Ukraine offenbar in einigen Fällen zu Wucherpreisen von einigen Hundert Euro je Tamiflu-Packung gekommen, obwohl der Schweizer Pharmakonzern Roche dem Land das Medikament zu einem Sonderpreis zur Verfügung gestellt hatte. Die Regierung kündigte an, diesen Preis-Wucher auf Kosten der Bevölkerung hart zu bestrafen. Gleichzeitig deckten sich viele Menschen mit traditionellen ukrainischen "Medikamenten" ein: Wodka, Zitronen und Knoblauch.

Анна Кукарцева

Смертность от свиного гриппа такая же, как от обычного

КП, 3 ноября 2009, 23:40
https://www.kp.ru/daily/24388/567190/

Замминистра здравоохранения Вероника Скворцова успокоила всех, сказав, что в России умеренный уровень заболеваемости - не выше, чем в прошлый годы.

С сегодняшнего дня Минздравосцразвития ввел еженедельный мониторинг заболеваемости ОРВИ и гриппа, чтобы контролировать ситуацию. Результаты будут публиковать также еженедельно. Но при этом чиновники Минздрава успокаивают журналистов, а стало быть и общественность. Сегодня замминистра Вероника Скворцова сказала:

- Россия относится к странам с умеренным уровнем заболеваемости. Опасений, что сценарий болезни будет развиваться в неблагоприятном направлении, нет. Мы надеемся, что этого удастся избежать. Заболеваемость ОРВИ этого года не выше, чем в предыдущие два года. Получаемые данные говорят и о том, что смертность от гриппа AH1\N1 находится на уровне смертности от сезонного гриппа.

Но, чтобы подстраховаться, еженедельно буду исследоваться данные по случаям заболевания ОРВИ, гриппом, в том числе гриппом AH1\N1. Отдельно буду исследоваться случаи заболеваний, протекающих с тяжелыми осложнениями и внимательно отслеживаться группы риска –детей и беременных женщин.

Хуже всего – на Дальнем Востоке

Вероника Скворцова рассказала журналистам и про регионы:

- По данным на вчерашний день наиболее напряженная ситуация по сезонному гриппу зарегистрирована в субъектах Дальневосточного федерального округа. Из 9 субъектов округа эпидемический порог заболеваемости гриппом и ОРВИ по совокупному населению превышен в 7 (кроме Магаданской области и Чукотского автономного округа). Из-за этого там отменены все массовые мероприятия.

Будет усилен санитарный контроль на границе с гриппующей Украиной:
- Все лица, пересекающие границу, будут подвергаться обычным карантинным мероприятиям. Будет проводиться оценка состояния здоровья. При выявлении ОРВИ будет назначено лечение. В особых случаях будет назначен карантин, - уточнила Скворцова.

Вакцинация поможет распространению инфекции

Напомним, что вакцинация от H1N1 начнется раньше запланированного срока. Прививать первую партию - медиков, коммунальщиков и водителей общественного транспорта – начнут уже 9 ноября.
- В первую очередь вакцинация начнется в субъектах, граничащих с регионами с превышенным эпидемиологическим порогом, – сказала замминистра. –Таким образом мы хотим создать барьер дальнейшему распространению инфекции».

Напомним, что вчера министр здравоохранения и соцравития Татьяна Голикова собирала всех производителей вакцин. Они отчитались, что к 7 ноября произведут не менее трех миллионов доз живой вакцины. Во время клинических испытаний она показала свою эффективность и безопасность. При использовании живой вакцины будет проведена двукратная иммунизация с периодом в 10 дней. На вакцинацию выделено четыре миллиарда рублей, поэтому она будет бесплатной.

Между аптеками и фармакомпаниями – «водяное перемирие»

Вчера же Татьяна Голикова призвала фармпроизводителей не наживаться на панике вокруг гриппозного сезона, и не повышать цены. А представителей аптечных сетей настоятельно попросила следить за наличием необходимых для лечения ОРВИ препаратов и медицинских масок, на которые в аптеках большой спрос.

Сегодня Вероника Скворова подтвердила, что повышения цен на противовирусные препараты не будет:

- Производители заверили, что отпускные цены на противовирусные лекарственные препараты они будут держать на уровне цен начала этого года. Стационары и аптечные сети регионов снабжаются противовирусными препаратами и масками бесперебойно и в полном объеме.

Люди стали ответственней

Радует, что наиболее ответственно к эпидемии относятся именно обычные люди. Не стесняются появляться в метро и общественном транспорте в масках, проводит витаминотерапию, закупают противовирусные препараты. И хотя, согласно опросам, треть россиян все же не верят в опасность свиного гриппа, остальные относятся к своему здоровью трепетно. И правильно!

Но при этом, по словам Скворцовой, несмотря на всю серьезность проблемы распространения вируса H1N1, шумиха вокруг всего этого сильно преувеличена:

- Ежемесячно от сердечно-сосудистых заболеваний умирает более 90 тысяч россиян! От свиного гриппа скончалось 14 человек. Паника вокруг этого совершенно необоснованна.

Напомним, что погибали люди, которые занимались самолечением, запустили болезнь, и у них развилось осложнение – пневмония. Как следствие отек легких и смерть… Также у большинства погибших были серьезные хронические заболевания.

Цифры: На сегодняшний день в России подтверждены 3122 случая гриппа A\H1N1, сейчас им болеют 1200 человек, 1908 человек выздоровели. 14 случаев закончились летальным исходом. 6% заболевших переносят вирус гриппа в тяжелой форме, четверть из них требуют интенсивной терапии.

Кстати, в Забайкалье ввели штрафы за неношение масок.

В Забайкалье ситуация со свиным гриппом довольно серьезная. Чиновники от Минздрава в Чите даже предложили штрафовать всех, кто не носит маски. Для простых людей штраф будет 500 рублей, а чиновники могут лишиться 20 тысяч рублей.

Polish Health Minister on swine flu jabs issues A/H1N1

Polish Parliament, 5 November 2009
video: https://www.youtube.com/watch?v=RhZesZe33cw
text: https://orka2.sejm.gov.pl/Debata6.nsf/main/6421D78B

Panie Marszałku! Wysoka Izbo! Chcę państwu powiedzieć, że zasadę: ″Po pierwsze nie szkodzić″, którą wyznawałam, będąc przez dwadzieścia kilka lat lekarzem, przeniosłem do gabinetu na Miodową. Nie ma w tym nic złego. I nie dopatruję się w tym niczego złego. Wręcz przeciwnie. W sytuacji, w której miałabym zaaplikować pacjentowi jakikolwiek lek, u każdego z nas, kto pracuje w ochronie zdrowia i ordynuje ten lek, przez ułamek sekundy pojawia się myśl: czy dałabym to swojej wiekowej mamie lub swojemu dziecku? I takie myśli, właśnie takie myśli, spowodowały, że stałam się bardzo skrupulatna, jeśli chodzi o sprawdzanie informacji o leku, który minister zdrowia ma zarekomendować Polakom. Nie sobie, za to biorę sama odpowiedzialność, jeśli w aptece kupuję sobie preparat bez recepty i go połykam, ale właśnie milionom Polaków, którzy nie mają wiedzy medycznej i nie muszą jej mieć, ale liczą na wiedzę, którą posiada minister czy specjalista, jakim jest pani prof. Brydak. Specjalista, który od 40 lat pracuje nad grypą w jednym ze 189 ośrodków badania grypy na świecie. Jeden z tych 189 ośrodków jest w Polsce. Czy dzisiaj można nam zarzucać niewiedzę o grypie? Czy można teraz kwestionować opinię pani profesor, która od 40 lat pracuje nad

grypą, nie jednym rodzajem grypy, wydała tysiące publikacji na ten temat. Toteż mam tylko jedno zasadnicze pytanie: Czy dzisiaj chcemy walczyć z pandemią grypy, czy chcemy walczyć z ministrem zdrowia przy okazji zachorowań na grypę? (Oklaski) I bardzo państwa proszę, abyście państwo zrozumieli jedną rzecz. Te wątpliwości nie biorą się w związku z istnieniem takiego normalnego polskiego uporu, że oto minister zdrowia pomyślała sobie: będę inna niż wszyscy inni ministrowie.

My dzisiaj mamy wiedzę na temat tego, jakie klauzule są zawarte w innych umowach, które podpisywane były przez rządy innych państw, dużo zamożniejszych. I wiemy również, jaką zaproponowano Polsce umowę. Dzisiaj ze względu na ochronę negocjacji, które toczymy, ja państwu nie mogę przytoczyć szczegółów tej umowy, ale jedno mogę powiedzieć: departament prawny znalazł tam co najmniej 20 punktów spornych. A więc czy obowiązkiem ministra i rządu jest doprowadzić do tego, aby zawierać umowy zgodne z interesem państwa i pacjentów polskich, czy też z interesem firm farmaceutycznych? (Oklaski)

Jeśli dzisiaj wiem, że na rynku dostępne są trzy szczepionki trzech różnych firm, a każda z nich, ja nie zdradzam tu tajemnicy, ma inną zawartość substancji czynnej, to nie zastanawia państwa to, że mimo iż w każdej z nich obecność substancji czynnej jest inna, są traktowane tak samo? Czy dzisiaj minister zdrowia i fachowcy, którzy to oceniają, nie mają choćby przez moment wątpliwości co do tego, że może ta, która zawiera tę substancję czynną w śladowych ilościach, jest po prostu wodą święconą, a nie szczepionką? (Oklaski) Za to mamy zapłacić?

Dzisiaj mamy przykład Niemiec, w których oczywiście kupiono 50 mln dawek szczepionki, z czego wykorzystano na chwilę obecną niecałe 10 mln. 13% populacji Niemiec chce za ten cudowny lek dzisiaj zapłacić i chce się zaszczepić. Ale dla przykładu powiem państwu, że właśnie to Niemcy, co dziwne, przodują w jednym - w wyszczepialności na grypę sezonową. Jeśli na 1000 mieszkańców w Polsce na grypę sezonową szczepi się 52 Polaków, to w Niemczech szczepi się 228 osób. Co nagle takiego się stało - tam jest przecież tradycja szczepień - co się stało, że rząd kupił szczepionkę, zaoferował, a oni mówią: 13%, czyli mniej niż na sezonową chce się szczepić? Czy to są powody, nad którymi powinniśmy się zastanawiać, czy też nie? Także ci, którzy decydują o tym, że wprowadzają preparat, który dzisiaj jest w pewnym sensie owiany tajemnicą, bo jeśli państwo zobaczylibyście dokumenty rejestracyjne, to nie mamy tam wyszczególnionej ilości adiuwantu.

Ale też pamiętajmy o jednej rzeczy, że są tzw. strony niepożądane odczynów poszczepiennych, strony, które obligują wszystkich tych, którzy dany preparat wyprodukowali, do informowania o tych niepożądanych skutkach, które się zdarzyły po szczepieniu. Szczepimy się od początku października, na świecie szczepią się ludzie od początku października. Chcę, żeby ktokolwiek z państwa na tej stronie znalazł choć jeden paradoksalny objaw uboczny, choć jeden - wysypka, uczulenie. To się przy najbardziej bezpiecznym leku może zdarzać. Nie ma, jest pusto, cudowny lek. A skoro taki cudowny, to dlaczego firma nie chce go wprowadzić na rynek, biorąc odpowiedzialność za swój lek? Jeśli cudowny i bezpieczny, to biorę za to odpowiedzialność, wprowadzam go na rynek, wszystko jest transparentne i nie obciąża strony, która kupuje ten lek, płaci za to. Ta strona, która kupuje, nie ma wglądu w badania, nie ma wglądu również w skład szczegółowy i nie zna wyników, które pokazują w tej czwartej fazie, czy są jakiekolwiek minimalne działania uboczne po szczepieniu.

Zobaczcie, państwo, co się wydarzyło. Krótki okres badań, ale też jaka mała populacja. Jedna firma przeprowadza badania na 160 zdrowych ochotnikach w wieku od 20 do 60 lat, inna firma oferująca tę szczepionkę na 600 osobach zdrowych od 18. do 60. roku życia. Czy to nam, tu obecnym, szczególnie lekarzom, wystarcza do tego, żeby powiedzieć: tak, szczepimy się tą szczepionką przeciw tej grypie? Mnie nie wystarcza. Chcę mieć pewność, oczywiście nigdy stuprocentowej mieć nie będę, albo przynajmniej taką wiedzę, która pozwoli mi to zarekomendować przed ukończeniem negocjacji. My nie wypadliśmy z kolejki po tę szczepionkę. Ten czas do momentu podpisania tejże umowy, jeśli taka decyzja zapadnie - rekomendowana oczywiście będzie przez komitet pandemiczny - chcemy wykorzystać do maksymalnego pozyskania wiedzy o bezpiecznym produkcie, który chcemy zakupić dla państwa - lub też nie, jeśli się okaże, że będzie niezbyt doskonały.

A więc dzisiaj zadaję sobie pytanie: Jeśli na całym świecie miliard ludzi choruje na grypę sezonową, umiera milion z tego powodu, to czy ktoś - a grypa sezonowa nie występuje u nas od roku, od dwóch lat - z tego względu ogłaszał pandemię? Mało tego, okazuje się, że te wirusy grypy sezonowej są zdecydowanie gorsze, bardziej zjadliwe, nawet powodujące skutki śmiertelne i ciężkie powikłania. Czy ktoś właśnie z tego powodu ogłaszał pandemię? Może ci, którzy dzisiaj mnie namawiają do tego, żebym tak chętnie kupowała szczepionki na grypę A/H1N1, wiedząc, że w Polsce mamy 193 przypadki zdiagnozowane na 1000 przypadków sprawdzonych, z tego tylko 124 osoby były hospitalizowane, a z tych 124 podania tamiflu wymagało 100 osób? Czyli jaka jest zjadliwość tego wirusa w porównaniu z normalnym wirusem grypy, tym sezonowym? Zdecydowanie mniejsza. I dlaczego akurat przy tym wirusie jest taka histeria, a przy poprzednich, występujących tyle lat, zbierających żniwo śmiertelne, nie było takiej paniki, nie było takiej determinacji? Tych, którzy dzisiaj dopingują mnie do zakupu tej szczepionki, pytam, dlaczego zlekceważyli objawy grypy sezonowej w ubiegłym roku, dwa lata temu, trzy lata temu i w roku 2003. W roku 2003 w Polsce na grypę sezonową zachorowało ponad 1200 tys. osób. Czy ktoś wtedy mówił o tym na tej sali, a przecież parlament był, istniał, czy tu rozrywano szaty i krzyczano: ″Kupmy wszystkim szczepionki na grypę sezonową″? Ja sobie tego nie przypominam. My dzisiaj uczciwie mówimy: skoro grypa sezonowa jest groźniejsza, szczepcie się państwo przeciwko tej grypie. Mało tego, widzimy wzrost wyszczepialności. Co robimy? Otóż rząd podjął bardzo szybkie działania, żeby za kilka dni trafiły kolejne setki szczepionek do naszych aptek i hurtowni. To jest rozsądne działanie.

A więc na koniec chcę państwu powiedzieć tylko jedno: Polacy to bardzo mądry naród.

(Poseł Teresa Wargocka: W tym nasza nadzieja.)

Polacy bardzo dokładnie potrafią odróżnić to, co jest prawdą, od kłamstwa i potrafią również odróżnić to, co jest obiektywną oceną sytuacji, od gry politycznej. Za to Polaków bardzo szanuję. I chcę powiedzieć, że bardzo mi przykro, kiedy przekonuję się, że na tej sali w imię prawdy można oszukiwać Polaków. Tę ostatnią kwestię kieruję do tych wszystkich, którzy przebierają nogami w tej chwili po to, aby wywrzeć nacisk na ministra zdrowia i zmusić go do działań, za które bardzo chętnie albo jeszcze chętniej byście mnie rozliczali, gdyby się okazało, że coś jest nie tak. Właśnie to wy zarzucalibyście mi niestaranność, to wy zarzucalibyście mi brak wyobraźni, a dzisiaj zarzucacie mi przewlekanie w czasie. Powtarzam: w Polsce na 193 przypadki chorych na grypę A/H1N1 nie zszedł z tego świata ani jeden pacjent. Ci wszyscy ludzie w większości, czyli w ponad 50%, przechorowali tę grypę w domu. W związku z tym bardzo proszę Wysoką Izbę przede wszystkim o wsparcie dla ministra, który chce być wyjątkowo i odpowiedzialnym, i ostrożnym, chce dbać, co jest oczywiste w przypadku ministra zdrowia, o życie i zdrowie polskich pacjentów. Dziękuję bardzo. (Oklaski)

(Poseł Krystyna Skowrońska: Brawo, pani minister!)

РИА НОВОСТИ

Андрей Лубенский

Лукашенко призвал меньше "визжать" про свиной грипп

РИА Новости, 5 ноября 2009
https://ria.ru/20091106/192113439.html

"Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьего" гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по свинячьи. А завтра, наверное, замурлыкаем или замычим", - сказал Лукашенко.

КИЕВ, 5 ноября 2009 – Причина искусственного ажиотажа вокруг свиного гриппа лежит в коммерческой сфере, считает президент Белоруссии Александр Лукашенко.

Эпидемия гриппа на Украине была объявлена в конце октября, в девяти западных областях введен карантин. По последним официальным данным Минздрава, от гриппа скончались 95 человек. Подтверждены 15 случаев заболевания гриппом A/H1N1. До сих пор в украинских аптеках не хватает антивирусных препаратов и медицинских повязок.

"Давайте говорить откровенно, давно ли мы перестали "кукарекать" по поводу "птичьего" гриппа? "Кукарекал" весь мир. Наверное, все (лекарства) уже продали. Сегодня завизжали по свинячьи. А завтра, наверное, замурлыкаем или замычим. Вы что, не понимаете, что происходит?" - сказал Лукашенко в четверг на совместной с президентом Украины Виктором Ющенко пресс-конференции в Киеве.

По мнению белорусского лидера, "этот грипп, пусть даже свинячий, – это не чума и холера, он вполне излечим", а ажиотаж только мешает в борьбе с болезнью. "Медикам приходится бороться не только с самим заболеванием, но и с ажиотажем", – заявил Лукашенко.

В то же время, президент Белоруссии отметил, что этот ажиотаж выгоден производителям лекарств и торговцам.

"Я знаю, что происходит в этой суперкоррумпированной, бандитской среде в производстве и торговле лекарствами", – подчеркнул он.

"Есть у нас марлевый завод, надо будут марлевые повязки – будем с Виктором Андреевичем вместе там штамповать и развозить. Только вы покупайте", – пошутил Лукашенко, добавив, что через неделю марлевые повязки украинцам уже не понадобятся.

Лукашенко выразил уверенность в том, что и Белоруссия, и Украина вполне в состоянии справиться с проблемой свиного гриппа. "Не надо бояться, нагнетать ситуацию и обстановку", – резюмировал белорусский лидер.

Президент Белоруссии посещает Украину с официальным визитом 5-6 ноября.

Made for minds.

WHO warns swine flu is a virus that must be taken seriously

Deutsche Welle, 5 November 2009
https://www.dw.com/en/who-warns-swine-flu-is-a-virus-that-must-be-taken-seriously/a-4864727

Audio file

https://www.dw.com/en/pod0511-swine-flu/audio-4864673

Englisch: POD0511 Swine Flu - Produziert: 05.11.2009 - 18:14:58 von Foulkes

... **Swine Flu** with the *first noticed just seven months ago* ...

The World Health Organisation has warned against complacency in the face of swine flu, saying the H1N1 virus should not be regarded as the same as seasonal flu.

THE FLU CASE

Johan Niklasson

Swedish media desperately fighting against readers posting comments to the "swine flu" propaganda

The Flu Case, 5 November 2009, 13:26
https://web.archive.org/web/20100102050103/http://theflucase.com/index.php?option=com_content&view=article&id=1624%3Aswedish-media-desperately-fighting-against-readers-posting-comments-to-the-qswine-fluq-propaganda&catid=1%3Alatest-news&Itemid=64&lang=en

The media in Sweden is publishing the ordered propaganda as never before. The few sick and the few deaths, linked to the H1N1 virus is reported ad nauseum and no where is it possibkle to read about any type of critizism or see any normal journalistic attempts to objectivity regarding the mass vaccinations.

Having been an avid poster of comments myself, I have noticed how the treatment of these posts have been changing during the last couple of weeks. My own comments and many similar are usually very polite and serious with questions about the present policies and often with information about the possible dangers with vaccines and especially the new so called "swine flu" vaccines. No foul language and no links within the comments that lead to forbidden materials. The comments are following the clearly stated rules for comments and there is no reason to remove them unless the intention is to see to that no such information is made available to the public.

Initially, such comments showed up but was removed within hours. Weeks later, the removal of comments went faster until today, they lasted a few minutes at the most. Also, a few weeks ago, when a comment was removed, an e-mail was sent out, informing the poster that the comment was "breaking the rules of the comment section" (which they did not) and in this way the poster was notified. These notifications stopped coming a week ago.

Today, another step was taken by Aftonbladet, the by far most popular site in Sweden for online news. Today, the possibility for me to post comments has been blocked completely. After a few of my normal informative posts, the site reports "a problem have occurred" and it is no longer possible for me to make any more posts. Everything else works fine on the site, other people can post comments and do so, but the critical comments from myself and others are quickly removed. I assume I am not the only one running into this "problem". I also assume (from reading many similar stories from our readers) that the situation is similar in several countries where the "swine flu" is marketed.

To me this is a sign of how desperate media in Sweden have become and how much they fear that the population gets any other information than the state controlled propaganda. It is also a sign that shows that the situation is about to become uncontrollable. Very many in Sweden are upset about the "swine flu" propaganda, the abuse of tax payers money to buy untested and deadly vaccines and the massive failure to give the people needed information about the reality of the H1N1 situation.

The Sydney Morning Herald

WHO urges people to maintain guard over swine flu

The Sunday Morning Herald, AFP, 5 November 2009, 01:16 pm
https://www.smh.com.au/world/who-urges-people-to-maintain-guard-over-swine-flu-20091106-i0i3.html

The World Health Organisation on Thursday urged people not to drop their guard over the swine flu pandemic and insisted on the value of vaccination despite the broadly mild symptoms of the virus.

"At the WHO we remain quite concerned about the pattern we are seeing, particularly because a sizeable number of people do develop serious complications and death," said Keiji Fukuda, special adviser on pandemic.

"Again, we are seeing most of this develop in people who are younger than 65 years, a picture which is different from seasonal influenza," he explained.

Fukuda reiterated that the cases of serious complications were largely found among the chronically ill, pregnant women as well as some otherwise healthy younger people.

He also countered signs of public scepticism about the vaccine revealed by surveys in several countries, despite the resurgence of swine flu in the northern hemisphere with the onset of the colder season.

"WHO believes that these *vaccines are very useful* against the pandemic virus," Fukuda said in a telephone news conference.

Vaccination against A(H1N1) influenza has now started in more than 20 countries and were demonstrably safe, according to the WHO.

"What we are seeing is that these *vaccines are highly safe* and have been received by a significant number of people without any problems," Fukuda said.

Swine flu has differed from seasonal flu in persisting in the northern hemisphere during the summer period and in a pattern of occasional serious illness affecting under 65-year-olds.

However, Fukuda acknowledged that it was as transmissible as seasonal flu, showed the same pattern of spreading more widely in winter and was "self limiting" in that the large majority of people who caught it got better without the need for special treatment.

More than 5,700 people have died worldwide since the pandemic virus was first discovered in April, with most deaths – 4,175 – reported in the Americas region, according to WHO data.

PORTUGAL resident

Chris Graeme

Swine flu claims first child victim in Portugal

Portugal Resident, 5 November 2009
https://www.portugalresident.com/swine-flu-claims-first-child-victim-in-portugal/

Portuguese health authorities have appealed for calm following the death of a child in Lisbon last week.

The sudden death of the 10-year-old boy was confirmed to be as a result of the A (H1N1) virus, which an autopsy showed had complicated an unknown but pre-existing congenital heart problem.

The Directorate-General of Health said in Lisbon over the weekend that the death "did not justify any changes in behaviour or plans," while the Portuguese Society of Paediatrics added that it wasn't necessary for parents whose children were exhibiting flu-like symptoms to "demand that they be hospitalised".

"They will be given a blood test, anti-viral medicine and are in the first phase of vaccination. This was an exceptional situation and there are no reasons for a change in policy," said Maria João Brito, from the SPP.

The child, named only as Adriano, died on October 28 at Lisbon's Estefânia Hospital in what doctors said was a death that "couldn't be avoided."

The preliminary findings of the autopsy showed that the child had been suffering from muscular cardiomyopathy, literally heart muscle disease, where the heart muscle is congenitally weakened.

"The patient could have lived for years with a weakened heart, with the asymptomatic problem going undiagnosed. It's difficult to imagine the same situation arising twice," said the hospital's Clinical Director Gonçalo Ferreira.

"Cardiomyopathy can cause sudden death among apparently fit people like professional athletes and sports players," said the Minister for Health, Ana Jorge, rejecting criticism that the child had not been treated promptly.

The boy had first been taken to Francisco Xavier Hospital on Monday after complaining of feeling unwell and exhibiting a mild temperature. He was sent home after being medicated since he had not "presented serious symptoms".

He was later taken to the Casualty Department of the same hospital on Tuesday night showing symptoms of flu and then taken to Dona Estefânia Hospital.

Reacting to criticism, the President of the Portuguese Society of Paediatrics argued that the São Francisco Xavier Hospital had followed "all the rules" laid down for diagnosing and treating the virus.

The following day, a 50-year-old-man, who suffered from a chronic illness, also succumbed to the A (H1N1) virus at Ponta Delgada Laurindo Frias Hospital in the Azores, making him the fifth victim of the A (H1N1) virus.

In the Azores case the victim had been admitted to hospital on Wednesday last week with "serious breathing difficulties" complicated by an associated chronic disease.

The total estimated number of flue victims from both seasonal and A (H1N1) strains has topped 20,000 in Portugal according to Portuguese Health Department statistics.

President of Russia

Dmitry Medvedev instructed the Healthcare and Social Development Ministry to help Ukraine battle the flu epidemic

Kremlin, 6 November 2009, 20:28
http://en.kremlin.ru/events/president/news/48781

The President issued this instruction at a meeting with Healthcare and Social Development Minister Tatyana Golikova. The Minister reported that a decision has already been taken to send Russian anti-flu medicines to Ukraine as humanitarian aid, and the ministry has also proposed sending specialists to Ukraine to help carry out necessary tests.

Regarding the flu situation in Russia, Ms Golikova said that the number of cases is similar to past years and that vaccinations against the new virus would begin on November 9.

Also discussed at the meeting was the production in Russia of strategically important medicines to ensure the country's independence from foreign suppliers in this area. Mr Medvedev noted that he will comment on this issue in his Annual Address to the Federal Assembly (parliament).

Responding to Ms Golikova's observation that the flu season has sparked speculative tendencies on the medicines market, the President promised to instruct the Federal Anti-Monopoly Service and the Prosecutor General's Office to monitor developments on the pharmaceuticals market and to launch criminal proceedings in cases of unjustified price hikes. The necessary legislation for such action is already in place.

Mr Medvedev issued a relevant instruction to Prosecutor General Yury Chaika immediately following the meeting.

ВОЗ:
Грипп A/H1N1 чаще всего проходит без серьезных осложнений

Взгляд, 6 ноября 2009, 18:00
https://vz.ru/news/2009/11/6/346014.html

Заболевание пандемическим гриппом вируса A/H1N1 в большинстве случаев протекает без серьезных осложнений, заявил руководитель Международной миссии ВОЗ Юкка Пуккила.

«Я хочу подчеркнуть, что как и в случаях сезонного гриппа, в случаях пандемического гриппа A/H1N1, заболевания у большинства людей протекают без серьезных осложнений и даже без потребности в медикаментозном лечении», - сказал он на пресс-конференции в пятницу.

В то же время представитель ВОЗ подчеркнул, что определенная часть людей заболевает тяжелыми формами пандемического гриппа.

При этом основными симптомами является боль в грудной клетке, выкашливание крови или окрашенной мокроты, осложненное дыхание и изменения в сознании человека. «В таких случаях необходимо срочно обращаться в больницу», - сказал эксперт.

Вместе с тем он подчеркнул, что препарат «Тамифлю» не следует давать людям, которые не больны тяжелой формой пандемического гриппа, а также тем больным, у которых не выявлен этот вирус гриппа.

«Действительно, «Тамифлю» не должен даваться людям, у которых не тяжелая форма заболевания, которые не относятся к группам риска, и людям, у которых точно известно, или скорее всего, заболевание гриппом A/H1N1. Об этом есть достаточно четкая рекомендация ВОЗ», - сказал Пуккила.

Главный государственный санитарный врач Украины Александр Биловол также подчеркнул, что препарат «Тамифлю» «дает очень высокий эффект» при лечении, однако он не является профилактическим средством.

Отвечая на вопрос, для чего Украина закупает такое огромное количество препарата «Тамифю», А.Биловол сказал: «Вы видите, что в этой ситуации у нас повышен эпидпорог заболевания на ОРВИ, вы видите, что в рекомендациях ВОЗ отмечено, что практически эффективность этого препарата при всех формах гриппа, в том числе и гриппа A/H1N1, который мигрирует у нас».

«Вторая особенность этого препарата - он может эффективно влиять на комплексные комбинированные инфекции, которые на сегодняшний день есть в Украине», - добавил Биловол, передает «Интерфакс».

КОМСОМОЛЬСКАЯ ПРАВДА

Анна Кукарцева

В России от свиного гриппа умер уже 21 человек

Комсомольская Правда, 6 ноября 2009, 20:53
https://www.kp.ru/daily/24389/568525/

Но Татьяна Голикова считает, что повода для паники нет и уровень заболеваемости ОРВИ и гриппом «умеренный».

Сегодня в интервью «Российской газете» министра здравоохранения и соцразвития РФ Татьяна Голикова сказала, что «уровень заболеваемости всеми типами ОРВИ и гриппа среди россиян можно назвать «умеренным», так как он не превышает показателей прошлого и позапрошлого года. Опасений по поводу развития событий по негативному сценарию у властей пока нет».

По словам министра, у людей возникают «излишние и необоснованные страхи». Поводов сеять панику из-за стремительного распространения во всех регионах России эпидемии свиного гриппа, просто нет. Все под контролем Татьяна Голикова подтвердила, что за ситуацией со свиным гриппом ведется непрерывный мониторинг, и все, что происходит, находится под строгим контролем.

Отдельно отслеживаются случаи, протекающие с тяжелыми осложнениями. Усилен контроль за беременными женщинами и детскими учреждениями. Все полученные министерством здравоохранения данные говорят пока только о том, что смертность от вируса А /H1N1 находится на уровне смертности от сезонного гриппа.

Как мы не раз уже писали, по наблюдениям, тяжело переносят свиной грипп примерно 5-6% от числа заболевших. Осложнения, требующие применения интенсивной терапии, в том числе искусственной вентиляции легких возникают у четверти тяжело заболевших – то есть примерно в 1,5% случаев.

Что делают власти и что делать нам С 9 ноября начинается вакцинация против свиного гриппа с первой группы риска. В нее входят работникам коммунальных служб, медикам, пенсионерам, беременным и детям. К концу уже этой недели будет выпущено около 3 миллионов доз живой вакцины.

Усилен контроль за работой аптек, отслеживается постоянное наличие вирусных препаратов, защитных масок и других необходимых для лечения ОРВИ и гриппа лекарств. Усилен контроль на границах со странами, где гуляет эпидемия, в том числе – с Украиной.

А простым людям не стоит забывать об элементарной профилактике:
- чаще мыть руки, особенно после улицы;
- избегать близкого контакта с больными людьми,
- не ходить на работу при симптомах заболевания ОРВИ,
- чаще гулять, стараясь избегать массового скопления людей, особенно в общественном транспорте,
- правильно питаться, не забывая о свежих овощах и фруктах, а также о хорошем мясе и рыбе.

Цифры: На сегодняшний день в России клинически подтверждены 3122 случая гриппа A/H1N1, болеют им 1200 человек. 1908 человек выздоровели, 21 человек умер.

REUTERS

Severe swine flu cases "snowballing"

Reuters, 6 November 2009, 12:21 AM GMT+8
https://www.reuters.com/article/uk-flu-england-idUKTRE5A43LN20091105/

London (Reuters) **-** The number of people needing hospital treatment for the H1N1 virus in England is "snowballing," although the rise in the overall number of estimated cases is slowing, health officials said on Thursday.

The Health Protection Agency (HPA) said there are now 848 patients in hospital with swine flu, of whom 172 are receiving critical care. In September, the number of swine flu patients in hospital was below 300.

Liam Donaldson, the chief medical officer, said the reason for the jump in severe cases was unknown, although the virus is not thought to have mutated.

"There has been a snowballing of cases in intensive care which is giving us concern," he told a news conference. "It is consistent with what happened in the southern hemisphere and it is unexplained."

There were an estimated 84,000 new cases of the flu in England, up from an estimated 78,000 the previous week, a rise of 7.7 percent, he added.

In the previous week, health officials said the number of estimated new cases had risen by nearly 50 percent.

The total number of people who have had flu since the outbreak began stands at 620,000. Donaldson said there was a small drop in the estimated number of people going to their GPs with flu-like symptoms, to 37.7 people per 100,000 compared to 42.8 in the previous week.

The HPA said the virus was generally mild and had shown no significant changes. The number of deaths of people with swine flu in England has reached 105, but not all those can be attributed to the virus.

WHO says A H1N1 breaking species barrier, potentially creating new diseases

The Flu Case // Romandie News, 6 November 2009, 16:47
http://www.romandie.com/ats/news/091106125559.gadpn9sy.asp (deleted)

WHO has reported that there is evidence that the A H1N1 virus has acquired genes that allow it to break species barriers as they cross over from animals to people. WHO has called for stricter controls on farms.

The fact that the A H1N1 virus has found ways to cross over from one species to another (by artificial, genetic manipulation in a lab?) will spark fears about the appearance of new diseases that can infect humans.

WHO said that the AH1N1 virus has the capacity to infect "multiple hosts" and that "there is a potential that animals other than pigs can generate a new virus," according to a report in French.

Grippe: l'OMS préconise de renforcer les contrôles sur les fermiers

GENÈVE - L'Organisation mondiale de la santé (OMS) préconise de renforcer les contrôles sur les fermiers en contact avec des animaux atteints de grippe étant donné le potentiel d'apparition de nouveaux virus, selon une note diffusée vendredi sur son site internet.

"Les études récentes suggèrent que les virus de grippe de type A chez les animaux et les hommes se comportent de plus en plus comme un groupe de gènes qui circulent parmi de multiples hôtes et qu'il y a un potentiel que des animaux autres que les porcs génèrent de nouveaux virus", explique l'organisation.

"Cette situation renforce le besoin de surveillance et de collaboration rapprochées entre les autorités sanitaires publiques et les vétérinaires", ajoute-t-elle.

L'organisation recommande notamment que lorsque des cas de grippe sont détectés dans une ferme animalière, un suivi particulier des personnes y travaillant soit mis en place de façon à déceler au plus tôt les signes de maladies respiratoires. Dans ce cas, l'OMS préconise de faire des tests pour vérifier s'il s'agit d'une infection au H1N1.

Elle souligne toutefois qu'à l'heure actuelle, les transmissions de l'homme aux animaux du virus pandémique H1N1 restent isolées.

Concernant les cas, "peu nombreux", de porcs atteints du H1N1, il y a "peu de preuves" démontrant que l'infection est d'origine humaine, dit l'OMS qui prévient toutefois qu'une telle transmission "devrait devenir plus fréquente".

Pour les autres animaux, l'organisation fait également état de cas de dindes malades au Chili et au Canada ainsi que quelques animaux domestiques aux Etats-Unis.

"Ces infections restent des évènement isolés et ne posent pas de risques particuliers pour la santé humaine", assure l'OMS qui rappelle que le virus est tué à la cuisson et qu'"aucun cas humain" de grippe n'était "lié à la consommation de viande correctement préparée".

Selon les dernières données de l'OMS, la maladie qui contient des gènes d'origine porcine, aviaire et humaine a tué au moins 5.700 personnes dans le monde depuis son apparition il y a sept mois.

INFOWARS

Kurt Nimmo

Pneumonic Plague Drill Held in Illinois

Infowars // The Flu Case, 6 November 2009, 10:31

https://web.archive.org/web/20100102034217/http://theflucase.com/index.php?option=com_content&view=article&id=1681%3Apneumonic-plague-drill-held-in-illinois-reports-kurt-nimmo-&catid=1%3Alatest-news&Itemid=64&lang=en

In Lake in the Hills, Illinois, police will conduct a drill to combat a fictitious pneumonic plague on Saturday. “The Lake in the Hills Police Department is carrying out the test as part of a grant from the McHenry County Department of Health for its emergency health plan. In case of a biological terrorist attack or widespread disease outbreak, the site would be able get medicine to the community, Lake in the Hills Chief of Patrol Services David Brey said," reports the Northwest Herald. Brey said officials picked pneumonic plague for the scenario “so it would have nothing to do with the swine flu."

In Ukraine, the pneumonic plague is not fictional, although officials in that country insist the disease is a mutated version of the H1N1 virus, not pneumonic plague. Over the period of six days, the mystery disease has afflicted more than 500,000 people. The plague or virus in the Ukraine has 10 times the mortality rate than the normal swine flu. In late October, officials in Ivano-Frankivsk, a city located in southwestern Ukraine, characterized the outbreak as pneumonic plague. Pneumonic plague is caused by bacterium and is more virulent and less common than bubonic plague.

Official Ukranian sources place the number of death at 33 (as of November 5) and the news website ZIK claims a total of 97 deaths. Deutsche Presse-Agentur put the number at 95 and reported on November 5 that 633,877 Ukrainians nationwide have registered with health authorities as suffering from the flu. Doctors in the region, however, dispute this and say thousands have died.

Residents of Kiev claim light aircraft sprayed a mysterious substance on residents of the city, according to Radio Netherlands Worldwide. The spraying was denied by the country’s Office of Emergency Response.

Reports from Ukraine on the mystery illness are contradictory and confusing. “While the mainstream media is reporting that it is a surge in H1N1 influenza, alternative media sources are reporting that it is a new unidentified virus, while other reports cite witnesses in Ukraine who say there is no evidence of a pandemic at all," Steve Watson wrote for Infowars on November 2.

On November 5, it was reported by the alternative media that a town in China was locked down after 2 people died from an outbreak of pneumonic plague. In August, the Associated Press reported on a deadly outbreak of pneumonic plague in a remote farming town in northwestern China.

It should be emphasized that at this time there is no conclusive evidence that Ukraine is suffering from an outbreak of pneumonic plague. Experts note that if the country was indeed suffering from the illness the death rate would be much higher.

However, it is odd that a preparedness drill in the United States would use the pneumonic plague as its fictional predicate. It is not explained why officials in Lake in the Hills have chosen to avoid basing their drill on the H1N1 virus.

Lake in the Hills has ranked high in Illinois cities taking federal money for “homeland security" initiatives, according to a survey conducted by the Daily Herald.

It is not known if the Department of Homeland Security is involved in the drill to be conducted this weekend.

50-åring från Tjörn skickades hem - dog

Expressen, 7 November 2009
https://web.archive.org/web/20091217135632/http://www.gt.se/nyheter/1.1771470/50-aring-fran-tjorn-skickades-hem-dog

Den rullstolsburne mannen sökte vård förra helgen, men skickades hem med diagnosen lunginflammation.

Två dagar senare var han död - i svininfluensa.

Och fler dödsfall är att vänta, bedömer smittskyddsinstitutet.

- Det går nog inte att undvika, säger statsepidemiolog Annika Linde.

Landstinget i Västra Götaland bekräftade i går att den rullstolsburne mannen från Tjörn utanför Göteborg dog i svininfluensa. Mannen, som var i 50-årsåldern, sökte vård på Jourcentralen i Stenungsund förra lördagen. Där fick han diagnosen lunginflammation och behandlades med antibiotika och luftrörsvidgande läkemedel. I måndags avled han i sitt hem.

"Det hela är djupt tragiskt"

I går konstaterade landstinget att orsaken var svininfluensa.

– Mannen uppfattade inte sig själv tillhöra någon riskgrupp utan såg sig som frisk. Dock var mannen rörelsehindrad, och den utredning som nu är påbörjad får visa om detta faktum påverkade sjukdomsförloppet, säger Monica Ericson-Sjöström, chefsläkare vid primärvården i södra Bohuslän. I ett pressmeddelande säger hon:

– Det hela är djupt tragiskt och vi känner ett stort deltagande med de anhöriga.

"Vi får skärpa kontrollerna"

Efter dödsfallet på Tjörn, det första som har konstaterats i Västra Götaland, säger jourhavande smittskyddsläkaren Leif Dotevall:

– Nu får vi skärpa kontrollerna för att fånga in dem som är allvarligt sjuka.

– För dem räcker det inte att ligga hemma och dricka vatten, de måste få vård.

Enligt Annika Linde, statsepidemiolog på smittskyddsinstitutet, löper man inte större risk att drabbas för att man är rörelsehindrad.

– Om man inte kan andas ordentligt, om man är rörelsehindrad på det sättet, så kan det påverka. Att man inte kan gå, eller sitter i rullstol av skäl som enbart påverkar benen, det har man inte sett som någon riskfaktor.

Smittskyddsinstitutet uppskattar att mellan 130 000 och 300 000 svenskar nu har smittats. I takt med att svininfluensan sprids ökar också risken för ytterligare dödsfall.

– Att det blir några till det tror jag är oundvikligt, säger Annika Linde.

– Men vi hoppas ju att vi i och med att vi har hunnit vaccinera så många i riskgrupperna att det inte ska bli riktigt så många som det hade kunnat bli annars.

"Hoppas att det blir färre"

Tidigare befarade man att mellan 30 och 100 svenskar skulle dö i svininfluensa. Men det var, enligt Annika Linde, om Sverige skulle avstå från att massvaccinera.

– Nu vet vi inte i vilken mån vi har lyckats bringa ner de här talen. Vi kan faktiskt inte räkna på det. Vi bara hoppas att det blir färre, säger hon.

Har Sverige haft få eller många dödsfall så här långt?

– Jag skulle tro att vi ligger någonstans i mitten. Irland, England och Norge ligger före oss. Sen finns det länder framför allt i Centraleuropa som ligger efter oss.

Страхи и статистика

Forbes, 8 ноября 2009
https://www.forbes.ru/tehno/meditsina/24320-strahi-i-statistika

Насколько опасен свиной грипп?

«Большинство людей переносят болезнь с мягкими симптомами или вообще без симптомов», – говорится в отчете Европейского центра по контролю заболеваний. Тот факт, что смертность от нового гриппа невысока, признает и объявившая пандемию ВОЗ. На сегодняшний день в мире умерло чуть больше 6000 человек из более чем 500 000 людей, которым был поставлен соответствующий диагноз, то есть 1,36%.

В России цифры еще менее удручающие: 14 умерших на 3122 лабораторно подтвержденных случая (0,45%, данные Роспотребнадзора). При этом, если статистика по летальным случаям обычно полна, то общее количество заболевших сильно занижено – как раз потому, что большая часть заболевших не сдают анализы. Таким образом, летальность свиного гриппа составляет заведомо меньше 0,5% (летальность птичьего гриппа, для сравнения, достигала 60%) и сравнима с летальностью обычного гриппа.

Чуть более полная статистика существует для Южного полушария, где эпидемический сезон уже закончился. Смертность от гриппа составила там от 0,4 до 1,5 человек на 100 000 населения, в Австралии – 0,86. (Эти данные собрали Майкл Бейкер из университета Отаго (Новая Зеландия) и его коллеги.

Абсолютные цифры пока тоже не дают поводов для беспокойства: в Америке, например, по состоянию на конец октября зарегистрировано 1365 смертельных случаев, при том что в среднем за год от осложнений после обычного гриппа умирает 36 000 человек.

Откуда паника в мире?

11 июня, в день объявления пандемии свиного гриппа, директор ВОЗ Маргарет Чан сказала: «У нас есть хорошие поводы ожидать, что пандемия будет не очень суровой». Но чрезвычайные меры были оправданы, с точки зрения ВОЗ, тем, что «вирус меняется очень быстро, и совершенно непонятно, как он себя поведет». В частности, эксперты очень боятся, что свиной грипп может обменяться генетическим материалом с птичьим. «Это событие имело бы самые неприятные последствия для человечества», – сказал недавно специальный координатор ООН по пандемиям доктор Дэвид Набарро. Тем не менее пока этого не произошло.

24 октября президент Обама ввел чрезвычайное положение в США, мотивировав свой шаг тем, что количество заболевших растет и американская система здравоохранения может не справится с наплывом больных. Между тем за полгода в США с диагнозом «свиной грипп» были госпитализированы только 20 000 человек. А еще за месяц до этого, в сентябре, было ясно, что свиной грипп не так опасен, как предполагалось ранее. «Не обсуждая возможные изменения вируса, я думаю, у нас сейчас пандемия первой категории», – говорил тогда гарвардский эксперт доктор Марк Липсич. Пандемия первой категории сравнима с сезонной эпидемией гриппа.

Так что чрезвычайные меры вводятся для того, чтобы подстраховаться. Никаких оснований для паники в настоящий момент нет.

Что происходит в России?

Первый официальный случай свиного гриппа был выявлен 22 мая. Официальные цифры о числе заболевших, публикуемые Роспотребнадзором, росли медленно, и к 20 октября официально заболевших в России было 927 человек. В тот же день появились данные, что число заболевших свиным гриппом в России в действительности гораздо больше.

Директор НИИ вирусологии академик Дмитрий Львов заявил, что цифру 927 человек «можно умножать на 10». Ему вторил Олег Киселев, директор НИИ гриппа РАМН и руководитель национального центра по гриппу ВОЗ.

Наконец, уже 30 октября, Министерство здравоохранения и социального развития в лице замминистра Вероники Скворцовой признало правоту экспертов: «Грипп A/H1N1 стал занимать до 75-80% случаев заболевания, выявляемого в России, вытесняя при этом обычный сезонный грипп».

Таким образом, официальное сообщение о том, чем больны россияне, появилось только через пять месяцев после появления болезни в стране. Возможно, это отчасти объясняет панические настроения населения, раскупающего респираторы и противовирусные препараты.

Тем не менее в России эпидемия проходит пока так же мягко, как и в остальном мире. «Опасений по поводу развития событий по негативному сценарию у нас, по крайней мере пока, нет», – сказала министр здравоохранения Татьяна Голикова в интервью «Российской газете». Чуть ранее Минздрав прокомментировал введение чрезвычайного положения в Бурятии, назвав его назвав его «преждевременным».

DN.se

Influensan osynlig i sjukskrivningar

DN.se, 8 November 2009, 14:14

https://web.archive.org/web/20091025161907/http://www.dn.se/nyheter/vetenskap/190-tal-biverkningar-av-vaccinet-1.979474

Antalet nya fall av svininfluensa i landet slår rekord – ändå syns det inte i sjukskrivningstalen. Orsakerna kan vara att mest yngre drabbas – men också arbetslösheten.

- Det kan vara en förklaring, nu när arbetslösheten är lite högre än tidigare, säger Michael McKeogh, företagsläkare och centralt medicinskt ansvarig på hälsoföretaget Previa, till TT.

I torsdags kom siffror från Smittskyddsinstitutet (SMI) om att antalet nya fall av svininfluensan var rekordstort under den föregående veckan, vecka 44. Då anmäldes 647 fall av smitta A/H1N1.

Men siffror från Previa, som administrerar sjuk- och friskanmälningar för över 80.000 privat- och offentliganställda runt om i landet, visar att bara 36 personer anmälde influensaliknande symptom under den veckan. Detta motsvarade bara 1,4 procent av de nya sjukanmälningarna.

Inte heller var den totala andelen sjukskrivna under veckan, medräknat alla orsaker eller symptom, högt. Den låg på tre procent, att jämföra med 3,2 procent under veckan innan.

Det var den 7 september som Previa införde influensaliknande symptom som en särskild kategori vid sjukanmälan. Sedan dess har den andelen av alla sjukskrivningar varierat mellan 0,5 och 2,1 procent. Högst andel hittills uppvisade den första veckan.

Förklaringen kan alltså vara att absolut flest nya fall rör barn i ålder 0—14 år, som naturligtvis inte har något jobb att sjukskriva sig från. Men samtidigt mäter Previa också antalet som har frånvaro för vård av sjukt barn.

- Men någon särskilt ökad frånvaro syns inte heller där, säger McKeogh.

Återstår gör förklaringen arbetslöshet. Efter gruppen 0—14 år är gruppen 15—39-åringar värst drabbade. Där ingår alltså många ungdomar som i dag också slåss mot en mycket svår ungdomsarbetslöshet.

Om ett yngre par har ett influensasjukt barn, och där den ena föräldern är arbetslös, så är det naturligt att den utan jobb vårdar barnet — utan att det syns i sjukskrivnings- eller frånvarostatistiken.

- Det måste vara någonstans där som skillnaderna uppstår, säger McKeogh.

Samtidigt säger alltså SMI att toppen ännu inte på något sätt är nådd, vilket också kommer att synas hos Previa, enligt McKeogh.

- Först när smittspridningen tar fart ordentligt kommer det att märkas i sjukfrånvaron och i vård av sjukt barn.

Invisible flu according to statistics in Sweden

The Flu Case, 9 November 2009

https://web.archive.org/web/20100102044700/http://theflucase.com/index.php?option=com_content&view=article&id=1713%3Ainvisible-flu-according-to-statistics-in-sweden&catid=1%3Alatest-news&Itemid=64&lang=en

Media in sweden seem to be competing against each other in writing the most horrible stories about anyone suspected to have been infected with the so called "swine flu". Extreme exaggerations and flat out lies are now published every day. Over 80.000 were claimed to be infected one week when only a couple of hundred in reality had been confirmed.

Now Dagens Nyheter writes that Previa who manages the reports for sick and absent from work for over 80.000 employees have statistics to prove that very few indeed have reported sick from any type of flu. Out of the 80.000 only 36 reported sick from flu like symptoms. And of them, likely very few had the AH1N1 variety since the "normal" seasonal flu is now active.

"The number of "swine flu" cases in the country are record high - still it does not show in sick leave reporting." The cases of "swine flu" reported in media is high. The number of people sick in any type of flu was 1.4% among the relatively few reported sick during the period.

Troops in Afghanistan fight swine flu amid war

The Seattle Times // Associated Press, 9 November 2009 at 6:45 am
https://www.seattletimes.com/nation-world/troops-in-afghanistan-fight-swine-flu-amid-war/

Hundreds of Afghan and international troops already battling a rising militant insurgency are facing a new fight – recovering from swine flu, the virus that has left 11 people dead in the country.

The Ministry of Public Health said Monday that 710 of the 779 cases of H1N1 reported since early July have been among Afghan, U.S. and Italian troops. The 11 people who have died from the virus were all Afghans, including one soldier.

Public Health Minister Dr. Mohammad Amin Fatemi said the Afghan National Army reported 390 cases of H1N1 and 320 cases were identified among foreign troops. Most are U.S. forces stationed at Bagram Air Base and Italian soldiers at the military base in Herat in western Afghanistan.

Worried that the flu could spread unabated through a country in its ninth year of war, the government decided earlier this month to close schools and universities for three weeks. Government health officials advised anyone with a fever to stay home from work, and those with mild symptoms to wear a mask in public places. The flu scare has prompted some people to wear blue surgical masks on the streets of the capital.

The day the government announced the school closings, Fatemi said he urged President Hamid Karzai to refrain from shaking hands with his deputies. That warning prompted Karzai to cancel several meetings that day, said Fatemi, who used hand sanitizer after shaking hands with people at the news conference.

"I don't think the decision to close educational institutions was taken lightly," Peter Graaff, the World Health Organization's representative to Afghanistan said at the press briefing. "If you decide to invoke measures, such as closures of educational institutions before you have, let's say, up to 1 percent of your population affected, you can reduce the number of people who will get the disease by a third to a half."

Graaff said Afghan health officials aggressively appealed to the WHO to be one of the countries to benefit from a global vaccine donation program, which is being administered by the organization.

"I'm pleased to say that out of the first 11 million doses that the WHO will receive – and we haven't received them yet – 500,000 doses will come to Kabul," Graaff said.

The ministry said 453 cases of H1N1 have been reported in Kabul; 272 in Parwan province; 32 in Kandahar province; 15 in Herat province; and the rest in Balkh, Bamiyan and Nangarhar provinces.

Comment mesure-t-on l'épidémie de grippe A?

Liberation, 9 Novembre 2009, 19:10
https://web.archive.org/web/20091112173116/http://www.liberation.fr/societe/0101602082-comment-mesure-t-on-l-epidemie-de-grippe-a

Tous les médecins le disent: impossible de faire la différence entre une grippe A et une grippe classique sans faire des tests de dépistage à l'hôpital. Alors d'où viennent les chiffres brandis par le ministère ?

Et si vous aviez la grippe A sans le savoir ? Courbaturé et/ou fiévreux, vous filez chez le médecin pour un diagnostic. Sauf que vous n'en ressortez pas plus avancé... Et pour cause: impossible pour un généraliste de différencier une grippe A d'une grippe classique, les symptômes sont les mêmes. «On repère les symptômes grippaux, mais de là à dire si c'est une grippe A, B ou C, on ne peut pas savoir», assure une généraliste installée à Lille. Comment sont alors recensés les grippés? D'où sortent les chiffres brandis par le ministère?

Seule solution pour trancher, le test de dépistage. Au tout début, quand le virus ne touchait encore qu'un petit nombre de personnes facilement repérables (de retour de l'étranger), les cas suspects étaient systématiquement hospitalisés et testés. La méthode avait l'avantage de la précision mais est devenue inapplicable en période d'épidémie.

Des tests pas systématiques

L'Institut de veille sanitaire (INVS), qui publie chaque semaine un bulletin épidémiologique, a donc changé de procédé, passant du recensement exhaustif à une estimation statistique dite de «surveillance populationnelle». Désormais, les médecins de ville ont consigne de n'hospitaliser qu'en cas de complications. «Au début, on savait à quoi s'en tenir. Maintenant que les tests nous sont interdits parce qu'ils sont trop chers (entre 200 et 300 euros le test, ndlr), on est dans le doute. Tant qu'il n'y a pas de facteur de risque, on ne va pas plus loin. Dans la majorité des cas, on ne peut pas dire à 100% que c'est une grippe A», constate le docteur Jean-Pierre Le Roy, généraliste à La Rochelle.

Comment l'INVS établit-il ses statistiques? Première donnée: le nombre de «consultations pour grippe» enregistrées par des médecins témoins, dits «vigies» ou «Sentinelles», et par SOS médecins.

Le docteur Michel Béhar fait partie des 1.300 médecins volontaires du «réseau Sentinelles». Chaque soir, comme il le fait depuis des années pour la varicelle, les diarrhées aigues, ou les tentatives de suicide, il fournit via internet un certain nombre d'informations sur ses patients présentant des symptômes grippaux. «Il faut qu'ils aient 39 de fièvre, un syndrome respiratoire et des courbatures. Les critères sont stricts...» Quitte à ne pas comptabiliser des grippes moins sévères. «Bien sûr, on peut avoir la grippe A avec un petit 38, on sait d'ailleurs que 30% à 40% des porteurs du virus n'ont pas de symptômes, explique Thierry Blanchon, responsable adjoint du réseau Sentinelles. L'important n'est pas de compter tout le monde mais bien de suivre une tendance, pour savoir comment évolue l'épidémie en France semaine après semaine».

La plupart des grippes sont des grippes A

En parallèle, l'INVS établit une surveillance virologique à partir des quelque 2000 prélèvements réalisés chaque semaine, à des fins statistiques, par les 600 généralistes et pédiatres «vigies» du réseau des Grog (Groupe régionaux d'observation de la grippe). L'INVS en déduit le taux de circulation de la grippe A. «Si l'on prend la semaine du 26 au 31 octobre, en Ile-de-France, 60% des prélèvements étaient positifs à la grippe A. Autrement dit, en ce moment, un Francilien qui a l'air grippé a 60% de "malchance" de faire une grippe A», résume le docteur Jean-Marie Cohen, coordinateur du réseau des Grog. «On est bien là dans un raisonnement probabiliste».

Au final, rien ne permet donc de connaître le nombre exact de personnes touchées par la grippe A. Cela n'a pas d'incidence quant à la prise en charge médicale. Tous les médecins le répètent, «le traitement est le même quel que soit le type de grippe. On ne donne pas du Tamiflu comme ça». En revanche, les chiffres jouent un vrai rôle dans le message politique, a fortiori lorsqu'il s'agit d'encourager une vaccination boudée par les Français.

Angst und Chaos: Verwirrung um die Schweinegrippe

_frontal 21, 9 November 2009.
http://frontal21.zdf.de/ZDFde/inhalt/3/0,1872,7927299,00.html (deleted)

Viele Patienten von Chefarzt Professor Wolf-Dieter Ludwig sind schwer krank. Die Krebspatienten kämpfen mit ihren Chemotherapien. Jetzt sind sie zusätzlich wegen der Schweinegrippe besorgt. Denn Ludwigs Patienten gehören zu der von Schweinegrippe besonders gefährdeten Risikogruppe der chronisch Kranken. Dennoch glaubt Ludwig nicht, "dass wir uns derzeit ernstlich sorgen machen sollten". Er findet es empörend, "dass fast jeden Tag eine Titelseite mit einem Todesfall dekoriert wird". Der Vorsitzende der Arzneimittelkommission der deutschen Ärzteschaft kritisiert, "dass die Öffentlichkeit nicht über alle Fakten informiert wurde".

Gerade die Nebenwirkungen sind ein Problem. Sie seien nicht genau erforscht, die bereits Geimpften würden so "Teilnehmer einer klinischen Studie", kritisiert Ludwig. Seiner Ansicht nach sei der in Deutschland eingesetzte Impfstoff nicht ausreichend getestet worden. Ludwig hält es darum gerade für besonders wichtig, alle Nebenwirkungen unbedingt zu melden.

Frontal21-Interview mit Chefarzt Professor Wolf-Dieter Ludwig, der die Meldung von Nebenwirkungen fordert.

Was die Nebenwirkungen bedeuten, spürt die Schwedin Lotta Lindström gerade am eigenen Leib. Die Krankenschwester wurde berufsbedingt vor drei Wochen gegen die Schweinegrippe geimpft. Einen Tag später litt sie unter starkem Fieber und hatte auch andere Grippe-Symptome. Seit der Impfung ist sie müde. Ihr Arm schmerzt. Vielen geimpften Kollegen erging es wie ihr. Lindström weiß heute nicht, ob sie sich einer zweiten Impfung unterziehen würde.

German mainstream TV showed programme about swine flu jab dangers - predicts damage

The Flu Case, 17 November 2009, 11:07
https://web.archive.org/web/20100102051023/http://theflucase.com/index.php?option=com_content&view=article&id=1837%3Agerman-mainstream-tv-showed-programme-about-swine-flu-jab-dangers-predicts-damage&catid=1%3Alatest-news&Itemid=64&lang=en

Germany's mainstream TV station, ZDF Frontal 21, showed a documentary film strongly criticising the swine flu pandemic scam and the untested swine flu jab on November 9th.

In spite of these warnings, and the reports of people dying after taking the Pandemrix jab, the German government has announced no plans to abandon the mass swine flu vaccination programme.

THE FLU CASE

WHO publishes plans to take over the whole of society in pandemic emergency

The Flu Case, 9 November 2009, 06:44

https://web.archive.org/web/20100102043344/http://theflucase.com/index.php?option=com_content&view=article&id=1704%3Awho-publishes-plans-to-take-over-the-whole-of-society-in-pandemic-emergency&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO has just released its "Whole of Society Pandemic readiness guidelines" first prepared in April 2009, the same month the swine flu virus mysteriously appeared in Mexico City, and revised in July 2009.

The plan outlines how WHO will take over a country's essential services, including water and sanitation; fuel and energy; food; health care; telecommunications; finance; law and order; education; and transportation under the pretext of a pandemic emergency.

WHO claims even a moderate flu "pandemic" will "test the limits of resilience of nations, companies, and communities, depending on their capacity to respond" and require WHO to assume charge of government functions.

"National inter-ministerial pandemic preparedness committees should map out the central government's roles, responsibilities, and chain of command and designate lead agencies," says WHO, omitting to mention these committees answer to the UN health body.

WHO says the Ministries of Defence should consider what military assets should be brought to bear in the event of a pandemic and how to mobilize them, preparing for the use of the army to force quarantine and vaccinate people – perhaps after WHO has once more given a live bird flu virus to pharma companies to contaminate vaccine material as happened in Austria in February when Baxter nearly triggered a global pandemic.

Baxter executives sit on WHO's key vaccine advisory board which recommended the toxic and untested swine flu jab for the world in the response to a flu milder than the seasonal one..

"Public health measures, such as quarantines and school and business closures might place serious burdens on society and individual liberties, especially if they are implemented on a wide scale. Governments should carefully weigh the risks and benefits of far-reaching restrictions on movement and implement these measures in a way that respects individual rights," says WHO.

However, WHO also says: "Ministries of Justice should consider what legal processes could be suspended during the pandemic and make alternative plans to operate courts during pandemic."

In France, leaked documents show that the Minister of Justice has ordered the suspension of the most basic rights, and people can be incarcerated for up to six months without having to appear before a judge in a pandemic emergency.

In addition, drills and exercises of the kind conducted by WHO in the Ukraine a month before the pneumonic plague appeared there are envisaged.

"6.5 Table-top and simulation exercises and drills at all levels are the best way to test, validate, and improve pandemic preparedness plans. Tools developed by WHO or international organizations and adapted to local circumstances may be useful for a quick review to identify gaps during the pandemic response mode."

Link to WHO and the document there:

H1N1: Behandlungsstrategie geändert

Nachrichten, 10 November 2009
https://web.archive.org/web/20091115010921/http://www.nachrichten.at/nachrichten/chronik/art58,291598

WIEN. *Das Gesundheitsministerium ändert, bedingt durch die rasche Zunahme an Erkrankungen, die Behandlungsstrategie bezüglich der Neuen Grippe (H1N1): Mit dem Ausrufen der Grippewelle wurde im Rahmen der höchsten Pandemie-Alarmstufe 6 von Mitigation Stufe 1 auf Stufe 2 umgestellt.*

Im wesentlichen bringt dies kleine Änderungen bei Tests, Meldepflicht und Behandlung mit sich. "Wir haben uns auf diese prognostizierte Welle an Influenza-Erkrankungen bestmöglich vorbereitet", betonte Gesundheitsminister Alois Stöger (S) am Dienstag in einer Aussendung.

Keine Tests aller Verdachtsfälle

Die neuen Regelungen gelten ab morgen, Mittwoch. Wichtigste Änderung: Künftig werden nicht mehr alle Verdachtsfälle getestet. Um die Ausbreitung der Influenza weiter beobachten zu können, wird künftig das sogenannte "Sentinella-System" eingesetzt. Dieses wird auch bei der saisonalen Grippe angewandt.

Ausgewählte Arztpraxen melden dabei Grippeerkrankungen an die Referenzzentrale. Auf Basis dieser Daten und der Krankenstandstage der Sozialversicherungsträger wird eine Hochrechnung über die Zahl der Erkrankungsfälle erstellt. Langjährige Erfahrungen zeigten, dass sowohl das sporadische Auftreten von Influenzaviren als auch der Beginn und das Ende von Grippewellen mit dieser Methode sehr gut erfasst werden könne, so das Ministerium.

Landessanitätsdirektionen, Krankenanstalten, Sozialversicherungsträger und niedergelassenen Ärzte werden in einem Schreiben über die neuen Maßnahmen informiert. Darin in Detail vermerkt: Rachenabstriche (spezifische PCR-Diagnostik) werden nur mehr im Rahmen des Sentinella-Systems sowie bei bestimmten Ausnahmen erfolgen. Letzteres ist der Fall, wenn ein Patient im Krankenhaus behandelt wird oder die Situation an einer Schule, einem Kindergarten oder anderen Gemeinschaftseinrichtungen abgeklärt werden muss. Dieses Vorgehen entspricht jenem bei der saisonalen Influenza.

Meldepflicht ändert sich

Verdachtsfälle werden künftig als Erkrankungsfälle gewertet. Weiters sind ab Mittwoch nur mehr laborbestätigte Erkrankungsfälle in Spitälern und Todesfälle meldepflichtig. Die Primärversorgung erfolgt nun im Regelfall durch niedergelassene Ärzte, wobei die Therapie mit Neuraminidasehemmern (Tamiflu Anm.) als Möglichkeit bleibt.

Leicht abgeändert wurde außerdem die Falldefinition "Neue Grippe", bei der die Komponente Auslandsaufenthalt wegfällt. Wegen der weltweiten Ausbreitung von Influenza A(H1N1) sei es nicht mehr zielführend, den Aufenthalt in bestimmten Ländern als epidemiologisches Kriterium zu verwenden, hieß es in der Aussendung.

THE FLU CASE

Austrian government drops requirement for accurate figures about swine flu

The Flu Case, 10 November 2009, 18:50
https://web.archive.org/web/20100102052427/http://theflucase.com/index.php?option=com_content&view=article&id=1723%3Aaustrian-government-drops-requirement-for-accurate-figures-about-swine-flu-&catid=1%3Alatest-news&Itemid=64&lang=en

The Austrian Health Ministry has said that there has been a rapid increase in illnesses caused by the swine flu and that doctors are no longer required to confirm the swine flu by lab tests or to report swine flu cases.

The relaxation of testing and counting requirements comes as officials have moved the pandemic emergency up a notch, switching from mitagation strategy 1 to 2 within the highest pandemic level framework of level 6.

The change in reporting and testing requirements will mean that the Austrian government is no longer required to produce accurate or specific figures for how many people are being infected by the swine flu or any other pandemic flu.

The absence of accurate figures will give the government more room to skew the figures for political purposes.

Both WHO and the Ukrainian government have been accused of manipulating statistics and exagerrating the number of swine flu cases to justify declaring pandemic emergencies that allow them to implement martial law and acquire power over key government functions.

The Austrian government's decision to change the criteria for tracking a pandemic virus comes as mass vaccination campaign has started and the mainstream media hype about the dangers of the swine flu has intensified.

Eyewitness reports from vaccine centers in Austria say the turn out for the vaccine jab was minimal but the state run TV station, ORF, is maintainingg there have been queues for the untested swine flu jab at some centers.

INTERPOL

International Bioterrorism Tabletop Exercise

Interpol, 10 November 2009
https://web.archive.org/web/20091110084341/http://www.interpol.int/Public/BioTerrorism/tabletop/default.asp

In September 2009, senior law enforcement officials, health care professionals and experts from international organizations joined their forces to confront a chilling crisis – the plague had just been unleashed on their countries by unknown evildoers.

A fictional scenario with a serious aim
Fortunately, this terrifying situation was a scenario under control, and the civilian authorities were all participants in a Tabletop Exercise on Preventing Bioterrorism hosted by INTERPOL. This exercise simulated a global bioterrorism attack and its aftermath. Participants in the Black Death scenario were faced with a fictional, intentional plague attack involving countries from their region, with the exercise designed to assist them in identifying critical co-operation and co-ordination issues which could hinder a quick and successful response to such an attack in real life.

The idea behind this exercise, the third in a series organized by INTERPOL, has been described by the Organization's Secretary General, Ronald K. Noble, as “helping focus our joint understanding of the role and responsibility of each of us – police, health care professionals, experts – in response to a bioterrorism incident, as well as identifying possible gaps or redundancies so that we can draw lessons from them."

Inter-agency co-operation in Central and Eastern Europe
Organized by the INTERPOL Bioterrorism Unit, this third edition of the event took place from 29-30 September in Warsaw, Poland. Participants in the workshop numbered 27 from six Central and Eastern European countries (Belarus, Czech Republic, Finland, Poland, Slovakia, Ukraine), as well as 15 participants from international organizations such as Europol, the UN Office for Disarmament Affairs (UNODA), the World Health Organization (WHO), the European Centre for Disease Control, the European Commission (Directorate General for Health and Consumer Affairs and Directorate General for Justice, Freedom and Security), the Organization for Security and Co-operation in Europe and the Commonwealth of Independent States (CIS).

A wide range of INTERPOL initiatives
The tabletop exercise is the latest in a series of initiatives launched by INTERPOL since the creation of its Bioterrorism Prevention programme. INTERPOL has worked ceaselessly since 2005 to heighten its member countries’ awareness of the dangers of bioterrorism and to enhance their preparedness for a bioterrorist attack. The Bioterrorism Prevention Programme has co-ordinated a series of events, starting with the Global Conference on Preventing Bioterrorism in March 2005; regional workshops in Africa, South America, Europe and Asia; train-the-trainer sessions all over the world; and practical tabletop exercises such as the one outlined above.

Свиной грипп в России: вакцинация на фоне дефицита

DW, 10 ноября 2009
https://p.dw.com/p/KS9w

Вакцинация от гриппа A/H1N1 в России началась, однако прививки будут делать избирательно. Между тем российские аптеки испытывают перебои с поставками противовирусных препаратов и средств профилактики.

Российская вакцина от вируса A/H1N1 должна была появиться в декабре. Тогда же планировали начать вакцинацию населения. Однако первые случаи смерти от нового гриппа заставили медиков поторопиться, и начало вакцинации перенесли на 9 ноября. Первыми вакцину получили Алтайский край, Тюменская, Брянская, Воронежская и Московская области. На первом этапе прививки будут делать работникам служб жизнеобеспечения, то есть коммунальщикам и сотрудникам МЧС. С конца ноября к ним добавятся медработники, учителя и студенты старших курсов медицинских вузов.

За бортом вакцинации

Рядовые граждане претендовать на получение особой защиты от свиного гриппа пока не могут. В поликлиники по месту жительства и в коммерческие структуры вакцина еще не поступала. Там советуют либо подождать, либо сделать прививку от сезонного гриппа, имеющего компонент H1N1. Это не тот штамм, который называют "свиным", но очень похож на него.

Как утверждают ученые, прививка может защитить если не от свиного гриппа, то от тяжелых осложнений. В Минздравсоцразвития, однако, настаивают на том, что вакцина от сезонного гриппа не защищает от штамма A/H1N1, поэтому тем, кто уже сделал прививки, рекомендовано повторить процедуру.

Пока надежной специфической защиты от гриппа нет, врачи советуют заниматься профилактикой. Но, как только эпидемия гриппа начала набирать силу, из аптек стали исчезать медикаменты и марлевые маски. Дефицит антивирусных препаратов нельзя назвать тотальным, хотя препарат "Арбидол" есть не в каждой московской аптеке. С большей вероятностью найти необходимое лекарство можно в крупных сетевых аптеках.

В областных населенных пунктах дела обстоят гораздо хуже. Так, в Наро-Фоминске ни в одной из четырех аптек ни "Арбидола", ни "Интерферона" найти не удалось. Кроме того, цена на отечественный препарат выросла за последний месяц примерно на 30 процентов. Президент России Дмитрий Медведев заявил 6 ноября на встрече с министром здравоохранения и социального развития Татьяной Голиковой, что за спекуляции на рынке лекарств может последовать уголовная ответственность.

"Наживаться на эпидемии – преступление. Я сейчас дам поручения Федеральной антимнопольной службе и Генпрокуратуре следить за этими процессами. В случае выявления злонамеренного характера действий - возбуждать уголовные дела. Необходимая правовая база для этого есть", - подчеркнул Медведев.

Спекулянты греют руки на масках

Марлевая повязка - самое простое и дешевое средство защиты от вирусной инфекции - и вовсе стала дефицитным товаром. В первую неделю ноября в Москве продали 350 тысяч масок, и их запасы на складах полностью иссякли. В более запасливых аптеках ввели норму продажи - не более трех масок в руки. В столичном департаменте здравоохранения, правда, заявили, что никакого дефицита нет и что резерв в 500 тысяч защитных масок позволит обеспечить всех желающих.

Между тем начальник эпидемиологического отдела Роспотребнадзора Ирина Лыткина советует гражданам шить маски самостоятельно. По ее словам, обычные четырехслойные маски, которые отлично защищают от респираторных инфекций, "можно стирать, кипятить", то есть использовать их многократно.

Сегодня люди с закрытым лицом на улицах Москвы - не редкость. И это, пожалуй, первая зима, когда горожане так демонстративно заботятся о своем здоровье. Татьяна Голикова не знает, радоваться или нет ажиотажному спросу на защитные маски. "Хорошо, что наши люди стали заботиться о здоровье и покупать препараты не только для лечения, но и для профилактики. Но ситуация с масками для нас представляется напряженной. Присутствует факт, к сожалению, спекулятивной скупки", - признала министр.

Народные средства не гарантируют эффекта

Однако не все знают, что носить маску можно не более двух часов, поскольку ее поверхность нагревается и становится влажной, а теплая влажная среда способствует размножению бактерий. Многие россияне предпочитают проверенные народные средства: чеснок, лук, мед с молоком и водка с перцем. Этот метод самозащиты сейчас, пожалуй, самый распространенный. Но у него есть и побочный эффект. По словам врачей, во всех случаях летального исхода, вызванного свиным гриппом, больные слишком поздно обратились за медицинской помощью и лечились самостоятельно.

Вот только ответа на вопрос, как поступать людям, когда лекарств и марлевых повязок не хватает, а народные средства эффекта не приносят, в Минздравсоцразвития пока не дают.

Г. Онищенко: Свиного гриппа не существует

РБК, 11 ноября 2009, 02:17
https://www.rbc.ru/society/11/11/2009/5703d77b9a7947733180c6b0

Эпидемию гриппа, в том числе гриппа А (H1N1) можно преодолеть за неделю, считает главный санитарный врач России Геннадий Онищенко. Главное, чтобы все граждане соблюдали меры предосторожности и рекомендации врачей.

Г.Онищенко, кроме того, высказался категорически против каких-либо определений пандемии гриппа. По его словам, ни свиных, ни собачьих, ни птичьих гриппов не существует. Г.Онищенко напомнил, что каждые несколько десятков лет появляется новый вирус, и нынешний вирус гриппа не последний, передает "Голос России".

Между тем накануне министр здравоохранения и социального развития Татьяна Голикова сообщила, что сейчас в РФ вирусом гриппа А (H1N1) болеют 1 тыс. 424 человека. Лабораторно подтверждено 4 тыс. 563 случая заражения этим вирусом по стране. Т. Голикова подтвердила, что умерли от гриппа А 19 человек.

Однако впоследствии стало известно, что за прошедшие выходные дни, 7-8 ноября, в Челябинской области от "свиного гриппа" скончались двое человек, и, таким образом, общее число погибших увеличилось до 21 человека.

Напомним, что в настоящий момент эпидемический порог заболеваемости гриппом превышен в 17 субъектах и 23 городах России.

Г. Онищенко: Этот грипп – не «свиной»! И победить его можно за неделю

КП, 11 ноября 2009, 15:35
https://www.kp.ru/daily/24392/570254/

Главный санитарный врач страны подтвердил заявления ВОЗ – пандемичный вирус не мутировал и не стал опаснее.

Во вторник Геннадий Онищенко выступал на Парламентских слушаниях.

- Если мы с вами будем соблюдать все меры предосторожности, граждане станут выполнять все наши рекомендации, с гриппом можно справиться за неделю, - сказал глава Роспотребнадзора.

И предложил особо не надеяться, что все за россиян сделает держава – самим тоже придется постараться. Носить маски, стараться оградить от заболевания детей. Этот вирус, по словам Онищенко, не первый и не последний, будут еще подобные.

- Нынешний вирус несколько засиделся, - сказал он, намекая, что последняя эпидемия гриппа была больше 40 лет назад. И поэтому эпидемиологи и вирусологи каждый год ждали появления новой «напасти». В 2009 – дождались. ...

И под конец главный санитарный врач попросил не называть новый вирус "свиным". Нет ни собачьих, ни кошачьих, ни свиных гриппов. Он - пандемичный!

Русская линия

Игумен Анатолий (Берестов):
Я подозреваю, что проблема «свиного гриппа» раздута

Русская Линия, 11 ноября 2009
http://rusk.ru/newsdata.php?idar=185825

Известный медик объяснил, кому выгодно сеять панику вокруг пресловутого вируса…

«Я не являюсь специалистом в области инфекционных болезней, но к мнению уважаемого академика Власова я, конечно, прислушаюсь. У меня у самого было интуитивное мнение, что проблема так называемого "свиного гриппа" раздута. Я полностью согласен с мнением академика, что разжигание истерии вокруг этого гриппа выгодно фармацевтической отрасли для увеличения прибыли», – заявил в интервью «Русской линии» руководитель Душепопечительского православного центра святого праведного Иоанна Кронштадтского, член Общественного совета Федеральной службы Российской Федерации по контролю за оборотом наркотиков доктор медицинских наук игумен Анатолий (Берестов).

«Подобная заинтересованность в сбыте своей продукции, фармацевтических препаратов и лекарств, хорошо просматривается на примере "аптечной наркомании". Не секрет, что в аптеках свободно без рецепта врача продаются лекарства, содержащие малое количество наркотиков. На эти лекарства "подсаживаются" наркоманы, которые в итоге погибают. Смертность от так называемой "аптечной наркомании" высокая, правда, не уточненная. Так что я допускаю возможность того, что в сеянии паники заинтересованы компании, которые хотят нажиться на "свином гриппе" », – добавил отец Анатолий.

В свою очередь, известный врач-педиатр, автор книг о детском и родительском здоровье Евгений Комаровский в интервью изданию «ForUm» заявил, комментируя истеричные сообщения СМИ об эпидемии «свиного гриппа», что 90% украинцев действительно перенесет это заболевание. «Я могу сказать с огромной долей вероятности, что 90% украинцев перенесет свиной грипп. Но только из этих 90% восемьдесят восемь процентов ничего не заметят – шмыгнут вечером носом, а к утру выздоровеют», – сказал врач. Комаровский отметил, что «свиной грипп» – это заболевание, которое может стать причиной смерти одного человека на миллион: «В остальных случаях у подавляющего большинства людей это заболевание протекает чрезвычайно легко».

«Пришел вирус, к которому ни у кого нет иммунитета, поэтому вся земля им переболеет. Но кто-то умрет, а кто-то даже не заметит, что болел. И что обидно в этом заявлении: люди произносят слова, но не объясняют их. А потом вся нация стоит на ушах. Так что в идеале хотелось бы, чтобы подобные заявления не звучали», – подытожил он.

Как сообщает издание, директор департамента здравоохранения и медико-биологической защиты МинЧС Украины Алексей Громазин заявил, что каждый второй украинец перенесет заболевание вирусом гриппа A/H1N1. «Специалисты прогнозируют несколько волн повышения заболеваемости гриппом и ОРВИ, а также A/H1N1, так как среди населения нет прослойки с иммунитетом к этому гриппу. Поэтому прогнозируется, что процентов 60, а может быть чуть больше или меньше населения страны переболеют этим гриппом», – сказал Громазин.

Русская линия

MED НОВОСТИ

Михаил Алексеев

Только без паники

MED Новости, 11 ноября 2009, 21:18
https://web.archive.org/web/20091116002821/http://medportal.ru/mednovosti/main/2009/11/11/nopanic/

Вирус A/H1N1, ставший на прошлой неделе доминирующим штаммом гриппа в России и мире, неуклонно распространяется по территории нашей страны. Согласно официальной статистике, сейчас эта инфекция лабораторно подтверждена у 4,5 тысячи россиян. Быстрый рост числа заболевших заставил Россию приступить к вакцинации против нового гриппа на несколько недель раньше запланированного срока. Минздрав и другие ведомства делают все возможное, чтобы убедить сограждан в том, что ситуация с гриппом находится под контролем и причин для паники нет.

Все в норме

По словам министра здравоохранения и социального развития Татьяны Голиковой, уровень заболеваемости всеми разновидностями гриппа и ОРВИ в Российской Федерации находится на уровне прошлых лет, а летальных исходов в первые девять месяцев 2009 года зафиксировано даже *меньше, чем в прошлом году*. Впрочем, доступная в настоящее время статистика ограничивается данными, собранными по сентябрь включительно, тогда как резкий скачок заболеваемости гриппом пришелся на октябрь и начало ноября.

В свою очередь, главный санитарный врач РФ Геннадий Онищенко поспешил заверить сограждан в том, что "эпидемию гриппа можно преодолеть за неделю", правда, при условии, что каждый россиянин будет соблюдать меры предосторожности, рекомендации врачей и носить защитные маски. При таком единодушии, конечно, справиться можно вообще с чем угодно.

В настоящее время на территории РФ выявлено 4563 случая гриппа H1N1, подтвержденных лабораторно. Дает ли эта цифра представление о реальном распространении инфекции, сказать сложно, поскольку лабораторные методы диагностики применяются только при нетипичных и тяжелых случаях течения инфекции. Однако для подавляющего большинства больных совершенно неважно, каким именно вирусом они заразились, поскольку, за редкими исключениями, грипп H1N1 не отличается по тяжести и симптомам от "обычных" гриппа и ОРВИ.

Согласно официальным данным, в России от нового гриппа умерли 19 человек. Впрочем, судя по сообщениям СМИ, умерших может быть существенно больше. Например, по информации анонимных источников "Интерфакса" в медицинских кругах, в Москве насчитывается уже семь скончавшихся от гриппа H1N1, тогда как официальные сообщения упоминают только об одном умершем.

По данным Минздравсоцразвития, эпидемический порог по гриппу и ОРВИ превышен всего в 17 субъектах федерации и в 23 городах. При этом кое-где, например в Москве, заболеваемость даже начала снижаться. По мнению Геннадия Онищенко, это свидетельствует об эффективности проводящихся в регионе противоэпидемических мероприятий – продления школьных каникул, карантинов в детских садах и вузах и т.д.

Вакцинация

Вакцинация против гриппа H1N1 в России началась 9 ноября, приблизительно на две недели раньше первоначально намеченного срока. Первыми прививки живой вакциной получили работники жилищно-коммунальных служб пяти регионов. В Московской, Брянской и Тюменской областях было привито по сто человек, в Воронеже – пятьсот человек, в Алтайском крае – сразу 14 тысяч. В начале следующей недели вакцинация работников системы ЖКХ, связи и водоснабжения начнется в Калужской, Тамбовской, Курской, Орловской, Ростовской, Астраханской областях, в Адыгее и Карачаево-Черкессии.

Следующими прививки живой вакциной получат сотрудники силовых структур: Минобороны, МВД, МЧС и пограничной службы. В общей сложности в России планируется обеспечить прививками около 40 миллионов граждан, так что пока число привитых очень невелико.

...

Лекарства

Наименований лекарств, предназначенных для лечения гриппа, в России сейчас намного больше, чем в какой-либо другой стране мира. Помимо "Тамифлю" и "Релензы", рекомендуемых Всемирной организацией здравоохранения, Минздрав РФ предлагает лечить "свиной грипп" лекарствами отечественного производства: "Арбидолом", "Ингавирином", "Кагоцелом" и другими. Нигде за пределами бывшего СССР эти препараты не применяются. Впрочем, некоторое время назад эксперты ВОЗ согласились рассмотреть предоставленные Россией данные об эффективности продукции отечественной фармпромышленности. О результатах этого рассмотрения пока ничего не известно.

Помощь ближним

Несмотря на то, что острый дефицит противовирусных средств ощущается в нескольких регионах России, правительство РФ выразило готовность уже на этой неделе поделиться российским "Арбидолом" с братской Украиной. Уже на этой неделе туда будет безвозмездно направлено 200 тысяч упаковок российского лекарства.

Ситуация с гриппом на Украине действительно тяжелая: с конца октября там зарегистрировано более 1,2 миллиона случаев ОРВИ и гриппа, более 90 тысяч людей госпитализированы, сотни скончались. Так что сейчас украинские власти принимают любую помощь не только от США, Евросоюза и ВОЗ, но и вообще откуда угодно.

По словам Татьяны Голиковой, в будущем Россия, возможно, сможет поделиться с Украиной и своими вакцинами против гриппа H1N1. Один из отечественных препаратов уже проходит регистрацию в украинском Центре иммунобиологических препаратов. Впрочем, учитывая темпы вакцинации в России, к моменту, когда в нашей стране появятся излишки вакцин, украинская эпидемия может уже закончиться.

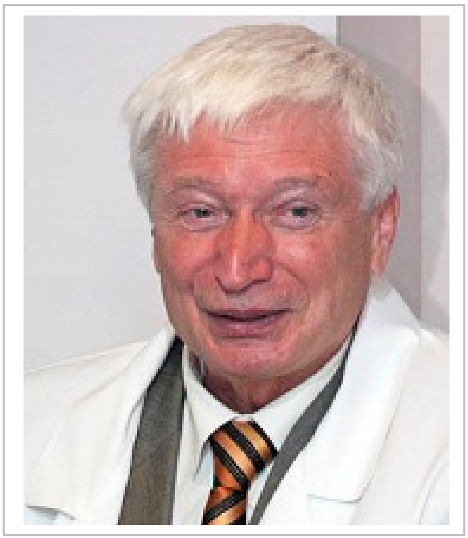
«Обыкновенный бизнес на обыкновенном гриппе»

Русская Линия, 11 ноября 2009
http://rusk.ru/newsdata.php?idar=731914

Академик Валентин Власов считает, что эпидемии «свиного гриппа» не существует…



Академик Валентин Власов: «То, что мы наблюдаем сегодня – это использование средств массовой информации в коммерческих целях. Результат этой деятельности – не якобы спасенные жизни, а опустошенные полки аптек», – рассказал директор Института химической биологии и фундаментальной медицины СО РАН академик Валентин Власов в интервью ИА Regnum.

«Несколько месяцев подряд нас пугают начавшейся эпидемией ужасного нового гриппа А (H1N1) с якобы очень тяжелым течением заболевания и высокой смертностью. Когда неподготовленный человек смотрит телевизор и видит лица в масках, госпитали и тому подобное, у него может сложиться впечатление о невероятной опасности.

На Украине началась уже настоящая массовая истерия. Но данные эпидемиологов показывают, что никакой "смертоносной пандемии" нет. Сравнительно с прошлыми годами сколько-нибудь значительного всплеска смертности не наблюдается», – отмечает Власов.

Среди умерших, о которых сообщают СМИ, большинство скончалось не от «свиного гриппа» как такового, а от пневмонии, бронхита и других заболеваний. Это обычная картина для обычной сезонной эпидемии гриппа, считает академик. Любой грипп (точнее – любой болезнетворный вирус) – это серьезное заболевание, оно ослабляет организм и вызывает осложнения, особенно опасные для маленьких детей, беременных женщин, пожилых людей. Зимние волны такой заболеваемости случаются фактически ежегодно, соответственно, для паники и экстраординарных мер нет никаких оснований, передает агентство слова академика.

«Вспомним, как несколько лет назад бушевала схожая паника по поводу так называемого "птичьего гриппа", как в Новосибирской области запрещали охоту, устраивали отстрелы дикой птицы и тому подобное. На что были затрачены немалые суммы. Есть обоснованное мнение, что нынешняя истерия уходит корнями туда. Во время операции птичий грипп на Западе были созданы огромные запасы фармацевтических средств. Тогда же на рынок выводились новые препараты – в частности, широко разрекламированный "Тамифлю", производимый фирмой "Гилеад", совладельцем которой является бывший министр обороны США. Возникла необходимость решить проблему сбыта, тем более в условиях кризиса. Лучшее средство активизации спроса лекарств — это распространение информации об угрозе здоровью и самой жизни, что мы и наблюдаем сегодня. Так что крики об особо ужасном вирусе – это не более, чем обыкновенный бизнес на обыкновенном гриппе. На таблетках, на вакцинах, на масках, а заодно и на лекарствах, не имеющих к гриппу никакого отношения», – считает Валентин Власов.

«Реклама сулит излечение от гриппа с помощью разнообразных таблеток. Должен огорчить – эффективность всех без исключения рекламируемых препаратов от гриппа, в том числе "Тамифлю", не имеет серьезных научных доказательств. Зато известно, что многие из них способны давать неприятные побочные эффекты, – говорит ученый. – Сегодняшние рекомендации по профилактике заболевания ничем не отличаются от правил поведения в условиях обычной сезонной волны гриппа. В основном это социальные меры.

У нас в Сибирском отделении готовится распоряжение директорам институтов: сотрудников с признаками заболевания немедленно удалять с работы. Вообще, следует избегать мест, где много людей скапливается в ограниченном пространстве: метро в час пик, больших собраний, а также, без необходимости – поликлиник и аптек. Необходимо соблюдать правила личной гигиены: пользоваться носовыми платками, несколько раз в день мыть руки с мылом (значение этой важной профилактической процедуры незаслуженно игнорируется), можно также смазать ноздри мыльным раствором или оксолиновой мазью», – заключил директор Института химической биологии и фундаментальной медицины.

Kate Kelland

Swine flu skepticism demands deft response

Reuters, 12 November 2009, 8:20 PM
https://www.reuters.com/article/GCA-SwineFlu/idUSTRE5A52FU20091112

London (Reuters) – European scientists and health authorities are facing angry questions about why H1N1 flu has not caused death and destruction on the scale first feared, and they need to respond deftly to ensure public support.

Accusations are flying in British and French media that the pandemic has been "hyped" by medical researchers to further their own cause, boost research grants and line the pockets of drug companies.

Britain's Independent newspaper this week asked "Pandemic? What Pandemic?"

In their response, scientists are walking a fine line.

They say that although the virus is mild, it can still kill, and that the relatively low fatalities in Europe are in part the result of official response to their advice.

On suggestions of "hyping" the threat to boost research funding, they point out that while we know enough to start to protect the vulnerable, we need to know a lot more to conquer the virus, and funding for new research and drugs is vital to be equipped for future pandemics.

H1N1 is hitting a younger population – adults in their 20s and 30s and children – and the global death count so far is more than 6,000, according to the WHO.

While seasonal flu attacks about 20 percent of the population in an average year, experts estimate that even in Britain – the worst-hit country in Europe so far – fewer than 10 percent of people have had H1N1 swine flu.

Fred Hayden, influenza research co-ordinator at the Wellcome Trust and a former World Health Organization (WHO) expert, said early planning is paying off, but added:

"I wouldn't characterize this as a "mild" pandemic at all. We are seeing some very unfortunate loss of life. I think it a bit early to make that judgment."

Yet the word "mild" is used so often to describe H1N1's impact in most people that it is prompting skeptical publics to ask what all the fuss is about. Why they should care? And why take a vaccine?

France's Le Parisien newspaper ran the headline: "Swine flu: why the French distrust the vaccine" and noted a gap between the predicted impact of H1N1 and the less dramatic reality.

"Although some 30-odd people have died....the disease is not really frightening," it said. "Dangerous liaisons between certain experts, the labs and the government, the obscurity of the contracts between the state and the pharma firms have added to the doubt."

Scenario Revised Down

In Britain, health authorities' original worst-case scenario – which said as many as 65,000 could die from H1N1 – has twice been revised down and the prediction is now for around 1,000 deaths, way below the average annual toll of 4,000 to 8,000 deaths from seasonal winter flu.

A group of eminent scientists who called a media briefing in London this week to announce 7.5 million pounds ($12.4 million) of new funding for British research into H1N1 found their plans hijacked by reporters asking why the pandemic was so weak.

Scientists say the truth is they can't win.

The WHO has been urging countries to prepare for a flu pandemic since 1997, when H5N1 avian flu infected 18 people in Hong Kong and was stopped only after a mass slaughter of birds. The re-emergence of H5N1 in China and South Korea in 2003 fueled the urgency to get ready.

Now that it has arrived, the apparently low impact of the H1N1 pandemic so far may show that the planning is paying off, the Wellcome Trust's Hayden said.

British officials repeatedly said the nation was well-prepared for a flu pandemic. It had high stocks of antivirals and orders for enough vaccines to cover its population in place very early.

Hayden said comparisons with earlier flu pandemics like the one in 1918, which killed an estimated 230,000 people in Britain and up to 50 million worldwide, were skewed by the fact that there were so few effective treatments at that time.

"We didn't have antivirals then, and we didn't have antibiotics for the high frequency of bacterial complications," he said. "We have these kinds of interventions now and they are making a difference."

At the funding briefing, Peter Openshaw, director of the center for respiratory infection at Imperial College London, dismissed suggestions that scientists were enjoying the fruits of a pandemic in the form of big grants to keep them in work.

"This is not something that we are licking our lips and welcoming," he said. "But there is certainly an enormous outbreak of scientific information that has greatly enriched our understanding of flu."

CDC Estimates of 2009 H1N1 Influenza Cases, Hospitalizations and Deaths in the United States, April – October 17, 2009

CDC, 12 November 2009, 1:00 PM ET
https://web.archive.org/web/20091115092422/https://www.cdc.gov/h1n1flu/estimates_2009_h1n1.htm

Background
Estimating the number of individual flu cases in the United States is very challenging because many people with flu don't seek medical care and only a small number of those that do seek care are tested. More people who are hospitalized or die of flu-related causes are tested and reported, but under-reporting of hospitalizations and deaths occurs as well. For this reason CDC monitors influenza activity levels and trends and virus characteristics through a nationwide surveillance system and uses statistical modeling to estimate the burden of flu illness (including hospitalizations and deaths) in the United States.

When the 2009 H1N1 flu outbreak began in April 2009, CDC began reporting the number of laboratory-confirmed cases, hospitalizations and deaths associated with 2009 H1N1 flu in the United States that were reported by states to CDC. These initial case counts, and subsequent ongoing laboratory-confirmed reports of hospitalizations and deaths, are thought to represent a significant undercount of the actual number of 2009 H1N1 flu cases in the United States.

A paper in Emerging Infectious Diseases authored by CDC staff entitled "Estimates of the Prevalence of Pandemic (H1N1) 2009, United States, April–July 2009" reported on a study to estimate the prevalence of 2009 H1N1 based on the number of laboratory-confirmed cases reported to CDC. [Reed C, Angulo FJ, Swerdlow DL, Lipsitch M, Meltzer MI, Jernigan D, et al. Estimates of the prevalence of pandemic (H1N1) 2009, United States, April–July 2009. Dec 2009; DOI: 10.3201/eid1512.091413]
https://web.archive.org/web/20091119151410/http://www.cdc.gov/eid/content/15/12/pdfs/09-1413.pdf

Correcting for under-ascertainment, the study found that every case of 2009 H1N1 reported from April – July represented an estimated 79 total cases, and every hospitalized case reported may have represented an average of 2.7 total hospitalized people. Since that time, CDC has been working to develop a way to estimate, in an ongoing way, the impact of the 2009 H1N1 pandemic on the U.S. in terms of 2009 H1N1 cases, hospitalizations and deaths.

Method to Estimate 2009 H1N1 Cases, Hospitalizations and Deaths
CDC has developed a method to provide an estimated range of the total number of 2009 H1N1 cases, hospitalizations and deaths in the United States since April, 2009, as well as a breakdown of these estimates by age groups. This method uses data on influenza-associated hospitalizations collected through CDC's Emerging Infections Program (EIP), which conducts surveillance for laboratory-confirmed influenza-related hospitalizations in children and adults in 62 counties covering 13 metropolitan areas of 10 states. To determine an estimated number of 2009 H1N1 hospitalizations nationwide, the EIP hospitalization data are extrapolated to the entire U.S. population and then corrected for factors that may result in under-reporting using a multiplier from "Estimates of the Prevalence of Pandemic (H1N1) 2009, United States, April–July 2009."
https://web.archive.org/web/20091119151410/http://www.cdc.gov/eid/content/15/12/pdfs/09-1413.pdf

The lower and upper hospitalization estimates also are calculated using the EIP hospitalization data. The national hospitalization estimates are then used to calculate deaths and cases. Deaths are calculated by using the proportion of laboratory-confirmed deaths to hospitalizations reported through CDC's web-based Aggregate Hospitalization and Death Reporting Activity (AHDRA). Cases are estimated using multipliers derived from "Estimates of the Prevalence of Pandemic (H1N1) 2009, United States, April–July 2009." The lower and upper end of the ranges for deaths and cases are derived from the lower and upper hospitalization estimates. The methods used to estimate impact may be modified as more information becomes available. More *information about this methodology* is available. =>

https://web.archive.org/web/20091124105202/http://www.cdc.gov/h1n1flu/pdf/details_eip_methods_plus_schematic.pdf

Throughout the remainder of the 2009 H1N1 pandemic CDC will update the range of estimated 2009 H1N1 cases, hospitalizations and deaths every three or four weeks. While EIP data is reported weekly during influenza season, because the system is based on reviews of patients medical charts there are sometimes delays in reporting and it can take some time for all the data to fill in. CDC will continue to provide weekly reports of influenza activity each Friday in *FluView* and will update the *2009 H1N1 Situation Update* each Friday as well.

https://web.archive.org/web/20091112122154/http://www.cdc.gov/flu/weekly/fluactivity.htm
https://web.archive.org/web/20091115131333/http://www.cdc.gov/h1n1flu/update.htm

The estimated ranges of cases, hospitalizations and deaths generated by this method provide a sense of scale in terms of the burden of disease caused by 2009 H1N1. It may never be possible to validate the accuracy of these figures. The true number of cases, hospitalizations and deaths may lie within the range provided or it's also possible that it may lie outside the range. The underlying assumption in this method is that the level of influenza activity (based on hospitalization rates) in EIP sites matches the level of influenza like illness (ILI) activity across the states.

This methodology is not a predictive tool and cannot be used to forecast the number of cases, hospitalizations and deaths that will occur going forward over the course of the pandemic because they are based on actual surveillance data.

The Numbers

- CDC estimates that between 14 million and 34 million cases of 2009 H1N1 occurred between April and October 17, 2009. The mid-level in this range is about 22 million people infected with 2009 H1N1.
- CDC estimates that between about 63,000 and 153,000 2009 H1N1-related hospitalizations occurred between April and October 17, 2009. The mid-level in this range is about 98,000 H1N1-related hospitalizations.
- CDC estimates that between about 2,500 and 6,000 2009 H1N1-related deaths occurred between April and October 17, 2009. The mid-level in this range is about 3,900 2009 H1N1-related deaths.

The results of this method confirm previous epidemiological data indicating that this disease primarily affects people younger than 65 year old, with the number of cases, hospitalizations and deaths overwhelmingly occurring in people 64 years and younger. This is very different from seasonal influenza, where about 60 percent of seasonal flu-related hospitalizations and 90 percent of flu-related deaths occur in people 65 years and older. The proportion of younger people being impacted by 2009 H1N1 is much greater than what occurs during seasonal flu and people 65 and older are much less affected by this virus than what routinely occurs with seasonal influenza. The results generated by this method also underscore the continued importance of the 2009 H1N1 vaccination program and support the recommended target groups for vaccination.

This methodology and the resulting estimates also underscore the substantial under-reporting that occurs when laboratory-confirmed outcomes are the sole method used to capture hospitalizations and deaths. Since the outbreak began in April, states have reported 2009 H1N1 hospitalizations and deaths to CDC. Cumulative reports of laboratory-confirmed 2009 H1N1 hospitalizations and deaths for the same period used in this analysis (April through October 17, 2009), are 17,283 hospitalizations and 1,004 deaths. CDC has maintained since the beginning of this outbreak that laboratory-confirmed

data on hospitalizations and deaths reported to CDC is an underestimation of the true number that have occurred because of incomplete testing, inaccurate test results, or diagnosis that attribute hospitalizations and deaths to other causes, for example, secondary complications to influenza.

CDC Estimates of 2009 H1N1 Cases and Related Hospitalizations and Deaths from April-October 17, 2009, by Age Group

2009 H1N1	Mid-Level Range*	Estimated Range *
Cases		
0-17 years	~8 million	~5 million to ~13 million
18-64 years	~12 million	~7 million to ~18 million
65 years and older	~2 million	~1 million to ~3 million
Cases Total	~22 million	~14 million to ~34 million
Hospitalizations		
0-17 years	~36,000	~23,000 to ~57,000
18-64 years	~53,000	~34,000 to ~83,000
65 years and older	~9,000	~6,000 to ~14,000
Hospitalizations Total	~98,000	~63,000 to ~153,000
Deaths		
0-17 years	~540	~300 to ~800
18-64 years	~2,920	~1,900 to ~4,600
65 years and older	~440	~300 to ~700
Deaths Total	~3,900	~2,500 to ~6,100

** Deaths have been rounded to the nearest ten. Hospitalizations have been rounded to the nearest thousand and cases have been rounded to the nearest million*

(Information about surveillance and reporting for 2009 H1N1 is available at *Questions and Answers*: Monitoring Influenza Activity, Including 2009 H1N1.)
https://web.archive.org/web/20091119032233/http://www.cdc.gov/h1n1flu/reportingqa.htm

The estimates derived from this methodology provide the public, public health officials and policy makers a sense of the health impact of the 2009 H1N1 pandemic. While these numbers are an estimate, CDC feels that they present a fuller picture of the burden of 2009 H1N1 disease on the United States. CDC will continue to use weekly data from systems that comprise the *National Influenza Surveillance System* to monitor geographic, temporal and virologic trends in influenza in the nation. https://web.archive.org/web/20091112122154/http://www.cdc.gov/flu/weekly/fluactivity.htm

Background Emerging Infections Program

The Emerging Infections Program (EIP) Influenza Project conducts surveillance for laboratory-confirmed influenza-related hospitalizations in children and adults in 62 counties covering 13 metropolitan areas of 10 states. (This includes San Francisco, CA; Denver, CO; New Haven, CT; Atlanta, GA; Baltimore, MD; Minneapolis/St. Paul, MN; Albuquerque, NM; Santa Fe, NM, Las Cruces, NM; Albany, NY; Rochester, NY; Portland, OR; and Nashville, TN.)
https://web.archive.org/web/20091117160703/http://www.cdc.gov/ncpdcid/deiss/about_eip.html

Cases are identified by reviewing hospital laboratory and admission databases and infection control logs for children and adults with a documented positive influenza test conducted as a part of routine patient care. EIP estimated hospitalization rates are reported every week during the flu season. More information about the Emerging Infections Program is available at
https://web.archive.org/web/20091117160703/http://www.cdc.gov/ncpdcid/deiss/about_eip.html

Healio

CDC: Estimated 22 million Americans sick from influenza A (H1N1) during six months of pandemic

Healio, 12 November 2009
https://www.healio.com/news/pediatrics/20120331/cdc-estimated-22-million-americans-sick-from-influenza-a-h1n1-during-six-months-of-pandemic

An estimated 22 milllion people in the United States became ill from influenza A (H1N1) during the first six months of the pandemic and as there are several more months of influenza season to go, vaccination of certain groups, particularly children, is key, according to the CDC's director of immunization and respiratory diseases.

Anne Schuchat, MD, said that the estimates are based on data from the Emerging Infections Program Network. She said that based on data from this surveillance system of hospitalized patients, CDC officials estimate about 98,000 people have been hospitalized and 3,900 have died from this illness so far. Of that number, about 540 were children.

Until now, the CDC had conservatively put the U.S. mortality associated with this strain of influenza at "more than 1,000," and had reported on 129 laboratory-confirmed deaths in children. The surveillance data are helping CDC officials paint a more accurate picture of total morbidity and mortality associated with this illness, Schuchat said.

The figures track from April to Oct. 17, and suggest the number of hospitalizations range from 63,000 to 153,000 and deaths range from 2,500 to as high as 6,100. Schuchat said the illness has affected all age groups, with adults ages 18 to 64 making up about 12 million cases and seniors about 2 million cases.

Schuchat said the new figures reemphasize the importance of getting the vaccinations to high-risk groups, such as children and adults with chronic conditions like diabetes. She noted that November is American Diabetes Month and she said that it is important for patients with diabetes and other chronic conditions to get vaccinated to protect themselves, even if efforts to obtain the vaccine have been difficult. She said about 12% of all hospitalized patients seen have had chronic conditions, and of those, about 19% of those patients have diabetes.

So far, about 41.6 million doses of the vaccine are available, Schuchat said, which is far less than manufacturers had projected by this time. However, she said, more "vaccine is being ordered and delivered very day." — *by Colleen Zacharyczuk*

The Telegraph

Kate Devlin

Swine flu: drop in cases raises hopes for peak in second wave

Telegraph.uk, 12 November 2009, 5:09PM GMT
https://web.archive.org/web/20091115102542/http://www.telegraph.co.uk/health/swine-flu/6555080/Swine-flu-drop-in-cases-raises-hopes-for-peak-in-second-wave.html

The number of new cases of swine flu has fallen for the first time in months, raising hopes that the second wave of the pandemic has peaked.

However, health officials warned that the drop could be an anomaly caused by school closures over half-term and urged at risk patients to still take the vaccine.

There were an estimated 64,000 new cases in England last week, down from 84,000 the previous week.

But the numbers dying from the disease continue to grow.

The death toll in England from the virus now stands at 124, up from 105 last week.

However, the number of people in hospital with swine flu has dropped slightly to 785, of whom 173 are in intensive care.

Sir Liam Donaldson, the Chief Medical Officer, cautioned that the dip in cases did not meant that they would not rise again next week.

The impact of school holidays over half term could last two weeks, he said, insisting that next week's figures should give a clearer picture of how the virus is developing.

Last month cases in America recorded a small dip only to rise again the following week.

Children have been described as 'super spreaders' of the swine flu, and there have been numerous outbreaks of the because of the virus in schools across the country.

The Department of Health is also publishing new guidance for pregnant women about the dangers of swine flu, which urges them to have the vaccine.

The information is being placed on the Department's website and leaflets will be in GP surgeries from next week.

Sir Liam said the Government was making a "strong recommendation" to pregnant women to have the jab, because they are known to be at higher risk of complications than many members of the public.

Clatsch News

Schweinegrippe Pandemie:
Österreich im Januar – Schweiz Pandemie angekommen

Clatsch News, 12 November 2009
https://web.archive.org/web/20091117090327/http://www.clatsch.de/2009/11/12/schweinegrippe-pandemie-sterreich-im-januar-schweiz-pandemie-angekommen/

Laut verschiedener Berichte soll angeblich in unserem Nachbarland der Schweiz die Pandemie Welle angekommen sein. Dort hab es in der letzten Woche eine Verdoppelung der Fälle. Dies wurde jetzt offiziell von Patrick Mathys des Bundesamt für Gesundheit (BAG) berichtet. Damit sei in der Schweiz die Pandemie der Schweinegrippe angekommen.

Er geht davon aus das die Anzahl der Erkrankungen weiterhin exponentiell steigen wird. Hoffen wir es nicht, denn solche Bilder möchte keiner sehen. In Österreich ist die Lage laut den berichten von OE24 noch nicht so bedrohlich. Dort wird erst so richtig ab Januar mit einem Ausbruch gerechnet. Dies geben allerdings nur Modellrechnungen so wieder und ich bin der Meinung, das die Aussagekraft dieser nicht wirklich gut ist.

Natürlich wird alles davon abhängen wie schnelle die Impfungen durchgeführt werden und vor allem wie die Impfbereitschaft sein wird. Je mehr sich Impfen lassen desto besser um einen Pandemie rechtzeitig noch abzuwehren.

Aber auch hier gibt es wie immer Unterschiedliche Meinung. Experten gehen allerdings davon aus das sich die Schweinegrippe weiterhin ausbreiten wird. Ob es wirklich zu den Szenarien kommen wird das die Intensivbetten in den Krankenhäuser ausgehen werden darf man nicht hoffen

=>

Fallen behind schedule with swine flu jabs,
Austrian government spreads idea no "pandemic" until January

The Flu Case, 14 November 2009, 14:45
https://web.archive.org/web/20100102040628/http://theflucase.com/index.php?option=com_content&view=article&id=1803%3Afallen-behind-schedule-with-swine-flu-jabs-austrian-government-spreads-idea-no-qpandemicq-until-january&catid=1%3Alatest-news&Itemid=64&lang=en

Far behind schedule with their swine flu vaccination campaign in Austria and Switzerland, the governments and media (see example below) have started preparing people for the idea that there will not be a pandemic until January and not in November/December as first predicted.

Many experts say that the vaccinations will cause the pandemic as happened during the Spanish flu pandemic of 1918. However, so few people have taken the swine flu jab in Austria and Switzerland so far that it will be hard to generate a pandemic by these means unless numbers can be increased.

One thing is for sure: with the economy about to collapse due to the criminal dealings of the banksters and their allies in government who have sucked billions of euros from tax payers under various pretexts, there is not a lot of time left to implement the "swine flu" vaccination campaign before people wake up to the full dimensions of the scam being perpetrated on them.

CDC Guesstimates, 'Recalculates' Swine Flu Deaths

New American, 12 November 2009, 11:24.
https://web.archive.org/web/20091122094913/http:/www.thenewamerican.com/index.php/usnews/health-care/2303-cdc-guesstimates-recalculates-swine-flu-numbers

The U.S. Centers for Disease Control and Prevention (CDC) recalculated its original estimates and is now indicating that over 4,000 Americans have likely died from problems linked to the H1N1 swine-flu virus.

The figure is four times higher than previous estimates of about 1,000 dead provided by federal health officials. The new number reportedly takes into account people who died from other related complications like pneumonia and bacterial infections. But the official tally is based mostly on educated guesses, since the CDC quit tracking actual cases back in August.

According to a Reuters analysis of the data entitled "New US swine flu death estimates will be guess," "The death figures will be based on models, calculated by looking intensively at small groups of people, gathering data on overall reports of sickness and death, and reconciling the two." The report also noted that there are not nearly enough diagnostic tests to see if everybody with flu-like symptoms really have the H1N1 swine flu.

A CBS investigation in late October revealed that the government was already inflating swine flu numbers, but experts suggest that even 4,000 deaths would still rank the current H1N1 virus as relatively mild. Some doctors have also seriously questioned even the earlier estimates of 1,000 deaths.

"The central question is: have a thousand people died from H1N1," explained Dr. Joseph Mercola, also an author and vaccine critic, while discussing President Obama's declaration of a national emergency. "It does not appear to be the case — there are no substantiation or any support or factual data on the CDC's own website, in fact we have evidence to the contrary."

The World Health Organization estimates that about 6,000 people have died worldwide from swine flu-related complications. The figure is also based on calculations, not confirmations. But to put that number in perspective, the WHO claims that seasonal influenza is linked to between 250,000 and 500,000 deaths each year.

The Stockholm-based European Center for Disease Prevention and Control has reported slightly more than 400 deaths in Europe so far, while the death toll from a supposed health emergency in Ukraine still remains unclear. British health authorities have been forced to revise future worst-case scenario death-toll estimates down from an original 65,000 to a more modest prediction of 1,000. That number is well under the 4,000 to 8,000 who normally die each year from seasonal flu, Reuters reported in an article entitled "Swine flu skepticism demands deft response" about the alleged profitable "hype" surrounding swine-flu hysteria.

U.S. presidential council concluded this year that up to 90,000 Americans could die from H1N1-related-complications, but medical experts cited by the *New York Times* have disputed the assertions. Discussing the new CDC estimates in an article entitled "Recalculating the Tally in Swine Flu Deaths," the *Times* warned that "a much higher death rate would mean more drastic measures to keep people apart and could mean, for example, adding immune-boosting adjuvants to the vaccine so more people could get it."

The new estimates come as the federal government still faces massive problems nearly a month into its mass vaccination campaign. Concerns about safety and efficacy, along with reports of side effects including the neurological disorder Gullian-Barre Syndrome and even reports of deaths attributed to the vaccine in Europe have caused many Americans to remain skeptical of the government program. There have also been reports of some vaccine shortages, but whether the shortages are real or are merely part of a strategy to get people to clamor for the vaccine, a move that was proposed at the Council on Foreign Relations to build up demand for the inoculations, is unknown.

The government routinely misleads the public with its numbers, on everything from the Consumer Price Index to unemployment figures to health statistics. Whether 4,000 people have actually died from complications "related" to swine flu is certainly up for debate, but Americans should always regard government numbers with healthy suspicion until proven with facts. More importantly though, education is key for individuals and families considering options to keep the flu at bay.

Schweinegrippe: Serbien Notstand

MM News, 12. November 2009
https://web.archive.org/web/20091115120243/http://www.mmnews.de/index.php/200911124198/Dies-Das/Schweinegrippe-Serbien-Notstand.html

Wegen der Schweinegrippe hat Serbien einen Epidemie-Notstand ausgerufen. Massnahme erlaubt ein Verbot von Massenveranstaltungen. / Politiker in Polen halten H1N1- Gegenmittel für Betrug. Verstärkt Hinweise auf gezielte Panikmache.

Immer mehr Länder nutzen die Schweinegrippe, um einen Notstand auszurufen. Wegen H1N1 hat Serbien nun einen Epidemie-Notstand erklärt. Die Massnahme, die unter anderem ein Verbot von Massenveranstaltungen erlaubt, soll helfen, die Infektionskrankheit einzudämmen.

Die Entscheidung ermöglicht es der Regierung auch, Schulen zu schliessen und Besuche in Krankenhäusern zu verbieten. Serbien hat bei bisher rund 260 nachgewiesenen Schweinegrippe-Infektionen bereits sieben Todesfälle gemeldet.

Ganz anders sieht die Situation z.B. in Polen aus. Das polnische Parlament hat in einer Sondersitzung über die sich zuletzt ausbreitenden Grippegefahren an Ost- und Westgrenze des Landes beraten.

Im Ergebnis der Tagung geht man nun davon aus, dass Polen, zumindest aktuell, kein Opfer irgendeiner Epidemie ist. Was die Schweinegrippe betrifft, habe man es zwar mit 193 Fälle von H1N1-Infektionen zu tun, doch alle Betroffenen zeigten harmlose Krankheitsverläufe und noch nie sein ein Patient daran gestorben.

Polnische Politiker halten H1N1- Gegenmittel für Betrug

Der Stellvertretender Minister für das Gesundheitswesen Adam Fronczak fügte hinzu, dass es in der Saison 2006/2007 349 Tausend Grippefälle in Polen gab. In der Saison 2007/2008 - 235 Tausend und in der Saison 2008/2009 - gar 543 Tausend. "Kein abnormale Sache, denn an der jährlichen saisonalen Grippe leiden mehr als eine Milliarde Menschen auf der ganzen Welt, und eine Million stirbt hieran - sagte Fronczak. Der der polnischen Regierungspartei PO angehörende prominente Abgeordnete Janusz Palikot behauptet, dass die Impfstoffe gegen Schweinegrippe einem riesigen Betrug dienen und es keine neue bedrohende Grippe gebe. Die Pharmaunternehmen bezeichnete er als Mafia. Dies meinen auch andere polnische Politiker. Zum Beweis, dass es keine gefährliche Krankheit gibt will man nun in die ukrainische Stadt Lemberg fahren und dort jedem die Hand reichen, der dies zulasse.

Verstärkt Hinweise auf gezielte Panikmache

"Egal was wir jetzt tun, wir können die Pandemie nicht mehr verhindern: "Die Schweinegrippe ist in der Schweiz jetzt richtig angekommen. Auf der Nordhalbkugel und inbesondere in Irland breitet sich die Schweinegrippe derzeit explosionsartig aus" - liest man aktuell in Schweizer Zeitungen, also aus einem Land wo H1N1 Arzneien hergestellt werden. In Deutschland sind die Medien da schon etwas kritischer, auch wenn sie den Bürgern zuletzt nicht verraten wollten, dass sie die eigentlichen Testopfer für die Nebenwirkungen eines möglicherweise völlig wertlosen, aber offenbar gefährlichem, Produktes geworden sind. Die deutschen Politiker haben dagegen durch eine eher harmlose Vitamin-C Injektion, die man auch "abgespeckte Version" des nationalen Grippemittel nennt, nichts zu befürchten.

USA: Schweinegrippe-Hysterie in vollem Gange

Die Zahl der tödlich verlaufenen Schweinegrippe-Infektionen in den USA ist auf angeblich mindestens 4.000 gestiegen. Die Gesundheitsbehörden teilten am Mittwoch mit, diese Zahl schließe Sterbefälle aufgrund von Komplikationen wie Lungenentzündungen und bakterielle Infektionen mit ein.

THE FLU CASE

Serbia using the swine flu as a pretext to suspend civic rights, suggests MMNews

The Flu Case, 13 November 2009 18:46

https://web.archive.org/web/20100102044814/http://theflucase.com/index.php?option=com_content&view=article&id=1785%3Aserbia-using-the-swine-flu-as-a-pretext-to-suspend-civic-rights-suggests-mmnews&catid=1%3Alatest-news&Itemid=64&lang=en

Michael Mross of MMNews has said that more and more countries are using the swine flu as a pretext to declare an emergency and suspend basic rights.

Serbia has declared an emergency, allowing the government to ban public gatherings, close schools and prohibit visits to people in hospitals in spite of the fact there have been only 260 cases of swine flu officially reported and 7 deaths, he writes.

In the meantime, the Polish government has rejected the idea that there is a swine flu pandemic in the country with only 193 reported cases of swine flu and no deaths while there were 543,000 cases of seasonal flu in 2008/2009.

Polish MP Janusz Palikot has said that the vaccine against the swine flu is a huge fraud and there is no dangerous flu. He called the pharmaceutical companies a mafia.

Виктор Резунков

Эксперты в гостях у Виктора Резункова обсуждают, как в России и в Петербурге, в частности, борются с эпидемией гриппа A/H1N1

Радио Свобода, 13 ноября 2009
https://www.svoboda.org/a/1878429.html

Виктор Резунков: В российской прессе продолжают появляться многочисленные публикации, посвященные эпидемии гриппа A/H1N1. Причем публикации самые противоречивые.

В одних сообщается о том, что Россия не успела подготовиться к эпидемии, и поэтому надо ожидать массовых заболеваний, в других – о том, что вирус гриппа A/H1N1, по сравнению с вирусом обычного гриппа, совершенно безобиден, и его нечего бояться, в третьих граждан призывают бежать прививаться, в четвертых советуют не спешить и сообщают о побочных эффектах вакцин против гриппа. Не понятно, судя по публикациям, сколько граждан в России заболело новым гриппом, сколько скончалось от него, как вообще определяется эта статистика. Не ясно, какими лекарствами надо лечиться, а может быть, надо лечиться народными средствами. Все эти вопросы, на которые в российской прессе ответы самые противоречивые, не только запутали простого российского гражданина, но и создали в целом чуть ли не панику в стране.

Конечно, на все эти вопросы дать ответы четкие и ясные в нашей передаче мы не сможем, но хотя бы попытаться разобраться в этой ситуации попробуем. В Петербургской студии Радио Свобода - врач-инфекционист, координатор программы «Российского Красного Креста» «Стоп, грипп!» Андрей Дьячков и корреспондент газеты «Санкт-Петербургские ведомости» Александр Жабский.

В начале нашей передачи я бы хотел определиться с терминами. Информационное агентство «Росбалт» публикует заявление главного санитарного врача Российской Федерации Геннадия Онищенко, который сообщает: «Нынешнюю эпидемию гриппа, в том числе A/H1N1, можно преодолеть за неделю, если каждый будет соблюдать меры предосторожности и рекомендации врачей. Все будет зависеть от нас. Если мы будем выполнять меры предосторожности и наши рекомендации, то можно преодолеть грипп за неделю. Не надо надеяться только на то, что все за нас сделает держава. Это не первая и не последняя напасть. Нынешний вирус явно «пересидел». Онищенко категорически высказался против каких-либо определений пандемического гриппа. «Нет ни свиных, ни собачьих, ни птичьих гриппов», - резюмировал глава Роспотребнадзора».

Я хочу сказать, что я не буду употреблять выражение «свиной грипп», но так как я буду цитировать статьи, то я вынужден буду это делать.

Андрей, все правильно?

Андрей Дьячков: Вирус гриппа A/H1N1 действительно известен достаточно давно. Еще в 70-ых годах в США были обнаружены случаи этого заболевания у людей. Свиней бояться не надо – хрюкать мы не начнем, если заболеем. У свиней есть похожий вирус. И изначально в Мексике действительно случаи были у людей, которые ухаживали на фермах за свиньями. Но это термин, который «прилепился» к этому вирусу неправильно. Более корректное название «A/H1N1». То есть все вирусы подразделяются, у них есть два белка - гемагглютинин и нейраминидаза, и классификация вируса гриппа как раз проходит по этому принципу.

Виктор Резунков: И я бы хотел зачитать публикацию из немецкого издания «Die Zeit», которое отмечает: «Несмотря на активное распространение по всей России эпидемии свиного гриппа, сообщения о летальных исходах и появление людей в марлевых повязках в московском метро, на взгляд иностранцев, среди россиян никакой паники не наблюдается». Как пишет издание: «Многие россияне относятся к эпидемии с равнодушием – смесью отсутствия интереса, граничащего с наивностью оптимизма и уверенности в том, что жизнь вообще опасная штука. Отметим, что одной из самых популярных в России действительно является шутка Юрия Олеши на эту тему: «Жизнь вредна, от нее умирают». В качестве аргумента, что бояться нечего, россияне приводят примеры, что в Российской Федерации без всякой эпидемии ежедневно от последствий употребления алкоголя умирают 110 человек, в автомобильных авариях гибнут 93 человека».

Как вам это нравится, Александр?

Александр Жабский: В этом есть, конечно, доля правды, может быть, даже очень большая доля. Действительно, мы – народ, который не подвержен паникам на пустом месте. Мы, скорее, будем запасать соль и спички, чем марлевые повязки. Но это и хорошо. То есть мы не выходим, мне кажется, за рамки разумного. А вообще остерегаться, конечно, надо. Я, едучи сюда, в метро видел двух немолодых дам, которые шли в повязках, не панически совершенно, но они решили побеспокоиться о своем здоровье. С другой стороны, насколько я знаю, об этом писала и наша газета, что работникам метрополитена вменено в обязанность носить такие повязки, но вот вчера-сегодня я их не видел на них, ни на «Чернышевской», ни на станции «Парк Победы». Наверное, это следствие того самого, о чем пишет немецкий журналист.

Андрей Дьячков: Мне кажется, чтобы не звучало, что мы как будто рекламируем всем носить обязательно маски, надо ко всем методам профилактики подходить разумно. То есть в определенных ситуациях маска действительно полезна. Если вы находитесь в местах массового скопления людей короткое время, например, можно эту маску применить. А на улице ее использовать совершенно бесполезно. Естественно, если у вас самого есть симптомы простуды или гриппа, то лучше находиться дома. Но если вы вынуждены выйти, например, в поликлинику или какие-то другие обстоятельства, тогда, естественно, социально ответственное поведение – это именно надеть эту маску. Мне кажется, должен быть баланс, не должно быть какого-то шапкозакидательства и наплевательского отношения, но и какой-то истерики вокруг этой ситуации не должно быть. Потому что существуют определенные правила профилактики, соблюдая которые, ну, не остановить за одну неделю, но, по крайней мере, действительно ограничить распространение вируса точно возможно.

Александр Жабский: Видимо, об этом как раз и говорит немецкий журналист. Можно сделать вывод, что в Европе, видимо, более панически к этому относятся. А смогут ли они управиться за неделю – интересно посмотреть. Хорошо бы, чтобы Геннадий Онищенко сделал такой анализ: такие точные, пунктуальные, ответственные и такие доверяющие всем службам, в том числе и медицинским, европейцы, справятся они за неделю или нет.

Виктор Резунков: Журналисты «Вечернего Петербурга» провели эксперимент. Они прошли по аптекам в Петербурге, пытаясь найти лекарства против гриппа и маски. Но они не обнаружили во многих аптеках этого.

Андрей Дьячков: Совсем недавно прошла информация о том, что у нас соль то ли исчезнет, то ли подорожает, и в общем-то, ее тоже смели с полок. Поэтому я думаю, что если под нужным соусом подать информацию, то могут и телевизоры, и швейные машинки пропасть.

Александр Жабский: Я-то думаю, что тут как раз не в этом дело. Просто прагматичные владельцы аптек, наверное, и не завезли такую кучу всяких препаратов, понимая, что российский человек не кинется скупать все это, в отличие от соли и спичек. Можно и так подумать.

Виктор Резунков: Вы знаете, в Петербурге уже отмечен один случай ограбления с использованием противогриппозной маски. Пришел человек и попытался ограбить, по-моему, сберегательную кассу.

Александр Жабский: Но это не бросает на нее тень, я думаю, так же, как и на капроновые чулки.

Андрей Дьячков: Мне больше нравится версия, когда маску украшают какими-то рисунками, и все это выглядит достаточно мило и интересно.

Виктор Резунков: Я приведу выдержку из публикации Агентства «Росбалт»: «Главные врачи нижегородских больниц - депутаты областного Законодательного собрания убеждают нижегородцев не впадать в панику по поводу распространения гриппа A/H1N1. «Вирус гриппа меняется ежегодно, впадать в панику от появления его новой разновидности оснований нет, - утверждает главный врач Арзамасской городской больницы скорой помощи Александр Цопов. - Сегодня напряженность в обществе нагнетается во многом искусственно, что, на мой взгляд, совершенно недопустимо. Нельзя создавать нервозную обстановку, ни к чему хорошему это не приведет. Серьезно нужно относиться к вирусу в целом, вне зависимости от того, как он называется. Нужно понимать, что это ОРВИ - острая респираторно-вирусная инфекция, которая передается от человека к человеку воздушно-капельным путем. Меры профилактики в этом отношении аналогичны тем, что применяются при обычном сезонном гриппе».

Андрей, вы с этим согласны?

Андрей Дьячков: В целом, наверное, да. Всегда хорошо сохранять спокойствие. Единственно, мне кажется, в чем возникла сейчас проблема – все-таки в дефиците информации. Вот мне, как врачу, ежедневно мои знакомые и друзья звонят с вопросом: «Что же это все-таки за грипп? Что приобретать?». Это говорит о том, что несмотря на то, что внимание в прессе уделяется достаточно пристальное этой теме, но конкретной информации все-таки не хватает. И я хотел бы сказать, что в Интернете создан сайт Роспотребнадзор его курирует, это официальный сайт Роспотребнадзора. И с достаточно высокой регулярностью, периодичностью обновляется информация по гриппу и доступны рекомендации не только российской, но и Всемирной организации здравоохранения, и Американского центра по контролю заболеваемости в США.

Виктор Резунков: А кто тогда нагнетает обстановку, если разобраться?

Александр Жабский: С моей точки зрения, может быть, даже и санитарные врачи. Вот вспомним Онищенко, который говорил, что не надо нашим детям ездить за границу летом в лагеря, не надо футбольным болельщикам ездить за нашими командами в Европу, потому что там этот грипп A/H1N1. Теперь он говорит, что если мы поднапряжемся, ничего страшного нет, то и ликвидируем. Конечно, сшибка в сознании у людей происходит. Наверное, как-то растерялись. Все-таки главный санитарный врач, хотя всякие, даже экстравагантные он решения принимал в недавнее время, но он пользуется уважением, ну, просто потому, что больше не к кому обратиться. Ну, не президент же будет эти вопросы решать. И я думаю, что во многом это зависит от неточных посылов, которые идут, может быть, даже от санитарных медиков и от организаторов здравоохранения. Они сами-то, наверное, еще до конца не разобрались. Я понимаю, что фармакологические компании мировые нагнетают как раз этот интерес для того, чтобы больше сбыть. Но в России это не пройдет, повторяю, у нас спички и соль будут закупать, а не фармакологические средства антигриппозные. Но там это проходит. И видимо, доходит волна до России. Врачи разбираются и видят, что, да, это грипп, это тоже опасно, потому что всякий грипп опасен. Насколько мне известно, примерно 1% людей всегда во времена сезонных эпидемий умирает, а заболевает очень много людей. Но чего-то из ряда вон выходящего, такого, что нужно уж прямо прятаться от всего мира и заматываться платками, я думаю, не происходит.

Андрей Дьячков: Мне кажется, сейчас новый виток, можно назвать, истерии, он случился после сообщений из Украины.

Александр Жабский: Речь идет в прессе о том, что, будто бы, Украина уже вся слегла.

Андрей Дьячков: Совершенно верно. И мы можем не очень ориентироваться на западные страны, которые мы, может быть, считаем слишком предусмотрительными или слишком осторожными, то когда наши братья-славяне начинают так себя вести – ходить в масках, то поневоле задумаешься: а почему мы этого не делаем?

Виктор Резунков: А у вас в «Красном Кресте» есть ли какие-то данные по Украине? Насколько там ситуация действительно сложная?

Андрей Дьячков: Мы не являемся мониторинговой организацией, эпидслужба этим занимается. Я знаю, что украинское общество «Красного Креста» распространяет информацию о гриппе. И мне кажется, тут должен быть конгломерат, симбиоз государства со своими медицинскими мерами и общественные организации с немедицинскими мерами профилактики. И вот это надо донести до каждого человека. И тогда можно серьезным образом повлиять на развитие эпидемии.

Виктор Резунков: Русскоязычный журнал «Newsweek» приводит пример того, как с гриппом борются, например, в Великобритании: «Попытка остановить свиной грипп на границах в России провалилась. Теперь выясняется, что Россия не успела подготовиться к эпидемии. Если чувствуете недомогание - ни в коем случае не идите к врачу. Просто зайдите на сайт Минздрава и заполните специальную анкету. Программа тут же определит, есть ли у вас симптомы свиного гриппа. Если есть, вам пришлют личный код. Его нужно сообщить другу или родственнику, который сходит в аптеку и получит для вас препарат тамифлю и другие лекарства. Лечитесь дома - к врачу обращайтесь, только если станет совсем худо. Такая система борьбы со свиным гриппом действует в Великобритании. «Отличный способ, - одобряет зампред комитета по охране здоровья Думы академик Российской Академии медицинских наук Сергей Колесников, - но у нас это, к сожалению, невозможно. Не так широко распространен Интернет».

Андрей Дьячков: Я думаю, что не каждый раз, когда человек заболевает острым респираторно-вирусным заболеванием, он должен бежать к врачу. Другой вопрос, что ему «больничный» нужен, поэтому он, может быть, вынужден обращаться за медицинской помощью. А в целом, конечно, есть определенные показатели, которые говорят о том, что заболевание течет необычно, более тяжело. Например, если температура держится больше четырех дней, если у вас появились трудности при дыхании, если изменился характер кашля или характер мокроты, которая отходит, изменился ее цвет – она стала желто-зеленого цвета, если судороги, а особенно у детей, - это, безусловно, показания к обращению к врачу. Повторный подъем температуры после периода улучшения самочувствия, это какие-то психические нарушения, бредовые расстройства, галлюцинации – это все может возникнуть на фоне тяжелого течения гриппа. Но правильно было замечено, летальность и тяжелые формы развиваются не у всех людей. Сейчас подключают и 6-ой курс Педиатрической академии,

потому что, конечно, обслужить то количество вызовов, которое обрушивается на «скорую», на поликлиники, просто невозможно.

Александр Жабский: А мне все-таки более симпатична инвектива нашей медицины. Обращайтесь к врачу, не занимайтесь самолечением. Конечно, врачи рассказывают, какую проводить профилактику элементарную: есть определенные продукты, просто мыть руки. Просто мойте чаще руки – и будет меньше любых инфекций, а не только гриппозной. Мне кажется, что это более правильно. Вот если докажут британские медики, что это эффективный путь, можно им последовать. А пока все-таки мы верим нашей традиционной медицине российской, которая имеет глубочайшие корни и санитарные, а не только «вылечивательные», так скажем. Поэтому мне как-то симпатичнее наш способ.

Андрей Дьячков: И потом, все-таки наша медицина в периоды кризиса лучше справляется. Еще можно вспомнить первое заседание Народного комиссариата здравоохранения. Владимир Ильич Ленин сказал о том, что или вши победят революцию, или революция победит вшей. Со многими эпидемиями уже в России справлялись, и я думаю, что и с этой тоже справятся.

Александр Жабский: Хотя страшная «испанка» унесла во всем мире и в России слишком много людей.

Виктор Резунков: Андрей, а вы можете рассказать о вашей программе, которая называется «Стоп, грипп!»? Что это такое?

Андрей Дьячков: Мы собрались с волонтерами, когда вся эта ситуация начала раскручиваться, и мы подумали о том, как мы, молодые люди, можем принять участие в противодействии эпидемии. И поняли, что наша роль именно в информировании. Опять же я сужу по себе, сколько звонков мне, как врачу, поступает от моих друзей, и постоянно с какими-то вопросами, которые кажутся достаточно элементарными, но, тем не менее, они людей беспокоят. И мы подумали, что, наверное, с «Красным Крестом» больше всего ассоциируются дети. Мы подумали, что школы, детские садики – там мы больше всего нужны, можем помочь. И мы решили научить людей, как правильно мыть руки, а это тоже нужно делать правильно. Существует специальный алгоритм, он на всемирном уровне принят, везде так должны мыть руки. И как правильно защищаться при чихании. То есть нельзя прикрываться ладошкой, нужно использовать либо платочек одноразовый, бумажный, после чего его выбрасывать, либо прикрываться локтем. Потому что если вы прикрываетесь ладошкой, вы взялись за ручку двери, другой человек, если возьмется за нее и дотронется до своего глаза, потрет слизистые носа или рта, он может таким образом заразиться. То есть наша работа – это информационная работа. Мы начали в Калининском районе. Если все пойдет хорошо, будут положительные отзывы, мы готовы продолжать в других районах города.

Александр Жабский: А молодежь хорошо поддерживает волонтерский призыв?

Андрей Дьячков: Сначала, конечно, была ирония: как это – учить мыть руки? Но сейчас, когда наши волонтеры посетили детский садик... У нас сейчас небольшой гимн у этой программы появился – это песня из фильма «Усатый нянь». Она позитивная, и действительно, все эмоции у ребят именно такие.

Александр Жабский: Если молодежь подхватит – дело получится.

Андрей Дьячков: Мне тоже так кажется. Тем более что в конце каждого занятия мы говорим школьникам: «Ребята, расскажите вашим мамам, папам, бабушкам и дедушкам. И если вы в следующий раз увидите на улице человека, который чихает в локоть, значит, это работает».

Виктор Резунков: И давайте о вакцинах поговорим. Агентство «Росбалт» сообщает: «Поскольку вакцина от свиного гриппа создана лишь недавно, то об эффективности и безопасности такой прививки детальных данных обнаружено не было - лишь заверения официальных лиц и разработчиков вакцины о несомненной безопасности современных вакцин. Тем не менее, большинство опрошенных врачей все-таки предполагает, что вакцинация от свиного гриппа не менее эффективна и безопасна, чем и от сезонного. Однако очевидно, что целую группу медиков смущает тот факт, что научных данных о безопасности недавно созданной вакцины против свиного гриппа слишком мало. Тот же испанский профессор Хуан Хервес вспоминает вакцину, созданную в США в 1976 году, в разгар гриппозной эпидемии: «Мы ничего не знаем об эффективности и безопасности вакцины против свиного гриппа, которая готова к маркетингу. Однако известно, что в 1976 году в США разработали подобную вакцину - результатом стала эпидемия тяжелых побочных эффектов (синдром Гийена-Барре, неврологические заболевания, тяжело пострадали десятки человек). Программа вакцинации была остановлена. Ускоренная разработка таких вакцин не приносит пользы (это справедливо и в отношении гриппа A/H1N1, смертность от которого столь низка)».

Андрей Дьячков: Наверное, было бы неправдой сказать, что при выполнении прививок не бывает побочных эффектов. Это давно известный факт, и он подтвержден многочисленными исследованиями. Но давайте задумаемся, о каких побочных эффектах мы говорим. То есть после вакцинации от гриппа, как правило, бывает небольшое повышение температуры, могут быть какие-то небольшие проявления простудного заболевания, но это нормальная ситуация, и это нельзя назвать серьезным побочным эффектом, который побудил бы людей отказаться от вакцинации. И хочется привести пример наших украинских коллег. Там случилась неприятность

при вакцинации от кори, летальный случай, после чего и ВОЗ, и UNICEF украинским правительством были обвинены чуть ли не в шпионской деструктивной деятельности на территории Украины. А сейчас они лучшие друзья. То есть колеблется информация, и нам иногда не совсем понятно, по каким причинам. Но надо сказать, что все вакцины действительно проходят тщательное исследование. Постоянно проводится мониторинг побочного действия вакцин. То есть каждая прививка отслеживается. А в педиатрической практике особенно тщательно проводится. Поэтому я не думаю, что стоит бояться именно вакцины, потому что это давно известная практика, и необходимо ее применять.

Виктор Резунков: А чем можно объяснить, что в России существует мощное «антивакцинозное» движение, если так можно выразиться?

Андрей Дьячков: Когда я ходил в школу, мне родители говорили: «Будут предлагать прививку – отказывайся». А почему отказывайся? Ну, прошли опять-таки какие-то материалы в СМИ. И к чему это привело? Например, в середине 90-ых у нас был сумасшедший подъем заболеваемости дифтерией, очень тяжелые случаи. Как Булгаков в «Записках молодого врача» описывал, у нас такие случаи. Сейчас это все сошло на нет, потому что, в том числе, поняли, что надо вернуться к вакцинации. И естественно, ее надо делать по календарю, по плану. Отсутствие противопоказаний. И медикам это все очень давно известно.

Александр Жабский: Тем не менее, мне кажется, что ваши родители поступали правильно. В 90-ых годах учились мои дети. И я тоже им это говорил. Но это не связано с недоверием к вакцинации. Это связано с тем, что через родителей этот вопрос должен решаться. Родители отвечают за детей, они знают состояние здоровья ребенка. Медсестра в школе чаще всего может и не знать, к каким лекарственным средствам не расположен ребенок. Я был членом родительского комитета, и я помню, что мы все это обсуждали. И я говорил медикам: «Пожалуйста, ставьте нас в известность».

Виктор Резунков: Я зачитаю выдержку из публикации в газете «Санкт-Петербургские ведомости»: «Объявлено, что с понедельника в особенно неблагополучных регионах началась вакцинация от свиного гриппа. В неблагополучные попали Москва, Брянск, Воронеж, Тюмень и Алтай. На все про все: и на разработку вакцин, и на закупку выделяется 4 миллиарда из бюджета страны. При этом разработкой вакцины заняты три структуры: НПО «Микроген», «Петровакс» и наш (петербургский – В.Р.) НИИ гриппа. Как государственные деньги поделены между ними, не сообщается. А сообщается лишь, что вакцина для взрослых уже проходит апробацию, а разработка вакцины для детей – в начальной стадии. Как тут не вспомнить пресловутую атипичную пневмонию, птичий грипп. Кстати говоря, нашему НИИ гриппа до сих пор должно икаться от той истории. Шумели много! Пугали всех до облысения. А между тем, как в прошлом году выяснила Контрольно-счетная палата Петербурга, проверяя городское управление ветеринарии, 15 миллионов рублей, выделенные в 2006-2007 годах на разработку вакцины от птичьего гриппа, оказались потрачены «безрезультатно» (так записано в заключении) – вакцина так и не была разработана».

Андрей Дьячков: Дело в том, что ситуация с «птичьим гриппом», например, совершенно особняком стоит. Это вирус гриппа H5N1, и меры профилактики предпринимались не только в нашей стране. И понятно, что, может быть, те прогнозы, которые строились, они не оправдались, но не предпринимать никакой работы в этом направлении просто нельзя. А насчет ее эффективности – это уже должны комментировать специалисты, которые занимались разработкой этой вакцины.

Александр Жабский: Я с вами совершенно согласен. Тем более что я всегда думаю: сколько денег закопано в дамбу, закопано вообще в никуда. И если уж мы потратились, может быть, и не очень эффективно на разработку этой вакцины, ведь на кону же стояло здоровье людей. Это, может быть, и нехорошо, но не думаю, что это трагично.

Виктор Резунков: У нас есть звонки. Дмитрий из Москвы, здравствуйте.

Слушатель: Здравствуйте. Я врач по профессии, и знаю, что не может продолжаться эта эпидемия перманентно. У нее есть довольно-таки ограниченный срок. А сейчас она уже превращается в перманентную, я бы сказал, эпидемию, перефразируя нашего великого Троцкого. И еще один момент в связи с вакцинами. К ним никакого доверия быть не может, тем более, со стороны врача. Потому что, прежде всего, лично каждый из врачей сам не проводил исследований, не являлся наблюдателем или экспертом. В этом плане врачи не могут быть истиной в последней инстанции. Мы можем только лишь надеяться на свое здоровье: выдержит – выдержит, не выдержит – не выдержит.

Александр Жабский: Какой же врач, даже районный, может отвечать за Аспирин или какое-то другое средство?

Андрей Дьячков: Я хотел бы привести пример. Обязательно все лекарства проходят многостадийные клинические испытания. И с вакцинами та же самая ситуация. Существуют у врача отдельные формы регистрации всех случаев поствакцинальных осложнений, и они достаточно быстро доходят до сведения и разработчиков, и до органов, которые регулируют применение этой вакцины. Поэтому по поводу ответственности врача, врач в этом смысле полагается на результаты клинических исследований, которые проводятся по определенным стандартам.

Виктор Резунков: Георгий Серафимович из Москвы, здравствуйте.

Слушатель: Здравствуйте. Очень хорошую тему вы сегодня обсуждаете. Но у меня масса сомнений в отношении правильности ваших советов. Вот консультант из «Красного Креста» рекомендует обращаться к врачам, если появились какие-то симптомы гриппозного порядка. А как учитывается в данном случае влияние закона о техническом регулировании, который в 2002 году отменил все нормативы по всем видам деятельности в России и принял решение разработать новые? В силу этого ответственности у изготовителей фармацевтических препаратов совсем никакой не осталось. Все эти многочисленные испытания, которые проводятся ими, им верить нельзя, потому что уже давно известно, что очень много фальшивых лекарств, так называемых «дженериков». Где, скажите, у нас гарантия в этом случае получить действительно объективную медицинскую помощь в поликлинике, а не заболеть еще чем-то дополнительно?

Андрей Дьячков: Хотел бы обратить внимание, что, безусловно, не нужно заниматься самолечением. И если ваше самочувствие у вас вызывает какие-то сомнения, необходимо, конечно, обратиться к врачу. Я перечислил некоторые признаки, когда точно нужно идти к врачу. И хотелось бы обратить внимание, что все-таки каким-то образом мы должны доверять производителям лекарств, потому что они за это отвечают своим именем, своей репутацией. И исследованиям, которые проводятся, у меня нет оснований им не доверять. Они проводятся независимыми экспертами и в соответствии с международными стандартами. Как раз вы можете быть уверены, что признанные в мире препараты прошли все испытания, и в их надежности и безопасности можно быть уверенным. И по поводу дженериков. Это не совсем поддельные лекарства, это просто лекарства, которые выпускаются не оригинальным заводом-производителем, но с использованием тех же самых действующих веществ.

Александр Жабский: То есть та же формула, ничем не отличается от бренда по составу, но имеет иное название. Но это никак не фальшивые лекарства, которые могут принести вред.

Виктор Резунков: Александр, Бологое, здравствуйте.

Слушатель: Здравствуйте. Очень хорошая тема, затрагивающая нужное дело в стране, да и вообще в мире. Я хотел бы предложить такую тему. Зимой перевести младшие классы, хотя бы до 6-го класса, чтобы они летом учились – июнь-июль, а зимой три месяца они бы находились дома. И дети бы не заболевали ОРЗ, может быть, гриппом.

Виктор Резунков: Хорошая идея! Ее можно обдумать и предложить.

Александр Жабский: Я думаю, школьники восстанут. Как я радовался, что есть каникулы, а есть еще возможность поболеть, погрипповать, как говорилось в мое детство. Я знал, что мама меня всегда вылечит и наш доктор районный.

Виктор Резунков: Юрий Николаевич из Москвы, здравствуйте.

Слушатель: Здравствуйте. В одной из радиопередач я слышал консультации специалиста, который рекомендовал, что Арбидол не очень-то эффективен для профилактики гриппа и укрепления иммунитета. Он рекомендовал Амиксин, кажется, антивирусный и укрепляющий препарат.

Андрей Дьячков: Буквально вчера я говорил со своим знакомым фармацевтом, и он сказал, что кто-то в какой-то программе упомянул название одного препарата, и на следующий день его не было в аптеках. Мне кажется, что такие высказывания по поводу того, что этот препарат действует, а этот не действует... Опять же можно обратиться к сайту Минздравсоцразвития, Роспотребнадзора, к врачам, и они назначат те препараты, которые действительно работают.

Александр Жабский: И вообще лучше всего действует, мне кажется, здравый смысл. А все, что из этого вытекает, то и будет полезно.

Виктор Резунков: Марина Майорова, наш постоянный слушатель, пишет: «Действительно, сплошные сомнения. Сегодня была на приеме у невропатолога, та предложила мне сделать вакцинацию. У нас в поликлинике ее делают. Заглянула к терапевту, та посоветовала не спешить, так как в июне у меня была сложная гинекологическая операция, да и лет мне более чем. Может быть, действительно пару месяцев подождать?».

Андрей Дьячков: Диагнозы по телефону врачами никогда не ставятся. Поэтому прислушайтесь к совету специалиста, который непосредственно с вами общался, он вас лучше знает и знает вашу ситуацию.

Александр Жабский: А лучше сходить к главврачу поликлиники, и пусть он проведет консилиум.

Виктор Резунков: Михаил Андреевич из Москвы, пожалуйста.

Слушатель: Я - не стандарт, у меня такой принцип: если хочешь быть здоров, меньше слушай докторов. Поэтому я лечусь пивом с водкой.

Андрей Дьячков: Я надеюсь, что этого не слышали дети и подростки.

Виктор Резунков: Марина задает вопрос: «Какова должна быть санобработка марлевых повязок? Может ли стирка или кипячение уничтожить вирус? Если мы носим повязку, значит, мы свой собственный вирус глотаем».

Андрей Дьячков: В некоторых газетах в Питере уже призвали изготавливать марлевые повязки самостоятельно. В принципе, вирус порядка 6 часов на объектах окружающей среды может оставаться. Поэтому стирка, которая подразумевает потом сушку, она вирус уничтожит. Но если вы сами имеете симптомы заболевания, и вы возьмете чистую повязочку руками, на которые чихнули, то, соответственно, эту повязочку нужно отправлять обратно в стирку. Поэтому мойте руки почаще, пожалуйста.

Виктор Резунков: Алла Павловна из Москвы пишет: «Панику в связи с эпидемией искусственно создают заинтересованные лица. Вчера купила в аптеке марлевые повязки по 9 рублей, а неделю назад они стоили 3 рубля. Оксолиновой мази нет, зато есть Арбидол, и он широко рекламируется по телевизионным программам. Какие деньги наживают бизнесмены!..».

Александр Жабский: Кто-то, видимо, и наживается. Но я-то все-таки убежден, что вряд ли нажива идет по линии антигриппозных препаратов. У нас знают, что люди этим запасаться сильно не будут. Хотя в отдельно взятом месте могли и сыграть на этом.

Виктор Резунков: Давайте обсудим ситуацию в Петербурге, в частности. Интернет-издание «Фонтанка.Ру» сообщает: «Специалисты НИИ Гриппа заявили, что в Петербурге пора объявлять об эпидемии гриппа. Врачи 12 ноября сообщили журналистам, что количество заболевших горожан ежедневно растет в геометрической прогрессии. Пора привлечь к ситуации внимание общественности, уверены они. По данным НИИ Гриппа, большая часть Европы, 48 штатов США и Канада уже охвачены эпидемией. При этом выделяется порядка 10 тысяч вирусов, курсирующих по всему миру, основным среди которых является грипп типа A/H1N1, в народе именуемый «свиным». В России эпидемия пока зарегистрирована лишь в нескольких регионах: Приморском крае, Восточной Сибири и Забайкалье. В Институте гриппа уверены, что Петербургу уже давно пора последовать их примеру - эпидемиологический порог в городе превышен на 50% (для сравнения, в Чите эта цифра составляет 700%). В середине октября во Всемирной организации здравоохранения обсуждались особенности пандемической болезни. Оказалось, что A/H1N1 имеет ряд особенностей: основная масса заболевших - люди в возрасте от 5 до 30 лет. Это молодые, здоровые люди, многие из которых, в результате, попадают в палаты реанимации. При этом порядка 25-30% требуется искусственная вентиляция легких и интенсивная терапия. Однако, наиболее опасен «свиной» грипп для детей до 2-х лет, людей с нарушением обмена веществ, а также имеющих хронические заболевания бронхолегочной системы и пожилых. Кстати, в НИИ Гриппа говорят, что паника недавних лет, вызванная сообщениями о «птичьем» гриппе, очень сильно помогла ученым. Вакцину от «свиного» создавали по образу и подобию средства от уже слегка подзабытого H5N1. Прививать от A/H1N1 в России начали 9 ноября».

Александр Жабский: С другой стороны, в другой публикации говорилось, что та вакцина не удалась. Конечно, это специфика научных исследований, и говорилось не в шутку. Ну, как не верить нашему НИИ Гриппа?! Авторитетнейший. Единственно, мы можем, может быть, протранслировать еще раз их тревогу Роспотребнадзору, который принимает решения о принятии мер для того, чтобы считать это эпидемией в городе или нет. Мы не в состоянии этого сделать.

Виктор Резунков: Я приведу выдержки из публикации в российских средствах массовой информации, которые рассказывают о том, какие методы лечения применяются в России. «Традиционные и не очень народные рецепты регулярно озвучивают с телеэкранов ведущий и гости популярной программы «Малахов+». Один из сентябрьских выпусков был посвящен гриппу, и из него можно было почерпнуть следующее: грипп (обычный, не свиной) весьма успешно лечится спиртовыми обтираниями, чаем с лимоном и малиной. Чеснок же Геннадий Малахов советует не есть, а нарезать пластинками и положить между слоями самодельной марлевой маски - по его словам, такие чесночные ингаляции, вдыхание «обеззараженного» воздуха, «на 100% защитят от любого гриппа».

Андрей Дьячков: Я скажу, что существуют записи египетских иероглифов, где было указано, сколько лука и чеснока было съедено при строительстве египетских пирамид. Чеснок никто не отменял. Ну, обтираться спиртом в нашей стране тяжело рекомендовать, потому что этим может не ограничиться, во-первых, а во-вторых, это все-таки не панацея. То же самое и относительно других домашних средств. Все-таки какое-то здравомыслие должно присутствовать и беззаботного отношения не должно быть. Если три-четыре дня вы пробуете лечиться – не получается, то обязательно надо обращаться к врачу. Если что-то вас смущает раньше, идите раньше.

Александр Жабский: Я тоже так обычно делаю. Симптом почувствовал – принял меры. Но это не болезнь, это некий намек или сигнал, что она может возникнуть. Болезнь – это дело, конечно, уже медицинское.

Виктор Резунков: Дальше. «Вообще вся программа изобиловала рецептами, их прозвучало свыше десятка, и все они приведены в текстовой расшифровке на сайте. В основном речь шла о приготовлении различных настоев из лекарственных и огородных растений. На этом фоне самый необычный способ избавления от гриппа

озвучила гостья передачи, народная артистка Зоя Зелинская. Она поведала, что от запущенного гриппа, переросшего в сухой плеврит, ее спасло... пение (как своего рода дыхательное упражнение)».

Андрей Дьячков: Известный факт, что больным с пневмонией рекомендуют надувать шарик воздушный, разрабатывать легкие в период восстановления.

Александр Жабский: Был такой великий певец в Узбекистане Батыр Закиров, отец Фаруха Закирова, создателя «Яллы». А я выходец из Ташкента, поэтому его хорошо знал. Вот он от тяжелейшей формы туберкулеза спасся тем, что уехал в горы, ему врачи посоветовали, и надувал футбольные камеры – и выздоровел.

Андрей Дьячков: Но речь, наверное, не идет о тех ситуациях, когда вы остро заболели, первые несколько дней. И надо почаще менять воздушный шарик.

Виктор Резунков: Дальше продолжаю. «Насчет пения как средства профилактики гриппа медики молчат (некоторые, впрочем, утверждают, что больное горло нельзя перегружать, иной раз даже разговорами), однако они порадовали другим нетрадиционным и не менее приятным, чем пение, способом борьбы с простудными заболеваниями - это секс. Врачи из ряда стран Европы на днях пришли к выводу, что он является прекрасной профилактикой простудных заболеваний и защищает от вирусов при условии соблюдения двух простых правил: сексом следует заниматься регулярно и без фанатизма».

Александр Жабский: А как определить регулярность и фанатизм?! Это сложно. Но вообще хорошее средство, я скажу.

Виктор Резунков: Владимир из Москвы, здравствуйте.

Слушатель: Здравствуйте. Вот вы в вашей программе привели такой пример, что маски россияне уже используют даже для ограбления банков. Вообще российский человек имеет такую особенность превращать все в абсурд. Вот я сегодня прочитал статью в «Советском спорте». В шахматном турнире, который сейчас в Москве проходит, «Мемориал Таля» Иванчук воспользовался вот этой маской и одержал первую победу. То есть он психологически очень здорово подействовал на Бориса Гельфанда и обыграл его. Конечно, надо ко всему не так серьезно относиться, как сейчас это все раздули, всю эту шумиху. Надо предостерегаться, но не в такой степени, как нам это навязывают.

Александр Жабский: Российская абсурдность вообще все побеждает. Ну, может быть, и это тоже отчасти.

Виктор Резунков: Я продолжаю дальше. «Специалисты из Европы утверждают, что обмен слюной при поцелуе не представляет чрезмерной опасности в плане заражения. Портал отмечает, что у этих энтузиастов секс-терапии, безусловно, есть оппоненты, призывающие к воздержанию, чтобы избежать лишних проблем в период сезонного гриппа. Те, кто склонен прислушаться к совету последних, могут попробовать лечиться грибами: ученые пришли к выводу, что с их помощью можно снизить риск заболевания гриппом. Как оказалось, грибы активизируют работу цитокинов - протеинов, «которые играют ключевую роль в защите организма человека от заражения вирусами, а также способны уничтожать клетки злокачественных опухолей», - пишет газета «Дни.ру».

Андрей Дьячков: Опять же какие грибы...

Виктор Резунков: Ну да, если поганок наесться, то...

Андрей Дьячков: Опять же ругая фармакологические компании, вопрос: была ли у них контрольная группа, которая не ела грибы, у которых исследовали содержание цитокинов? Мне кажется, что предложение по поводу поцелуев все-таки критики не выдерживает. Недаром во французских школах уже давно выпущена рекомендация... При встрече сейчас молодежь часто лобызается в щечку, а этого категорически не рекомендуется делать. И у нас тоже не стоит этого делать. И такой рыцарский жест, как рукопожатие при встрече, на период эпидемии тоже рекомендуют ограничить.

Виктор Резунков: Елизавета Михайловна из Москвы, здравствуйте.

Слушатель: Здравствуйте. Я вот удивляюсь, что никто не скажет о том, что у нас школьники поголовно курят, и этим они наверняка ослабляют свои дыхательные пути, сопротивляемость вообще любой инфекции. Может быть, этим самым просто боятся задеть наше табачное лобби? И второе. А почему наши власти не обратят внимания на то, что в аптеках взвинтили цены на эти повязки и на средства от гриппа?

Виктор Резунков: Насколько известно, сейчас как раз обсуждается этот вопрос, и фискальные органы занимаются изучением того, почему повышаются цены на противогриппозные препараты и повязки.

Андрей Дьячков: А вот то, что касается курения, то я хочу сказать, что мы с Александром буквально перед началом эфира обсуждали тему подросткового курения. Безусловно, это снижает резистентность, устойчивость организма к вирусам.

Александр Жабский: А я-то другому удивляюсь: почему у нас не говорят не только о детском курении и курении вообще, а в целом об ослабленности народа? Ведь крепкий организм, напитанный витаминами... Вот моя мама спаслась в блокаду, когда ее вывезли по «дороге жизни», и врач военный, когда осматривал, он сказал: «Вы выжили только благодаря тому, что в детстве ели много ягод, грибов». Она росла в местности под Ленинградом. У нас ослабленный организм, у нас плохая структура питания. Я не доктор, конечно, но думаю, что и побочные эффекты разных вакцин антигриппозных тоже, может быть, больше проявляются на ослабленных организмах. Если бы люди хорошо питались, если бы люди были крепкие, сытые, бодрые, то, наверное, к ним меньше всякой дряни-то вязалось. Вот о чем еще надо думать. К сожалению, кстати, в послании президента об этом не было сказано ни слова.

Виктор Резунков: Но Госдума, по крайней мере, по поводу сигарет – акцизы повышаются.

Андрей Дьячков: Безусловно, идет борьба. Им запретили проводить всякие благотворительные мероприятия, чтобы не рекламировать себя.

Виктор Резунков: Валерия из Московской области, здравствуйте.

Слушатель: Здравствуйте. Я слышала в вашей передаче, кстати, что сказали, что в период активизации заболевания уже поздно прививаться, нужно было заранее, чтобы переболеть и приобрести иммунитет. Как вы на это смотрите? И еще у меня один народный рецептик. Мед, чеснок и лимон – вот эту смесь на ночь по столовой ложке и запивать теплой водой.

Андрей Дьячков: Любое лекарство хорошо в меру. У меня был один знакомый доктор, который говорил мне, что если пациент ест толченое стекло – и ему это помогает, то надо его оставить в покое с этим толченым стеклом. Ну а в отношении меда ничего не могу сказать. Единственно, у меня возникают сомнения относительно желудочно-кишечного тракта, который ежедневно мучается от чеснока с медом. Но если ваш организм переносит, плохого в этом ничего не будет.

И по поводу прививок. Конечно, прививаться должен человек, у которого нет проявлений заболевания. То есть должна быть нормальная температура, не должно быть никаких катаральных явлений – насморка, кашля, естественно, никаких болей в горле и других проявлений гриппа. И так прививка сработает. Понятно, что лучше это сделать раньше, но если не получилось, то прививайтесь. Если вы сейчас здоровы, то можно привиться, и прививка будет работать.

Александр Жабский: А вот если из того средства еще вычесть чеснок, а только натертый с цедрой лимон с медом смешать – меня так лечила мама, и так лечил я своих детей. И все здоровы, слава Богу.

Андрей Дьячков: Это музыка сфер.

Виктор Резунков: Сергей из Ростовской области, здравствуйте.

Слушатель: Здравствуйте. Допустим, человек заболел «свиным гриппом». Насколько известно, есть такой препарат Тамифлю.

Андрей Дьячков: Действительно, есть такой препарат, он рекомендуется и на международном уровне, и наши медики тоже не отказываются от того, что, да, он эффективен.

Александр Жабский: Но радиослушатель, видимо, хотел спросить: от другого вида гриппа он помогает, а от A/H1N1 поможет?

Андрей Дьячков: Помогает, да.

Александр Жабский: Значит, в Ростовской области можно лечиться и этим препаратом.

Виктор Резунков: Наша передача подошла к концу. И я закончу перечислением тех шести способов защититься от гриппа, которые рекомендует еженедельник «Аргументы и факты»: мойте руки, сдерживайте эмоции – поцелуи при встречах и пожимание рук, сделайте прививку, пейте витамины, ходите по лестнице, потому что это помогает повысить сопротивляемость организма, носите водолазки. «Когда человек чихает или кашляет, зона мгновенного поражения микробами может составлять до 1,5 метров. А следовательно, если вы сидите напротив кого-то, кто не совсем здоров, вам крупно не повезло. Прийти на работу в марлевой повязке - это чересчур, но вот надеть свитер или водолазку с высоким воротником вполне можно».

H1N1 has killed 3,900 Americans, U.S. CDC says

Reuters, 13 November 2009, 6:52 AM GMT+8
https://www.reuters.com/article/idUSN12428571/

Washington, Nov 12 (Reuters) - H1N1 swine flu killed an estimated 3,900 Americans from April to October, including more than 500 children, U.S. health officials said on Thursday.

More complete data and more comprehensive calculations than previously released now show that, in the first six months of the pandemic, H1N1 infected an estimated 22 million Americans and put 98,000 in the hospital, the U.S. Centers for Disease Control and Prevention said.

Of these totals, children account for 8 million of the infected, 36,000 of those in hospital and 540 deaths.

"I have already seen a larger number of deaths than we have had for several years," the CDC's Dr. Anne Schuchat told reporters. "I do believe the pediatric death toll from this pandemic will be extensive and much greater than what we see with seasonal flu."

In an average flu season, about 82 children die in the United States, the CDC says. But those are lab-confirmed cases, which Schuchat points out are far lower than the kinds of estimates released on Thursday.

For the first six months of this pandemic, 129 U.S. children who died had lab-confirmed H1N1 flu.

The CDC said swine flu is causing the worst flu season in the United States since 1997, when current measurements started.

"What we are seeing in 2009 is unprecedented," Schuchat said. "Influenza is really serious. The vaccines we have are the best way to protect patients."

But the vaccines are being produced and distributed slowly. Schuchat said 41.6 million doses were available or had been distributed but this is far below what had been expected.

"Last week we did mention that we had been led to expect about 8 million doses this week," Schuchat said. "Based on what we have today, we aren't expecting to meet that estimate that the manufacturers gave us."

Many things can go wrong with flu vaccine production, Schuchat noted.

Quick Antivirals

The CDC said doctors need to treat cases of severe flu quickly with the antiviral drugs Tamiflu, made by Roche AG, Relenza, made by GlaxoSmithKline, or for severe hospitalized cases, peramivir, made by BioCryst.

But a team of CDC experts said in a report released on Thursday that only about 75 percent of hospitalized patients with laboratory-confirmed pandemic H1N1 get them.

Schuchat stressed that the pandemic is not worsening but noted that it takes time to gather data on flu cases and deaths. Thursday's count is not an actual reckoning of deaths but is an extrapolation based on detailed data from 10 states.

CDC's precise count of confirmed flu deaths is 1,265.

"For influenza it's virtually impossible to find every case with a lab test. So the estimation method we are using now we believe gives a bigger picture, a probably more accurate picture of the full scope of the pandemic," Schuchat said.

In an average flu season, about 36,000 Americans die and 200,000 are hospitalized. But 90 percent of these are people over 65.

With H1N1, the opposite is true – 90 percent of those infected and seriously ill are younger adults and children.

And Schuchat pointed out that it is only November. "We have a long flu season ahead of us," she said. The U.S. flu season usually runs from October to May.

Most of the confirmed flu cases are H1N1 flu and about 30 percent of people who show up at the doctor's office and are actually tested for influenza turn out to have flu, as opposed to some other infection.

Из паники – в Пофигизм

Domik Новости, 13 ноября 2009
https://domik.ua/novosti/iz-paniki---v-pofigizm-n69513.html

Киевские власти говорят, что в городе – 31 больной свиным гриппом и 6 смертей. Власть, к ужасу иммунологов, требует немедленной вакцинации.

Когда свиной грипп в Тернополе только-только перестал быть предположением, дрожала и шепталась вся Украина. Вирус A/H1 N1 казался страшней любой другой опасности. «Самое яркое впечатление: две тетки в масках, перебегающие улицу на красный свет», - писали в одном из блогов. А что сейчас? За сутки, по официальным данным, в стране умирает по 15-19 человек, зараза точно в Киеве – а народ расслабился. Масок, во всяком случае, в транспорте стало на порядок меньше. Сработал механизм, о котором «Газету... » предупреждал социальный психолог Олег Покальчук: тема перестала волновать новизной, превратилась в гнетущую «почти обыденносты» – и сознание старается ее вытеснить. Вдобавок мы убедились, что можно перенести свиной грипп, благополучно выздороветь, и только потом узнать, чем болел.

– Умирают в основном те, у кого есть осложнения по другим хроническим заболеваниям, – рассказала вчера на брифинге заммэра Ирэна Кильчицкая. – Это диабет, болезни эндокринной системы, ожирение. Или те, кто поздно обратился за помощью. Среди умерших – одна беременная женщина с диабетом.

По словам Кильчицкой,до понедельника в Украине работало всего 2 лаборатории, которые могли диагностировать свиной грипп: е институте Громашевского и в институе гриппа. Каждая из лабораторий могла делать не больше 30 анализов в сутки. Это очень мало, поэтому у многих диагностировали свиной грипп уже после того, как они переболели и выздоровели.

С понедельника государственная санитарная служба открыла лабораторию, где могут определять штамм вируса за 8 часов. Экспресс-тесты далеко не всегда говорят правду.

Были случаи, когда они не подтверждали наличие вируса свиного гриппа, а длительный тест потом подтверждал. И наоборот.

Обнаружили вирус у девочки, дочки 35-летней женщины, умершей от свиного гриппа в ночь со 2 на 3 ноября (напомним, это был первый смертельный случай в Киеве). Но девочка идет на поправку. Из 3-ей детской больницы выписался 3-месячный ребенок.

Лишь после его выздоровления определили, что малыш переболел именно свиным гриппом. В больнице N°9 сейчас лечится гражданин России. 3 ноября у него, когда он был еще на родине, диагностировали свиной грипп. был в больнице, пошел на поправку, выписался и приехал в Киев 7 ноября в командировку. Здесь ему снова стало плохо. И результат анализа снова подтвердил, что у него свиной грипп. Еще два подростка 17 и 18 лет лежат в детской больнице, им стало лучше.

Власти убеждают, что ужесточать карантинные меры, несмотря на такую статистику, не стоит. Уровень заболеваемости резко не увеличивается, остается примерно на одном и том же уровне. Прогнозируют, что так будет и в дальнейшем. А вот второй всплеск заболеваемости прогнозируют, когда закончится карантин и студенты начнут возвращаться в Киев.

Недавний страх перед свиным гриппом притупившийся у всех

...

Премьер Юлия Тимошенко заявила вчера, что наметившийся спад с 8 ноября прекратился и 10 ноября количество заболевших за сутки, увеличившись в 2 раза, достигло 90.592 человек. Тимошенко заговорила об «угрожающей динамике, требующей снова более активных действий».

А это, с ее слое, - обеспечение врачей лекарствами и оборудованием (хотя недавно мы слышали, что «страна полностью подготовилась»!) и немедленная вакцинация как от сезонного гриппа, так и от калифорнийского. Прививать нас собираются бесплатно и добровольно. Но ведь медики говорили, что во время эпидемии это бесполезно и даже вредно!

Спад по «гриппу вообще» в Киеве продолжается Мы не сообщали киевским медикам, что обращаемся к ним, чтобы поставить под сомнение слова премьера. Но никто о всплеске заболеваемости рассказать не смог.

– К нам с первых чисел ноября стало обращаться на 30% меньше больных с ОРВИ и гриппом, -говорит начмед поликлиники Подольского района N°2 Игорь Омельченко. – А с 7-8 числа мы отмечаем уменьшение на 5-7%.

– На выходных таких пациентов было много, но с понедельника – все меньше, рассказывает Леся Дорошенко, начмед поликлиники Дарницкого района N°3, – больше больных с ОРВИ и гриппом? Да нет же, их в последние дни становится меньше, – удивляется Валентина Антонова, зам главного врача поликлиники Шевченковского района N°3.

Допустим, увеличение - не за счет столицы, а за счет востока страны. Об этом вчера говорил и главный санврач страны Александр Биловол, тоже настаивающий на вакцинации. Но разве в Минздраве не подозревали, что грипп поползет туда? Почему же тогда «снова активные действия» понадобились внезапно, а не были выполнены заранее, без шума и пыли? И кто заслужил за это хорошего ремня?

А Польша неисследованной вакциной прививаться не будет...

Вакцинироваться от сезонного гриппа надо, от свиного - тоже. Но вот Ева Копач, глава польского Минздрава, отказалась проводить вакцинацию от A/H1 N1, пока фирмы, делающие вакцину, не предоставят результаты исследований ее безопасности. Критику в свой адрес Копач объяснила тем, что производители хотят быстрей заработать на вакцине, но не хотят брать на себя ответственность, если она вдруг нанесет вред. Украину это отчего-то не пугает.

Так или иначе, «Газета...» не раз печатала заявления иммунологов: делать прививку надо не во время эпидемии, а хотя бы парой недель раньше, чтобы иммунитет успел сформироваться. Есть и более жесткие мнения.

– Прививать во время эпидемии – это преступление! – считает ученый секретарь института микробиологии и иммунологии имени Мечникова Артур Мартынов. - Вы не отличите здорового человека от того, кто только что переболел в очень легкой форме, введете ему вакцину - и можете вызвать тяжелейший рецидив!

KURIER

Schweinegrippe: Drittes Todesopfer

Kurier, 13 Novewmber 2009, 20:16
https://web.archive.org/web/20091116073146/http://kurier.at/nachrichten/1954828.php

Die Schweinegrippe hat in Österreich einen 26-Jährigen das Leben gekostet. Der Student hatte eine angeborene Nierenkrankheit.

Die Schweinegrippe hat ein drittes Todesopfer in Österreich gefordert: Am LKH Graz ist ein Risikopatient laut *Kleiner Zeitung* gestorben. Der 26-jährige Student hatte eine angeborene Nierenkrankheit und war schon mehrfach nierentransplantiert. Der Student ist vor fünf Tagen mit Fieber ins Spital gekommen. Die Diagnose lautete H1N1-Infektion, erklärte die Pressestelle des Krankenhauses. Der junge Mann habe in Folge eine schwere Lungen- sowie eine Herzmuskelentzündung entwickelt, deren Verlauf tödlich gewesen sei. Eine Obduktion wurde angeordnet.

Von Geburt an habe der 26-Jährige an einer Erkrankung der blutreinigenden Organe gelitten. Da er nach den Einpflanzungen von fremden Nieren Immunsuppressiva nehmen musste, war sein Körper geschwächt und anfällig für Viren. "Alle Intensiv-Maßnahmen haben nichts geholfen," so Gernot Brunner, ärztlicher Direktor des LKH Graz.

Die Schweinegrippe hat zuvor bereits zwei Opfer in Österreich gefordert: Am 2. November war ein elfjähriges Mädchen aus Südtirol im LKH Innsbruck einer H1N1-Infektion erlegen. Am Dienstag starb ein 38-jähriger Mann in Schwarzach in Salzburg an der Folgen der Krankheit.

Aftenposten.no

John Hultgren, Ingeborg Moe, June Westerveld

Hvor er alle de syke?

Aftenposten, 13 November 2009, kl. 23:48
https://web.archive.org/web/20091116180546/http://www.aftenposten.no/helse/article3372691.ece

Aldri før i moderne tid har så mange nordmenn vært syke som nå, ifølge helsemyndighetene. Så hvorfor merkes det ikke mer i samfunnet?

Hver syvende nordmann har fått svineinfluensa. Pandemien har truffet oss for fullt. Bare i forrige uke ble 300000 nye smittet, opplyser Folkehelseinstituttet. Overlege Hans Blystad forteller at det aldri i moderne tid har vært så mange nordmenn som er influensasmittet i samme sesong.

Offentlige etater og private bedrifter har lagt kriseplaner for hva de skal gjøre i en slik situasjon der en stor del av arbeidsstokken kan forventes å ligge rett ut i sengen i stedet for å gå på jobb. Det er en situasjon der produktiviteten i samfunnet er forventet å gå ned. Hvor det ikke lenger er noen selvfølge at bussen eller trikken kommer når den skal om morgenen. Hvor butikker må stenge. Hvor samfunnet lammes.

Er Norge slik nå?

Lavere fravær

For å finne ut hvor vanskelig situasjonen er, har Aftenposten kontaktet 10 av Norges største bedrifter i tillegg til NHO, LO og Fagforbundet, som organiserer blant annet sykehuspersonell og andre offentlig ansatte. Fagforbundet kontaktet alle sine 19 fylkeslag. Spørsmålet alle har fått er hvor mange flere enn vanlig som er syke, og hvilke problemer det skaper. Det ga et litt uventet resultat.

–Vi overvåker sykefraværet kontinuerlig, men har ikke sett noen store endringer i det siste. Vi har understreket viktigheten av håndvask, være hjemme når man er syk, og eventuelt bruk av hjemmekontor for å hindre smitte, sier informasjonssjef Elisabeth Evjen i Telenor, som har 6500 ansatte i Norge.

– Sammenlignet med tidligere år ser vi faktisk at sykefraværet er noe lavere i høst. Det kan ha sammenheng med tiltakene, og at befolkningen har vært flinkere for eksempel med håndhygiene, sier Evjen

Heller ikke i Posten er det flere som er syke. Informasjonssjef Kjell Rakkenes opplyser at sykefraværet i oktober ikke skiller seg ut. De har sett en økning i antall personer som er hjemme med sykt barn, men antallet er fortsatt lavt.

Vaksinert

Tone Zander er informasjonssjef i Fagforbundet. Torsdag ba hun i en e-post alle fylkeslag om å melde inn rapporter om mannskapsmangel rundt i kommunene. Bare ett fylke meldte tilbake. Det var Vestfold, og de meldte at alt var i orden. Da ringte Zander rundt til ytterligere fire, og situasjonen var ikke så annerledes der.

– Det er ingen som rapporterer at de har noen krise. Flere mener det kan være fordi mange er vaksinert, forteller hun.

– Overrasker det deg?

– Jeg vil si at hvis dette er riktig, så tyder det vel på at helsemyndighetene har gjort en god jobb, sier Zander.

Men det etterlater uansett spørsmålet om hvor de er, alle de som er syke. En mulighet er at anslagene fra Folkehelseinstituttet rett og slett er feil, men flere eksperter Aftenposten har kontaktet sier den metoden som brukes, er god. Det påpekes likevel at det er betydelig usikkerhet knyttet til anslagene, men at det ikke finnes bedre måter å gjøre dette på. Folkehelseinstituttet opplyser at overvåkingssystemet deres dekker 15prosent av befolkningen.

– Hvorfor ser vi ikke større konsekvenser i samfunnet?

– Størstedelen av dem som smittes, er under 30 år. Det er en stor andel skoleelever og studenter. Derfor merker kanskje ikke arbeidslivet det like mye. Skolen merker det mest, sier lege Siri Hauge ved Folkehelseinstituttet.

Mild sykdom.

Tallene for bekreftede tilfeller av svineinfluensa er svært lave i forhold til det antallet nordmenn som egentlig er smittet. Men disse tallene viser likevel at mer enn en tredjedel av dem er mer enn 30 år gamle. Man skulle altså tro at de ikke lenger er studenter.

Så hvorfor rammes da ikke arbeidslivet hardere?

– Jeg tror den viktigste årsaken er at dette er en mild sykdom. Det er derfor ikke noe langt sykefravær vi snakker om. For noen er sykdommen så mild at de ikke vet at de har den, og likevel går på jobb, sier professor Steinar Westin ved Institutt for samfunnsmedisin ved Norges teknisk-naturvitenskapelige universitet (NTNU).

–Men det er en sykdom med to ansikter. For de fleste er den veldig mild, men for enkelte er den svært brutal. Hadde det ikke vært for det siste, så hadde vi møtt denne sykdommen med et skuldertrekk, sier Westin.

THE FLU CASE

Where are all the sick? asks Norwegian news paper

The Flu Case, 17 November 2009, 13:30

https://web.archive.org/web/20100102044537/http://theflucase.com/index.php?option=com_content&view=article&id=1847%3Awhere-are-all-the-sick-asks-norwegian-news-paper&catid=1%3Alatest-news&Itemid=64&lang=en

The news paper Aftenposten's headline "Where are all the sick", summarize their article where they compare the official numbers of sick, given by the Norwegian authorities and the simple fact that the sick are nowhere to be found in reality. Only in the last week, over 300.000 people were infected according to the official numbers from the Norwegian Helth Agency, Folkehelseinstituttet. This is an obvious bluff, so obvious that even normally controlled media can no longer play along.

John F. Edmaier, Wien.

Offener Brief an den Gesundheitsministe

Kronen Zeitung, 14 November 2009
https://web.archive.org/web/20091117014847/http://www.krone.at/krone/S99/object_id__171152/hxcms/index.html

Sehr geehrter Herr Minister, ich suche Antwort auf die Frage, wie weitsichtig die europäischen Gesundheitsbehörden eigentlich sind.

Einer namhaften Pharmafirma die auch in Österreich ansässig ist wurde bereits am 4. März 2009 die Bewilligung erteilt, einen Impfstoff gegen den (vermuteten) A/H1N1 (vulgo Schweinegrippe, vulgo Neue Grippe) zu entwickeln.

Allerdings ist der erste Krankheitsfall ironischerweise in Mexiko aber erst im April 2009 aufgetreten bzw. gemeldet worden. Hat die Lobby dieser Pharmafirma die Fähigkeit, in die Zukunft zu blicken?

Müsste nicht der verantwortliche Forscher, der den Impfstoff entwickelt hat, für den Nobelpreis nominiert werden? Oder handelt es sich um eine "erfundene Pandemie", um den Misserfolg mit dem vorangegangenen Impfstoff Tamiflu wettzumachen?

Warum wird eine Pharmafirma in Europa beauftragt/ermächtigt, einen Impfstoff zu entwickeln der voraussichtlich in Mittelamerika zuerst auftreten wird? Man könnte auch auf den Gedanken kommen, dass ein solches Virus im Labor entwickelt wird um dagegen einen Impfstoff entwickeln zu können, der bei entsprechender Panikmache dann gewinnbringend verkauft werden kann.

Oder ist die Entscheidung der europäischen Gesundheitsbehörde unter der Rubrik "europäisches Dogma" einzuordnen, dem von aufmüpfigen Steuerzahlern nicht widersprochen werden darf? Ihrer erklärenden Antwort sehe ich mit Spannung entgegen.

INFOWARS

Barbara Loe Fisher

H1N1: Fact or Fiction?

Infowars, November 14, 2009
https://web.archive.org/web/20091116070704/http://www.infowars.com/h1n1-fact-or-fiction/

It's been about six months since the Department of Health and Human Services and the Secretary of Homeland Security followed the World Health Organization and declared a very scary pandemic influenza public health emergency in the United States.[1]

Last spring we suddenly found ourselves watching You Tube videos of people being quarantined in hotels and detained on airplanes by HazMat teams.[2] When we went to the grocery stores, we encountered fellow Americans wearing face masks.[3] And every time we turned on the television, there were news reports about schools closing so desks and lockers could be scrubbed down.[4]

The Worst Is Yet to Come?

And we watched CDC press conferences[5] warning us that the worst was surely yet to come because the H1N1 swine flu virus first identified outside a pig farm in Mexico had the potential to mutate and kill tens of thousands more Americans[6] than the 36,000 that CDC officials tell us die every year from seasonal influenza.

It was enough to make us very, very afraid.

No Liability for Vaccine Makers

It was enough to make Congress give drug companies more than a billion dollars of our taxes to quickly create H1N1 swine flu vaccines[7] and then throw in another couple of billion dollars for health officials to deliver and aggressively promote vaccination in Sesame Street ads[8] and on the internet and radio and TV. And while they were at it, Congress shielded everyone who has anything to do with making, promoting and giving swine flu vaccines from all liability in civil court whenever somebody gets hurt or dies after getting vaccinated.[9]

It was enough to make us very, very afraid.

Health Worker Mandates & School Vaccination Programs

It was scary enough to make legislators in Massachusetts and other states talk about passing stronger laws to suspend civil liberties and force people to be quarantined or vaccinated whenever a public health emergency was declared.[10] It was scary enough to prompt New York state health officials to mandate that health care workers get seasonal and H1N1 influenza shots or be fired.[11]

And then there were calls by public health officials for children to line up and get vaccinated in schools[12] just like in the polio mass vaccination campaigns of the 1950's and early 60's.

Older Americans Have Antibodies to H1N1 Swine Flu

Throughout the summer, we were told that H1N1 swine flu was sweeping through the country[13] and millions of us had already been infected with the new virus and pregnant women and children were dying.[14] Curiously, many Americans over 60 were told they didn't need H1N1 vaccine because we were still protected by antibodies we got when we recovered from being infected with similar H1N1 flu strains in the past.[15-16]

Drug Companies Want Adjuvants, No More Eggs

And then, the vaccine manufacturers, who had been pressing the FDA for decades to let them use reactive squalene adjuvants[17] in vaccines, started complaining that they couldn't grow the H1N1 virus fast enough.[18] The threat of vaccine shortages suddenly loomed on the horizon.

The drug companies complained that they didn't want to use chicken eggs anymore to make flu vaccines. They wanted the FDA to let them use insects,[19] and e coli bacteria,[20] and fungus,[21] and virus like protein particles,[22-23] and dog kidney cells,[24] and other really, really interesting stuff.

This is an EMERGENCY they said and drug companies need to be allowed to make flu vaccine any way they want to right now because this is a really serious public health emergency.[25] And, oh by the way, let's not forget that it is so serious that everyone who has anything to do with making, promoting and giving new flu vaccines need to be shielded from liability in civil court if people get hurt or die after getting vaccinated.

Yes, it was enough to make us all very, very afraid.

H1N1 Swine Flu Looks Like Seasonal Flu

And when we are really afraid, we don't think we have time to ask questions or double check the facts. We just want someone to tell us what to do right now so we can feel safe and not afraid anymore.

By the end of the summer, while the drug companies and NIH were testing the new H1N1 vaccines on several thousand healthy American children and adults,[26-27] reports started coming out of Australia and the southern hemisphere where they had just finished their influenza season, that the H1N1 swine flu virus was really not so bad after all.[28-29] It was not causing excess mortality, which means there weren't more people dying from H1N1 than had died in years past from other seasonal flu strains.

Yes, people were getting sick with what looked like influenza just like they do every year but – for most people – it was a few days of fever, chills, body aches, runny nose and cough, maybe some diarrhea, staying in bed, drinking lots of water and juice, and then – feeling just fine again.

CDC Stops Confirming Most Suspected H1N1 Cases

Abruptly at the end of July – when the Secretary of Health quietly extended the national public health emergency declaration for three more months – the CDC announced they were not going to lab confirm suspected cases of H1N1 swine flu anymore.[30-31] The CDC told the states not to test Americans who were flooding doctors, offices and hospitals with symptoms of influenza and confirm that they WERE in fact suffering from type A or B influenza, especially H1N1 swine flu. The story was – if it looks like influenza then it IS influenza and can be ASSUMED to be H1N1 swine flu.[32]

Really? Is that how the CDC "scientifically" calculates how many Americans die from regular influenza every year?

Two to Four Flu Shots for Many Young Children

The decision to stop testing for H1N1 was followed by an announcement that all children between the ages of 6 months and 10 years – who had never gotten a flu shot before – should get 4 doses of influenza vaccine this year: two seasonal flu shots and two doses of H1N1 vaccine. Further, that the millions of chronically ill and disabled children and adults and also pregnant women should be the first in line to get two shots of influenza vaccine this year.[33]

And then Americans, who were still very afraid, started asking questions because most of us, who got sick with flu-like symptoms this year, realized that it was no worse than the flu we got last year. And most of us didn't know anyone who had died from the flu this year, which was true for most other years as well.

Two to Four Doses of Mercury?

And then we started asking questions about why young children needed two to four doses of influenza vaccine this year. And we thought – what is up with mercury still being in most vials of

influenza vaccine?[34] We thought – is it really a good idea to give children – whose doctors don't have access to single dose vials of mercury free flu vaccine – two to four doses of mercury this year? Especially when it is against HazMat regulations to pour unused mercury containing influenza vaccine down the drain or toss it into a garbage can?[35-36]

Is It Influenza, Seasonal, H1N1 or None of the Above?

And then a veteran investigative journalist at a major news network published an interesting report about the fact that 83 to 97 percent of all specimens of suspected H1N1 cases sent to the CDC by state health departments for lab confirmation last spring and summer came back negative – for not only H1N1 swine flu influenza – but also negative for ANY kind of type A or Type B influenza. at all.[37] Which confirmed what the CDC's influenza expert said at an FDA meeting in 2003: that 80 percent of all flu-like illness every year is not actually influenza but viral and bacterial infections that LOOK like influenza.[38]

Wait a minute. Didn't President Obama stand up at a press conference in October and say that 1,000 Americans, including about 100 children, had died from H1N1 swine flu?[39]

But were those 1,000 H1N1 lab confirmed deaths or deaths that were ASSUMED by the CDC to be deaths caused by swine flu?

And how does that number of deaths compare with the 36,000 deaths that CDC officials say are caused by seasonal influenza every year?[40]

People Started Asking Questions

And then something unusual happened. Doctors started asking questions and privately some of them told their patients not to bother getting the H1N1 vaccine.[41] And the people, who were still being told by health officials to be very, very afraid, started to do their own research using the great new Library of the World, the internet. People started asking more questions of their government health officials – not just in America – but in Great Britain[42] and the Netherlands,[43] in Germany[44] and Italy,[45] in Poland[46] and in Canada[47] and many other countries.

And then the poll results started coming in revealing that about 50 percent of us were saying "yes" I want to get a swine flu shot and[48] percent of us were saying "No, thank you."[48-49]

Fear or Facts?

And that is where it stands today. Some of us are still very afraid and some of us are not.

I am reminded of a famous quote from Abraham Lincoln: You can fool some of the people all of the time and you can fool all of the people some of the time, but you can't fool all of the people all of the time.

New Vaccine Ingredients Calculator

And I would urge those of you who want to get seasonal or H1N1 vaccines, to go to the homepage of the website of the National Vaccine Information Center at www.NVIC.org and look at the new Vaccine Ingredient Calculator, which will tell you how much mercury is in those vaccines.

Support NVIC's Research & Public Education Programs

And I would urge those of you, who want better vaccine science and the right to make vaccine choices, to become a donor supporter of the National Vaccine Information Center's research and public education programs.

Truth and freedom are not free, especially when there are so many doing so much to limit the people's access to both.

Korneuburg prosecutor stays silent on reasons why he dropped the Baxter case

The Flu Case, 14 November 2009, 14:34
https://web.archive.org/web/20100102044717/http://theflucase.com/index.php?option=com_content&view=article&id=1802%3Akorneuburg-prosecutor-stays-silent-on-reasons-why-he-dropped-the-baxter-case&catid=1%3Alatest-news&Itemid=64&lang=en

On Wednesday, I sent the Korneuburg state prosecutor Christian Pawle an email asking to see the files on his investigation into Baxter's contamination of 72 kilos of seasonal flu vaccine material with the live bird flu virus to assess what the basis for his decision to drop the case against Baxter was.

A memeber of the Korneuburg prosecutor's office told me on the phone on Wednesday it was possible, in principle, to see the files.

I asked for a reply by the end of Wednesday about whether I could see the files, but have so far received no information.

Questions that need to be answered include:

- how could 72 kilos of seasonal flu vaccine material be contaminated with the live bird flu virus when strict biosafety level 3 precuations are in place at Baxter's lab in Orth an der Donau close to Korneuburg that require the bird flu virus to be keep in siolation at all times in a separate lab etc?

- what was the exact sequence of events that led to the accidental contamination of the material as Baxter maintains?

- what records has Baxter maintained of the incident? Are the records complete?

- why did Baxter have the bird flu virus in its facilities in Orth an der Donau in the first place when it is a production and research facility not connected with the bird flu?

- what type of bird flu virus was it? Was it genetically engineered?

- why did WHO give Baxter the viru`s?

- how come the vaccine material with the live bird flu virus left the facilities without being properly radiated?

- how come it was sent under a false label to 16 labs in Austria, Germany, Slovakia and the Czech Republic via Avir in Vienna?

- how come Avir and a Czech lab, BioTest, have said the end purpose of the material was for use in regular flu vaccines when Baxter maintains it was research material?

- why was the contaminated vaccine material returned to Baxter?

- what has happened to the contaminated vaccine material?

NBC NEWS

Swine flu shows signs of peaking in some areas

NBC News // Reuters, 14 November 2009, 1:54 AM +08
https://www.nbcnews.com/id/wbna33912366

The winter flu season that began early in the northern hemisphere this year may be peaking in parts of north America and western Europe, the World Health Organization said on Friday.

In an update on the H1N1 swine flu virus, the WHO said parts of the southern and southeastern United States, as well as Iceland and Ireland, seemed to have weakening levels of disease.

But the U.N. agency, which declared a global flu pandemic in June, said that big sections of the United States were still experiencing "widespread and intense" flu infections. It described waves of outbreaks across Canada and in Mexico, where the first severe cases were identified earlier this year.

"In Europe and central Asia, overall influenza transmission continues to intensify," the WHO said, adding that almost all the influenza viruses analyzed in Europe in recent weeks have been the H1N1 strain and not seasonal flu.

While saying "high to very high intensity of respiratory diseases" have been reported in some parts of Europe including Belarus, Bulgaria and Russia, it said experts were now less concerned about a big outbreak in Ukraine.

"The initial analysis of information from Ukraine indicates that the numbers of severe cases do not appear to be excessive when compared to the experience of other countries and do not represent any change in the transmission or virulence of the virus," it said in a statement posted on the WHO website.

Israel has suffered sharp increases in flu infections and Mongolia has seen a severe impact on its health care system from people falling ill, the WHO said. China and Japan have also experienced continued increases but in much of south and southeast Asia the transmission rates are leveling off.

The H1N1 virus has now spread to 206 countries, with the latest reported laboratory-confirmed cases in Somalia, Nigeria and Burundi. There have been more than 6,250 deaths to date, mostly in the Americas region, according to the WHO toll.

"In the temperate region of the southern hemisphere, little pandemic influenza activity has been reported in recent weeks," the WHO said, while noting that Buenos Aires has had a cluster of pandemic flu cases.

Ukraine and Belarus have recently extended school breaks due to fears about the pandemic virus while Afghanistan declared a health emergency and ordered its schools shut for three weeks to battle it.

WHO spokesman Gregory Hartl said that school closures were among steps that could slow viral spread at the beginning of an outbreak, but had less usefulness once the flu had reached 5 percent of a given population.

"After the virus becomes more widespread in a country, closing schools has less of an impact," he told a news briefing earlier this week. "If you take a decision to close schools and universities and other institutions you have to be aware there are social and economic consequences of this decision."

Ajmone Kuqi, Jochen Becker

Hysterie um die Schweinegrippe

3NDR, 15 Novembre 2009, 00:00 Uhr
https://web.archive.org/web/20091119064205/http://www3.ndr.de/sendungen/zapp/archiv/medien_politik/schweinegrippe328.html

Das Schweinegrippe-Virus beherrscht die Schlagzeilen und das schon seit Wochen. Zwar weiß keiner so ganz genau wie es aussieht, wie es wirklich wirkt und vor allem, was dagegen wirkt. Aber viele Medien tun zumindest so, als wüssten sie es. Menschen, Viren, Sensationen und Spekulationen.

Die Schweinegrippe ist in den Schlagzeilen: "Infektionen explodieren" titelt die "Bild" am 3. November. Die Boulevardzeitung befürchtet am 21. Oktober "35.000 Tote". "Die unaufhaltsam Seuche" schreibt am 15. Juli die "Süddeutsche Zeitung". An Superlativen herrscht kein Mangel. Viele Medien schüren eine "Epidemie der Angst" ("Tagesspiegel" vom 5. November), verbreiten Panik: "Ein Killer-Virus, das für Zehntausende Todesfälle allein in Deutschland verantwortlich sein wird, vermuten Seuchenexperten", ist etwa in "Spiegel TV" vom 21. Oktober zu hören. Dr. Günther Jonitz, Präsident Ärztekammer Berlin, meint: "Das Bild, das derzeit von der Schweinegrippe gezeichnet wird, ist krass überzogen. Die Schweinegrippe wird als flächendeckende tödliche Bedrohung, insbesondere für Junge, Gesunde dargestellt, wo man also schleunigst sich unbedingt impfen lassen muss, um nur ja nicht krank zu werden." Norbert Bolz, Professor für Medienwissenschaft, erklärt, "das fasziniert die Aufmerksamkeit und es macht Angst. Insofern gehören die Massenmedien natürlich auch zu einer Art Angstindustrie, die davon lebt, dass Informationen nicht neutral und besonnen aufgenommen werden, sondern dass sie unmittelbar emotionalisieren und in dem Fall eben Angst schüren".

Fast täglich Tote auf dem Titel

"Bild" zählt die angeblichen Opfer der Schweinegrippe. Jeder einzelne Fall wird zelebriert. Besonders der Tod der 15-jährigen Büsra. Ihr Schicksal wird bei "RTL aktuell" dramatisch ausgebreitet. Dort heißt es am 6. November: "Im Fall von Büsra aus Kassel hatten die Ärzte alles versucht, um das Mädchen zu retten. Ihre Schule bleibt vorerst zwei Tage geschlossen, nicht wegen der Schweinegrippe, sondern damit Freunde und Mitschüler ihre Trauer verarbeiten können." Die Schülerin ist für "Bild" ein Opfer der Schweinegrippe. Nach Angaben des Gesundheitsamtes ist noch unklar, was die tödliche Herzmuskelentzündung verursachte. In einer Presseerklärung heißt es: "Bei dem Mädchen wurde das Schweinegrippevirus H1N1 nachgewiesen. Dies bedeutet jedoch nicht, dass das Virus nachweislich die Ursache der Herzmuskelentzündung ist."

Für Norbert Bolz bestehen "die Interessen der Medien (...) natürlich einerseits darin, über die Welt zu informieren, die über die Lage zu informieren. Auf der anderen Seite aber darin auch Sensationen zu verbreiten, das heißt ja nämlich die Aufmerksamkeit der Zuhörer und Zuschauer zu fesseln".

Verharmlosen und Dramatisieren

Auch in der Berichterstattung über die Impfung gilt: nur nicht verharmlosen. Selbst der "Spiegel" zitiert angesichts der Impfung am 3. August: "Was wir hier erleben, ist ein Großversuch an der deutschen Bevölkerung". Der Kölner Express berichtet am 4. November über den "Kollaps bei der Impfung". "Frau stirbt nach Impfung", heißt es bei "Bild" am 12. November in der Überschrift. Nur

klein im Text darunter die Einschränkung durch den Witwer: "Es besteht kein Zusammenhang zwischen der Impfung und dem Tod meiner Frau. Sie hatte unmittelbar nach der Impfung keine Beschwerden."

Dr. Günther Jonitz meint: "Das Problem, was wir allerdings in einer solchen dramatisierenden Berichterstattung zu Krankheiten haben, ist, dass damit jede Menge Menschen unnötig verängstigt werden, (...) und dann nicht zur Impfung gehen und sich nicht behandeln lassen, obwohl es eigentlich für genau diese Menschen sinnvoll wäre. Das heißt, das Aufrühren von Emotionen, das schüren von Gefühlen dient letztendlich nur dem Geschäft, aber nicht der Gesundheit."

Zahlen-Verwirrung und viel Emotionalität

Es gibt haufenweise Zahlen von Infizierten in allen Medien. Sie gaukeln Wissen vor, wo in Wahrheit Unklarheit herrscht. Menschen erkranken und sterben als Zahl im Balkendiagramm. Bei "Bild" startet die Infektions-Rakete. Zwischendurch gibt es in der Zeitung Expertenprognosen: "30 Millionen Kranke". Es herrscht Zahlenwirrwarr. Dr. Günther Jonitz erklärt: "Die Zahlen haben eigentlich überhaupt keine Aussagekraft. Denn wenn ich wissen möchte, für mich persönlich, wie gefährlich ist die Krankheit, dann reicht mir nicht aus zu wissen, wie viele sterben dran. Ich muss dann vor allen Dingen wissen, wie viele erkranken an der Krankheit und wie viele Menschen gibt es überhaupt." Für Norbert Bolz ist klar: "Niemand weiß, wie groß die tatsächliche Bedrohung ist, aber genau das kann man nicht senden und das kann man auch nicht drucken, denn zu sagen ich weiß es nicht, ist keine Information. Das ist uninteressant und wird deshalb auch von den Medien nicht berücksichtigt."

Dafür gibt es massenhaft Mitgefühl, zum Beispiel in der Sendung "Kerner". Hier wird der Fall einer Frau mit Schweineg endig als Familiendrama inszeniert. Im Sportclub im NDR Fernsehen wird am 8. November jemand im Studio geimpft, kommentiert von Moderator Gerhard Delling: "Absolute Stille, da kann man hören, wie die Nadel hineingeht. (...) Ist die Schweinegrippe so gefährlich wie die Einen sagen? Ist sie besonders gefährlich für die Sportler?" Selbst der "Bild" - Chefredakteur Kai-Diekmann lässt sich mutig impfen. Seine Erkenntnis gibt es im Video vom 26. Oktober in seinem Blog zu sehen: "Das wars schon?" meint Diekmann zur Ärztin, die antwortet: "Das war es schon".

Plakative Einzeleinschätzungen – auch von Experten

Prof. Christian Floto, Wissenschaftsredaktion "Deutschlandfunk", meint: "Das ist ein Prinzip: Geh du voran! Schaut, macht es uns nach. Ich weiß nicht, was da die Botschaft sonst anders sein könnte. Ich halte das allerdings für bedenklich. (...) Die gesamte Differenzierung, die wir auch versucht haben, mit Informationen in den Medien auch zu geben, wird geopfert zugunsten einer plakativen Einzeleinschätzung, die überhaupt völlig unfundiert ist." Plakative Einzeleinschätzungen bietet auch eine schier unerschöpfliche Zahl von Experten. Zurate gezogen aus Ratlosigkeit. Ihre Aussagen werden nur selten hinterfragt oder eingeordnet. Christian Floto sagt: "Wofür ist jemand Experte? So werden hier auch Experten benannt für Schweinegrippe, die beispielsweise nie einen Patienten gesehen haben, weil sie von Haus aus Biologen, Biochemiker, Grundlagenforscher sind. Das sind hervorragende Virusforscher beispielsweise, aber was den klinischen Verlauf angeht, haben die noch nie einen Patienten gesehen und können irgendwo wirklich den Einzelfall auch einordnen."

Für Norbert Bolz liegt "das größte Problem bei der Heranziehung von Experten, also Leuten wie meinesgleichen, die aus dem Bereich der Wissenschaften kommen, in dem Fall natürlich vor allen Dingen der Medizin, (...) darin, dass die Experten auch etwas lernen, im Umgang mit den Medien. Nämlich dass sie überhaupt nur noch gefragt werden, wenn sie extreme Meinungen produzieren".

Für die Journalisten läuft das Geschäft mit der Angst gut in diesen Tagen. Die erste Grippeimpfung, war ein mediales Großereignis. Parallel zur Schweinegrippe grassiert die Medienpandemie, die Ängste schürt und sich völlig unkontrolliert verbreitet. Prof. Christian Floto: "Diese mediale Unwucht, diese Verzerrung, die da stattfindet, die ist eigentlich keinen einzigen Tag mehr auszuhalten."

LE FIGARO

Grippe: 3 écoles fermées en Pyrénées

L Figaro, AFP, 15 Novembre 2009, à 12:29
https://www.lefigaro.fr/flash-actu/2009/11/15/01011-20091115FILWWW00059-grippe-3-ecoles-fermees-en-pyrenees.php

Trois établissements scolaires des Pyrénées-Atlantiques, une école, un collège et un lycée, seront fermés à compter de lundi matin pour une semaine en raison de cas groupés de grippe H1N1, a annoncé la préfecture. Les trois établissements concernés sont le collège Henri IV et le lycée Paul Rey à Nay, et l'école Sainte-Marie à Biarritz, a indiqué la préfecture dans un communiqué.

"Au cours de la semaine du 9 au 13 novembre, un niveau élevé d'absentéisme pour des syndromes grippaux a attiré l'attention et induit des vérifications sérologiques sur un échantillon" de ces trois établissements, selon la même source.

"Les résultats des analyses ont été connus cette après-midi et ont confirmé, dans la totalité des cas, une infection au virus de la grippe H1N1", poursuit le communiqué.
Les trois établissements n'accueilleront aucun élève de lundi à samedi inclus, a-t-elle précisé.

THE FLU CASE

Three schools closed in south of France because of pandemic:
are Baxter vaccines the cause?

The Flu Case, 16 November 2009, 11:04
https://web.archive.org/web/20100102010044/http://theflucase.com/index.php?option=com_content&view=article&id=1821%3Athree-schools-closed-in-south-of-france-because-of-pandemic-are-baxter-vaccines-the-cause&catid=1%3Alatest-news&Itemid=64&lang=en

Three schools have been closed in the south of France, in the Pyrenees-Atlantic region following an outbreak of swine flu.
The college Henri IV and a grammar school in Nay as well as the Sainte Marie school in Biarritz have been closed from today, Monday, for a week because so many pupils are sick, according to Le Figaro.

=>

Jean-Jacques Crèvecoeur predicted in a report dated October 23rd that any pandemic in France would start in the south, noting that stocks of Baxter vaccine material were delivered at the end of August to a facility at Miramas, Provence, where they are kept under military guard.

Dr. Leonard G. Horowitz

Protect yourself from death by "Cytokine Storm," gross criminal negligence, and murderous official malfeasance

911 Blogger, 16 November 2009 // First Published: 15 November 2009
https://nwoobserver.wordpress.com/2009/11/17/protect-yourself-from-h1n1-flu-shot-conspiracy/

People worldwide now realize there is something foul brewing in the H1N1 swine flu vaccines, government prescribed drugs, and the mass media manufactured "emergency." I guarantee H1N1 will not kill you.

What can and probably will if you don't take this warning seriously, and act on it, is *Death By Toxic Shock*, resulting from an overwhelmed immune system, thanks to a combination of chemical and biological assaults, officials' malfeasance, and gross criminal neglect of the deadliest, most common, naturally-remedied killer – the "cytokine storm."

Since the normal seasonal flu is about 94% more deadly than the current H1N1 pandemic, it is not likely to kill you or especially healthy children and teens.

So why are young people with most solid immune systems said to be most vulnerable to death from the "pandemic" flu?

Fueled by the imposed geopolitics and economics that triggered World War I, the 1918 Spanish Flu is estimated to have killed between 50-100 million people.

Mostly young healthy victims, experts say, were vulnerable, as they are today, attributable to immune system hyper-stimulation called the "cytokine storm."

Cytokines are blood messengers that act like hormones in your body enabling cells to communicate. Every cell is intelligent and knows what it needs to sustain itself. It does so by sending messages within and around itself to regulate everything much like your heartbeat is regulated by adrenalin and other chemicals that operate bio-energetically, passing messages electro-magnetically and bio-acoustically. This life-sustaining system is naturally tuned like an orchestra by each hormone, cytokine, or "instrument" playing an important part in the symphony of your "living temple."

If one or more of these music makers suddenly decides to play solo, raising its volume unnaturally, or if suddenly a thousand trumpets were injected into the brass section, then every other instrument has to compensate by likewise playing, even screaming, louder to be heard. The noise becomes stressful and unbearable to the audience.

Similarly, cytokines are finely-tuned electrochemical messengers responsible for system-wide (i.e., systemic) homeostasis or balance in your body. Scientists observe their increase following trauma and infections. So their numbers have everything to do with body electro-chemistry since trauma, toxicity, and infections require white blood cell body guards to fight for your life, requiring oxygen and generating acid much like muscles generate lactic acid during contractions.

Too much acidity following inflammation or immune system hyperactivation, combined with lowered oxygen levels following similar repeated intoxications, and you have a real problem – *Death by Toxic Shock and Cytokine Storm*.

Over-production of cytokines occurs during intoxications (especially from adjuvanted vaccinations) and there is some evidence they may be the primary cause of death in Toxic Shock Syndrome (TSS) and other systemic infections such as yellow fever wherein circulatory shock develops secondary to cytokine storm. The "storm" spreads pieces of virus and body proteins throughout your body like a mushroom cloud spreads radioactive fallout and death following a nuclear blast.

A cytokine storm is evidenced by blood analysis showing increased levels of messenger molecules including interleukin (IL)-6, IL-1 receptor antagonist, inferno-inducible protein-10, tumor necrosis factor (TNF) alpha, and others too confusing for public discussion.

Suffice it to say that when the cytokines are exploding in numbers, fluid and immune cells accumulate in critical organs such as lungs, heart, kidneys, liver, and elsewhere, causing multi-organ failure, and hemorrhaging as seen in the aftermath of graft and organ transplant rejections, and in the lungs of cytokine storm victims of Acute Respiratory Distress Syndrome (ARDS), SARS, and hemorrhagic pneumonia now spreading in the Ukraine as a co-infection among vaccinated and non-vaccinated carriers of H1N1.

So herein lies the main problem – the greatest gravest risk.

"Live" injected viruses (i.e., vaccinated H1N1s) are now spreading from vaccinated persons to the vast majority of people who are refusing to take vaccines.
As the H1N1s spread, many of them pick up more deadly genes from viruses along the way.

Add to these infectious inoculations and mutating transmissions (both grossly neglected by health officials and their marketing media), additional intoxicating chemicals in our air, food, and water, and more pollutants from vaccines containing adjuvants, and you have now diagnosed the primary cause of cytokine storms, severe sepsis, toxic shock, and deaths by intoxicating faith in drug-pushers profiting BigPharma.

It is a disgrace to the human race that every reasonably informed medical doctor and public health official knows this! Vaccine pushers tell you that young healthy people who have stronger immune systems are at higher, not lesser, risk of suffering cytokine storms following acute intoxications and infections. So they can't claim ignorance when they inject you with toxic ingredients in immune hyper-stimulating vaccines. This is egregious, grossly criminal, murderous negligence!

Diagnosing Gross Criminal Negligence and Second Degree Mass Murder

Can you imagine health officials prescribing vaccines and drugs that directly cause, or significantly increase, the vast majority of deaths associated with H1N1-linked cytokine storms?

Who better than vaccine scientists and immunologists would know more about this murderous activity? What about President Obama's science czar, John Holdren?

Stewardship of the 2009-2010 H1N1 Swine Flu "national emergency" by the Obama administration is advancing akin to mass murder motivated by profit and the goal to depopulate more than half the world's population.

You think this is foolish conspiracy nonsense? Research the "health reformers," drug pushers, and media moguls in the Partnership for New York City, the Population Council, and you will learn why Holdren wrote the book Ecoscience (in 1977), calling for massive depopulation using vaccinations for sterilization! (Nonoxynol-9, a spermicide linked in early research to spontaneous abortions, and currently to Toxic Shock Syndrome and birth defects, is in the MF59 adjuvant added to many H1N1 flu vaccines.)

Not only is mass murder evidenced by gross criminal neglect of cytokine storm triggers, but also the repeated hideous attacks on American health freedoms. Non-toxic alternative preventatives and curatives for infectious diseases *have been outlawed in health food stores*, restricted in clinics, and prohibited on the Internet by BigPharma's prostitutes in Washington.

It is treasonous to murder ignorant innocent people lulled into cytokine storms by savvy media "shortage marketing," and fraudulent claims of vaccines' safety and efficacy based on studies lacking placebo controls and long term observations. Totally toxic mercury, Tamiflu, and Relenza are additional prescriptions for death by systemic shock.

Humanicide – the mass killing and enslaving of people everywhere to drugs for profit and population control–best describes the inexcusable neglect of public education and common sense recommendations, including no risk, low-to-no-cost, natural preventatives to cytokine storms including alkalizing body chemistry through good nutrition and pH-adjusted hydration.

Is it too much to expect health officials to recommend powerful anti-viral vitamins C, D, and immune supportive antioxidant vitamin E? Instead, it is unforgivable that federal authorities and attorneys general are persecuting intelligent better-informed people who choose to exercise their right to "life, liberty, and the pursuit of happiness" – our First Amendment US Constitutional rights to access "free markets" wherein natural preventatives and curatives once available, such as vitamin B17, are now gone.

People in every state and province in North America must now fight for their rights by filing legal complaints to raise public awareness and compel officials' accountability for this ongoing genocide, legally-termed negligent homicide.

Prevention Through Public Education & Natural Product Utilization

People with Acute Respiratory Distress Syndrome (ARDS), SARS, and cytokine storms, do best when treated with a variety of antioxidants. Nathens et al showed that critically ill patients treated with vitamin C and E antioxidants suffered fewer multi-organ failures than others treated without these vitamins.

According to Heyland et al, antioxidants, particularly selenium, lowered death rates among critical care patients. DeFlora et al., showed that nutritional supplementation with N-Acetyl-Cysteine (NAC), a precursor of the antioxidant glutathione, significantly reduced flu patients'symptoms.

Lock and other medical doctors published that acetaminophen or paracetamol (Tylenol, Panadol) depletes glutathione in the body, while ibuprofen (motrin) does not.

Taking fish oil containing Eicosapentaenoic acid (EPA) (and gamma-linolenic acid [GLA]), is a powerful immune suppressant that can reduce vaccine-adjuvant-triggered cytokine storms.

These oils are recommended by vaccination intoxication expert and neurosurgeon Russell Blaylock.

High doses of EPA make you more susceptible to infections, but because it is a natural immune suppressant, it can tame a deadly adjuvant reaction or cytokine storm.

Pontes-Arruda et al showed that death rates, organ failure, need for mechanical ventilation, and length of stay in intensive care units was reduced in patients given a diet high in EPA and gamma-linolenic acid (GLA), compared to those who were not supported this way.

Coupling EPA and NAC nutritional supplementation with flavinoids along with silver hydrosols can dramatically reduce the risk of infections and cytokine storms.

Silver hydrosols provide patients who are well hydrated, and ideally minimally intoxicated with heavy metals and chemicals, including mercury and aspartame, the most powerful natural protection against systemic infections following detoxification that should be accomplished first to prevent the Herxheimer reaction, commonly called the "healing crisis."

Detoxification, prior to silver hydrosol administration, is most safely and powerfully accomplished using both chelation and clathration. These are best accomplished simultaneously most safely and effectively at home using zeolites, the most advanced being ZeoLife that replaces minerals and is developed using advanced biophysics to help reduce electromagnetic radiation stress as well.

These simple recommendations, compared to drug and vaccine poisonings, offer a far more reasonable, inexpensive, and effective life-saving approach to preventing and treating cytokine storms that governing officials criminally neglect while advancing a deadly campaign to inoculate, intoxicate, and depopulate the planet.

THE FLU CASE

Axel Springer's BILD carries hit piece against me:
BILD lies easy to prove

The Flu Case, 16 November 2009 13:42
https://web.archive.org/web/20100102045530/http://theflucase.com/index.php?option=com_content&view=article&id=1824%3Aaxel-springers-bild-verlag-carries-hit-piece-against-me&catid=1%3Alatest-news&Itemid=64&lang=en

Axel Springer's Bild newspaper is carrying a hit piece today, maintaining no criminal charges were filed in Vienna against Baxter and Avir for attempting to trigger a global bird flu pandemic by contaminating 72 kilos of vaccine material with the live bird flu virus by "a woman" (that is myself).

Bild also maintains that the Vienna state prosecutor's office has confirmed that no charges were filed against Baxter and Avir in February.

The Bild piece claims the adjuvant squalene is harmless, the H1N1 is mild and that plans to put a nanochip in the swine flu vaccine are nonsense - when of course, all the evidence points to the nanochips being in the government-distributed syringes and not the vaccine.

I have sent Bild Verlag (Katharina Bedei, Martin Brand and Manfred Hart) an email with a copy of a letter from the Austrian Ministry of Health dated 20th May (BMG-92400/0049-I/B/8/2009) and signed by Dr Sylvia Füsli in which the Austrian health ministry confirms that I filed criminal charges against Baxter and Avir, and asked them to print a retraction.

Here is the PDF file

"**Stö805/Jane BURGERMEISTER betr. Anzeige gg Baxter** (Vogelgrippe)

Sehr geehrte Frau Burgermeister!
Das Bundesministerium für Gesundheit bestätigt den Erhalt und die Kenntnisnahme

Ihres e-mails an den Herrn Bundesminister Stöger vom 26. April 2009. Ihre Anzeige bei der Staatsanwaltschaft Wien wird durch diese bearbeitet werden," says the letter.

Further proof is that I received a summons to attend an interview at the Sicherheitsdirektion Wien - and attended the interview. How is that possible if no charges were filed?

What about the stamp showing the charges went in?

Also, the case against Baxter and Avir has just been dropped by the state prosecutor in Korneuburg as many witnesses can confirm. How can it just have been dropped if no charges were filed?

As for Barack Obama, those charges were filed with the FBI at the US embassy in Vienna.

This is the Bild report:

Tim Sausen

Schweinegrippe: Todes-Chip & Bio-Terrorismus:
Immer mehr irre Verschwörungs-Theorien

BILD, 16 November 2009, 09:29 UHR
https://web.archive.org/web/20091220063142/http://www.bild.de/BILD/news/2009/11/16/schweinegrippe-verschwoerungs-theorien/im-internet-bild-klaert-auf.html##

Ist die Schweinegrippe eine riesige Verschwörung? Im Internet kursieren die irrsten Grusel-Szenarien rund um das Virus. Viele Menschen fragen sich: Ist da doch was dran? BILD ging den Verschwörungstheorien nach.

Die irrste Behauptung: Mit der Impfung wird ein Spionage-Chip oder "Todes-Chip" injiziert.

Die Wahrheit: Völliger Unsinn – und technisch auch nicht möglich. Prof. Dr. Albrecht Rothermel (50), Experte für Mikroelektronik an der Uni Ulm: "Allein von der Größe her unmöglich. Es gibt keine Mikrochips, die durch eine Impfnadel passen würden."

Behauptung: H1N1 wurde angeblich verbreitet, um einen Großteil der Weltbevölkerung zu töten.

Wahrheit: Natürlich frei erfunden. Prof. Dr. Frank Torsten Hufert, Virologe von der Uni Göttingen erklärt: "H1N1 ist für den Menschen selten tödlich. Um die Weltbevölkerung zu dezimieren, bräuchte man ein viel aggressiveres Virus. Das würde sich nur dann als effektive Biowaffe eignen, wenn es gegen Grippemittel und Impfstoff resistent wäre."

Behauptung: Der Wirkverstärker Squalen ist wie Gift. Er verursacht Rheuma bei Ratten und das Golfkriegssyndrom.

Wahrheit: Eine Sprecherin des Paul-Ehrlich-Instituts: "Die Menge, die Versuchstieren verabreicht wurde, ist bis zu 2000-mal höher als die, die bei der Schweinegrippe-Impfung zum Einsatz kommt. Daher ist der Befund nicht aussagekräftig."

Behauptung: Eine Frau behauptet, sie habe wegen "Bio-Terrorismus" die WHO, Barack Obama und die österreichische Regierung angezeigt. Sie zeigt ein Schreiben mit dem Stempel der Staatsanwaltschaft Wien.

Wahrheit: Eine Sprecherin der Staatsanwaltschaft: "Die Anzeige ist bei uns nicht eingegangen."

THE FLU CASE

Is WHO panicking? Signs of growing instability and uncertainty

The Flu Case, 16 November 2009 15:34

https://web.archive.org/web/20100102051150/http://theflucase.com/index.php?option=com_content&view=article&id=1825%3Ais-who-panicking-signs-of-growing-instability-and-uncertainty&catid=1%3Alatest-news&Itemid=64&lang=en

For the global-based international corporate crime syndicate that has just engineered an economic collapse in such a way as to enrich themselves, planning and executing a major operation involving the deliberate release of biological agents and pandemic material in order to justify the implementation of military rule as well forced vaccinations with a soft kill vaccine and quarantines is a formidable task.

But risking social upheaval and riots as people discover why they have no jobs, no pension and yet have to pay huge interest on debts to the banksters etc is even more dangerous for them.

No amount of high security around a hotel in which the corporate crime syndicate meets in networks such as the Freemason-based Bilderbergs will be enough protection when millions of people wake up to the scale of the robbery that has just been committed on them under the pretext of dealing with "credit crunch".

The "subprime" crisis, credit crunch and the gigantic mountains of debt we have been burdened with and for which we will have to pay interest to the banks for years are as artificial as the "swine flu" pandemic.

The corporate media has lied to people about the financial crisis just as they have lied about the 2swine flu" pandemic.

The international corporate crime syndicate knows that time is running out. Every day more companies are going bankrupt as a result of the banksters withdrawing credit; more people are loosing their jobs in Europe. Tax revenues are plummeting.

Soon the bankster's allies in governments will have an excuse to declare the state bankrupt (most of the money has gone to the banks in bailouts and interest payment).

However, at that point the banksters have to be sure to to be able to leverage a control apparatus sufficient to crush the protests that will spring up on the day when millions of people find themselves in dire poverty as in the Great Depression of the 30s.

Even in Austria, students have launched protests against the crippling lack of funding for the universities.

When I spoke to a bar keeper about those protests a couple of days ago, he said that it would not be long before the whole of Austria is on the streets.

"There is no more middle class," he said. "It's just the very rich or the very poor. " A year ago, you would never have heard that from a middle aged man in Austria.

Austria is on the verge of revolution. The dynamic is there.

But it is not just the Austrians who are fed up. The student protests have spread to Germany. In France, there were so many riots last summer that the government banned the TV from showing them.

Right now, the crime syndicate are behind with their plan to impose forced vaccinations and quarantines on people under the pretext of a pandemic and so they cannot get control of the growing social unrest.

News about how the same group that profits from the pandemic financially and politically – namely the banksters, Baxter, Novartis and their front agency WHO – has been implicated in triggering pandemics has spread quickly on the internet.

News about the toxic and untested soft kill swine flu jab has spread quickly, too. In spite of swine flu hysteria pumped up by newspaper such as Bild in Germany, people are not taking the swine flu jab in the numbers the international corporate crime syndicate hoped for.

The pandemic plague or something similar in the Ukraine has to be introduced here quickly to get panic spreading and provide the government with an opening to crack down on protestors, arrest opponents and implement quarantines.

Planes have been spotted in Poland and Austria.

A pandemic outbreak in France.

The people of Europe appear to be under a new phase of sustained biological attack.

In this day and age of instant communication, we, however, know about planes spraying areas at night time and we will also know about the emergence of a plague almost as fast as it happens.

We can follow the moves of the global crime syndicate in real time.

And the resistance is growing.

Every day that passes they are losing a grip on the decisive force that is required to impose their plan on us the people - and they are panicking.

Key to their success are the willingness of the army and police to go along with the plan to implement vaccinations and quarantines or to be removed from the chess game by forced vaccinations and replaced by UN troops.

But now even the French Gendamerie has refused a compulsory jab.

In this situation, the global crime gang knows only one approach to saving themselves: to keep on pushing through with their plan no matter how many threats and instabilities are pulling it apart so that the sequence and simultaneity are in disarray and success looks highly unlikely.

Their controlled media has to keep out pumping out the same old lies about a swine flu pandemic and how great the vaccine is no matter how implausible they are.

But we, the people, will not be lied too.

We do not want the bankster's fascist New World Order. We don't want to be microchipped, controlled, tracked, kept under surveillance and enslaved by criminals who dare not even show their face to us in public.

And we, the people, - together with the truth – will win out.

Time is short. The crisis is coming. But we, the people, will not back down in any confrontation with the fascist oligarchs and their helpers.

Intensified lobbying for WHO decision on mass vaccination

Information, 16 November 2009
https://www.information.dk/udland/2009/11/staerk-lobbyisme-bag-who-beslutning-massevaccination?lst_cntrb

Several of the WHO's influenza advisors are paid by the pharmaceutical industry. The industry thus helped to influence the decision that influenza A is a pandemic – and that a vaccine is necessary. Since then, the same companies have received vaccine orders worth up to DKK 55 billion.

On 11 June 2009, WHO Director-General Margaret Chan declared swine flu a pandemic. This meant a huge financial gain for the pharmaceutical industry. Many member states - including Denmark - have contracts with the large pharmaceutical companies and are therefore obliged to buy vaccines in the event of a pandemic.

The investment bank JP Morgan estimates that the pharmaceutical industry will receive vaccine orders worth up to DKK 55 billion this year. A large part of that turnover is due to the WHO's decision.

However, many of the apparently impartial researchers that the WHO uses are paid by the companies that produce the vaccines. The many dual roles are problematic, believes Professor T**om Jefferson**, an epidemiologist at the Cochrane Center in Rome: "It is worrying that many of the members of WHO's committees sign themselves with other titles, even though they actually represent the pharmaceutical industry," he says to Information.

One of the experts in the WHO special H1N1 advisory group, Dr. **Albert Ostenhaus**, has just become an item on the Dutch government's agenda. The government has called a crisis meeting because it has emerged in an article in Science that Albert Ostenhaus has financial interests in several pharmaceutical companies. At the same time, Dr. Albert Ostenhaus in Holland known as 'Dr. Flu' because he promotes vaccine as the solution to epidemics.

Dr. **Frederick Hayden** is an external expert in WHO's council SAGE (Strategiz Advisory Group of Experts), which advises WHO on vaccines. He appears in the official papers as an influenza research coordinator from the anonymous-sounding 'The Welcome Trust' in London. But in a Google search it appears that Dr. Hayden has many other employers. He is, among other things, 'paid consultant' to pharmaceutical companies Roche, RW Johnson, SmithKline Beecham and Glaxo Wellcome.

Dr. **Arnold Monto**, who also appears as an invited expert on SAGE's member list, is a paid consultant for the companies MedImmune, which produces inhalable influenza vaccine, Glaxo Wellcome and ViroPharma. On SAGE's list, he is listed only as head of a department at the University of Michigan.

In addition to the experts in SAGE, several of the major vaccine manufacturers such as GlaxoSmith Kline, Novartis and Baxter also sit as 'observers' when SAGE holds a meeting at the WHO:

"It's a great collection of people," says specialist in community medicine, and former employee at Aarhus University Mauri Johansson. "After all, there are more pharmaceutical industry people in the room than there are decision-makers. It shows everything about the commingling that is going on. They are called 'observers'. But one can wonder that they have to be present at all,' says Mauri Johansson.

He believes that this makes it difficult to see what is up and down:

"There is a blanket of medicine lobby in the WHO, and it has been going on like this for a long time. It is difficult to discern what is in the industry's interest and what is factual information, he says.

In the minutes of a SAGE meeting, which was held on 7 July, it is stated, among other things, that: "It will probably be necessary to give two doses of vaccine to ensure protection," although several researchers have pointed out that a single vaccine should be enough. In the minutes of the meeting, it is also recommended that all employees in the health sector and all pregnant women should be vaccinated. In addition, it is noted that there is a need for "a better understanding of the global vaccine demand" and the member states "are encouraged to consider the use of vaccine as part of their pandemic preparedness."

Mysterious recommendations

Tom Jefferson from Cochrane has also encountered mysterious recommendations from the WHO:

"In the WHO's latest recommendations on the control of pandemic influenza, masks and frequent hand washing are mentioned twice. Vaccines and antivirals, on the other hand, are mentioned 24 and 18 times. Why would an international public health organization emphasize a much more expensive intervention such as vaccines and medicine when it has not been proven that they work?' he says and emphasizes that handwashing is the only thing that is certain to have an effect.

Wolf Dieter Ludwig, who is head of the pharmaceutical commission of the German Medical Association, has no doubts about what has happened: "The authorities have fallen for a campaign by the pharmaceutical companies, which aims to make money from a non-existent threat," he says to Der Spiegel.

According to **Tom Jefferson**, the result should be that the WHO committee splits up:

"The advisers must be separated from WHO decision-makers and from those who evaluate WHO recommendations. It must be two separate processes. And then we must ensure that no one can get away with not disclosing their conflicts of interest,' he says.

Something to contribute

Spokesman for the WHO, **Gregory Härtl**, believes that it is quite natural that the pharmaceutical industry participates in the WHO's meetings. "Everyone has something to contribute to this process - the industry and NGOs and professional participants - so we can gather all the information. They cannot vote, they have no influence on the outcome, and they can only speak when asked. When we have to make vaccine recommendations, we need knowledge about what is needed to produce a vaccine. Only the manufacturer has that knowledge.'

- **Frederick Hayden** and Alfred Monto attended the July 7 meeting as experts from a university, but they are both paid by the pharmaceutical industry. Information about their financial affiliations is just not publicly available under WHO auspices. Why not?

"All experts must sign a declaration of their conflicts of interest, so that we are aware of their background. But then again, Frederick Hayden is the best influenza virologist in the world, so if you want to know how a flu behaves, you ask Fred Hayden. Regardless of what else he does. That is why there is a difference between observers and participants.'

- But why is the financial information not shared with the public?

"I'm not sure why we don't publish it... I can't answer that for you."

- If researchers from the WHO warn millions of people about a life-threatening pandemic and recommend a vaccine, in which it turns out that he has a financial interest. Will this have any consequences under the auspices of the WHO?

"I don't know... WHO has a system that guarantees independence. We are aware that we do not let anything or anyone influence us'.

- Will the WHO continue not to disclose the financial interests of medical experts?

"I will not comment on that... it is possible that we will look at a code for the publication of financial information, but I cannot promise anything."

THE FLU CASE

WHO moves to ban gatherings of a 1000 people as global crackdown begins

The Flu Case, 16 November 2009 13:40

https://web.archive.org/web/20100102040149/http://theflucase.com/index.php?option=com_content&view=article&id=1823%3Awho-moves-to-ban-gatherings-of-a-1000-people-as-global-crackdown-begins&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The WHO has moved to impose a ban on gatherings of more than a 1000 people under the pretext of fighting a pandemic emergency.

WHO's new guidelines called "*Interim planning considerations for mass gatherings in the context of pandemic (H1N1) 2009 influenza*" state that anyone planning an assembly of a 1000 people or more should consult health authorities.

https://cdn.who.int/media/docs/default-source/influenza/interim-planning-considerations-for-mass-gatherings-in-the-context-of-pandemic-(h1n1)-2009-influenza.pdf?sfvrsn=49ee4588_3&download=true

The authorities are allowed to restrict the right of assembly if they determine an event will contribute to the "spread of a pandemic."

The ban has been widely expected as WHO under the subterfuge of fighting a pandemicclamps down on protests triggered by bank and government corruption that has impoverished people in Europe and the USA.

WHO supplied the pharmaceutical company, Baxter, with the live bird flu virus that Baxter used to contamiante 72 kilos of vaccine material in ist biomedical facilities in Austria in February, and WHO has been accused of seeking to trigger a global bird flu pandemic for political and financial gain.

WHO conducted bioterrorism exercises in the Ukraine shortly before the appearance of a pneumonic plague in a mysterious circumstance in which Baxter's Ukrainian facility has also been implicated.

The pneumonic plague prompted WHO and the government to suspend elections and basic rights.

WHO is now advising the Ukraine government on who should be given the toxic and untested swine flu jab under special powers WHO has acquired by declaring a pandemic level 6 alert in June, according to reports.

Baxter, Novartis and other pharmaceutical managers sat as "observers" on WHO's key vaccine advisory board which recommended the toxic jab with squalene to fight the "pandemic".

Under the International Health Regulations 2005, WHO is allowed to take deploy troops to carry out quarantines and forced vaccinations in all 193 signatory countries as soon as it declares a pandemic level 6 emergency, which WHO did this June after loosening the criteria.

The WHO ban could lead to escalating protests by students in Austria being restricted.

Thousands of students have occupied universities and demonstrated on the streets around Austria concerning cuts in the education budget.

The Austrian Education Minister has offered an emergency 30 million euros to plug some of the deficits, a fraction of the estimated 160 million euros plus that the government has spent on 16 million doses of Baxter's toxic, soft kill swine flu vaccine.

WHO's attempt to push through a ban on gatherings of more than a 1000 people will be give the Austrian government a pretext to crack down on the student gatherings.

THE FLU CASE

Are Poland and Austria at the forefront of an undeclared biological war?

The Flu Case, 16 November 2009, 23:05
https://web.archive.org/web/20100102024224/http://theflucase.com/index.php?option=com_content&view=article&id=1826%3Aare-poland-and-austria-at-the-forefront-of-an-undeclared-biological-war&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Eyewitness reports from Poland and Austria indicate that both countries are being subjected to new kinds of aerosoal spraying by aircraft.

This seems to be an attempt to trigger a pandemic in the same way as occured in the Ukraine recently when pneumonia plague emerged after reports of night time aerosol spraying by low flying planes.

Three aircraft flying in formation were seen at night time in Klagenfurt one month ago apparently on a spraying operation.

New types of spraying were seen in eastern and southern Austria today.

This is one report from Lower Austria:

"I followed your homepage today and saw that you put up that link where you reported that in Villach new types of Chemtrails have been laid by Chemtrail Aircrafts to set the real flu pandemic in motion here as well.

I am covering Chemtrails for at least 6 months, also putting them online via youtube under my youtube name "Silberhorter".

On Sunday when I went out in our garden in Lower Austria (near Wr. Neustadt) I recognized massive spraying activity on almost unprecedented scale. I will upload this action tomorrow night. The spraying was done by new kind of airplanes with strange colors on them (yellow, red. I also detected one plane to put the trigger on and off twice. you can see this action on the video taken on Sunday 15.11.09: http://www.youtube.com/watch?v=N661mbZ5XrY [deleted]

Do you have more info about this new kind of Chemtrail acts? Was it from Sunday? Because today it was already completely cloudy (must be the result of yesterdays spraying acts, because the sky was completely covered with intense mist only 1 hour after they attacked).

If you have more info please let me know to compare it with what I saw on Sunday. What I took notice of was that the trails lingered quite fast and that all sort of different tactics and planes were carried out...

If you check on my channel on Wednesday morning you should see a summary of this Chemtrail activity of Sunday, 15.11.09 near Wr. Neustadt."

газета.ru

Александра Борисова

Возраст притупляет свиной грипп

Газета, 17 ноября 2009, 10:22
https://www.gazeta.ru/science/2009/11/17_a_3287877.shtml

Иммунная система взрослого человека подготовлена к борьбе со свиным гриппом лучше, чем предполагалось ранее

Иммунная система взрослого человека подготовлена к борьбе со свиным гриппом куда лучше, чем предполагалось ранее. Сходство вируса H1N1 образца 2009 года с предыдущими «версиями», циркулировавшими среди людей с 1957 года, позволяет защитным системам организма использовать «иммунную память», которая притупляет действие инфекции.

«Проблема свиного гриппа сильно раздута», — так считают не только российские, но и зарубежные эксперты. Исследования показали, что предыдущие эпидемии вирусов гриппа штамма H1N1 вполне подготовили иммунную систему взрослых людей к сезонному гриппу-2009, а статистика говорит о том, что среди взрослых людей наблюдаемая смертность от этого заболевания ниже ожидаемой.

Группа ученых из Института аллергологии и иммунологии (Ла Хойя, Калифорния), супер-компьютерного центра Сан-Диего (Калифорния) и университета Техаса провела сравнение структуры вирусов сезонного гриппа, существовавших между 1988 и 2008 годами, с новым вирусом свиного гриппа. Результаты их исследования публикует Proceedings of the National Academy of Sciences.

Исследователи сравнивали строение особых молекулярных структур в составе вируса – антигенных детерминант (эпитопов).

Именно по ним иммунная система распознает вирус. Данные об эпитопах сезонного гриппа в США каталогизированы в специальной базе данных (www.iedb.org). Вирусные антигенные детерминанты распознаются так называемыми иммунными клетками типа В и типа Т. В-клетки стимулируют образование антител, которые могут связываться с вирусом и блокировать инфекцию, а Т-клетки проводят «отчуждение» пораженных вирусом клеток.

Анализ структурной базы данных показал, что некоторые эпитопы свиного гриппа и более ранних сезонных гриппов идентичны. Эти эпитопы распознаются двумя наборами Т-клеток - CD4 и CD8, и они идентичны на 41% и на 69%, соответственно. Сходство эпитопов, распознаваемых В-клетками, составляет только 31%. Последующие эксперименты с образцами крови, взятыми у здоровых взрослых людей, показали, что «законсервированные» Т-клетки, знакомые с этими антигенными детерминантами по предыдущим эпидемиям, лучше защищают организм и ослабляют течение свиного гриппа в случае заболевания.

Однако большое количество эпитопов вируса свиного гриппа в значительной степени мутировали и не похожи на эпитопы предыдущих «версий». Необычность ситуации состоит в том, что вирус H1N1 образца 2009 года имеет больше общего с вирусами, которые вызывали болезни людей 10–15 лет назад и более, чем с недавними вирусами.

Именно этот факт, считают ученые, объясняет то, что взрослые люди легче справляются со свиным гриппом, а группа риска среди молодых людей включает не только младенцев, но и школьников.

По статистике, в США в период с апреля до середины октября свиными гриппом переболели 22 млн человек (это около 7% населения). Грипп или его осложнения стали причиной смерти 4 тыс. человек, из них 540 детей. Госпитализация понадобилась 98 тыс. пациентов, из них 36 тыс. детей. Статистика показывает (и лабораторные исследования подтверждают эту статистику), что грипп представляет опасность в большей степени для молодых людей, поэтому в вакцинации нуждаются именно они. Из-за различий в структуре вируса свиного гриппа и сезонных вирусных инфекций последних лет их иммунная система не подготовлена к борьбе с этой болезнью: ее «иммунная история» пишется с чистого листа.

Официальная служба вакцинации США рекомендует прививаться только нескольким категориям граждан: беременным женщинам; людям, находящимся в постоянном контакте с младенцами до 6 месяцев, медперсоналу, детям и молодым людям в возрасте от полугода до 24 лет. Взрослым людям (25–64 года) рекомендуется прививаться только в случае наличия особого осложненного состояния здоровья, например астмы.

REUTERS

U.S. estimates 22 million had swine flu, 3,900 dead

Reuters, 17 November 2009, 8:55 AM GMT+8
https://www.reuters.com/article/us-flu-usa-factbox/factbox-u-s-estimates-22-million-had-swine-flu-3900-dead-idUKTRE5AB54H20091112/

(Reuters) – New estimates suggest the pandemic of H1N1 flu is far worse than an average influenza season, with at least 22 million infections and 3,900 deaths, according to the U.S. Centers for Disease Control and Prevention.

The new estimates are extrapolations based on detailed data for April-October from 10 states and do not reflect a worsening of the pandemic, the CDC stressed. Following are the figures released by the agency, with the median number of cases followed by the full potential range:

Estimated Cases by Age

* 0-17 years – 8 million estimated cases, with a range of 5 million to 13 million
* 18-64 years – 12 million estimated cases, range 7 million to 18 million
* 65 and older – 2 million estimated cases, range 1 million to 3 million
* Total cases – 22 million, range 14 million to 34 million

Estimated Hospitalizations

* 0-17 years – 36,000 hospitalizations, with an estimated range from 23,000 to 57,000
* 18-64 years – 53,000 hospitalizations, range 34,000 to 83,000
* 65 and older – 9,000 hospitalizations, range 6,000 to 14,000.
* Total hospitalizations – 98,000, range 63,000 to 153,000

Estimated Deaths

* 0-17 years – 540 deaths with a potential range of 300 to 800.
* 18-64 years – 2,920 deaths, range 1,900 to 4,600
* 65 years and older – 440 deaths, range 300 to 700
* Total deaths – 3,900 deaths, range 2,500 to 6,100. Source: CDC here

THE FLU CASE

Could WHO announce the "return" of the Spanish Flu any day?

The Flu Case, 17 November 2009, 15:09
https://web.archive.org/web/20100102023129/http://theflucase.com/index.php?option=com_content&view=article&id=1850%3Acould-who-announce-the-qreturnq-of-the-spanish-flu-any-day&catid=1%3Alatest-news&Itemid=64&lang=en

WHO-affiliated French scientist Bruno Lina told Lyonmag this summer that his team in Lyon was looking for a gene to make the current swine flu virus more virulent...

Also, WHO supplied the live bird flu virus – a lab engineered variation of the swine flu – to the pharmaceutical company Baxter and Baxter then used that virus to contaminated 72 kilos of a regular seasonal flu material in Austria circumventing biosafety level 3 safeguards, and so almost sparking a global bird flu pandemic this February.

Under Senate Bill 666 from 2003 – steered into law by Jay Rockefeller of the Rockfeller dynasty that has funded the UN and WHO, – tax dollars were channelled into private pharmaceutical companies such as Baxter to fund bioweapons research. It is not clear what funding Baxter got for what project. Baxter is known, however, to have patented an especially lethal version of the bird flu virus.
https://www.senate.mo.gov/22info/pdf-bill/intro/SB666.pdf

A recent mass "bird flu" vaccination campaign ordered by WHO in Indonesia resulted in the emergence of a lethal strain. The Indonesian Health Minister, at first, refused to give WHO the bird flu samples because she said they would be used as a bioweapon.
http://www.prisonplanet.com/articles/february2008/022108_bird_flu.htm

Given the amount of effort that WHO and Baxter have put into finding a lethal virus, it is only a question of time before they – and their corporate media – proclaim the "return" of the Spanish Flu.

As soon as WHO declares that the swine flu has mutated into the Spanish Flu, it can insert that virus strain into vaccines, claiming this is a prophylactic measure.

Just as in 1918, people who take the vaccines will get the Spanish Flu.

The Spanish Flu broke out among US soldiers who were vaccinated before going to fight in Western Europe in 1918.

Greece one of the few countries that had no mass vaccination programme in 1918 had almost no victims from the Spanish Flu.

A vaccine-generated pandemic can then be used as an excuse to drive more people to take the toxic, untested and deadly swine flu jab.

In addtion, WHO – the de facto controller of national governments during a pandemic level 6 emergency of the kind declared in June – can order military style rule, ban assemblies, and implement quarantines and even forced vaccination in all 194 countries that have signed the International Health Regulations 2005 under the pretext of dealing with a pandemic emergency.

Náthás békesség. Egyházak és a H1N1

Evangelikus, 17 december 2009, 15:30
https://archiv.lutheran.hu/lapszemle_2009-2011/nathas-bekesseg-2013-egyhazak-es-a-h1n1

A világszerte terjedő influenzajárvány miatt több keresztény egyház is úgy döntött, feláldozza évszázados szokásait a higiénia oltárán.

Egyre több katolikus templomban üresek a szenteltvíztartók, és sok helyütt kézfertőtlenítő alkalmatosságokat szerelnek a padsorok végére: az új influenza és az ellene való védekezés tartja lázban a szent helyekért felelős egyházi személyeket (is). Egyetlen felekezet sem szereti, ha hívei – egészségüket féltve – hónapokra elmaradnak a közösségből, ezért kisebb-nagyobb engedményekkel és óvintézkedésekkel szinte mindent megtesznek azért, hogy a H1N1 elkerülje soraikat. Amerikai protestáns és katolikus közösségekben például hanyagolják a tradicionális – az isteni és testvéri békesség jeleként alkalmazott – üdvözlő kézfogást, ehelyett visszafogott fejbólintással fejezik ki egymás iránti pozitív érzéseiket.

"Jöjjetek énhozzám mindnyájan, akik megfáradtatok" – hívja Krisztus az evangélium szavaival a bűnösöket és a lélekben erőtleneket, ám több egyházközségben a papok és a lelkészek inkább otthon maradásra buzdítják azokat, akiknek a járvány miatt fogyott el az erejük. Az anglikán egyházban már júliusban arra intette papjait Rowan Williams canterburyi érsek, hogy kerüljék a közös kehelyből ivás rituáléját. Ehelyett – szólt a főpapi tanács – alapos kézfertőtlenítés után a pap mártsa bele az ostyát a borba, majd adja azt a hívők kezébe. E tekintetben régi hagyományokat ápolnak az anglikánok: a 16. századi pestisjárvány idején született egyházi szabályzat szerint indokolt esetben akár szüneteltetni is lehet a szentség vételét. Némely londoni anglikán gyülekezet pedig akképpen veszi fel a harcot a vírussal, hogy kézfogás helyett megölelik egymást a hívek. Pedig Williams érsek – mintegy felülírva korábbi tanácsait – nemrégiben már azt üzente püspökeinek, hogy mivel sokan beoltatták magukat, és a járvány kevésbé pusztító, mint eredetileg gondolták, a brit egészségügyi minisztériummal való tanácskozás után úgy döntöttek, vissza lehet térni az áldozás hagyományos formájához.

Más egyházi alkalmazottak arra panaszkodtak, hogy hiába a jó tanácsok, a templomba járó emberek az alapvető higiénés szabályokat sem akarják megtartani, mondván: Krisztus testéről és véréről nem terjedhetnek kórokozók. E hiedelmeket több helyütt hiába cáfolják a papok és lelkészek, tanácsuk sokszor pusztába kiáltott szó marad.

Feladták a hívek győzködését több svédországi protestáns gyülekezetben, ahol úgy vélik a lelkészek, hogy az úrvacsorai bor feljavításával tehetik a legtöbbet nyájuk épségéért. A karlskogai evangélikusok például továbbra is körbeadják a kelyhet, amelybe azonban kizárólag avinált bort töltenek. Az avinálás során a borhoz erős borpárlatot adnak – ilyen például a portugál portói vagy a spanyol sherry. Rosszmájú svéd publicisták máris azon élcelődnek: most, hogy erős, 15-20 százalék alkoholtartalmú italt osztanak a templomokban, megnőhet az istentiszteletet látogatók száma. Egyébként több amerikai gyülekezetben is előírták a legalább 12 százalék alkoholtartalmú bor használatát, és jóllehet a kehely közös, azt sok helyütt nem foghatják kézbe a hívek, kizárólag a lelkész kezéből ihatnak.

Komoly teológiai vitákat kavart a katolikus egyházban néhány óvintézkedés. Például az, hogy több egyházközségben – Kanadában, Portugáliában és gyakorlatilag egész Új-Zélandon – áttértek a plébánosok az úgynevezett kézbe áldoztatásra, vagyis nem a hívek nyelvére helyezik az ostyát, hanem a kinyújtott jobb kezükbe, ahonnan az illető maga teszi a szájába. A tradicionalista, latin misézést pártoló katolikusok felháborítónak tartják, hogy erre a szerintük "liberális" módszerre kötelezik őket. Amerikai episzkopális hívek viszont azon kezdtek vitázni, vajon a kézbe áldozás vagy a közös kehelybe való ostyamártogatás a kevésbé veszélyes. Sokan utóbbit tartják higiénikusabbnak, annak ellenére, hogy – mint internetes blogokban többen is felhívták rá a figyelmet – egyes híveknek beleérhet az ujja a kehelybe, miáltal megnőhet a fertőzés veszélye. A szenteltvíztartók kiürítésének alternatívájaként pedig egy olasz feltaláló olyan urnát alkotott, amely automatikusan néhány garantáltan csíramentes szenteltvízcsöppet szór az odatartott kézre.

A muszlimok a Koránból vezetik le a járvány elleni védekezés szükségességét. Már a nyáron arra biztatták vallási vezetők a híveket, hogy mindenekelőtt kérjék Allah segítségét, már csak azért is, mert az újfajta vírusok sokszor Allah csapásai az emberiség parázna tetteiért. Persze azt is jónak látták a tanult vezetők a hívek tudomására hozni, hogy a rituális mosakodások és a gyakori kézmosás – a karantén időnkénti alkalmazása mellett – szintén hasznosak lehetnek.

Számos protestáns és neoprotestáns kisegyházban elegánsabban oldották meg a kérdést: amint azt Mészáros Kálmán, a Magyarországi Baptista Egyház elnöke a HVG-nek elmondta, felekezetük már több évtizeddel ezelőtt áttért arra, hogy közös kehely helyett mindenki külön kis pohárkából igya meg az úrvacsorai bort. Nincs is kötelező előírásuk járványos időkre, lelkészeik lelkiismeretére bízzák, milyen módon óvják nyájuk egészségét.

Némileg extrém módon kívánja oltalmazni híveit a gonosztól Miroslav Bustruk horvát katolikus pap, aki novemberben kerek perec kijelentette: globális összeesküvés keretében törnek az emberiség elpusztítására a H1N1 elleni oltás propagálói. Bustruk – talán a Magyarországon már korábban terjedő szóbeszédből táplálkozó – "tanai" szerint a vakcinával mikrocsipet juttatnak az emberekbe, ezért a hívek azzal tehetik a legtöbbet egészségükért, ha tartózkodnak az oltástól. Az országos botrányt okozó pap azt ígérte, az ügyben a közeljövőben a Vatikán is nyilatkozni fog. Ilyesféle nyilatkozatot a Szentszék eddig még nem tett, viszont munkatársainak javasolta az oltás beadását.

De a legóvatosabban minden bizonnyal a keresztény nemzetközi influenzaegyház jár el. Az angol nyelvű fluchurch.com lelkes lelkészei senkivel sem óhajtanak személyesen találkozni, ellenben mindenkit várnak honlapjukon, ahol "addig prédikálunk, amíg jobban nem érzik magukat".

Beijing Flu Center to speed new virus research, scientists say
WHO and China to Open New Virus Research Center

Bloomberg, 17 November // The Flu Case, 4 December 2009
https://web.archive.org/web/20100102045849/http://theflucase.com/index.php?option=com_content&view=article&id=2181%3Awho-and-china-to-open-new-virus-research-center&catid=1%3Alatest-news&Itemid=64&lang=en

Nov. 17 (Bloomberg) – *China and the World Health Organization agreed to open an influenza research center in Beijing* to identify and share knowledge about new strains.

Approval to open the center was given last week, when health officials and WHO Assistant Director-General Keiji Fukuda met in Beijing, China's Center for Disease Control and Prevention said in a statement on its Web site today. Arrangements to formally designate the laboratory as a WHO collaborating centre are still being worked out, the United Nations health agency said.

The new collaborating center for reference and research on influenza will join a network of WHO-affiliated labs in Atlanta, London, Tokyo and Melbourne that monitor flu strains and make recommendations on vaccines to fight the virus. A center in Beijing may enable scientists to more quickly identify new strains that emerge in China, said John Mackenzie, a Melbourne- based virologist who chaired the WHO's emergency committee responding to the influenza pandemic sparked by swine flu.

"It will be ideal to have a center in China because it's the cradle of influenza evolution," Mackenzie said in a telephone interview today.

The WHO collaborating center in Beijing "will not only greatly enhance China's ability to monitor and prevent flu from spreading, but also increase China's influence and power in decision-making in the area," according to the CDC's statement.

China sought WHO approval for the center two years ago and lodged an official request in March 2008, it said.

The WHO center will be located at China's National Influenza Center, which was established in 1957 and joined the WHO flu surveillance network in 1981.

General Register Office for SCOTLAND
information about Scotland's people

Rona Watters, Health Protection Team

On Seasonal Flu

General Register Office for Scotland, 17 November 2009

https://web.archive.org/web/20100102015357/http://theflucase.com/index.php?option=com_content&view=article&id=2148%3Ascottish-government-reclassifying-all-flu-deaths-as-swine-flu-deaths&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Daer Mr. McGillivray. Thank you for your email of 2 November which requested information under the Freedom of Information (Scotland) Act 2002 on the number of deaths from seasonal influenza in Scotland since the start of the H1N1 Swine Flu pandemic. I have been asked to provide a response to the question you have raised.

Thus far this flu season (2009-10), there have been no deaths from seasonal influenza communicated to colleagues in NHS Health Protection Scotland. However, I detail below some of the difficulties that exist around identifying deaths as a result of influenza.

The General Register Office for Scotland (GRO(S)) receives all data held on each death registered in Scotland and this is collated into the GRO(S) Annual Report. From time to time, GRO(S) also compiles reports comparing trends over time. If influenza is recorded at any point on a death certificate this information is counted in these official statistics.

GRO(S) have recently produced a report compiling information on influenza deaths across the period 1990 to the end of the 2008/2009 seasonal flu season, and this is available at: http://www.gro-scotland.gov.uk/statistics/publications-and-data/increased-winter-mortality/increased-winter-mortality-in-scotland-2008-09.html.

In this report, GRO(S) comment on the difficulty of capturing data on influenza related deaths. In overview, it is likely that to date there has been under-reporting of influenza, which is due to the fact that recording of deaths is often ascribed to a complication of influenza rather than to influenza itself. In many cases, the episode of influenza has passed, and the physician reporting the death may not record this infection on the death certificate. Furthermore a number of experts suggest that stress on the body caused by influenza may precipitate heart attacks, strokes and other conditions in those who are already in poor physical health. It will be these rapidly fatal conditions that appear on the death certificates rather than influenza itself. This may also explain partly the excess winter deaths due to stroke and heart attacks, although other factors such as the cold temperatures may also be attributable. To overcome this difficulty, the GRO(S) report describes excess deaths compared to that expected for each season.

In September this year, the Chief Medical Officer Dr Harry Burns issued a letter to NHS Boards setting out instructions and providing national guidance to those responsible for certifying death certificates. Dr Burns requested that death certificates should record the whole sequence of conditions and events leading up to death, which in future will provide better understanding when establishing the number of deaths where seasonal influenza has been a contributory factor.

If you are unhappy with this response to your request, you may ask us to carry out an internal review, by writing to Dr Kevin Woods, Director General - Health, Floor 1E.07 - St Andrews House, Regent Road, Edinburgh, EH1 3DG. Your request should explain why you wish a review to be carried out, and should be made within 40 working days of receipt of this letter, and we will reply within 20 working days of receipt. If you are not satisfied with the result of the review, you then have the right to make a formal complaint to the Scottish Information Commissioner.

Yours sincerely, *Rona Watters*, Health Protection Team

franceinfo:

Grippe A: 1,5 million de Français déjà atteints, une centaine: d'écoles fermées

France-Info, 18 Decembre 2009
https://web.archive.org/web/20091120225255/http://www.france-info.com/sciences-sante-2009-11-18-grippe-a-1-5-million-de-francais-deja-atteints-59-ecoles-fermees-370431-29-30.html

Le virus de la grippe A progresse très fortement: le nombre de personnes infectées a été multiplié par cinq en quelques jours. Les hospitalisations de cas graves et les décès augmentent également. Plus de cent établissements scolaires sont fermés…

Après un léger tassement au moment des vacances de la Toussaint, le virus de la grippe A a repris du poil de la bête: en quelques jours, le nombre de personnes infectées a été multiplié par cinq. L'Institut de veille sanitaire (InVS) a recensé plus de 400.000 consultations médicales pour la seule semaine dernière. Et depuis l'apparition du virus, la grippe a déjà frappé 1,5 millions de Français.

"Nous assistons à un redémarrage très franc, notamment dans le sud de la France", observe Françosie Weber, directrice de l'InVS). Plus inquiétante, "l'augmentation du nombre d'hospitalisations pour cas graves" (25 personnes étaient en réanimation ou en soins intensifs la semaine dernière). Et 21% de ces cas graves concernent des moins de 15 ans, "c'est plus que la grippe saisonnière", avertit Françoise Weber. En France métropolitaine, 46 personnes ont succombé à des complications liées à la grippe A, dont 14 au cours de la dernière semaine.

S'agissant des fermetures d'établissements scolaires, là aussi les chiffres montrent une accélération de la contamination. Le ministère de l'Education nationale recensait ce mercredi 155 classes et 104 établissements fermés pour cause de grippe A/H1N1, répartis sur 18 académies. 100 classes et 79 écoles fermées en maternelle et en primaire, ainsi que 55 classes et 25 établissements fermés au niveau collège-lycée.

KURIER

Gebhard, E. Mauritz

Schweine-Wahn im Internet

Kurier, 18 November 2009, 18:32
https://web.archive.org/web/20091120114030/http://kurier.at/nachrichten/1955913.php

Dunkle Mächte wollen mit H1N1 die Weltherrschaft an sich reißen: So lautet nur eine von vielen Verschwörungstheorien.

Haarsträubender Unsinn." Das sagt die Virologin Monika Redlberger zu Verschwörungstheorien rund um die Neue Grippe im Internet.

Mythos 1: Weltgesundheitsorganisation (WHO) und Pharmafirmen haben den Plan, mit vergifteten Impfstoffen die Weltbevölkerung auf zwei Milliarden zu reduzieren - dies belege ein Laborunfall bei Baxter im Februar. (siehe auch Video-Link)

Die Realität: Bei diesem Zwischenfall handelte es sich um einen einmaligen Fehler, so Baxter: "Influenza-Virusmaterial" für Labor-Tests aus der Forschungszentrale in Orth a. d. Donau, NÖ, war mit Vogelgrippe-Viren verunreinigt - in einem tschechischen Labor starben dadurch Frettchen. In keinem der Labors, in die dieses Material geliefert wurde, infizierte sich ein Mitarbeiter. Nie war daran gedacht, es Menschen zu verabreichen. Baxter hat seither zusätzliche Sicherheitsvorkehrungen eingeführt.

Mythos 2: Die H1N1-Impfungen verbreiten die Grippe, statt sie zu stoppen.

Die Realität: "Das ist völlig unmöglich", sagt Redlberger: Die Impfung besteht aus abgetöteten Viren ("Totimpfstoff"), die sich nicht vermehren können. Allerdings: Erste schützende Antikörper bildet der Körper erst ein bis zwei Wochen nach der Impfung, deshalb kann man auch noch nach der Impfung erkranken. Und vor grippalen Infekten ("Schnupfen") schützt die Impfung nicht.

Mythos 3: Ein Bestandteil des des Wirkverstärkers des in Deutschland verwendeten Impfstoffes Pandemrix löst das Golfkriegssyndrom aus.

Die Realität: Das Golfkriegssyndrom (Muskel- und Kopfschmerzen, Erschöpfung) trat bei heimgekehrten US-Soldaten auf. Impfkritiker sehen die Ursache in einem Impfstoff gegen Milzbrand und ziehen Parallelen zu Pandemrix.

Das Paul-Ehrlich-Institut weist beides zurück. Der Wirkverstärker sei bei mehr als 30.000 Probanden ohne auffällige Nebenwirkungen eingesetzt worden. Der "österreichische" Impfstoff Celvapan enthält keinen Verstärker.

Mythos 4: Die WHO hat ein Kriterium für eine Pandemie - hohe Zahl von Toten - gestrichen, um jetzt mehr Macht zu erhalten.

Die Realität: "Es gab 2005 auf einer Homepage die Formulierung ‚enorme Zahl von Todesfällen und Erkrankungen'", so WHO-Sprecher Gregory Hartl . "Das wurde oft missinterpretiert. Man muss aber ‚Tote' und ‚Erkrankte' zusammen lesen - und das entspricht exakt der jetzigen Situation. Wir bedauern die schlampige Formulierung 2005. In unseren offiziellen Pandemie-Leitlinien war die Todesrate aber nie ein Kriterium."

Sozialmedizinerin Claudia Wild ortet aber "eine unglückliche Nähe" von Impfstoff-Herstellern zur WHO und fordert, dass bei Entscheidungsträgern in Impf- und Pandemie-Gremien eventuelle Geldflüsse von der Industrie oder Beteiligungen offengelegt werden.

Mythos 5: Es gibt überhaupt kein krankmachendes H1N1-Virus. Es ist eine reine Erfindung der Pharmaindustrie, um einen wirkungslosen Pseudo-Impfstoff verkaufen zu können.

Die Realität: Zahlreiche Forschungslabors weltweit haben das Neue Virus nachgewiesen. Mittlerweile gibt es auch spezielle Testverfahren zum Virus-Nachweis. Aufgrund genauer Analysen der genetischen Sequenzen konnte auch einwandfrei bewiesen werden, dass es sich um ein neues H1N1-Virus handelt. Zudem sind in zahlreichen medizinischen Fachzeitschriften bereits fundierte Studien zu dem neuen Virus erschienen.

Mythos 6: Die Weltgesundheitsorganisation will demnächst weltweit eine Zwangsimpfung verordnen, die mit Polizei- und Militärgewalt auch exekutiert werden wird. Jeder, der sich weigert, wird mit furchtbaren staatlichen Repressalien - wie Gefängnisaufenthalt - rechnen müssen.

Die Realität: Die WHO kann keine Impfpflicht verordnen, das ist Sache der einzelnen Regierungen. In Österreich hat das Gesundheitsministerium bereits mehrfach erklärt, dass es keine Impfpflicht geben wird - auch nicht im Gesundheitsbereich.

Österreichs bekannteste Verschwörungstheoretikerin ist die Wienerin Jane Bürgermeister. Ihre bizarren Ausführungen zum Weltkomplott hinter der Schweinegrippe wurden zum Weberfolg:

THE FLU CASE

Austria's mainstream news propaganda for Big Pharma: swine flu jab plot "hair-raising nonsense"

The Flu Case, 19 November 2009

https://web.archive.org/web/20100102044129/http://theflucase.com/index.php?option=com_content&view=article&id=1957%3Aaustrias-mainstream-news-propaganda-for-big-pharma-swine-flu-jab-plot-hair-raising-nonsense-&catid=1%3Alatest-news&Itemid=64&lang=en

Austria's mainstream newspaper, the Kurier, has attempted to persuade reluctant Austrians that getting injected with a new and untested swine flu jab produced by Baxter is a good idea and to portray people who present the evidence showing there is an agenda by big pharma and WHO ("dark forces") to create an artificial pandemic and then deliver toxic swine flu jabs to accumulate huge profits and power as crazies.

Mindful of the fact legal action can be taken against them for defamation, the Kurier has mentioned me only in the last part as the "Viennese Jane Bürgermeister" who puts forward these "myths" about a nonsensical "swine flu conspiracy theories", (ignoring the fact I am half Irish and was born in Switzerland). The Kurier does, however, put up a link to a German youtube clip that has been viewed about 300,000 times in roughly a month underlining the fact that the word is spreading among people who otherwise rely on the mainstream media for information.

Under a talking point called **Myth 1**, Kurier makes out that Baxter's contamination of 72 kilos of "influenza virus material" with the live bird flu virus in its facilities in Orth an der Donau – material which labs and other documents stated was meant for vaccines -- was a "one off mistake". They omit to mention that biosafety level 3 regulations apply when handling the bird flu virus and that a one off mistaken contamination of one gram let alone 72 kilos is therefore impossible.

Furthermore, the Kurier doesn't explain why Baxter had the bird flu virus in its lab in the first place. The bird flu virus is a lab engineered virus reconstructed from the Spanish Flu pandemic virus of 1918 by scientists working for a US bioweapon lab as Der Spiegel reported in 2005. WHO supplied Baxter with the live bird flu virus on Baxter's own admission.

The Kurier notes that none of the staff of external labs who got Baxter's contaminated material were infected with the bird flu, but it fails to mention that all 36 staff from the labs Avir and BioTest who came in contact with it had to be treated preventatively for the bird flu in Vienna and the Czech Republic because doctors thought they could have got it in spite of their protective clothing etc.

Only because a member of staff at BioTest in the Czech Republic tested the falsely labelled and irradiated contaminated material on ferrets, who got sick and had to be put down as a result, was the contamination with the live bird flu virus discovered before the material could have wrecked more havoc. A little detail the Kurier omits.

Both BioTest and Avir have said the contaminated material was meant for vaccines making Kurier's claim that it would never have been used as vaccine material very odd.

Under talking point **Myth 2**, the Kurier tries to claim the vaccines will not cause a pandemic. Quite apart from whether they contain live viruses or not, the mass vaccination with a swine flu jab for which there are no clinical data, as even a quick scan of the EMEA documents shows, could well lead to death and damage as happened in 1976 during the national swine flu vaccination program in the USA, which had to be abandoned. But the Kurier ignores this and claims that the viruses in the vaccines will be dead and therefore cannot spread disease.

The Kurier ignores the fact that WHO's vaccine advisory board – on which Baxter and other pharma executives sat as "observers" – mandated the swine flu jab which is "new technology that... formulated with oil-in-water adjuvants and live attenuated influenza vaccines."

The Kurier also ignores the huge body of scientific evidence showing the link between squalene and the Gulf War Syndrome and relies instead on confusing readers by saying that the US and UK soldiers got a different vaccine altogether, implying there was no squalene in the anthrax vaccine under a talking point called **Myth 3**.

Talking point **Myth 4** attempts to whitewash WHO for manipulating the criteria in April 2009 in order to declare a pandemic level 6 but actually presents more evidence of WHO's manipulation by quoting WHO spokesman Gregory Hartl as admitting that WHO said that there had to be "enormous numbers of deaths and sickness" in 2005 for a pandemic.

Hartl says WHO regrets the "careless formulation."

The Kurier claims under "**Myth 5**" that supporters of swine flu "conspiracy theories" say there is no new H1N1 virus, when we all know there is because labs have been engineering it for more than ten years and been publishing the results i n scientific journals.

The issue is: how widespread is this virus if even US government studies say as many as 9 out of 10 rapid diagnoses of swine flu were false and if there is no requirement for lab testing of the virus? Is it widespread enough to justify a pandemic level 6?

Under talking point **"Myth 6**", Kurier also claims that the WHO cannot order forced vaccination and quarantines when the International health regulations make it clear they can, though it is up to each government to implement it. Austria's national pandemic plan from 2005 makes it clear forced vaccination and quarantine are possible.

What use are the assurances from the health Minister that there will be no forced vaccination when the same Health Minister has covered up Baxter's role in nearly triggering a pandemic?

Why not if there is no vaccine obligation? Why does the national pandemic plan say it is a goal to vaccination 100% of the population? How do they intend to accomplish that without making it compulsory? Why has the Health Minister said in parliamentary questions and answers that there are no plans to store any of the surplus 16 million doses of swine flu jab ordered from Baxter?

The Kurier hit piece is very little the Bild hit piece claiming I had never filed criminal charges in Austria and quoting a Vienna state prosecutor spokesperson to that effect. Even when I emailed and then alter faxed them a letter from the Austrian Health Minister confirming I had filed charges, BILD did not reply or seek to correct their report riddled with error after error.

Arturo San Agustín

Artículo de Arturo San Agustín: 'La monja'

El Periódico, 19 Novembre 2009, 00:00
https://www.elperiodico.com/es/opinion/20091118/articulo-arturo-san-agustin-monja-95833

Hasta hace poco las monjas solo eran noticia cuando los poetas republicanos y agnósticos las sacaban en alguno de sus poemas. Y siempre las llamaban *monjitas*. O cuando, muchos años después de haber muerto, hacían milagros. O cuando, muchísimos años después, las beatificaba Juan Pablo II, que ha sido el Papa que más interés le ha puesto al asunto de los beatos y los santos. Al polaco los santos le entusiasmaban. Algunos.

Ahora, desde que han comenzado las vacunaciones contra la gripe A, es noticia la monja benedictina *Teresa Forcades* quien, a través de internet, les está complicando diariamente el trabajo a médicos y enfermeras. Pobres profesionales de la sanidad pública. Hasta la monja benedictina, experta en teologías feministas, les crea problemas.

En este país, lo normal es que uno vaya al médico y le diga lo que tiene que recetarle. Y lo que el paciente pide o exige al médico que le recete son las mismas pastillas que toma su cuñada. O su vecina. Ahora, desde que la monja *Forcades* se nos ha hecho aún más famosa a través de internet con el vídeo *Campanas por la gripe A* nuestros médicos y enfermeras de la sanidad pública han de enfrentarse también a la monja. «¿Me vacuno o no me vacuno? Se lo pregunto porque la monja dice en internet que no debemos vacunarnos.» Y así todo el día.

La monja ***Forcades*** que, cuando aconseja no vacunarse contra la gripe A, posa con su monasterio al fondo para darle más crediblidad y más fuerza cinematográfica a su mensaje, debería decidirse. Nadie le niega que, como médica que también es, tiene derecho a opinar lo que le dé la gana o lo que le permitan sus superiores o el Papa, pero no debería aprovecharse de su hábito. Porque si bien es verdad que el hábito no hace al monje, también lo es que el hábito hace más creíble cualquier mensaje. Y eso es jugar con ventaja, en un tema, el de la gripe A, en el que nadie, hasta ahora, parece tenerlo claro.

Horrorszenarien: Die Schweinegrippe und die Medien

Monitor, Nr. 600, 19 Novembre 2009.
https://web.archive.org/web/20091123185636/http://www.wdr.de/tv/monitor/sendungen/2009/1119/grippe.php5

Sonia Mikich: "Ich bin heute früh zur Arbeit gefahren und obwohl jährlich viereinhalbtausend Menschen bei Autounfällen sterben, hatte ich keine Sekunde Angst vor dem Autofahren. Angst an der Schweinegrippe zu sterben, ist dagegen gang und gäbe zurzeit. Das ist seltsam angesichts der realen Zahlen, und darum möchten Georg Restle und Ralph Hötte die Fieberkurve der allgemeinen Aufgeregtheit nach unten bringen. Ohne Verharmlosung, ohne Glaubensbekenntnis pro oder kontra Impfung. Einfach Fakten, die Sie überraschen werden."

35.000 Tote. Seit Wochen trommelt die Boulevardpresse. Schweinegrippe: Jeder Fall ein neuer Schocker. Und keine Nachrichtensendung ohne das Virus. "Die Zahl der Schweinegrippen-Infizierten in Deutschland steigt immer schneller." "Die Schweinegrippe legt jetzt bei uns so richtig los." Eine mediale Fieberkurve - mit Wirkung.

Gerd Antes, Univ. Universität. Mitglied der Ständigen Impfkommission: "Die Folgen dieser Angstmaschinerie sind natürlich dann teilweise makaber. Drei weitere Tote - und plötzlich rennt alles zu den Impfstellen. Was dann natürlich doppelt makaber ist, weil, aufgrund des nicht verfügbaren Impfstoffes, die Gruppe, die den Impfstoff wirklich haben müssten, plötzlich ohne Impfstoff dastehen."

Vor allem ein Fall beschäftigte die Medien. Ein 15-jähriges Mädchen, kerngesund, plötzlich verstorben an den Folgen einer Schweinegrippe-Infektion.

"Sie war doch so lebenslustig! Die 15-jährige Schülerin aus Kassel ist das zwölfte Todesopfer, das die Schweinegrippe fordert." "Gerade mal 15 Jahre alt war das jüngste Opfer." Ein nachgewiesener Tod durch Schweinegrippe? Was sagt das zuständige Gesundheitsamt?

Karin Müller, Gesundheitsamt Kassel: "Bis heute ist überhaupt nicht klar, ob die Schweinegrippe in irgendeiner Weise mit dem Tod des Mädchens im Zusammenhang steht. Fest steht, dass das Mädchen klinisch an einer Herz-Muskel-Entzündung verstorben ist."

Erstaunlich, selbst das Robert-Koch-Institut führt den Fall bereits in seiner Statistik der Schweinegrippe-Toten, und das obwohl medizinisch überhaupt noch nicht geklärt ist, ob es überhaupt einen direkten Zusammenhang gibt zwischen dem Tod des 15-jährigen Mädchens aus Hessen und dem Virus, das es in sich trug gab. 27 Tote wurden in Deutschland bisher gemeldet. Eine bedrohliche Zahl?

Prof. Michael Kochen, Präsident Deutsche Gesellschaft für Allgemeinmedizin: "Wenn Sie die Zahl der Infizierten, insbesondere, wenn man die Dunkelziffer anbetrifft, die sehr viel höher ist, mit der Zahl der Komplikationen und der Zahl der Toten vergleicht, so handelt es sich hier um eine relativ harmlose Infektion."

Jedenfalls für die allermeisten. Für ein genaueres Bild lohnt ein Blick nach Mexiko – das Land, in dem das H1N1-Virus zum ersten Mal für Angst und Schrecken sorgte. Bilder von damals, als die Menschen noch Mundschutz trugen. Heute ist die Grippewelle hier vorüber - und seit letzter Woche liegt die erste umfassende Untersuchung zur Epidemie vor. Fakt ist: Viele Menschen haben sich in Mexiko mit dem Virus angesteckt. Die Dunkelziffer ist hoch. Aber die Zahl der Schweinegrippe-Toten ist deutlich niedriger als befürchtet. Bei einer Gesamtbevölkerung von 110 Millionen waren es nur 63 Tote, bei denen das Virus nachgewiesen wurde.

Gerd Antes, Universität Freiburg, Mitglied der Ständigen Impfkommission: "Die Zahlen aus Mexiko bestätigen den Eindruck, dass überall dort, wo man genauer hinschaut, es nicht so dramatisch ist wie wir vielleicht gedacht haben. Mexiko war so der Inbegriff des Schreckens. Das, was dort an Schlimmem passiert ist, transportierte man zu uns. Das ist das praktisch, was uns noch bevorsteht."

Und noch ein Land machte Schlagzeilen. Die Ukraine.

"... sogar die nationale Sicherheit bedrohen kann, erlebt derzeit die Urkaine."

"Das ukrainische Gesundheitsministerium zum Beispiel meldet mehr als 255.000 Infizierte und über 70 Tote." "Dramatisch ist die Lage in der Ukraine." "Dort erlagen schon 70 Menschen der Schweinegrippe. Die Regierung hat ausländische Hilfe angefordert."

Zuletzt war sogar von Hunderten Schweinegrippe-Toten die Rede. Doch wie sieht die Lage in dem Land wirklich aus? Tatsächlich gab es auch hier viele Infektionen, aber hunderte Tote? Wir recherchieren beim ukrainischen Gesundheitsministerium, medizinischen Instituten und der Weltgesundheitsorganisation. Das Ergebnis: Die Ursache für die allermeisten gemeldeten Todesfälle ist noch völlig ungeklärt. Bisher wurden erst 29 Fälle untersucht. Nachgewiesen wurde das H1N1-Virus bisher bei 17 Toten. 178 weitere Verdachtsfälle werden erst noch geprüft.

Prof. *Michael Kochen*, Präsident Deutsche Gesellschaft für Allgemeinmedizin: "Die Ukraine zeigt im Grunde genommen genau dasselbe Bild wie in allen anderen Ländern. Eine sehr leicht verbreitbare Infektion, die sehr viele Leute betrifft. Also wir haben eine hohe Anzahl von Fällen. Und wir haben eine relativ niedrige Anzahl von Todesfällen."

Für Meldungen aus einem anderen Land dagegen interessierte sich hierzulande kaum jemand: Australien auf der Südhalbkugel, wo der Winter längst vorbei ist - und mit ihm auch die Grippesaison. Auch hier hatte man Schlimmstes befürchtet, nach dem die WHO die Pandemie ausgerufen hatte. Letzte Woche hat das australische Gesundheitsministerium eine erste Bilanz der Schweinegrippe-Epidemie gezogen. Und stellte fest: Die Zahl der Toten blieb auch hier weit hinter den Befürchtungen zurück. Insgesamt gab es in Australien 189 nachgewiesene Todesfälle im Zusammenhang mit H1N1. Erstaunlich findet der Bericht aber noch etwas anderes:

Zitat: "Die Schweinegrippe hat das saisonale Grippe-Virus fast vollständig verdrängt."

Prof. *Peter Collignon*, Direktor "School of Medicine", Universität Canberra (Übersetzung *Monitor*): "In diesem Winter hatten wir insgesamt weit weniger Grippetote als in den Vorjahren. Normalerweise haben wir hier in Australien geschätzt 2.000 bis 3.000 Todesfälle wegen der Grippe. Dieses Jahr waren es nur etwa 190. Die Auswirkungen dieser neuen Grippe – zumindest was die Toten angeht - blieben deutlich hinter dem zurück, was wir hier normalerweise erleben.

Prof. *Michael Kochen*, Präsident Deutsche Gesellschaft für Allgemeinmedizin: "Das neue Virus wird unser neues, normales saisonale Grippevirus sein. Und in Gefolge dieser Entwicklung werden wir auch in den nächsten Jahren mit sehr viel geringeren Todeszahlen zu rechnen haben als bisher in den letzten 22 Jahren, durch die saisonale Grippe."

Richtig bleibt, in Einzelfällen kann das Virus gefährlich werden. Gerade auch für Jüngere mit Vorerkrankungen. Für Panik und Hysterie dagegen, besteht bisher kein Grund.

Sonia Mikich: "Die eigentliche Pandemie ist die Angst vor ihr."

A serious threat?

Deutsche Welle, 19 November 2009
https://www.dw.com/en/experts-defend-scientific-community-over-claims-of-swine-flu-exaggeration/a-4901330

Health and scientific organizations deny claims that the swine flu threat has been exaggerated as the number of global infections and deaths from the H1N1 virus begin to slow down.

Rather than being relieved that current figures show less death and destruction being caused by the swine flu than first predicted, some quarters of the international media and a section of the global public are becoming perplexed over why the H1N1 virus has not reached the devastating scale initially predicted.

In Europe, sections of the British and French media have accused medical experts of exaggerating the threat. Britain's Independent newspaper led with a front page headline last week which asked "Pandemic? What Pandemic?"

France's Le Parisien ran a story about the gap between the predicted impact of H1N1 and the less dramatic reality. "Although some 30-odd people have died, the disease is not really frightening," the French paper wrote.

With many European countries continuing to report new cases - the Robert Koch Institute in Germany reported this week that infections had doubled in the last seven days, and Hungary declared an epidemic as over 22,000 people complained of flu-like symptoms - health officials have said there's no reason for countries to let down their guard.

"We are still seeing hundreds and thousands of cases, especially in the temperate zones of the Northern Hemisphere," Gregory Haertl, the leader of the World Health Organization's H1N1 Global Alert and Response team, told Deutsche Welle. "Most cases have been mild, but we need to be prepared."

Reactions to a changing threat

But on a global scale the spread of the virus is slowing, according to the WHO. Fatalities around the world are also decreasing: 179 people died of the virus last week, down from 224 a week earlier and an estimated 700 in the last week of October.

In Britain, one of the European countries affected most by the pandemic, the predicted number of deaths has been revised down twice from the initial figure of 65,000 and now stands at around 1,000. This is considerably lower than the UK's average annual toll of 4,000 to 8,000 fatalities from seasonal winter flu.

"Predictions were based on the first figures of fatalities from Mexico, and these were released after the outbreak had been spreading for some time," Karl Ekdahl, head of the Health Communication Unit at the European Center for Disease Prevention and Control in Stockholm, told Deutsche Welle. "Our predictions were then toned down when we learnt more about the virus and how it spread."

Worst case vs. accurate forecast

News that the numbers of infections and deaths are slowing has given rise to media reports that the swine flu threat may have been exaggerated and that the public may have been informed of a worst-case scenario rather than an accurate forecast.

Looking back on preliminary forecasts of up to 65,000 death in the UK alone, the Independent's health editor Jeremy Laurance wrote recently that scientists were extremely sensitive about possibly being wrong about swine flu's scope.

"Speaking to virologists in recent days, I sense a certain defensiveness, a reluctance to accept that, potentially, they may have overdone it on flu," he wrote.

Scientists, however, rejected such accusations.

"The World Health Organization has not and will never follow the policy of promoting a worst case scenario to the public," said Haertl "We have not given any scenarios for H1N1. What we have done is warn people and governments of the potential challenges and concerns in relation to this pandemic."

Scientists and health authorities have also warned that the current figures and reports of statistical manipulation should not lull the public into a false sense of security. While the situation currently looks better than predicted, the virus could still mutate, Ekdahl said.

"We have no idea what may happen next," he added. "In the worst case, the virus will mutate but we haven't seen much evidence of that so we can say at the moment that there is no immediate threat of mutation but it is too early to say."

Infection comparisons difficult, inaccurate

Lack of an accurate model to serve as the basis of H1N1 infections left researchers making initial predictions from a position of uncertainty.

"We didn't have a historical precedent for this pandemic, and we were planning for an outbreak of the avian flu not a swine flu," Ekdahl said. "We were all planning for the potential mutation of the avian flu over the next three to five years into a person-to-person transmittable disease."

Planning for any influenza outbreak is difficult because, by its nature, influenza viruses are highly unpredictable, with outbreaks happening at random intervals and taking on very different characteristics than previous pandemics, Ekdahl said.

"We can only work from assumptions, what we believe the virus will do," he said. "We do plan for the worst-case scenario and this can often produce figures which are thankfully never met."

Bulgaria set to call off Swine Flu Epidemic, second wave feared

20 Novinite, 19 November 2009, 09:51
https://www.novinite.com/articles/110146/Bulgaria+Set+to+Call+Off+Swine+Flu+Epidemic%2C+Second+Wave+Feared

Bulgaria's Chief Epidemiologist, Dr. Angel Kunchev, has stated that the Health Ministry will call off the national swine flu epidemic at the end of this week due to a fall in cases of infection.

Kunchev stated that there has been a significant drop in cases of people infected with the A(H1N1) virus and said he expected that the epidemic is over. He added that Blagoevgrad, Gabrovo, Pazardzhik, Pleven, Silistra and Yambol remain the regions in which the swine flu virus is most widespread.

Kunchev concluded that he fears a second wave of swine flu will hit Bulgaria but he added that it is too early to say when or if it will certainly happen.

A 36-year-old man became Bulgaria's 14th victim of the A(H1N1) virus on Tuesday after developing double pneumonia.

The man died in the hospital in the northern Bulgarian town of Gorna Oryahovitsa, thus becoming the first swine flu victim in the Veliko Tarnovo District.

THE FLU CASE

Bulgaria has officially declared the swine flu pandemic to be "over"

The Flu Case, 21 November 2009.
https://web.archive.org/web/20100102034734/http://theflucase.com/index.php?option=com_content&view=article&id=2005%3Abulgaria-declares-swine-flu-pandemic-at-an-end&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Bulgarian Ministry of Health said that the rate of infection had dropped to 190 people for every 10,000 people.

The declaration of an end of the pandemic by the government will result in the swine flu vaccination programme being put on ice.

In a report on Bulgaria from mid November, experts from European Centers for Disease Prevention and Control (ECDC) said that the swine flu situation in Bulgaria was no different from that in other countries in Europe in as far as the swine flu – if it could be confirmed in a lab at all - was a mild sickness.

Bulgaria's decision to declare an end to the swine flu pandemic raises the question: why have other countries in the European Union not declared the swine flu pandemic at an end.

THE SCOTSMAN

Swine flu claims 48th victim in Scotland

The ScotsMan, 20 November 2009, 22:15
https://web.archive.org/web/20140821070115/http://www.scotsman.com/news/health/swine-flu-claims-48th-victim-in-scotland-1-770373

THE death toll linked to swine flu in Scotland has risen to 48, the Scottish Government said yesterday.

Health secretary Nicola Sturgeon confirmed that an adult from the NHS Ayrshire and Arran Health Board area had died after contracting the H1N1 virus. The patient had underlying health conditions.

Last week, seven patients died after contracting swine flu in Scotland – two of them had no reported underlying health problems.

Yesterday, Ms Sturgeon said: "It deeply saddens me to confirm another H1N1-related death.

"I want to reassure the public that we are doing everything we can to fight H1N1."

Doctors are continuing to vaccinate patients against swine flu, with hopes to complete the at-risk groups by Christmas.

Then the vaccination campaign is set to move on to children under five.

Ms Sturgeon added: "Vaccination is our best defence against H1N1 and the programme is progressing well."

MailOnline

Tragedy of girl, five, struck by swine flu:
Three GPs and a hospital doctor thought she had tonsillitis

Daily Mail, 20 November 2009, 01:40 GMT
https://www.dailymail.co.uk/health/article-1229277/Swine-flu-jab-healthy-children-age-five.html

A five-year-old girl suffering from swine flu died after doctors took two weeks to diagnose her illness, it was claimed last night. Nida Qureshi was seen by three GPs and a hospital doctor who told her parents she may have tonsillitis.

By the time doctors discovered that she had the H1N1 virus, the youngster was on a life support machine, her family said. She died eight days later.

Last night relatives said Nida's parents - Zubair, 28, and Raheela, 30, who is pregnant with their second child - believe that their daughter may have survived if swine flu had been detected earlier.

Nida's uncle, Jawaid Qureshi, said: 'Her mum, herself a child carer, and dad are very angry that doctors and GPs failed to diagnose it earlier. It's devastating. She may have lived if it had been diagnosed earlier.'

Mr Qureshi said Nida - a 'bright' girl without any underlying health problems - fell ill with a temperature and vomiting on October 19.

The family phoned a GP, who advised paracetamol. The next day she went to her doctor and was prescribed antibiotics.

Five days later, the family took her back but were told to carry on giving the antibiotics.

On November 1, after her condition worsened, the family took her to A&E at their local hospital, Wexham Park, in Slough.

Mr Qureshi said: 'When she was breathing she was in agony. She was coughing a lot as well. The doctor at hospital said it might be tonsillitis but they did not take any blood or urine samples.

They prescribed her with more medicine and said: "Go back to the GP if she continues not to feel well". It was a very bad decision to allow her to go home.'

Two days later she had a seizure and never regained consciousness. She was put on a life support machine and finally diagnosed with the H1N1 virus. Nida was transferred to St Mary's Hospital in London.

A spokesman for NHS Berkshire East said: 'We can confirm that a young girl from east Berkshire died at St Mary's Hospital, London, on November 11. She had tested positive for H1N1 swine flu.'

Professor John Oxford, professor of virology at Queen Mary School of Medicine, said her death could have been caused when the swine flu virus moved into her central nervous system.

Normally, the virus attacks the lungs. But in extremely rare cases, often affecting children, it can attack the nerve tissue and cause a seizure.

He added: 'Diagnosing flu in a five-year-old is extremely difficult. It is also impossible to say if Tamiflu would have made any difference in this case.'

AFTONBLADET

Linda Hjertén

Svinfluensan muterar

Aftonbladet, 20 November 2009.
https://web.archive.org/web/20091123062759/http://www.aftonbladet.se/nyheter/svininfluensan/article6160420.ab

Viruset kan nå längre ner i lungorna. Svininfluensa-viruset har muterat.

Den nya varianten, som dykt upp i både Sverige och Norge, kan nå längre ner i lungorna och vara allvarligare för patienten.

Men norska och svenska hälsomyndigheter säger att det inte finns någon orsak till panik.

Norge har drabbats hårdare av den nya influensan A/H1N1 än Sverige och hittills har 23 personer dött i följderna av viruset och minst 700 000 har insjuknat.

Det norska Folkehelseinstituttet (FHI) övervakar situationen noga och har gjort omfattande tester på viruset från både sjuka och avlidna patienter, skriver VG.

"Når längre ner i lungorna"

I dag på en presskonferens avslöjade FHI att Norge ser ut att ha råkat ut för ett mer aggressivt influensavirus än många andra länder.

De har hittat bevis för att svininfluensa-viruset har muterat i åtminstone tre fall, och att det tar sig längre ner i lungorna än vid vanlig svininfluensa. Resultaten har presenterats för Världshälsoorganisationen WHO.

– Det muterade viruset orsakar en mild sjukdom hos de flesta, men kan vara allvarlig för några få. Den här varianten kan nå längre ner i lungorna än den ursprungliga varianten, sade direktör Geir Stene-Larsen på Folkhälsoinstitutet vid en presskonferens på fredagen enligt VG.

Även i Sverige

Samma variant av svininfluensaviruset som upptäckts i Norge har också hittats i Sverige, hos både svårt sjuka, lindrigt sjuka och hos personer som inte insjuknat alls, skriver TT. Men varken svenska Smittskyddsinstitutet (SMI) eller WHO har hittills funnit några tecken på förändringar hos de cirkulerande stammarna som gör den nya influensan mer aggressiv.

Allt tyder även på att vaccinet och Tamiflu fungerar på samma sätt mot det nya, muterade viruset. Och den norska hälsoorganisationen säger att ingenting tyder på att fler kommer att drabbas av det muterade H1N1-viruset.

Eftersom det, vad man hittills kunnat se, bara drabbat patienter som legat inlagda på sjukhus så räknar experterna med att det är mindre smittsamt. – För oss som nu ser sjukdomen runt oss, och för de som blir sjuka framöver, så betyder nog inte det här så mycket. Vi förväntar oss att de flesta kommer att få en mild variant av sjukdomen, säger hälsodirektör Bjørn-Inge Larsen till NRK.

THE FLU CASE

Johan Niklasson

New mutated H1N1 virus in Norway and Sweden

The Flu Case, 20 November 2009, 16:31

https://web.archive.org/web/20100102035038/http://theflucase.com/index.php?option=com_content&view=article&id=1994%3Anew-mutated-h1n1-virus-in-norway-and-sweden&catid=41%3Ahighlighted-news&Itemid=105&lang=en

According to Aftonbladet, a new mutation of the AH1N1 virus has been found in several people in both Norway and Sweden. In Norway, the only ones being found with this virus were already in Hospitals. This new mutated virus is supposedly more dangerous since it travels deeper inside of the lungs. The three confirmed cases in Norway have been reported to the WHO.

It is expected that the new mutation has been infecting many so far resulting in different milder symptoms and Health authorities in the countries state there is no reason to panic.

It is unclear weather the new mutated virus is supposed to be "covered" by the "swine flu" vaccinations that are being injeted in thousands of individuals in Norway and Sweden. It is suspicious that these new types of viruses appear just after mass vaccinations starts and could indicate that it was in fact present in the "swine flu" shots, which was given to already sick in the first wave of vaccinations.

World Health Organization

Pandemic (H1N1) 2009 - update 75

Geneva, WHO, 20 November 2009.
https://web.archive.org/web/20091231141342/http://www.who.int/csr/don/2009_11_20a/en/index.html

Weekly update
20 November 2009 – As of 15 November 2009, worldwide more than 206 countries and overseas territories or communities have reported laboratory confirmed cases of pandemic influenza H1N1 2009, including over 6770 deaths.

As many countries have stopped counting individual cases, particularly of milder illness, the case count is likely to be significantly lower than the actual number of cases that have occurred. WHO is actively monitoring the progress of the pandemic through frequent consultations with the WHO Regional Offices and member states and through monitoring of multiple sources of data.

Situation update:
The situation remains similar since the last update. In temperate regions* of the northern hemisphere, the early arriving winter influenza season continues to intensify across parts of North America and much of Europe. However, there are early signs of a peak in disease activity in some areas of the northern hemisphere.

In the United States, influenza transmission remains active and geographically widespread, although disease activity appears to have recently peaked in most areas except in the northeastern United States. In Canada, influenza transmission continues to intensify without a clear peak in activity; the ILI consultation rate, which has been highest among children aged 5-19, continues to significantly exceed mean rates observed over the past 12 influenza seasons.

In Europe, widespread and increasing transmission of pandemic influenza virus was observed across much of the continent but the most intense circulation of virus occurred in northern, eastern, and southeastern Europe. Transmission appears to have peaked in few countries of Western Europe including Iceland, Ireland, the UK (Northern Ireland), and Belgium after a period of sustained intense transmission. Further east, a number of countries reported sharp increases in the rates of ILI** (Serbia, Moldova, Norway, Lithuania, Georgia) or ARI (Belarus, Bulgaria, Romania, and Ukraine). A moderate or greater impact on the healthcare system was reported in parts of northern and southeastern Europe. Greater than 20% of all sentinel respiratory specimens tested positive for influenza in at least 20 countries, with ≥ 50% of samples testing positive for influenza in Spain, Portugal, Estonia, Slovenia, Slovakia, Moldova, Bosnia and Herzegovina, Greece, Norway, Finland, Denmark, Belgium, Iceland, and Ireland. Over 99% of subtyped influenza A viruses in the Europe were pandemic H1N1 2009.

In Central and Western Asia, increasing diseases activity and pandemic influenza virus isolations continues to be reported in several countries. A high intensity of respiratory diseases with increasing trend was reported in Kazakhstan. Recent increases in rates of ILI or ARI have been observed in Uzbekistan and in parts of Afghanistan (particularly in the capital region and in southern and northeastern provinces). In Israel, sharp increases in rates of ILI and pandemic virus detections have been reported in recent weeks.

In East Asia, influenza transmission remains active. Intense influenza activity continues to be observed in Mongolia with a severe impact on the healthcare system; however, disease activity may have recently peaked in the past 1-2 weeks. In Japan, influenza activity remains elevated but stable nationally, and may be decreasing slightly in populated urban areas. A small number of seasonal H3N2 and H1N1 influenza viruses continue to be detected in China and South East Asia, though the proportion of seasonal viruses is declining in relation to the proportion of pandemic influenza H1N1.

In tropical zone of the Americas and Asia, the intensity of influenza transmission is variable. In the tropical areas of Central and South America, most countries continue to report declining influenza activity, with the exception of Peru and Colombia. In the Caribbean Epidemiology Centre (CAREC) countries, after a recent peak of disease activity, rates of ARI have declined over the past 3-4 weeks. With the exception of Sri Lanka, overall transmission continues to decline in most parts of tropical South and Southeast Asia. In Hong Kong SAR, rates of ILI have returned baseline after a recent wave of predominantly pandemic H1N1 influenza in September and October.

In the temperate region of the southern hemisphere, little pandemic influenza activity has been reported.

For more epidemiologic information please refer to the recent Weekly Epidemiological Report on Transmission Dynamics and Impact of Pandemic Influenza A (H1N1) 2009 Virus.

THE FLU CASE

WHO maintains swine flu rampant
while Polish Parliament told tiny number of cases

The Flu Case, 21 November 2009 13:01
https://web.archive.org/web/20100102011703/http://theflucase.com/index.php?option=com_content&view=article&id=2002%3Awho-maintains-swine-flu-rampant-while-polish-parliament-told-tiny-number-of-cases&catid=1%3Alatest-news&Itemid=64&lang=en

WHO is continuing its fear mongering, maintaning the swine flu has reached at least 206 countries and territories across the globe and killed more than 6770 people, still far less than the normal seasonal flu.

In its weekly update, WHO maintains swine flu widespread in Asia, USA, Canada and Europe and is continuing to increase.

Meanwhile, the Polish Parliament was recentlytold by health experts that only 193 people in the country who had come down with the flu were found to have actually had the swine flu.

In addtion, all of those people had a mild sickness. In the past few days, this number has increased but still remains under 300 cases of confirmed swine flu.

WHO's swine flu vaccine terrorism against people around the world, therefore, has no justification.

FHI

Mutation of pandemic influenza A(H1N1) in Norway

FHI, 20 November 2009, 15:36

https://web.archive.org/web/20091124102134/http://www.fhi.no/eway/default.aspx?pid=238&trg=MainLeft_5812&MainLeft_5812=5825:81363::0:5967:1:::0:0

The Norwegian Institute of Public Health announced today to have found a mutated version of the influenza A(H1N1) virus in three patients in Norway who had tested positive for the new flu.

The Norwegian Institute of Public Health has analysed virus from a number of patients as part of the surveillance of the pandemic flu virus. The viruses have many similarities, but some mutations have been observed. This is normal and most of these mutations will probably have little or no importance.

However, one mutation has caught special interest. It has been found in two patients who died from the new influenza A(H1N1) and in one patient with severe influenza disease. These were the two first patients who died from the new influenza in Norway. Some of those who died later have been examined without finding the same mutated virus.

The mutation could possibly make the virus more prone to infect deeper in the airways and thus cause more severe disease.

- We have analysed approximately 70 viruses from confirmed Norwegian cases and found the mutation in only these three patients, says Director General Geir Stene-Larsen at the Norwegian Institute of Public Health. - Based on what we know so far, it seems that the mutated virus does not circulate in the population, but might be a result of spontaneous changes which have occurred in these three patients.

- There is no indication that this change in the virus is of any importance for the effect of the vaccine or the effect of antiviral treatment, concludes Stene-Larsen.

Anine Hallgren

H1N1-viruset har mutert

Nyhetene, 20 November 2009, 14.21
https://web.archive.org/web/20091122004519/http://www.tv2nyhetene.no/innenriks/helse/h1n1viruset-har-mutert-3019035.html

De to første som døde av svineinfluensa, hadde muterte H1N1-virus, opplyser helsemyndighetene.
På en pressekonferanse fredag ettermiddag informerte norske helsemyndigheter at de regner med at 700.000 nordmenn så langt er smittet av svineinfluensa.

Under pressekonferansen ble det opplyst at H1N1-viruset har mutert i fem av 70 tilfeller, blant annet hos de to første som døde av svineinfluensa.
– Vi har funnet det muterte viruset hos to av de første pasientene som døde her i landet. Dette viruset har vært i omløp i Norge helt siden pandemien startet, sier direktør Geir Stene-Larsen ved Folkehelseinstituttet.

Diskutert med WHO
Dette funnet regner myndighetene som såpass alvorlig at de gransker de nye funnene videre. Men både Tamiflu og vaksine skal virke på denne virusvarianten, forsikrer Stene-Larsen.

– Funnet av denne mutasjonen understreker viktigheten av gjeldende råd som er å vaksinere seg og bruke antiviralia som Tamiflu. For å ha effekt bør behandlingen startes innen 48 timer etter første symptomer. Disse legemidlene kan nå fås direkte på apotek uten resept fra lege ved å fylle ut et egenmeldingsskjema, sier helsedirektør Bjørn-Inge Larsen.

Det «nye», muterte viruset smitter dypere ned i luftveiene og kan være farligere enn tidligere antatt.
Funnene er gjort etter undersøkelser av 70 laboratorieprøver, av disse ble det funnet fem mutasjoner.
To av dem som ble smittet av dette viruset, er døde - de tre andre har vært innlagt på sykehus.

Mutert virus sirkulerer ikke
– Basert på det vi vet så langt ser det ut til at det muterte viruset ikke sirkulerer i befolkningen, men at det kan være snakk om spontane forandringer som har oppstått i de tre pasientene, sier direktør i Folkehelseinstituttet Geir Stene-Larsen.

Mutasjonen er diskutert med Verdens helseorganisasjon (WHO) fredag, og WHO opplyser at mutasjonen også er påvist i andre land.

Japan, Brasil, USA, Mexico, Ukraina og Kina er i tillegg til Norge de andre landene som har registrert denne mutasjonen.

Helsemyndighetene understreker at mutasjonene ikke trenger å bety flere tilfeller av alvorlig sykdom eller død.

Likevel har helsemyndighetene undersøkt 15 døde pasienter, for å se om de finner svar på hvorfor Norge har hatt såpass mange døde. De foreløpige resultatene viser at fire av dem hadde fått Tamiflu, og at ingen av dem var vaksinert.

Torsdag var det meldt om 23 dødsfall som kan knyttes til svineinfluensaen. Av disse var sju yngre enn 20 år. Helsemyndighetene tror dette kan skyldes at Norge tidlig fikk en kraftig bølge av smittespredning før vaksineringen var skikkelig i gang.

– Samtidig er det viktig å undersøke om det likevel er noe ved de norske dødsfallene som skiller oss fra andre land, og som gjør at vi kan lære noe som styrker vår behandling av de som blir alvorlig syke. Vi har også forpliktelser internasjonalt for å dele av eventuelt ny kunnskap, sier helsedirektør Bjørn-Inge Larsen.

1000 vaksiner til allergikere

Helse- og omsorgsdepartementet fikk fredag vite at Østerrike vil avgi 1000 vaksiner beregnet på eggallergikere.

– Det har vært viktig raskt å skaffe en influensavaksine til dem som av medisinske årsaker ikke kan få Pandemdrix-vaksinen som er kjøpt inn til hele den norske befolkningen, sier helse- og omsorgsminister Anne-Grete Strøm-Erichsen.

– Jeg har stor forståelse for at de berørte og deres pårørende har vært bekymret og engstelige i mangel av et godt vaksinealternativ ved alvorlig eggallergi, sier Anne-Grete Strøm-Erichsen.

Vaksinene vil ankomme Norge i løpet av kort tid. Folkehelseinstituttet vil informere om hvem som vil få vaksinen og hvordan vaksineringen av disse vil skje i praksis.

THE FLU CASE

Stories of mutated killer virus in Norway: fact or fear mongering?

The Flu Case, 20 November 2009, 16:45

https://web.archive.org/web/20100102045122/http://theflucase.com/index.php?option=com_content&view=article&id=1996%3Astories-of-mutated-killer-virus-in-norway-fact-or-fear-mongering&catid=1%3Alatest-news&Itemid=64&lang=en

The Norwegian TV Channel TV2 has said two people have died from a mutated swine flu virus in Norway.

The two people who died from the mutated virus were also the first deaths in the country attributed to the swine flu.

The Norwegian Institute of Public Health said today it had found a mutated version of the influenza A(H1N1) swine flu virus.

It is not clear what this mutation is or how lethal it is, sparking concerns that the media is fear mongering to drive Norwegians to take the untested swine flu jab.

Government wants right to detain sick people

Adelaide News, 20 November 2009 12:01 am
https://web.archive.org/web/20091128090644/http://www.news.com.au/adelaidenow/story/0,22606,26375106-2682,00.html

Health authorities want the power to detain people for up to three months if they refuse testing or treatment for infectious diseases.

Under draft legislation proposed by the State Government, someone with swine flu, measles or meningococcal disease could be *forcibly held, examined and treated*.

It is one of several wide-ranging powers sought to protect the public.

The Public Health Bill also would, for the first time, give authorities the power to override parents who refused treatment for their children with infectious conditions.

Other diseases that could be controlled include AIDS, polio, rabies, salmonella and cholera.

The tougher enforcement powers would come with a substantial increase in fines - up from $60,000 to $1 million and 10 years' jail - and relate to any serious risk caused to public health. SA Health public health director Kevin Buckett said the new legislation would give authorities wider powers to act more quickly.

"There's nowhere on Earth that is more than 36 hours from anywhere else and where people go, bugs can go," he said yesterday.

"We have to have legislation that can respond in that sort of time.

"The idea would be that we get them out of circulation, where they can't infect other people." Dr Buckett said there were many reasons people refused treatment, including mental health issues, language barriers and even malicious behaviour.

Non-communicable diseases, such as cancer and diabetes, could also be declared, allowing the Government to introduce codes of practice for certain industries or the community. Opposition health spokesman Duncan McFetridge said he supported powers to protect the public from infectious diseases but feared parts of the Bill - to be debated next year - would allow the Government to control people with chronic conditions.

"It's bordering on nanny-state legislation," he said. "It's understandable but how far do we go?"

Australian Medical Associat- ion state president Andrew Lavender said he welcomed most of the changes. as important to protect the public.

H1N1 flu spreading east, peaking in some areas: WHO

Reuters, 21 November 2009, 1:41 AM GMT+8
https://www.reuters.com/article/us-flu-who/h1n1-flu-spreading-east-peaking-in-some-areas-who-idUSTRE5AI2BL20091120/

Geneva (Reuters) – The H1N1 flu is moving eastwards across Europe and Asia after appearing to peak in parts of western Europe and the United States, the World Health Organization (WHO) said on Friday.

At least 6,770 deaths have been recorded worldwide since the swine flu virus emerged in April, according to the latest WHO update which showed 520 known fatalities in the past week.

There are "early signs of a peak in disease activity in some areas of the northern hemisphere," the WHO said in a statement.

H1N1 flu is still widespread across the United States although it appears to have recently peaked in most areas except the northeast. But transmission continues to intensify in Canada, with the highest number of doctor visits by children.

Spread of the flu appears to have peaked in western European countries including Belgium, Britain, Iceland and Ireland after a period of intense outbreaks, the United Nations agency said.

Norway and countries further east including Georgia, Lithuania, Moldova and Serbia are reporting sharp increases in influenza-like illness or acute respiratory infection, it said.

Kazakhstan, Uzbekistan and parts of Afghanistan – particularly Kabul – are reporting higher numbers of flu cases. Israel is also reporting sharp increases.

"Essentially what is happening is that it is spreading eastwards," Anthony Mounts, medical epidemiologist on WHO's influenza team, told Reuters. "Typically seasonal influenza always starts west and moves eastwards. It seems to be following that pattern except it is coming very early this year."

Flu transmission remains active in east Asia, the WHO said. "In Japan, influenza activity remains elevated but stable nationally and may be decreasing slightly in populated urban areas," it said.

Most countries in tropical areas of central and South America continue to report declining numbers of flu cases, with the exception of Peru and Colombia, it said.

THE FLU CASE

WHO talks up alleged "fatal cases" of Norway's mutated virus in press briefing

The Flu Case, 21 November 2009

https://web.archive.org/web/20100102045823/http://theflucase.com/index.php?option=com_content&view=article&id=2014%3Awho-talks-up-alleged-qfatal-casesq-of-norways-mutated-virus-in-press-briefing&catid=1%3Alatest-news&Itemid=64&lang=en

World Health Organization

Public health significance of virus mutation detected in Norway:

Pandemic (H1N1) 2009 briefing note 17

Geneva, WHO, 20 November 2009

https://web.archive.org/web/20091121215655/http://www.who.int/csr/disease/swineflu/notes/briefing_20091120/en/index.html

20 November 2009; **Geneva** – The Norwegian Institute of Public Health has informed WHO of a mutation detected in three H1N1 viruses. The viruses were isolated from the first two fatal cases of pandemic influenza in the country and one patient with severe illness.

Norwegian scientists have analysed samples from more than 70 patients with clinical illness and no further instances of this mutation have been detected. This finding suggests that the mutation is not widespread in the country.

The virus with this mutation remains sensitive to the antiviral drugs, oseltamivir and zanamivir, and studies show that currently available pandemic vaccines confer protection.

Worldwide, laboratory monitoring of influenza viruses has detected a similar mutation in viruses from several other countries, with the earliest detection occurring in April. In addition to Norway, the mutation has been observed in Brazil, China, Japan, Mexico, Ukraine, and the US.

Although information on all these cases is incomplete, several viruses showing the same mutation were detected in fatal cases, and the mutation has also been detected in some mild cases. Worldwide, viruses from numerous fatal cases have not shown the mutation. The public health significance of this finding is thus unclear.

The mutations appear to occur sporadically and spontaneously. To date, no links between the small number of patients infected with the mutated virus have been found and the mutation does not appear to spread.

The significance of the mutation is being assessed by scientists in the WHO network of influenza laboratories. Changes in viruses at the genetic level need to be constantly monitored. However, the significance of these changes is difficult to assess. Many mutations do not alter any important features of the virus or the illness it causes. For this reason, WHO also uses clinical and epidemiological data when making risk assessments.

Although further investigation is under way, no evidence currently suggests that these mutations are leading to an unusual increase in the number of H1N1 infections or a greater number of severe or fatal cases.

Laboratories in the WHO Global Influenza Surveillance Network closely monitor influenza viruses worldwide and will remain vigilant for any further changes in the virus that may have public health significance.

Behörden bestätigen Todesfälle durch veränderten Erreger:
Schweinegrippe-Mutation tötet zwei Norweger!

BILD, 21.November 2009, 11:17 UHR
https://www.bild.de/news/2009/mutiert-todesfaelle-norweger-mutation-10537122.bild.html

Das H1N1-Virus ist mutiert! In Norwegen sind bereits zwei Menschen an der Mutation gestorben, teilte die Weltgesundheitsorganisation (WHO) mit.

Beunruhigend: Ähnliche Veränderungen des Erregers wurden bereits in Brasilien, China, Japan, Mexiko, der Ukraine und den USA festgestellt.

Das Institut für Öffentliche Gesundheit in Norwegen warnte, die Mutation könne möglicherweise einen schwereren Krankheitsverlauf verursachen, da dieser Erreger in Gewebe vordringe, das tiefer in den Atemwegen liege als bei der gewöhnlichen Form.

Die WHO erklärte jedoch, dass die Bedeutung der Mutation für die öffentliche Gesundheit noch unklar sei. Die Mutation scheine sich nach ersten Erkenntnissen bisher nicht auszubreiten.

Es gibt laut WHO auch keine Hinweise, dass die veränderten Viren einen ungewöhnlichen Anstieg der Zahl der H1N1-Infektionen oder Todesfälle auslösen werden.

Die Organisation sagt zudem, dass die Schweinegrippe-Impfung und die entsprechenden Grippe-Medikamente zurzeit auch gegen die Mutation wirken.

Die Schweinegrippe grassiert – dennoch sind 90 Prozent der Deutschen gegen eine gesetzliche Pflicht zur Impfung.

Nur neun Prozent (Westdeutschland acht, Ostdeutschland zwölf Prozent) sprechen sich für eine Impf-Pflicht aus, wie sie bis zum Sommer 1983 in der Bundesrepublik für Pocken vorgeschrieben war. Dies ist das Ergebnis einer repräsentativen Umfrage des Instituts Emnid im Auftrag von BILD am SONNTAG

Weltweit sind bislang mehr als 6750 Menschen an der Schweinegrippe gestorben.

THE FLU CASE

Is BILD fear mongering with reports of mutated killer virus in Norway?

The Flu Case, 21 November 2009, 13:47
https://web.archive.org/web/20100102020452/http://theflucase.com/index.php?option=com_content&view=article&id=2012%3Abild-newspaper-spreads-fear-with-qmutated-virusq-in-norway&catid=1%3Alatest-news&Itemid=64&lang=en

BILD, the attack dog of the German-controlled corporate media, is hyping the dangers of a mutated virus in Norway that has allegedly killed two people.

Similar mutations have been detected in Brazil, China, Mexico, the Ukraine and the USA, reports BILD, - but none of them so far have proved to be lethal, a fact BILD omits.

BILD's report appears to be part of yet another syncrhonised and coordinated propaganda campaign by Europe's corporate media to scare people into getting the untested swine flu jabs, even though the untested jabs can offer no protection if the virus has mutated.

THE FLU CASE

Norway's police crackdown on "alternative medicine" as scare mongering over "new mutated" virus grows

The Flu Case, 21 November 2009, 13:58

https://web.archive.org/web/20100102042208/http://theflucase.com/index.php?option=com_content&view=article&id=2013%3Anorways-police-crack-down-on-qalternative-medicineq-as-scare-mongering-over-qnew-mutatedq-virus-grows&catid=1%3Alatest-news&Itemid=64&lang=en

As the hype and fear mongering grows in Norway over the emergence of a new mutated "killer" virus, the local media has reported that police have carried out coordinated raids to crack down on suppliers of alternative medicine.

It is not clear why "alternative" medicines, including vitamins and colloidal silver, which have been proven to offer safe, effective and inexpensive ways of protection against any virus, are being subjected to restrictions in Norway right now if there really is a killer virus about.

It would appear the government is trying to limit Norwegians choice for treating this "mutated virus" to a toxic and untested swine flu jab that will offer no protection against any mutated virus and that contains mercury and squalene and so will most likely cause damage.

NASA, the US space agency, recommends colloidal silver for its astronauts because it has been found to be one of the most effective ways of killing disease-creating organisms of any kind.

Boosting vitamin C and D levels will strengthen the immune system.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

Were Swine Flu Death Projections Hyped?

InfoWars, 22 November 2009

https://web.archive.org/web/20091124104851/http://www.infowars.com/were-swine-flu-death-projections-hyped/

The 2009 H1N1 swine flu "pandemic" may turn out to be one of the most overblown and expensive medical crises in modern history. Indeed, this particular swine flu may be one of the weakest in history. The most recent figures show that the numbers of flu cases are already dropping in the U.S., England, and elsewhere.

It is a mild illness in most but occasionally can lead to severe complications due to bacterial superinfections. In the UK, under 200 people have died from the virus and in the US a debatable 4 thousand people have died. The number of deaths in the US greatly expanded from 1,200 to 4,000 after the CDC recently decided to lump in bacterial infections and "flu-like illnesses" with confirmed swine-flu related deaths.

Even with these inflated numbers, in comparison to previous pandemics or even compared to seasonal flu epidemics, this has been a relatively mild illness. The Spanish H1N1 flu of 1918 was estimated to have killed up to 50 million people. In 1957-58, the Asian HN2 flu caused the death of 1.5 million to 2 million people. Only a decade later, this was followed by the Hong Kong H3N2 in 1968-69 which is thought to be responsible for one million deaths. So far, the 2009 H1N1 flu has only been implicated as the cause of death for a few thousand people.

What is striking is that just six months ago, officials in the US and UK were predicting tens of thousands if not hundreds of thousands of deaths from this swine flu. Since that time officials have had to revise their numbers downward on many occasions.

According to the UK Independent, "Britain's Chief Medical Officer, Sir Liam Donaldson, published a worst-case scenario suggesting the country should plan for up to 65,000 deaths. That planning assumption has since been revised downwards twice. In September the 'worst case' was cut to 19,000 deaths, and in October it was cut again to 1,000 deaths. This compares with an average annual toll of 4,000 to 8,000 deaths from seasonal winter flu."

A similar revisionist trend has occurred in the United States.

As a result of the original nightmare "pandemic" scenarios, governments around the world have spent billions of dollars to stockpile antivirals (i.e. Tamiflu) and to propagandize, produce, and distribute H1N1 vaccinations. The most notable change in how government has tackled this flu emergency has been how they have used the media to spread panic amongst the citizens of the world. Just take the example of Kathleen Sebelius who is the US Health and Human Services (HHS) director. She has publicly gloated over the US Federal Government's campaign to spread H1N1 flu information on children's television programming. This has included putting flu messages and even creating whole television shows devoted to government flu propaganda on programs such as Elmo's World on Sesame Street, Sid the Science Kid, and ESPN. They have also spread their reach into

internet social networks like Facebook. In her testimony before Congress, she remarked that she is particularly proud of hearing stories of children that are now correcting their misinformed parents after they had watched the government programming. This propaganda campaign is in addition to direct advertising and almost continuous hysteria from supposed health experts on prime-time television. The advice from these individuals is sometimes so obviously biased that it can be nauseating.

How could the estimates have been so wildly exaggerated? Unfortunately, it all comes down to power, money, and prestige. In order to get to the bottom of why swine flu hysteria was so overblown one has to simply ask: Who is profiting from the whole swine flu hysteria?

In answer to that question one has to look no further than the drug companies and the medical research establishment. As I have reported previously, drug companies are in line to make billions of dollars over this pandemic and are preparing to expand vaccinations for years to come. As drug companies have already produced vaccinations for most of the other infectious diseases that cause significant mortality in the western world, they are now looking for a new crop of diseases that could become potential vaccine candidates. In fact, facing the prospect of curtailed drug spending, pharmaceutical companies foresee vaccination expansion as one of their greatest areas of focus and future profit. According to the Associated Press (AP), "vaccines are seen as a critical path to growth for drugmakers, as slowing prescription medicine sales and intensifying generic competition put pressure on company bottom lines."

In addition to drug companies, as reported in Reuters, medical researchers have had to respond to "accusations" that the "pandemic has been 'hyped' by medical researchers to further their own cause, boost research grants and line the pockets of drug companies." In response to this, researchers have maintained that "we need to know a lot more to conquer the virus, and funding for new research and drugs is vital to be equipped for future pandemics."

Where this comes full circle is with the government. The great majority of medical research spending is sponsored by government. It is well known that funding from the US National Institute of Health (NIH) and other international governmental bodies favors "pertinent" or as I like to call it "trendy" research. This funding favoritism is especially true of research that can be used to support government policy positions. Most recently, this has been seen in the great expansion of government sponsored global warming research. Now, vaccine experts and their infectious disease cohorts are likely to profit greatly in terms of research grants for preparing for "future pandemics." One only has to hope that those future pandemics will actually deserve all the attention and expense that this one has.

Finally, central governments profit greatly from supposed pandemics such as this one. It permits them to try to justify their existence as our "great guarantors" of health and safety. It also allows them to continue to expand their tentacles of influence and power to an even greater extent in individual lives as they try to remove our medical freedom by making health care decisions for us. Remember that the government, as President Obama's top economic advisor Rahm Emanuel puts it, "never" likes to "waste a good crisis" by not effecting a change that they would ordinarily not be able to accomplish. In this case, governments are trying to expand their mandate as the sole provider of health care because they were the only ones able to protect us from a supposedly horrific swine flu pandemic. Even if the truth has been that their efforts have been largely fruitless, the vast majority of people will remain oblivious to this fact. In the future the government will never cease to congratulate itself for coming to our rescue.

The way government has reacted to this flu reminds me greatly of Orwell's "doublethink" as employed by the totalitarian government in his book Nineteen eighty-four. In terms of the swine flu, the H1N1 "doublethink" means that government says one thing but the reality is the exact opposite.

This "doublethink" says that freedom from death from the swine flu means surrendering your medical freedom to a government health bureaucracy. The reality is that government intervention will have proven to do little more then spend our tax dollars and come at the expense of our health care freedom. This is evidenced by the fact the governments have used this mild flu and hysteria surrounding it to create medical emergency acts that would grant powers to forcibly vaccination citizens despite their objections.

One has to ask the question – would government, researchers, and drug companies been able to justify billions of dollars of expenditures and encroachments on our freedoms if realistic swine flu death projections were used from the beginning? In addition, would the public have been so eager to tune into government and media flu propaganda, or support totalitarian pandemic emergency power bills, or shown up for mass vaccinations if they knew the truth and not the worst? Would they have done any of these things if they had known from the beginning that this pandemic would amount to a few hundred deaths? Surely, the answer would be no.

Many health professionals agree that the original estimates were unreasonably high. According to the UK Independent, "Dr Steven Field, chairman of the Royal College of GPs, said: ‘I thought the original predictions for the number of deaths were incredibly high’."

As with the avian flu scare before it, these groups have great incentive to inflate worst case scenarios because they have the most to profit from the hysteria. There is really no reason why this inflationary pattern will not continue so long as government can use the hysteria to justify increased expansion, drug companies can produce the needed pandemic vaccines, and researchers need a reason to justify massive pandemic research grants.

In the end, I urge you to resist the temptation to sacrifice any of your freedoms for any ounce of government "well-meaning" slavery, especially over a contrived "pandemic’ such as with the 2009 H1N1 swine flu.

Forcades, entre ciencia y espíritu

El Pais, 23 Noviembre 2009, 07:00 CET
https://elpais.com/diario/2009/11/23/sociedad/1258930805_850215.html

La monja que cuestiona la vacuna contra la gripe A clausura un congreso en Barcelona - Comparte foro con defensores del "autoatentado' del 11-S".

Barcelona ha reunido este fin de semana a un amplio grupo mundial de amantes de las teorías de la conspiración, místicos, estudiosos de la Biblia de la era cuántica y visionarios de espíritus de la naturaleza, maestros ascendidos y extraterrestres. El economista y sociólogo Lluís Botinas habló sobre el "montaje *made in USA*" del VIH, cuya existencia negó; Diana Castillo, bióloga, explicó sus *investigaciones* sobre el *"autoatentado* de 11-S" y la "voladura controlada" de los Torres Gemelas. Y la joven canadiense Jessica Schab, autodenominada *Niña cristal*, narró la existencia de los niños índigos y cristal y sus encuentros con los alienígenas grises. Así, hasta una quincena de ponentes del mismo signo.

Y junto a ellos, clausurando el II Congreso Ciencia y Espíritu, estuvo la benedictina y médica Teresa Forcades, autora del vídeo *Campanas por la Gripe A* que, con más de un millón de descargas en YouTube, ha puesto en tela de juicio la eficacia y seguridad de la vacuna contra el H1N1, invitando a la gente a rechazarla.

Forcades, benedictina de Montserrat y residente en Berlín, demostró sus poderes de comunicación e íntima conexión con el auditorio. A los cinco minutos se metió a la gente en el bolsillo y, después de una conferencia de una hora, tuvo que responder otra más de preguntas del público. Pero anuló una rueda de prensa. "Los periodistas la estáis atosigando demasiado", se excusó un miembro de la organización.

Si la monja ha levantado polémica dentro de la comunidad de epidemiólogos y virólogos con sus tesis, ayer Forcades se reafirmó en cada uno de los puntos expuestos en el controvertido vídeo y dijo que ningún experto había sido capaz de rebatirla. Forcades insistió en la supuesta conspiración e invención del virus H1N1, pero como en el vídeo, siempre ofreciendo datos en boca de terceros: este experto ha dicho, ese investigador ha asegurado, la revista tal ha publicado y usando en todo momento el condicional "podría". También sembró dudas sobre la posibilidad de que algunas vacunas estén contaminadas a raíz del incidente ocurrido en los laboratorios Baxter cuando se inoculó un compuesto a unos hurones. Investigación judicial que, como señaló, ha sido archivada judicialmente.

De esta manera, Forcades citó al virólogo australiano Adrian Gibbs, que en una entrevista en Bloomberg, el pasado mayo, aseguró que el virus H1N1 era fruto de un laboratorio. Conclusión que Forcades, aunque evitó hacerla suya, comentó que "podría" ser cierto, porque nunca un virus había combinado ocho segmentos genéticos (seis de la zona americana y dos de la euroasiática). Asimismo, negó la existencia de estudios científicos sobre los efectos secundarios de la vacuna y de los adyuvantes - estimuladores del sistema inmunológico- a largo plazo. Y afirmó que podrían causar problemas cardiovasculares e inflamaciones intestinales. La doctora no citó el documento, publicado esta misma semana por la Organización Mundial de la Salud, que limita al 0,0005% las reacciones graves en el total de 65 millones de vacunas inyectadas. Y puestos a lanzar mensajes intranquilizadores, señaló que la vacuna del papiloma ha provocado 25 muertes. Lo cierto es que en Estados Unidos la vacuna se ha administrado a 23 millones de adolescentes y ha provocado 32 fallecimientos.

Forcades anunció que liderará una iniciativa para reclamar al Gobierno tres medidas: que no obligue a la ciudadanía a vacunarse, que publicite los contratos con las farmacéuticas y la puesta en marcha de estudios sobre la eficacia de la inmunización.

A. Pawlowski

Flying with the flu? Some may be tempted

CNN, 23 November 2009, 09:08 GMT (1708 HKT)
http://edition.cnn.com/2009/TRAVEL/11/23/flying.with.flu/

(CNN) – Air travelers bracing themselves for the annual Thanksgiving rush this week may have something else to fret about: passengers who could be bringing a little extra baggage of the viral kind on board.

Of all the places where H1N1 or other flu viruses may lurk, none seems as worrisome as the cramped cabin of an airplane, where hundreds of human beings share the same space and air.

"When people come together, germs can come together too," said Dr. Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases.

"There are not that many studies about flu spreading on airplanes and trains, but anytime people are close together, there's a possibility of germs spreading."

So it may be unsettling to discover that 51 percent of respondents in a recent informal poll on TripAdvisor.com would fly while sick with the flu rather than pay a flight rebooking fee. About 2,300 people answered the online survey question.

Frequent fliers say the results are disturbing, but not surprising. – "I do think that's an unfortunate attitude, because the airplane is like a petri dish in the sky," said Rene Foss, a flight attendant for 25 years and the spokeswoman for the Association of Flight Attendants. – "[But] people really are resistant to paying any extra fees."

Frustrating options

Every holiday travel rush is crazy on its own. But this one comes during the outbreak of the swine flu and in the midst of a recession that has many people watching every penny.

It's a perfect storm that forces air travelers to make frustrating decisions. Take the story of a Texas couple recently featured in the Airline Biz blog of The Dallas Morning News.

Their 6-year-old daughter became sick with the swine flu two days before the family was to fly on American Airlines. When the girl's father contacted the airline to cancel and rebook the tickets, which had cost $189 each, he was told he would have to pay a cancellation fee – at $150 per ticket.

"Of course I objected, asking for a medical waiver. Our pediatrician even offered to provide a note as proof of the swine flu. They refused," wrote the man, whose name was withheld by the blog.

"I suggested with this policy that they are almost forcing people to fly when they have the swine flu, therefore subjecting others to the flu."

How much, if anything, you would have to pay to reschedule a nonrefundable ticket depends on the carrier.

American Airlines says that if someone chooses not to travel because of an illness or another reason, the value of their ticket is governed by the applicable fare rules, which may include a change fee. In

those cases, the value of the ticket can be used for future travel, minus the fee. It's one of the risks people take when purchasing lower-fare tickets, said Tim Smith, a spokesman for the airline.

US Airways also says change fees still apply to nonrefundable tickets.

Delta works with passengers who are too ill to travel on a case-by-case basis, but if they provide a doctor's note, the airline will reschedule the flight without fees, said spokeswoman Susan Elliott. AirTran Airways and United have similar policies.

Airlines urged to be lenient

The prospect of people sneaking on board with H1N1 to avoid paying a fee has some physicians urging a lenient policy for ill passengers who want to change their travel plans.

"It is clear people should not fly when they're infected, but they should also not be penalized for being responsible citizens," said Dr. Stephanie Haridopolos, a family practitioner in Melbourne, Florida.

Haridopolos, whose 3-year-old daughter recently had the swine flu, believes all airlines should temporarily waive cancellation fees for H1N1-infected passengers who have a doctor's note. – "The current policies force people to choose their pocketbook versus their health," she said.

How do you know when you're too sick to fly?

The Centers for Disease Control and Prevention urges people who have a fever and cough to avoid traveling until 24 hours after their fever has broken, Schuchat said. You can find other symptoms to watch out for and more travel advice on flu.gov.

Watching each other

If flu-stricken air travelers do try to fly, they may find other passengers on edge and eyeing each other suspiciously.

Foss, the veteran flight attendant, said she's seeing more people using face masks and hand sanitizer. When she recently flew as a passenger, the woman next to her took out a scarf and wrapped it around her nose and mouth after a man in the row behind them began coughing.

"She kind of created her own protective device," Foss recalled. "I'm a bit of a hypochondriac myself, and it started to make me nervous, and I found myself lifting my turtleneck over my nose."

Passengers have complained to Foss about other people seemingly ill in the cabin. In fact, the CDC's Schuchat recommends that if someone is coughing excessively, you should ask a flight attendant whether they could be moved to a less crowded part of the plane.

Fifty-seven percent of air travelers would alert flight staff to a passenger displaying flu-like symptoms, according to an online TripAdvisor.com poll released last week.

Flight attendants are trained to look for signs of trouble such as labored breathing and excessive coughing or sneezing, Foss said. If a passenger appears to be too ill too travel, they can bring that person to the attention of the captain before takeoff. Gate agents can also stop passengers from boarding.

But people can be sick and still look fine, Foss said, and some may not even know they're ill.

To keep germs at bay, the basic advice still applies: Wash your hands frequently, and avoid touching your eyes and nose. And if you're sick, don't fly.

International Swine Flu Conference

Conference: November 23-24, 2009 • Workshop: November 25, 2009 Toronto, Canada

International Swine Flu Conference Canada
November 23-24, 2009, Workshop: November 25, 2009

New-Fields Exhibition, Inc.
https://web.archive.org/web/20090830041448/http://new-fields.com/isfc_canada/

Top leaders and key decision-makers of major companies representing a broad range of industries will meet with distinguished scientists, public health officials, law enforcers, first responders, and other experts to discuss pandemic prevention, preparedness, response and recovery at the 1st International Swine Flu Conference.

At the International Swine Flu Conference, attendees will be able to draw on first-hand best practices to create the solid business continuity plans that their companies and organizations need in order to prepare for, respond to, and survive a pandemic.

The International Swine Flu Conference draws on the success of the seven previous Bird Flu summits which featured as speakers several distinguished personalities such as Dr. David Nabarro, the United Nations Coordinator for Avian and Human Influenza, Alex Thiermann of the World Organization for Animal Health (OIE) and Dr. Wenqing Zhang of the WHO Epidemic and Pandemic Alert and Response.

Well-known emergency responders, heads of hospitals from around the world, and hog/swine industry leaders will speak in this summit.

Each day of the conference will offer papers on a wide range of topics including:
- Preparing Community Strategies
- Local Partnership and Participation
- Delivery of Vaccine and Antiviral Medication
- Emergency Response and Hospital/Healthcare Coordination
- Prevention Education Efforts and Risk Communication
- Command, Control and Management
- Business Community’s Role

Panel Discussions include:
- Clinical Picture: Country Report & Situation Update
- Clinical Picture: Impact of US Export Regulations on International Cooperation in the H1N1 Pandemic Flu Response
- Risk Communication, Prevention Education Efforts and Risk Communication
- Understanding the Connection Between Human and Animal Disease, Exploring One World, One Health

Vaccines delivery
Over 20 breakout sessions will be offered addressing a wide range of issues, including:
Breakout: Agricultural Perspective: Socio-Economic Impact on Swine Industry
Breakout: Schools/University Planning: How and When to Close Schools

Next International H1N1 Swine Flu Conference
=> International Swine Flu Conference. – London, UK, 2-3 December 2009.
=> International Swine Flu Conference. – London, UK, 10-12 March 2010.
=> 2nd International Swine Flu Conference. – Washington, DC, 18-19 August 2010.

Des gendarmes pour fermer une école pour cause de grippe A(H1N1)

Reuters, 23 novembre 2009, 17h13 PM GMT+8
Reuters, 24 November 2009, 12:19 AM GMT+8
https://www.reuters.com/article/ofrtp-france-grippe-ecole-20091123-idFRPAE5AM0M020091123/

Bordeaux (Reuters) - Les gendarmes sont intervenus lundi matin pour fermer une école contre l'avis du maire, qui refusait de mettre en application l'arrêté préfectoral de fermeture pour cause de grippe A(H1N1), apprend-on auprès de la mairie et de la préfecture.

L'école de Saint-Supice-de-Royan (Charente-Maritime), qui comprend sept classes et 160 élèves, a été fermée par les gendarmes à la demande de la préfecture alors que le maire, Martial de Villelume, attendait une décision des parents.

"Tout est rentré dans l'ordre. Ça s'est passé dans le plus grand calme. Il m'a été rappelé que c'est le préfet qui prend la décision et que le maire n'a rien à voir là-dedans", a indiqué à Reuters Martial de Villelume.

Le premier magistrat de cette commune de 2.700 habitants proche de Royan a précisé que "depuis ce matin les enfants partent au fur et à mesure de l'arrivée de leurs parents qui galèrent pour certains pour organiser la garde".

Martial de Villelume a expliqué que son refus était né de la méthode utilisée.

"On m'a prévenu par téléphone vendredi soir alors que l'école était fermée jusqu'à lundi et c'était compliqué de prévenir les familles. J'ai considéré qu'on pouvait attendre lundi pour en parler avec les parents", a-t-il dit.

Le maire de la petite commune proche de l'embouchure de l'estuaire de la Gironde a regretté que la décision de fermeture ait été prise uniquement sur des "suspicions de grippe A".

"Vendredi, il y avait 14 cas suspects mais les médecins ont avoué qu'ils étaient incapables de dire s'il s'agissait de la grippe A ou de la grippe saisonnière", a précisé le maire qui dit avoir tenté en vain de négocier avec le préfet pour une fermeture seulement des classes les plus touchées.

Les sept classes de l'école primaire de Saint-Sulpice-de-Royan seront fermées jusqu'à lundi prochain.

Grippe A: le maire refuse de fermer son école

The Flu Case, 23 novembre 2009
https://web.archive.org/web/20100102033712/http://theflucase.com/index.php?option=com_content&view=article&id=2084%3Apolice-in-france-shut-down-school-over-alleged-swine-flu-threat-after-mayor-refuses&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Sante. Le maire de Saint-Sulpice-de-Royan (17), veut d'abord discuter avec les parents avant de fermer son école, comme le lui a demandé la préfecture

À chaque édile local sa manière de réagir aux injonctions préfectorales. Francis Herbert, le maire de Saint-Augustin, a pris acte de l'arrêté signé vendredi, de la main d'Henri Masse, signifiant la fermeture de l'école de sa commune, l'école des Chênes, pour cause de risque de propagation du virus de la grippe A.

Sur les 85 enfants inscrits en maternelle et en élémentaire à l'école des Chênes, une vingtaine manquait à l'appel en fin de semaine. Même si «peut-être cinq ou six enfants montraient des symptômes d'une grippe, pas forcément de la grippe A, d'ailleurs», convenait Francis Herbert au cours du week-end. Samedi après-midi, la directrice a joint toutes les familles pour leur annoncer que les cours ne seraient pas assurés cette semaine.

Prévenu tardivement

Frappé de la même obligation, transmise également vendredi soir par les services de la préfecture, le groupe scolaire Denis-Ricard de Saint-Sulpice-de-Royan, accueillera, lui, tous les enfants qui se présenteront ce lundi matin.

Une décision commune de la directrice de l'école, fréquentée par quelque 170 enfants, de la maternelle au primaire, et du maire de la commune, Martial de Villelume.

Avec un léger sourire, le premier magistrat de Saint-Sulpice reconnaît, dans son attitude, «un petit côté frondeur». Martial de Villelume se fait même piquant à l'égard de la préfecture.

«En étant informé vendredi soir par un fax adressé à la mairie à 18 h 47 et par téléphone vers 20 heures, je ne vois pas comment il aurait possible d'avertir l'ensemble des familles concernées au cours du week-end. Pour peu que je ne puisse être joint vendredi, j'aurais appris dans "Sud Ouest" la fermeture de l'école.»

«On fera le point ce soir»

Bien sûr, à Saint-Sulpice, comme dans la commune voisine de Saint-Augustin, les parents auraient pu être avisés samedi, par téléphone, de la fermeture annoncée du groupe scolaire.

Mais Martial de Villelume s'interroge, lui, sur les conséquences de cette décision. «Tous les parents n'ont pas des membres de leur famille à proximité immédiate ou une solution de garde autre que de rester chez eux garder leur enfant.»

À une fermeture de l'ensemble du groupe scolaire, le maire de Saint-Sulpice «préfère que l'école ouvre normalement lundi. Après les cours, je réunirai les enseignants et les parents qui pourront être

présents pour faire un point de la situation. Si une majorité de parents souhaite une fermeture de l'école, par mesure de précaution, nous irons dans ce sens. Dans le cas contraire, je demanderai au préfet de revoir son arrêté et de le moduler.»

Sans nier la réalité d'une propagation du virus H1N1, Martial de Villelume veut raison garder. «Je refuse de céder à la psychose. Nous avons regardé les chiffres de l'absentéisme avec la directrice de l'école: l'an dernier, à la même époque, on recensait davantage d'élèves manquants. Sur les 170 enfants inscrits cette année, 14 étaient absents en fin de semaine. On parle bien de 14 absents, pas de 14 cas de grippe avérés! Certains souffrent probablement d'une rhinopharyngite, d'une otite ou d'une autre maladie courante en cette saison.»

«Résistance»

Martial de Villelume assume: il fait «un peu de résistance face à cette attitude systématique de fermeture, non pas d'une classe, comme il est normalement prévu quand trois cas sont signalés au sein de cette classe, mais de l'école entière. Sans concertation, qui plus est, avec les élus. Dans le cas de notre école, la décision de fermeture est intervenue alors même que la directrice avait convenu avec le médecin de la Ddass, avec qui elle était en contact, de refaire le point en début de semaine.»

Les petits Saint-Sulpiciens se présenteront donc ce matin en rangs par deux devant leurs enseignants. Tout comme, d'ailleurs, leurs camarades de Saint-Palais-sur-Mer, à quelques kilomètres de là.

À l'école Lucien-Robin, on a constaté près de 70 élèves absents en milieu de semaine dernière. Sans que la situation appelle une quelconque mesure de fermeture.

THE FLU CASE

Police in France shut down School over alleged Swine Flu threat after Mayor refuses

The Flu Case, 27 November 2009, 11:00
https://web.archive.org/web/20100102033712/http://theflucase.com/index.php?option=com_content&view=article&id=2084%3Apolice-in-france-shut-down-school-over-alleged-swine-flu-threat-after-mayor-refuses&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Gendarmes in France intervened to close down a school in Saint-Supice-de-Royan on Monday after the Mayor Martial de Villelume refused to comply with an order from the prefect of Charente-Maritime to shut the school immediately.

De Villelume received the instructions to close down the school on Friday evening by fax at 18:47 and by telephone at around 8 pm.

He decided to open as normal on Monday given that only 14 children were absent from the school, and none of these had a confirmed case of swine flu, and wanted give the parents an opportunity to vote on the issue, but the French Gendarmerie moved swiftly on the orders of the prefect to close down the school immediately, leaving parents in disarray.

De Villelume, mayor of the town on the Atlantic coast, was informed that the prefect of the department made the decisions and he "had no say in the matter at all," according to Reuters.

About 400 schools in France have been shut in the past couple of weeks as the government spreads swine flu hysteria.

De Villelume said that there was no evidence of swine flu in his school; 14 out of the 170 children were absent last week but they had not been diagnosed with swine flu.

He told Sud Ouest.com he was putting up "a little bit of resistance in the face of the systematic attitude concerning shutting things down, not just a class, as is envisaged in normal cases in the event of three cases in a class, but of an entire school. Without consultation, moreover, with the elected officials.

"In the case of our school, the decision to close the schools was made even though the school director had contacted the official doctor to consider the point at the beginning of the week."

The way the Gendarmes were sent to shut down a school against the wishes of the school director and mayor on the spurious grounds that there was a threat from the swine flu will heighten fears that the French government is cracking down on civil liberties step by step and of a mass forced vaccination programme.

So far there has been a low voluntary take up of the untested vaccines at special swine flu vaccine centers leaving the government behind schedule in its plans, leaked in August, to give everyone in France the swine flu jab by the end of January.

The French government is acting in coordination with WHO to implement military style "pandemic emergency" measures.

With the declaration of a pandemic level 6 emergency in June, WHO has obtained sweeping powers over national governments, including police and health services.

В России снижается число случаев свиного гриппа в общем объеме простудных заболеваний, заявил Онищенко

News.ru, 24 ноября 2009 г., 07:59
https://www.newsru.com/russia/24Nov2009/gripp.html

Медики заявляют, что удельный вес случаев свиного гриппа в общем объеме острых респираторных заболеваний и вирусных инфекций в России снижается. В настоящее время на вирус H1N1 приходится 29% случаев заболевания российских граждан гриппом и ОРЗ, при этом, на предыдущей неделе вирус свиного гриппа составлял 34% всех случаев простудных заболеваний, сообщил руководитель Роспотребнадзора, главный государственный санитарный врач России Геннадий Онищенко.

"В Европе, к примеру, удельный вес вируса H1N1 превышает 60% в общем объеме (острых респираторных заболеваний)", - сказал Онищенко. По его словам, в 11 российских регионах, где ранее было отмечено превышение эпидемических порогов по гриппу и ОРЗ, заболеваемость пошла на спад. В частности, это Забайкальский край, Амурская область, Хабаровский край и Москва, сообщает "Интерфакс".

Онищенко сообщил, что в большинстве российских регионов заболеваемость гриппом находится на доэпидемическом уровне или приблизилась к пороговым значениям.

"В Москве уровень заболеваемости снизился на 26,5%", - сказал Онищенко. Он сообщил, что все московские школы работают, 14 классов в девяти школах закрыты из-за гриппа на карантин.

Онищенко сказал, что медики уделяют особое внимание профилактическим мероприятиям в московском метро.

"На объектах московского метрополитена, в депо эксплуатируется 38 комплектов ультрафиолетового оборудования для обеззараживания. В подземных переходах метро установлено 32 комплекта ультрафиолетового оборудования. Установки по обеззараживанию смонтированы на 61 эскалаторе. Они безопасны. Весь вагонный парк московского метрополитена ежедневно проходит дезинфекцию. Это 3830 вагонов", - сказал Г.Онищенко. Он сообщил, что на этой неделе медики проверили 71 российский вуз на предмет мер по профилактике гриппа.

"Установлено, что в большинстве вузов разработаны соответствующие планы профилактических мероприятий, проводится дезинфекция, приняты меры специфической и неспецифической профилактики, по ограничению массовых мероприятий", - сообщил он.

При этом, по словам Онищенко, в ряде вузов проверка установила низкий уровень вакцинации студентов против сезонного гриппа. "Низкий уровень охвата вакцинацией - в Налоговой академии Минфина, Строительном университете, Московской государственной академии ветеринарной медицины и биотехнологий, Социальном университете", - сказал глава Роспотребнадзора.

Напомним, 9 ноября в России началась вакцинация против нового гриппа. На первом этапе она пройдет в Алтайском крае, Московской, Тюменской, Брянской и Воронежской областях. Прежде всего вакцину получат группы риска – те, кто общается с большим количеством людей: работники ЖКХ, водоснабжения, электрообеспечения.

С конца ноября будут привиты медработники, учителя, студенты старших курсов медицинских вузов. Затем пройдет вакцинация остальных категорий населения по группам риска по развитию тяжелых форм заболевания - в их числе люди, страдающие хроническими заболеваниями, беременные, дети.

Вакцинация остается основным профилактическим средством против гриппа, в том числе A/H1N1. Однако россиянам не стоит забывать и о других средствах, которые за многие годы заслужили внимание с точки зрения профилактики вирусных заболеваний. Как отмечают в Минздравсоцразвития РФ, это относится, в частности, к ношению масок и приему витаминов, причем не только в форме медикаментозных препаратов, но и фруктов и овощей.

How Big Pharma Profits from Swine Flu

Business Week, Bloomberg, 24 November 2009, 3:26PM EST

https://web.archive.org/web/20091126023933/http:/www.businessweek.com/globalbiz/content/nov2009/gb20091124_846373.htm
https://web.archive.org/web/20091128081343/http://www.businessweek.com/globalbiz/content/nov2009/gb20091124_846373_page_2.htm

Once spurned by drugmakers as low-margin and risky, vaccines to fight diseases such as H1N1 are now a growing business for Novartis and others.

Swiss pharmaceutical giant Novartis gave U.S. efforts to combat pandemic influenzas a boost with the Nov. 24 opening of the country's first large-scale cell-culture manufacturing plant. Located in Holly Springs, N.C., the Novartis plant, backed by $487 million in federal funding, represents a major milestone in using biotech production technologies to replace the 50-year-old manufacturing process based on growing vaccines in eggs. "This technology has the potential to leapfrog the traditional egg-based approach, increasing the reliability and productivity of vaccine production," says Novartis Chairman and Chief Executive Daniel Vasella.

Novartis (NVS) is one of two vaccine manufacturers using the newer cell-based methods. The Novartis plant will produce flu vaccines in dog kidney cells instead of chicken's eggs, shaving around one month off the estimated three to six months needed to create vaccines using eggs. According to Novartis, the plant will be able to crank out 50 million doses of seasonal flu vaccine and 150 million doses of pandemic vaccine for the U.S. within six months of the declaration of a pandemic. However, it will be 2011 at the earliest before the factory is able to start making cell-based vaccines.

Adjuvants and the H1N1 Vaccine

Still, any future increase in capacity is welcome news for the U.S. The current shortage of H1N1 (also knows as swine flu) vaccinations in the U.S. has highlighted the need for newer, more reliable vaccine development technologies. Though 50 million doses of the H1N1 vaccine have been distributed to date, that's only enough to reach about one-third of the 160 million Americans that the Centers for Disease Control would like to see inoculated.

A big part of the problem is that the U.S. Food & Drug Administration, unlike its counterpart in Europe, has yet to approve use of adjuvants, which are additives that increase the body's response to vaccines, lowering the required dose. Novartis already makes cell-based seasonal and H1N1 flu vaccines with its own licensed adjuvant at a factory in Marburg, Germany.

The Novartis seasonal vaccine is approved in Europe and Japan, and the pandemic vaccine recently won regulatory approval in Germany and Switzerland. Vasella says the trials have shown that using adjuvants could potentially double or even quadruple the vaccine supply. "Some 45 million doses of the cell-based vaccine with adjuvant have already been safely administered, so it is quite established in other countries," say Vasella. He's confident that cell-based technology will eventually be approved in the U.S. And if the pandemic suddenly explodes, the FDA would likely act quickly to approve the use of adjuvants.

The Resurgence of Vaccines

It wasn't too long ago that vaccines were deemed the poor relation of the pharmaceutical industry. Their complexity and high manufacturing cost – coupled with relatively low margins and risk of major litigation – deterred all but a handful of players, including Novartis, Britain's GlaxoSmithKline (GSK), France's Sanofi Aventis (SNY), New Jersey's Merck (MRK), and Wyeth – now a unit of Pfizer (PFE).

More recently, though, there's been something of a vaccine renaissance. That's partly because the industry is now facing serious challenges to its core prescription drug business. Some $135 billion in prescription drug sales will lose patent protection in the next five years, and there's little in drug companies' pipelines to replace those sales, says IMS Health (RX) consultant Alan Sheppard.

Vaccines are in the class of biological drugs, which are expensive and difficult to produce, but that makes them less vulnerable to generic competition from weaker manufacturers. Moreover, with blockbuster drugs harder to come by, the success of Wyeth's pediatric pneumococcal vaccine Prevnar, which now generates $3 billion plus in annual sales, proved that vaccines could be profitable.

With the $780 billion global prescription drug market growing at a sluggish 5% a year, many analysts reckon that the vaccine industry, which is forecast to climb 13% annually through 2012, offers the most upside potential. "More companies are investing in vaccines as a way of diversifying away from prescription drugs, and new technologies such as cell culture are enabling them to produce more sophisticated vaccines," says Michael Boyd, acting director general of the International Federation of Pharmaceutical Manufacturers & Associations (IFPMA).

Flu Vaccine Spurs Pharma Deals

Witness the slew of recent dealmaking centered on vaccines. Through its $68 billion acquisition of Wyeth, Pfizer is now in the vaccine business. On Sept. 28, Abbott Laboratories (ABT) splashed out $6.6 billion for Belgian flu vaccine maker Solvay, while Johnson & Johnson (JNJ) bought 18% of Dutch vaccine manufacturer Crucell (CRXL). GSK—which looks set to enjoy a windfall from swine flu vaccine – also recently inked a $2.2 billion 10-year deal to provide Brazil with its pneumococcal vaccine.

As emerging economies mature and health-care spending rises there, vaccines also offer drug companies attractive new markets. In June, GSK signed a $78 million joint venture with China's Shenzhen Neptunus Interlong Bio-Technique to develop flu vaccines. A month later, Sanofi acquired a majority stake in Indian vaccine maker Shantha Biotechnics, valuing the company at $824 million. And on Nov. 4, Novartis spent $125 million for an 85% stake in privately owned Chinese vaccines company Zhejiang Tianyuan.

A Seasonal Shot in the Arm

In the short term, at least, H1N1 vaccine sales will give a major lift to sales at the three major European vaccine makers. GSK says analyst predictions for $1.7 billion of H1N1 vaccine sales in the fourth quarter are broadly accurate, and similar numbers are forecast for the first quarter 2010. Novartis says it expects $700 million in fourth-quarter sales alone of its H1N1 pandemic vaccine. And Sanofi-Aventis says it expects H1N1 sales in the fourth quarter to hit $500 million.

But the flu vaccine business, notes Vasella, is seasonal and unpredictable. Longer term, other areas such as cancer or meningitis offer greater opportunity. Indeed, analysts say Novartis' two meningitis vaccines have multibillion-dollar sales potential. Novartis has much riding on their success, because analysts at Sanford C. Bernstein estimate that Novartis' vaccine and diagnostics will generate 2009 sales of $1.5 billion but post a loss of $257 million.

Vasella says increased investment in vaccine research and development, clinical trials, and manufacturing are the reason for the losses. The company, for instance, spent $200 million over the past three years building a second manufacturing site in Liverpool, England, dedicated to the production of the H1N1 vaccine supplied to the U.S. "These kinds of investments are only justified if as part of an overall long-term strategy," says Vasella. "We believe our investment will pay off."

CTV NEWS

China reports 8 cases of swine-flu virus mutation

CTV News // The Associated Press, 25 November 2009, 8:27, AM EST
https://www.ctvnews.ca/china-reports-8-cases-of-swine-flu-virus-mutation-1.457904?cache=klfcnyffis%3FclipId%3D104056%2F7.337730

Beijing - China has detected eight cases of swine flu mutation, a health official said Wednesday, amid longstanding concerns among scientists that the virus could change into a more dangerous form.

Last week, the World Health Organization said it was investigating samples of variant swine flu linked to two deaths in Norway.

But Shu Yuelong, director of the Chinese National Influenza Center, told the official Xinhua News Agency that the mutated swine flu virus found China has shown an "isolated" spread in the mainland, is not resistant to drugs and can be prevented by vaccines.

The report did not provide any more details, such as when the cases were detected and if they were linked to any deaths. Calls to the National Influenza Center rang unanswered while the Health Ministry did not immediately respond to a faxed list of questions.

Swine flu has triggered a global pandemic, and scientists are worried that swine flu could mutate into a more dangerous or more infectious form or swap genes with seasonal or other types of flu.

On Friday, the WHO said it was looking into two deaths and one severe case linked to variant swine flu in Norway, after that country's Institute of Public Health announced that the mutation could possibly cause more severe disease because it infects tissue deeper in the airway than usual.

The same mutation has been found in both fatal and mild cases elsewhere, including in Brazil, Japan, Mexico, Ukraine, and the United States, said the WHO.

WHO's spokeswoman in Beijing, Vivian Tan, said the agency is aware of three such cases in China that occurred in June and July that were similar to the cases being investigated in Norway. Tan said WHO had no information on the cases mentioned in the Xinhua report Wednesday.

There is no evidence the mutated swine flu virus is circulating widely in the world, Tan said, but since it has been linked to deaths in Norway and elsewhere, investigators are focusing on whether this mutation could be a marker for more severe disease.

"We are concerned, but realize that influenza viruses, including A/H1N1, are relatively unstable and change easily, especially as they infect more people," Tan told The Associated Press. "Some mutations can have minimal effects on how a virus functions, while other mutations can create important changes with significant public health impact."

China's Health Ministry said Wednesday that 51 swine flu deaths were reported last week, bringing the total number of fatalities in the country to 104.

В США пандемия свиного гриппа пошла на спад

News.ru, 25 ноября 2009 г., 03:43
https://web.archive.org/web/20210601172312/https://www.newsru.com/world/25Nov2009/vaccine.html

Есть признаки того, что пандемия гриппа A/H1N1 в США пошла на спад. Директор Национального института аллергических и инфекционных заболеваний д-р Энтони Фаучи сообщил об этом на брифинге для иностранных журналистов в Вашингтоне. Вместе с тем он сделал оговорку, что предсказывать развитие эпидемий гриппа - занятие крайне неблагодарное.

"По нашим оценкам, в США заражено около 22 млн человек, - заявил специалист. - Если проследить динамику за последние две недели, то сначала в стране было 48 штатов с широким распространением (нового гриппа), потом 46, а теперь - 43", передает ИТАР-ТАСС. Всего в состав США входит 50 штатов.

Соответственно, продолжал Фаучи, "можно высказать догадку о том, что мы, скорее всего, прошли пик и теперь начали снижение". "Однако с прогнозами по гриппу надо быть чрезвычайно осторожными, - тут же предупредил он. - Грипп славится своей непредсказуемостью".

Сейчас, по словам высокопоставленного эксперта, существует три основных сценария дальнейшего развития событий. Кривая развития пандемии может выровняться, что будет означать большое количество новых случаев заражения. Она может продолжать идти вниз до конца сезона, что, разумеется, было бы лучшим вариантом. Наконец, в середине зимы может прийти "вторая волна" вирусной инфекции.

На дополнительный вопрос о том, тревожат ли его мутации вируса, вызывающего H1N1, Фаучи ответил, что тревожиться о таких вопросах - его служебный долг.

Однако, продолжал он, если в нынешней ситуации есть позитивная сторона, так это то, что вирус, распространяющийся, как минимум, с апреля и обошедший уже весь мир, не очень-то видоизменяется.

"Нет существенных мутаций, которые бы указывали, что вирус уходит из-под действия вакцины, - сказал специалист, имея в виду противогриппозную вакцину, созданную за время пандемии. - Есть некоторые признаки устойчивости к воздействию лекарств, но очень маленькие. И вирулентность (заразность) вируса, насколько можно судить, не возрастает".

Фаучи признал, что вакцин от нового гриппа в США не хватает. В октябре их было всего 11 млн доз, сейчас - свыше 50 млн, но и этого недостаточно. Вакцины от гриппа выращиваются по старинке - в куриных яйцах, пояснил он.

К сожалению, вирус H1N1 плохо растет в яйцах. Такое порой случается, и именно этим объясняется нынешний разрыв между спросом и предложением.

Главный врач-инфекционист Америки решительно рекомендовал делать прививки от гриппа А. "Смертность среди молодых людей, которую мы сейчас наблюдаем, никогда не случается при обычном сезонном гриппе", - подчеркнул он.

Fiete Stegers

Die Risiken der Risiko-Berichterstattung

Tagesschau, 25 Novembre 2009, 12:01 Uhr
https://web.archive.org/web/20091127212207/http://www.tagesschau.de/inland/schweinegrippe696.html

Selten haben sich zu einem Thema so viele Experten geäußert, wie zur Schweinegrippe. Dennoch ist auch die Verunsicherung so groß wie selten zuvor. Viele Kritiker machen die Berichterstattung dafür verantwortlich, diese sei "krass überzogen". Doch es gibt auch Lob für die Medien.

Seit Monaten wütet die Schweinegrippe - zumindest in den Medien. Und besonders heftig in denen, die sich über große Schlagzeilen und große Gefühle am Kiosk verkaufen. Die freiwilligen Medienwächter von "Bildblog" haben kürzlich nachgezählt: In knapp vier Wochen stand die Schweinegrippe bei "Bild" und "Bild am Sonntag" zwölf Mal ganz oben auf der Titelseite. "Alles, was gesundheitsgefährdend ist, zieht", sagt der Kommunikationswissenschaftler Hans-Mathias Kepplinger, der sich mit der Kommunikation in Krisensituationen beschäftigt. Der Höhepunkt bei "Bild": Am 21. Oktober warnte das Blatt mit Berufung auf einen "Impf-Experten", in Deutschland seien 35.000 Tote durch die Krankheit zu befürchten.

"Das Bild, das derzeit von der Schweinegrippe gezeichnet wird, ist krass überzogen", sagte der Präsident der Ärztekammer Berlin, Günter Jonitz, dem NDR-Magazin "Zapp". "Zapp" führte noch weitere Fälle aus, in denen Boulevardmedien mit Zahlen jonglieren ohne diese ausreichend einzuordnen, wo sie Emotionen schüren, statt sachlich zu bleiben. Dass Journalisten Konflikte herausstellen und Gefahren beschreiben, liegt in der Natur der Medien, die sich auf Neues und Interessantes konzentrieren und Gegensätze benutzen, um Nachrichten interessant aufzubereiten.

"Der mediale Hype um die Schweinegrippe ist angesichts anderer Erkrankungen mit sehr viel höheren Todesopfern völlig unverhältnismäßig", sagte Christian Floter, Leiter der Wissenschaftsredaktion des Deutschlandsfunks, zu "Zapp". In der Anfangszeit der Schweinegrippe seien auch alarmierende Szenarien zur Verbreitung der Krankheit bedenkens- und berichtetenswert gewesen, meint Floter: "Dann gab es aber eine Abkoppelung der medialen Realität von der tatsächlichen."

Zuerst aufgetreten ist die Krankheit im März in Mexiko. Die damals geäußerten Befürchtungen von hohen Totenzahlen im Vergleich zur Gesamtbevölkerung haben sich allerdings mittlerweile nicht bestätigt, wie die ARD-Sendung "Monitor" berichtete. Auch in der Ukraine ist die Situation laut Recherchen von "Monitor" weit weniger dramatisch, als es zeitweise in einigen Berichten angesichts mehrerer hunderttausend mutmaßlich Infizierter vermittelt wurde. Die Zahl der nachweislich an der Schweinegrippe verstorbenen Ukrainer liegt laut "Monitor" bislang bei knapp 30 – nicht bei einigen hundert, wie teilweise prognostiziert.

Der Medienwissenschaftler Kepplinger, der noch im Mai in einem Interview über "Panikmache" redete, möchte die weitreichende Kollegen-Kritik von "Zapp" und "Monitor" jedoch nicht teilen. "Es ist nicht wie bei SARS oder der Vogelgrippe, dass eine verwilderte Meute einem Phantom hinterjagt, selbst wenn "Bild" das Thema seit Monaten powert", so Kepplingers Beobachtung.

Einzelne Journalisten hätten sich gut in das Thema eingearbeitet, beispielsweise seien jetzt häufiger als früher Vergleichszahlen zu hören, die die Zahl der Erkrankungen oder Todesfälle in Relation zur Gesamtbevölkerung setzten. Wenn sich bei mutmaßlichen Schweinegrippe-Toten doch etwas anderes als Ursache herausstelle, "wird das auch berichtet - wenn auch erst ein oder zwei Tage später", sagt Kepplinger. "Wichtig ist, dass Journalisten und Wissenschaftler der Öffentlichkeit immer wieder klar machen, wo Unsicherheiten in unserem Wissen über die Schweinegrippe bestehen."

Auf der Suche nach dem knalligen Experten-Zitat

Ein solche Differenzierung geschehe aber in den Medien zu wenig, meint Christian Floto vom Deutschlandfunk: Wenn sich nicht auf Medizinthemen spezialisierte Journalisten um Einordnung bemühen und sich dabei auf die Meinungen von Experten stützen, werde dabei oft genug eine "plakative Einzeleinschätzung" transportiert, egal wie fundiert diese sei, kritisiert Floto.

Diese Erfahrung hat auch der als kritischer Beobachter des britischen Gesundheitswesens bekannte Arzt Ben Goldacre gemacht. Ihn erreichten die Anfragen mehrerer Journalisten, die von ihm als Interviewpartner hören wollten, dass die Schweinegrippe ein Medien-Hype sei. Goldacre lehnte es aber ab, ein plakatives Zitat zu liefern. "Menschen können Risiken schwer begreifen, und Epidemien sind eine komplizierte Angelegenheit. Bei Infektionskrankheiten ist die mögliche Abweichung groß, und es ist sehr schwer, genaue Voraussagen zu treffen", schrieb Golcacre bereits im April in seinem Blog dazu. Und er betonte: "Voraussagen beziehen sich darauf, was passieren könnte - nicht auf etwas, was definitiv passieren wird."

Swine flu pandemic is yet another conspiracy
Danish media

Russia Tuday, 25 November 2009
https://www.youtube.com/watch?v=XFLHbXqSEVQ

Danish journalists claim that the World Health Organization and drug companies producing the swine flu vaccine are in partnership, and that the true nature of their relationship is shrouded in mystery.

"What we do know is that the pharmaceutical companies are present at the meetings of WHO expert groups, but what we don't know is what they talk about. And another thing is that scientists who appear to be independent are also hired consultants working for the same pharmaceutical companies who produce the vaccines," says *Louise Voller*, a journalist at the Danish Daily Information newspaper.

World Health Organization 'Manufactured' the Global Swine Flu Scare
Suspected of Corruption

InfoWars, 26 November 2009
https://web.archive.org/web/20091130162346/http://www.infowars.com/world-health-organization-manufactured-the-global-swine-flu-scare-suspected-of-corruption/

The Swine Flu Pandemic which Novye Izvestija has written about many times, may be the most ambitious scam and corruption of our time. In any case, the enormous commercial aspect of the "swine flu scare" is already evident.

The same conclusion was reached by Danish journalists who expertly examined the links between the World Health Organization (WHO) and the world's leading pharmaceutical companies, who gained wealth by selling drugs to counter the disease. It turns out, for example, that many scientists who sit on various committees of WHO, carefully concealed the fact that they receive money from the giant pharmaceutical companies of the world.

According to the international investment bank JP Morgan, the pharmaceutical industry will make more than 7 Billion Euros this year on the sale of A/H1N1 vaccines. Leading western countries have ordered enough doses to vaccinate either their entire population (such as Australia) or one third (Germany and several other EU member States). Factories making the vaccines and pills are working around the clock, in four shift rotations, with a backlog of orders …they are not experiencing the global economic crisis as others might.

For the first time in many years flu pandemic 'panic' has affected the EU. The vaccine has been produced without a sufficient number of clinical and laboratory tests.

Is such a panic justified? a growing number of specialists are examining the issue by comparing the mortality statistics from the swine flu virus and it's 'conventional' varieties, each Autumn they begin their march across the planet. So far, according to WHO, six thousand people have fallen victim to A/H1N1, while the average annual death rate during epidemics of 'traditional' varieties of flu reaches half a million.

The main cause of the hysterical response to the swine flu epidemic, according to reporters from the Danish newspaper 'Information', is not because it is so dangerous, but because of a strong public relations campaign by experts from WHO. Some of them [WHO experts] are literally in the service of the vaccine manufacturers.

"It is disturbing that many of the scientists who sit on various committees of WHO, are presented as 'independent experts', but they carefully conceal the fact that they receive money from pharmaceutical companies", Professor of epidemiology, Tom Jefferson, who works at the Cochrane Center in Rome, told reporters.

WHO announced the swine flu pandemic under pressure from a panel of advisers, headed by a Dutch doctor, Albert Ostenhaus, nicknamed 'Dr. Flu' (from the name 'Tamiflu') because he was active in promoting mass vaccination of the population through WHO, and the Western media. Now the government of the Netherlands is conducting an emergency investigation into the activities of

'Doctor Flu', as it became known that he receives a salary from several vaccine manufacturing companies. Many other WHO advisers sit 'on two chairs' (conflict of interest) like Ostenhaus, and while dealing with the swine flu pandemic on behalf of WHO, they do not like to advertise that they are paid advisers to pharmaceutical giants Roche, RW Johnson, SmithKline and Beecham Glaxo Wellcome, who have received the lion's share of orders for manufacturing of vaccines. The result of pressure from these experts was the resolution of WHO on 7th July this year, which called for an unprecedented campaign of mass vaccination.

"The WHO is biased in their recommendations – says Professor Tom Jefferson. – Normal hygiene measures provide much greater effect than these little-studied vaccines, and at the same time WHO refers to the use of masks and hand-washing as a means to combat swine flu only twice in their documents. Vaccines and other medications are referred to 42 times!" Dr. Jefferson and several of his colleagues believe that paid advisers of the pharmaceutical companies should be removed from their positions and not allowed to give recommendations to the WHO, but the organization itself is in no hurry to carry out such a reform. WHO spokesperson, Gregory Hertl, commenting on the article in 'Information' (Danish newspaper) said it is impossible to deny the services of the world's leading experts on the sole ground that they have a financial interest in the promotion of a strategy to combat various diseases.

It should be noted that this is not the first year that 'scope for corruption' in pharmacology has been the focus of the Western media. The New England Journal of Medicine published 'The Whistleblower' several years ago. In a series of articles, the Whistleblower showed the inside life of the 'medical mafia'. According to them, only 11-14% of pharmaceutical companies budgets are spent on research, but 36% of funds are spent on PR. Much of the money ends up in the pockets of doctors, scientists, and the accounts of various organizations working in health care.

Каждый пятый ребенок в Великобритании переболел свиным гриппом, даже не подозревая об этом

News.ru, 26 ноября 2009 г., 05:20
https://www.newsru.com/world/26Nov2009/antitela.html

Каждый пятый маленький житель Великобритании уже переболел гриппом A/H1N1, но многие из этих детей и их родителей не имеют об этом ни малейшего представления. Об этом выводе британских ученых сообщила газета Daily Telegraph.

Недавние анализы крови, взятые у населения Соединенного Королевства в ходе медосмотров, показали, что новым вирусом в период первой вспышки инфекции ранее в этом году заразилось гораздо больше людей, чем было принято полагать.

В ряде районов Великобритании, в частности в Лондоне, специалисты Агентства по здравоохранению после прохождения летнего пика заболеваемости выявили антитела к гриппу A/H1N1/ в крови каждого третьего ребенка. Это означает, что они уже перенесли болезнь.

В масштабах всей страны антитела к новому вирусу за это время приобрел каждый пятый маленький британец. Медики предполагают, что примерно у половины из них заболевание, вызванное гриппом A/H1N1, прошло без симптомов, передает ИТАР-ТАСС.

World Health Organization

Dr Margaret Chan

Director-General Statement following the sixth meeting of the Emergency Committee

Geneva, WHO, 26 November 2009
https://www.who.int/news/item/26-11-2009-director-general-statement-following-the-sixth-meeting-of-the-emergency-committee

The Emergency Committee held its sixth meeting, by teleconference on 26 November 2009.

The Committee was updated on the global pandemic situation and considered a proposal from the WHO Director-General regarding the continuation of three temporary recommendations issued under the IHR with respect to the on-going public health emergency of international concern. There was a consensus on continuing the first two temporary recommendations. The third recommendation was updated. Because pandemic infections are now widespread, there no longer is a scientific reason to delay international travel to reduce spread of infection. However, it remains prudent for ill travellers to delay travel for personal health reasons.

Having considered the views of the Emergency Committee, and the ongoing pandemic situation, the Director-General determined it was appropriate to continue all three temporary recommendations, namely:

- Countries should not close borders or restrict international traffic and trade
- Intensify surveillance of unusual flu-like illness & severe pneumonia

With an updated third recommendation, namely:

- If ill, it is prudent to delay travel.

THE FLU CASE

Iowa's Announcement of Appearance of Virulent Swine Flu Virus Spells Trouble Ahead

The Flu Case, 26 November 2009, 17:08

https://web.archive.org/web/20100102034640/http://theflucase.com/index.php?option=com_content&view=article&id=2078%3Aiowas-announcement-of-appearance-of-virulent-swine-flu-virus-spells-trouble-ahead&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Iowa has recorded a spike in swine flu deaths at 21.

Dr. Gregory Schmunk, Polk county's medical examiner, has said people are dying of symptoms similar to the kind reported in the Ukraine.

"In the autopsy, what we're seeing is very heavy, wet hemorrhagic lungs, lungs with a lot of blood in them," said Schmunk.

But where did this virulent virus come from all of a sudden?

According to doctors in the western Ukraine, the sudden appearance of the virulent California H1N1 virus in western Ukraine could not be explained by natural processes.

In an open letter, printed in the Ukraine media (a translation was published on this week on this website), doctors accused President Victor Yushchenko of genocide by means of the use of the introduction of an artificial virus for political gain.

Can the appearance of the virus in Polk Country also be explained by natural processes?

Or could this also be an artificial virus introduced by means of vaccinations and used to justify a government clampdown?

It is not clear how many people who came down with the virulent swine flu in Polk County had previously taken the swine flu jab.

Dr Gregory Schmunk does, however, encourage everyone to take the „swine flu" jab as protection against this flu even though there is no proof that it is safe or efficacious while there is significant proof it causes damage, in the meantime.

Will the US government now quickly move to lift the ban on the use of stockpilies of the dangerous adjuvants under the pretext of a pandemic emergency as people panic?

Adrian Gibbs, Australian virologist, this week published futher evidence the swine flu virus is artificial, giving indirect support to the assertion of the Ukrainian doctors.

Also, we know from documents that US researchers went to Alaska in 1995 to dig up the corpse of the victim of the Spanish Flu Pandemic, extract genetic material from the lung and reconstruct the virus in their lab. The team published updates on their progress in „Nature" and other scientifc journals.

The appearance of this artifical virus in western Ukraine was used as a pretext to generate panic and implement martial law, allege the doctors in their letter.

Yushchenko moved quickly to suspend elections he was almost certain to lose, impose quarantines on nine zones and close some borders in coordination WHO.

There have since been unconfirmed reports of mass deaths through forced vaccinations within those quarantine zones.

For sure, isolating specific areas, cutting it off from supplies, and outside communications and then sending in special pandemic task forces to carry out forced vaccinations is an easier way of approaching the problem of killing large numbers of people than taking on the whole of a country at once.

But would the Iowa authorities or the US government ever carry out any such a criminal plan as the Ukrainian?

It is a fact President Barack Obama declared a national emergency over the swine flu pandemic on October 23rd, although the laws allowing forced quarantine and forced vaccination have yet to be activated.

Pandemic drills have been reported.

As in the Ukraine, the US government, however, needs a pretext to implement a drastic crackdown.

The deaths from the virulent form of the swine flu reported in Iowa and North Carolinia could supply some of that pretext, though reports of more „infected" areas can be „expected" soon if adequate fear and confusion is to be generated.

An Iowa quarantine order surfaced this summer revealing that the authorities there are prepared to crack down on people in a pandemic emergency.

Failure to comply with this Quarantine Order can lead to arrests, fines, and imprisonment. Anyone suspected of even having contact with some with a pandemic flu can be quarantined indefinitely with very limited access to the outside world.

The blank template of Iowa's Facilty Quarnatine Order was developed with the help of the Center for Disease Control (CDC), which has published the document on its website.Together with FEMA and Homeland Security, the CDCis the main federal agency responsible for implementing a crack down in the event of a swine flu pandemic.

This is just one of a raft of drastic measures that have been introduced at state and federal level allowing the US government to force vaccinate and quarnatine people.

800 FEMA camps are reported to be in place in the USA ready to operate incinerators. FEMA trains are waiting on their tracks. Large quantities of plastic coffins have been reported.

In short, the entire infrastructure of mass murder that was in place in Nazi Germany is in place in the USA today - and the banksters and Bilderbergers with their back to the wall are desperate to use it before they

Swine flu scepticism

Financial Times, 27 November 2009, 02:00
https://www.ft.com/content/9ecc63dc-dab7-11de-933d-00144feabdc0

Just 1m of the 10m doses of the swine flu vaccine distributed to immunise the general public have so far been used, indicating slow progress in fighting the current pandemic.

David Salisbury, director of immunisation at the Department of Health, said on Thursday he remained "hopeful" that more than 11m people judged at high risk would be vaccinated "well before Christmas".

The low uptake appears to confirm opinion polls suggesting considerable scepticism about the benefits of vaccination, with the H1N1 flu virus less severe for most people than originally feared and an intense debate on the potential side-effects of vaccination.

The figures may stoke debate on the amount paid by the government for measures to counter the pandemic, including total orders of 90m doses of vaccine. Revised planning assumptions have cut the likely number of deaths caused by the virus to 1,000, from as high as 65,000 mooted in July. So far 242 have died across the UK, with infections only slightly higher this week at 46,000.

But Mr Salisbury said it was too early to draw conclusions, with many vaccines delivered only very recently to doctors.

Ian Dalton, national director of NHS flu resilience, who is co-ordinating the health service response to the pandemic, gave much higher estimates for take-up of the vaccine among the 2m frontline health and social care workers, although he said his information was anecdotal.

He said York hospital had vaccinated more than 1,000 staff, Guy’s & St Thomas’s in London had used 1,500 doses, and West Midlands Ambulance Service had given nearly two-thirds of its 1,115 doses.

Sir Liam Donaldson, chief medical officer, cautioned that the virus was a greater threat to children than normal seasonal flu and could mutate into a more serious form, for which the current vaccine could provide -protection.

A study by the Health Protection Agency released this week suggested that one-fifth of schoolchildren may already have been infected nationwide, but in a mild form without symptoms. That may have helped provide protection, which has slowed the spread of the illness. its further spread.

РИА НОВОСТИ

РФ может остановить членство в ВОЗ в случае сговора с фармкомпаниями

РИА Новости, 27 ноября 2009, 14:35
https://ria.ru/20091127/195797321.html

Москва: Появившиеся ранее в западных СМИ сообщения о коррупционном сговоре Всемирной организации здравоохранения (ВОЗ) с фармацевтическими компаниями необходимо проверить, в случае подтверждения этих данных Россия может приостановить свое членство в организации, считает член комиссии Госдумы РФ по законодательному обеспечению противодействия коррупции единоросс Игорь Баринов.

Согласно сообщениям некоторых СМИ, консультанты ВОЗ получали деньги от фармацевтических компаний, что могло повлиять на решение организации объявить пандемию свиного гриппа.

ВОЗ 11 июня впервые более чем за 40 лет официально объявила о введении шестого, максимального уровня угрозы пандемии в связи со стремительным распространением по миру гриппа A/H1N1.

По мнению Баринова, Россия не может оставить без реакции обвинения в адрес ВОЗ.

"Организацию подозревают в коррупции. Нам необходимо провести тщательное всестороннее расследование, прежде чем принимать какое-либо решение", - сказал он журналистам в пятницу.

"Если информация подтвердится, в этом случае нужно ставить вопрос о целесообразности участия России в работе ВОЗ, вплоть до приостановления членства", - сказал он.

По его данным, Россия потратила на борьбу с новым вирусом более 4 миллиардов рублей, которые, как считает парламентарий, можно было бы расходовать на решение других актуальных проблем.

Баринов призвал начать расследование в ВОЗ через российского представителя в этой организации, члена исполнительного комитета ВОЗ Владимира Стародубова.

"Заслуги ВОЗ в борьбе с малярией, оспой, ВИЧ/СПИД в 20 веке никто не ставит под сомнение, но сейчас надо выяснить, не поражена ли сама ВОЗ вирусом коррупции, насколько обоснованы ее рекомендации, можно ли ей беспрекословно доверять", - считает парламентарий.

В свою очередь, главный государственный санитарный врач РФ, руководитель Роспотребнадзора Геннадий Онищенко, выступая в пятницу на межведомственном совещании в Генпрокуратуре РФ, посвященном соблюдению законодательства в сфере обращения лекарственных средств, тоже заявил о наличии сговора во время борьбы со свиным гриппом в мире.

"Одна уважаемая международная организация с самого начала взяла курс на маркетинг одного из препаратов, который не давал российским производителям позиционировать себя на рынке лекарств", - сказал он и отметил, что Россия "не позволила" создать "монополию", которая "навязывалась с помощью иностранных препаратов".

Всемирная организация здравоохранения, объявив пандемию свиного гриппа в мире, на первом этапе настоятельно рекомендовала всем странам использовать для борьбы с вирусом препарат "Тамифлю" швейцарского производства.

Число лабораторно подтвержденных случаев заражения гриппом A/H1N1 в мире, по состоянию на 15 ноября, превысило 525 тысяч, 6,75 тысячи заболевших скончались, сообщается в опубликованном 20 ноября заявлении Всемирной организации здравоохранения (ВОЗ). В пресс-релизе отмечается, что, поскольку многие страны перестали вести индивидуальный учет случаев заражения гриппом A/H1N1, реальное число больных может значительно превышать цифру, представленную ВОЗ.

THE FLU CASE

La Russie pourrait suspendre son adhésion à l'OMS

The Flu Case, 28 novembre 2009, 09h54
https://web.archive.org/web/20100102035628/http://theflucase.com/index.php?option=com_content&view=article&id=2100%3Arussia-could-withdraw-from-who-over-swine-flu-corruption&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Grippe A: un député de «Russie unie» demande que la Russie suspende son adhésion à l'OMS (newsru.com 28-11-2009)

Article repris sur le site du KPRF sous le titre: Encore un sale coup des capitalistes, ou comment les laboratoires pharmaceutiques se font une fortune grâce à la «grippe porcine»

Il est absolument urgent de vérifier les informations parues dans les médias occidentaux sur la collusion présumée entre l'organisation mondiale de la santé (OMS) et les compagnies pharmaceutiques. Si ces soupçons étaient confirmés, la Russie pourrait suspendre son adhésion à l'organisation, déclare Igor Barinov, membre de la commission de la douma d'État en charge des affaires de corruption.

D'après certaines sources, les experts de l'OMS ont reçu de l'argent des compagnies pharmaceutiques, et c'est ce qui aurait conduit cette organisation, pour la première fois depuis plus de 40 ans, à déclarer officiellement le niveau six d'alerte de pandémie en rapport avec la diffusion mondiale rapide de la grippe A/H1N1. Ce sont des journalistes du journal danois Information qui, après avoir étudié les liens des experts de l'OMS avec les grandes compagnies pharmaceutiques mondiales, en ont conclu que la pandémie de grippe porcine pourrait être l'affaire de corruption la plus grandiose de notre époque.

L'OMS, après avoir déclaré l'état de pandémie de grippe porcine dans le monde, a dans une première étape recommandé fortement à tous les pays d'utiliser dans la lutte contre le virus le produit Tamiflu des laboratoires suisses. Rappelons que ce produit a suscité des critiques en Russie à cause de ses effets secondaires possibles. En même temps, le ministère de la santé ukrainien a été accusé de faire des achats excessifs et injustifiés de Tamiflu.

D'après Barinov, la Russie ne peut rester indifférente aux accusations portées contre l'OMS. «L'organisation est suspectée de corruption. Nous devons absolument mener une enquête minutieuse avant de prendre toute décision» - a-t-il déclaré vendredi aux journalistes. «Si l'information est confirmée, nous devrons poser la question du bien-fondé de la participation de la Russie de l'OMS, et le cas échéant suspendre notre adhésion».

D'après les chiffres qu'il cite, la Russie a dépensé pour la lutte contre le nouveau virus plus de 4 milliards de roubles, qui, selon le député, auraient pu être dépensés à meilleur escient, annonce RIA Novosti.

Barinov a suggéré de faire mener l'enquête à l'OMS par le représentant russe dans cette organisation, le membre du comité exécutif de l'OMS Vladimir Starodoubov. «Personne ne remet en cause les services rendus au XXe siècle par l'OMS dans la lutte contre la malaria, la variole, le sida, mais aujourd'hui il faut se demander si cette organisation n'est pas frappée elle-même par le virus de la corruption, et dans quelle mesure ces recommandations sont fondées, dans quelle mesure on peut lui faire confiance» - estime le député.

De son côté, le directeur de l'institut de veille sanitaire Guennadi Onichtchenko, prenant la parole vendredi à une conférence du parquet général de la fédération de Russie consacrée au respect de la législation dans le domaine pharmaceutique, a déclaré lui aussi que la lutte contre la grippe porcine dans le monde prend l'allure d'un complot.

THE FLU CASE

Russia Could Withdraw from WHO Over Swine Flu Corruption

The Flu Case, 28 November 2009

https://web.archive.org/web/20100102035628/http://theflucase.com/index.php?option=com_content&view=article&id=2100%3Arussia-could-withdraw-from-who-over-swine-flu-corruption&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A Russian deputy of the Duma has called for Russia to withdraw from the WHO if an investigation into the alleged collusion between the WHO and pharmaceutical companies on the swine flu scandal proves to be accurate, according to reports in the European media.

Igor Barinov, Member of the Commission of the State Parliament (Duma) in Charge of Corruption, said that there needed to be an investigation into whether experts advising WHO received money from pharmaceutical industry and whether this influenced WHO to declare a pandemic level 6 emergency for the first time in 40 years in spite of the fact that the swine flu is neither lethal nor spreading rapidly.

Danish journalists belonging to "Information" concluded that the swine flu could be the biggest case of corruption in our era after examining links between experts of WHO and the pharmaceutical companies.

WHO recommended the purchase of the controversial Swiss-based Roche's Tamilfu in spite of evidence the drug causes serious side effects. The Ukrainian ministry for health bought large and excessive stocks of Tamiflu.

"The organization is suspected of corruption. We certainly must carry out a meticulous inquiry before making any decision," Barinov declared on Friday to journalists.

"If the information is confirmed, we will have to put the question of whether it makes sense for Russia to belong to WHO, and to suspend our membership if necessary".

Russia has spent more than 4 billion roubles so far on the swine flu.

Barinov suggested making the head of the investigation of WHO, the Russian representative in this organization, the member of the executive committee of WHO, Vladimir Starodoubov.

"Nobody calls into question the services rendered in the 20th century by WHO in the fight against the malaria, AIDS, but today it should asked whether this organization is not struck itself by the virus of corruption, and up to what point these recommendations are founded, up to what point can we trust it," said Barinov.

The director of the Russian National Sanitary Surveillance Institute Guennadi Onichtchenko said in a meeting with the general prosecutor of the federation of Russia for legislation in the pharmaceutical field that the fight against the swine flu in the world has the characteristics of a plot.

There is also mounting evidence WHO was instrumental in spreading AIDs.

Communiqué de presse: Grippe A (H1N1) 2009:
le point en France métropolitaine

Saint-Maurice, le 27 novembre 2009
https://web.archive.org/web/20091201172803/http://www.invs.sante.fr/display/?doc=presse/2009/communiques/cp_h1n1_271109/index.html

L'Institut de veille sanitaire (InVS) signale l'identification en France par les Centres nationaux de référence de mutations dans le génome de virus de la grippe A (H1N1) 2009 et retrouvés chez deux patients qui, par la suite, sont décédés.

Pour ces deux patients, sans relation entre eux et hospitalisés dans des villes différentes, il s'agit d'une mutation récemment signalée en Norvège. Cette mutation pourrait augmenter les capacités du virus à atteindre les voies respiratoires basses, et notamment, à atteindre le tissu pulmonaire. Pour l'un de ces patients, à cette mutation s'ajoute une autre mutation connue pour conférer une résistance à l'oseltamivir. Il s'agit de la première souche résistante en France parmi les 1200 souches analysées à ce jour.

La survenue de mutations du virus A (H1N1) 2009 n'est pas inattendue du fait des caractéristiques des virus grippaux. L'impact de ces mutations sur le caractère pathogène et la capacité de diffusion de ces virus n'est pas documenté et va faire l'objet d'investigations complémentaires à l'échelon français et international.

L'efficacité des vaccins actuellement disponibles n'est pas remise en cause.

Par ailleurs, le nombre des décès signalés en métropole depuis le début de l'épidémie s'élève à 76, soit 8 de plus que dans le bulletin du 24 novembre (publié le 26 novembre). Le nombre de cas graves augmente quant à lui de 63 depuis le même bulletin, passant à 420 depuis le début de l'épidémie en France métropolitaine. L'InVS précise que ce bilan englobe l'ensemble des décès notifiés (cas confirmés et cas probables[1]).

(1) Cas probable: forme clinique grave sans autre étiologie identifiée, dont le tableau clinique et l'ensemble des renseignements fournis au médecin évoquent le diagnostic de grippe même si la confirmation biologique n'a pu être obtenue

L'Institut de veille sanitaire (InVS) est chargé de surveiller l'état de santé la population et d'alerter les pouvoirs publics en cas de menace pour la santé. L'Institut met en œuvre cette mission dans tous les domaines de la santé publique (notamment maladies infectieuses, maladies chroniques, traumatismes, santé environnement, santé travail).

Pour plus d'informations, vous pouvez consulter le dossier dédié à la grippe A (H1N1) 2009 du site Internet de l'InVS.

Swine Flu Mutated Virus Detected in France. – The Flu Case, 30 November 2009, 13:31
https://web.archive.org/web/20100102004146/http://theflucase.com/index.php?option=com_content&view=article&id=2129%3Aswine-flu-mutated-virus-detected-in-france&catid=1%3Alatest-news&Itemid=64&lang=en

A more virulent mutation of the swine flu found in Norway and Denmark has now been detected in two people in France, according to a press release from the L'Institut de veille sanitaire (InVS).

It is not clear if these people had been given the swine flu jab or the seasonabl flu jab with the H1N1 virus.

The New York Times

Donald G. McNeil Jr.

Experts say Swine Flu mutations do not warrant New Alarm

The New York Times, 27 November 2009
https://web.archive.org/web/20121115211101/http://www.nytimes.com/2009/11/28/health/28flu.html

The World Health Organization tried this week to dampen fears about mutations seen in the swine flu virus in several countries, noting that both mutations had been found in very few people.

A change that created Tamiflu resistance has been found in about 75 people around the world, said Dr. Keiji Fukuda, chief flu adviser to the W.H.O.'s director general. Two clusters, in cancer units at Duke University Medical Center in North Carolina and a hospital in Wales, were both among patients whose immune systems had been severely suppressed by cancer treatment; some had had their bone marrow, which produces infection-fighting white blood cells, wiped out so that replacement blood stem cells could be injected.

Such patients are more likely to develop resistant viruses when on Tamiflu because they can not clear a virus on their own. But the mutant strain appears not to spread easily in people with normal immunity, like hospital workers.

"We don't know the full answer, but it is more likely that we are not seeing a major shift," Dr. Fukuda said.

Widespread Tamiflu resistance is a serious problem in the seasonal H1N1 virus, but it has not crossed over into the swine H1N1.

Dr. Fukuda also said W.H.O. scientists were "not sure" of the level of threat posed by a separate mutation that helps the virus reach the lungs. It has been found in Norway, Ukraine, Brazil, China, Japan, Mexico and the United States, in both serious and mild cases.

Experts still need to see whether the mutation – whose shorthand name in virology is D222G or D225G – is becoming more common, and how often it leads to severe disease, he said.

One isolate from Ukraine with the mutation had changed so that swine flu vaccine probably would not protect against it well, Britain's national medical laboratory reported Friday.

Flus mutate so fast, Dr. Fukuda cautioned, that announcing each change is "like reporting changes in the weather."

More than 100 million swine flu shots have been administered in 40 countries, and the side effects are similar to or lower than those from regular flu shots, he added.

Six cases of anaphylaxis were widely reported in Canada when it was found that all were from one batch of vaccine, which was recalled. Anaphylaxis is an allergic reaction, usually to egg protein, that can range from mild hives to fatal airway swelling. All six patients recovered, and Dr. Fukuda pointed out that there were 172,000 doses in the batch, most of which caused no problems, so it was unclear whether the cause was a bad batch or just a coincidence.

Douglas County joins others in state with isolation and quarantine policy

91.3 KUWS, 27 November 2009, 11:38 a.m.
https://web.archive.org/web/20091130221654/http://www.businessnorth.com/kuws.asp?RID=3172

Wisconsin counties have a little-known policy that allows forced isolation or quarantine of people using armed law enforcement and deputized civilians. Mike Simonson reports from Superior.

This is to help health officials in a worst-case scenario to contain outbreaks.

Wisconsin statute requires each county to have an isolation and quarantine procedure. The order originated with the Centers for Disease Control from anthrax threats in 2001. But the policy is broader. It includes isolating people infected or even suspected of being infected with a contagious disease such as tuberculosis or in a flu pandemic.

Douglas County Health Officer Deb Clasen says every county health officer in the state can now order that guards be put on infectious people.

"So you put law enforcement by the door to assist with containing and preventing people from exposing other individuals."

Clasen is quick to say this is only used if voluntary approaches don't work or are ineffective. Washburn County Sheriff Terry Dryden says this is a tool that may be needed at flu vaccination clinics as well.

"The potential is there for emotion. I want my child or we need the vaccine before anyone else type thing where you could get a little volatile in those areas. I don't expect any of those kinds of problems. We're not going to have SWAT teams surround the nurses giving the vaccine."

The policy also has provisions for a large quarantine facility with restricted public access. Jason Shrader is the director of the Western Region Partnership for Public Health Preparedness in Balsam Lake. He understands the hesitancy to use the "Q" word.

"Although we plan for the worst-case scenario, it's not valuable for a health department to have a policy that looks at end of the world-type scenarios."

The plans do give people held in forced isolation or quarantine due process to appeal.

Coût de la grippe H1N1: Environ 2 milliards d'Euros, selon le Sénat

Sante Log, 29 Novembre 2009
https://web.archive.org/web/20091202073511/http://www.santelog.com/modules/connaissances/actualite-sante-co%C3%BBt-de-la-grippe-h1n1-environ-2-milliards-deuros,-selon-le-s%C3%A9nat_2258.htm

Jean-Jacques Jégou, rapporteur de la loi de finances pour 2010 devant le Sénat, au nom de la Commission des finances de cette assemblée, a présenté à ses collègues l'addition des dépenses engagées par la France pour protéger sa population de la grippe pandémique à virus A/H1N1, évaluées à plus de 1,06 milliard d'euros par le ministère de la Santé, dépense qui se répartit comme suit. A ce compte, s'ajoutent de nombreuses autres dépenses dont des dépenses territoriales qui laissent apparaître un coût total lié à la pandémie compris entre 1,8 et 2,2 milliards d'euros.

En millions d'euros:

-Achat de vaccins	807,0
-Campagne de vaccination	35,8
-Acquisition de respirateurs	5,8
-Achat d'antiviraux	20,0
-Achat de masques	150,6
-Dépenses logistiques	41,6

(traitement des déchets, acheminement des produits)
Soit un total de 1 060 800 000 euros.

Un coût total estimé à 2 milliards d'euros : Néanmoins, un premier bilan des dépenses liées à la grippe A/H1N1, à partir de données collectées auprès du ministère de la Santé, de la Caisse nationale d'assurance maladie (CNAMTS) et du ministère de l'Intérieur, de l'Outre-mer et des Collectivités territoriales laisse apparaître un coût total lié à la pandémie compris entre 1,8 et 2,2 milliards d'euros!

Un bouleversement de la programmation budgétaire de l'EPRUS, comme le dit le sénateur Jégou, qui donnera lieu à d'importants mouvements de crédits en gestion. L'Etablissement de préparation et de réponse aux urgences sanitaires (EPRUS) est un établissement public de l'Etat à caractère administratif, placé sous la tutelle du ministère de la Santé. Il a pour missions:

- la gestion administrative et financière de la réserve sanitaire, coordonnée par la la Direction générale de la santé (DGS) ;
- l'acquisition, la fabrication, l'importation, le stockage, la distribution et l'exportation de produits et services nécessaires à la protection de la population face à des menaces sanitaires graves ou pour répondre à des besoins de santé publique non couverts (rupture de commercialisation à la demande du ministère de la Santé;
- la mise en place en son sein d'un établissement pharmaceutique chargé de la fabrication et de l'exploitation de produits de santé nécessaires.

Ainsi l'EPRUS a été amené à financer l'achat de vaccins, masques et autres produits de santé et à supporter les dépenses relatives à l'acquisition, à l'acheminement et au stockage des vaccins, masques et autres produits de santé acquis dès les premiers cas de grippe A/H1N1 fin avril 2009.

Outre les dépenses supportées par l'EPRUS, d'autres sont à distinguer:

- *consultations de généralistes, prescription de médicaments, indemnités journalières* (c'est pour l'Assurance- Maladie): entre 376 millions et 752 millions d'euros, selon estimations de la CNAMTS;
- *indemnisation des personnels de santé réquisitionnés*: 290 millions, hors frais de déplacement;
- *information et convocation des vaccinés :* 52,8 millions, prises en charge par l'Assurance-Maladie via le Fonds national de prévention, d'éducation et d'information sanitaires (FNPEIS);
- *communication: évaluation 6,8 millions*, financées par l'Institut national de prévention et d'éducation pour la santé (INPES);
- *organisation territoriale de la campagne de vaccination* (mobilisation des personnels, fonctionnement et location de des centres locaux). Ce coût est évalué à 100 millions;

En plus, le coût supporté par les collectivités territoriales: Cette estimation ne prend cependant pas en compte le coût supporté par les collectivités territoriales qui ont notamment été incitées à constituer des stocks de produits de santé en vue d'une crise sanitaire majeure.

D'autres crédits devront être versés à l'EPRUS pour 2009 car suite à la décision d'achat de 94 millions de doses de vaccins après les premiers cas de grippe A/H1N1 fin avril 2009, la programmation initiale des dépenses de l'EPRUS a été profondément bouleversée, avec des besoins en hausse massive… En 2010, l'EPRUS aurait des besoins en crédits encore plus forts !

Un bilan de l'action de l'EPRUS devra être dressé une fois le risque pandémique passé, afin d'apprécier toute la mesure du rôle effectif dévolu à l'établissement, ainsi que sa *valeur ajoutée* dans le dispositif de gestion des crises sanitaires, a conclu sur ce point le sénateur Jégou.

Fake Swine Flu Scare Will Cost France 2 Billion Euros

The Flu Case, 3 December 2009, 13:50
https://web.archive.org/web/20100102035349/http://theflucase.com/index.php?option=com_content&view=article&id=2173%3Afake-swine-flu-scare-will-cost-france-2-billion-euros&catid=1%3Alatest-news&Itemid=64&lang=en

The manufactured swine flu scam will cost France 2 billion euros, according to an estimate by Jean-Jacques Jegou, in charge of a French parliamentary committee.

More than 800 million euros will have been spent on the swine flu jabs.

... see above

Coût de la grippe H1N1: Environ 2 milliards d'Euros, selon le Sénat

Justine Hunter

Few cases of Suspected Swine Flu in Canada test positive

The Globe and Mail, 30 November 2009.
https://www.theglobeandmail.com/life/health-and-fitness/health/conditions/few-cases-of-suspected-flu-test-positive/article4310889/

Public health officials are warning the wave of H1N1 this fall is not nearly as widespread as suspected, leaving a significant number of Canadians who believe they have gained a ticket to immunity still vulnerable to the virus.

Last week in Ontario, fewer than one in four cases of suspected H1N1 tested positive in laboratory analysis. In British Columbia the rate was one in three. The rest, based on samples, were mostly rhinovirus – the common cold – and enterovirus, a common flu-like bug.

In a year when Canada has collected record amounts of clinical data about influenza, the evidence is mounting that even doctors aren't very good at telling the difference between H1N1 and the common cold.

"We have been notoriously inaccurate," said Michael Gardam, director of infectious disease prevention at Ontario's Agency for Health Protection and Promotion.

"This year is very different because we are swabbing way more than we ever would and we are more accurate than we've ever been before – and it's still not very accurate."

With labs overwhelmed by the number of cases being sent for testing, health officials are now asking doctors not to bother testing for H1N1 except in certain circumstances, such as for pregnant women or other people with underlying health concerns.

So most people who have had H1N1 have not been confirmed by a lab. Based on assessments earlier in the year in Australia and the United States, for every one lab-confirmed case of H1N1, there are another 135 people who have the virus.

That means thousands of cases of suspected H1N1 could be something else entirely. Even when the second wave of the virus was peaking a month ago, only half of the cases tested positive when examined in a lab.

"Most people will not have had laboratory testing on their respiratory illness," noted Travis Hottes, surveillance epidemiologist for the B.C. Centre for Disease Control. "There is no way, just based on the symptoms, to differentiate between influenza or one of these respiratory illnesses."

Which means people who think they don't need to be vaccinated because they believe they have already been exposed are gambling against poor odds, he said. "It's a guessing game and there isn't a good solid way to find out. We're recommending people get the vaccine unless they have had laboratory-confirmed evidence of this pandemic influenza virus."

In B.C., the Centre for Disease Control tested nearly 2,500 specimens a month ago when the virus was peaking. As in Ontario, roughly half of the swabs tested positive for influenza, and virtually all of the flu cases have proved to be H1N1.

Every week since, the rate of H1N1 in lab tests has dropped. In B.C. last week, 34.7 per cent of the 1003 samples tested positive. In Ontario, just 22.8 per cent of the specimens tested positive last week.

"I think people, despite all the messaging, are still confused about what the flu actually looks like," Dr. Gardam said. "The flu is really muscle aches and headaches, usually with a cough, usually with a fever, and you just feel miserable."

Because there are a number of common viruses that mimic those symptoms, doctors and patients alike can be fooled.

B.C.'s chief medical health officer, Perry Kendall, noted there are still a significant number of cases of H1N1 around and there is still a potential threat of another wave hitting Canada in the New Year.

"Because we are on the downside of the curve, there is less H1N1 around than there was, but there is still a considerable amount of H1N1 around and it's going to be around through the winter, I suspect," Dr. Kendall said.

"The one thing you can confidently predict, though, is that if you had sufficient percentage of the population protected, you won't see a third wave."

Comparison of adult patients hospitalised with pandemic (H1N1) 2009 influenza and seasonal influenza during the "PROTECT" phase of the pandemic response

Med J Aust, 30 November 2009, (2010); 192 (2): 90-93
doi: 10.5694/j.1326-5377.2010.tb03426.x
https://www.mja.com.au/journal/2010/192/2/comparison-adult-patients-hospitalised-pandemic-h1n1-2009-influenza-and-seasonal

Abstract

Objective:
To compare the patient characteristics, clinical features and outcomes of adult patients hospitalised with pandemic (H1N1) 2009 influenza and seasonal influenza.

Design and setting:
Retrospective medical record review of all patients admitted to Liverpool Hospital, Sydney, with laboratory-confirmed influenza from the initiation of the "PROTECT" phase of the pandemic response on 17 June until the end of our study period on 31 July 2009.

Main outcome measures:
Severity of illness; requirement for admission to the intensive care unit (ICU) and/or invasive ventilation; mortality.

Results:
Sixty-four adults were admitted to Liverpool Hospital with influenza, 48 with pandemic (H1N1) 2009 influenza and 16 with seasonal influenza. Thirteen patients were admitted to the ICU. Seven required invasive ventilation, with 2 patients requiring ongoing extracorporeal membrane oxygenation (ECMO). Five patients died (mortality rate, 8%) with two deaths occurring after the study period. Patients with pandemic (H1N1) 2009 influenza were younger and less likely to be immunocompromised than patients with seasonal influenza. However, the clinical features of pandemic (H1N1) 2009 influenza and seasonal influenza were similar.

Conclusions:
Our findings show that the clinical course and outcomes of pandemic (H1N1) 2009 influenza virus are comparable to those of the current circulating seasonal influenza in Sydney. The high number of hospital admissions reflects a high incidence of disease in the community rather than an enhanced virulence of the novel pandemic influenza virus.

…

In conclusion, our study shows that the clinical disease caused by the novel pandemic (H1N1) 2009 influenza virus in humans is comparable to that caused by the current circulating seasonal influenza strains in Sydney. The number of patients with severe disease reflects the disease burden in the community resulting from the pandemic. Pregnant women are at risk of severe infection from influenza, but whether pandemic (H1N1) 2009 influenza is particularly virulent in pregnant women and those in their postpartum period requires further study. It remains unclear whether antiviral drugs alter the clinical course of severe influenza infection.

The San Diego Union-Tribune

Swine flu hysteria confirmed anew

The San Diego Union-Tribune, 30 November 2009, at 4:52 p.m.
https://web.archive.org/web/20091206081925/http://www.signonsandiego.com/news/2009/nov/30/swine-flu-hysteria-confirmed-anew/

From Michael Fumento, one of the best science journos around and one of the few who actually understand and are good with math and statistics:

Flu Watch Nov. 30 - What Swine Flu ISN'T Doing

Swine flu is dying. Flu deaths and hospitalizations have declined for the third straight week according to the Centers for Disease Control and Prevention (CDC).

Reported infections have dropped 83% from their peak four weeks ago, and now only 32 states report widespread flu activity compared to 48 at the epidemic height.

CDC-defined "influenza-like illnesses" on college campuses are about a third what they were just two weeks ago, down from 29 new cases per 10,000 students to just 13.4. In all, 157,000 cases with a mere two deaths. So much for swine flu scything through the young.

And although the CDC's estimate for U.S. swine flu deaths puts them at a third to a twelfth that of seasonal flu at one in 5,500 cases, the estimate in France is just 1 death per 48,000 cases, while that in Japan is 1 per 140,000. "This little piggie" just keeps looking littler and littler.

New Zealand risk and policy advisor Ron Law estimates that for health people, the risk of swine flu death is about 1 per 400,000 as opposed to 1 per 7,500 for U.S. auto accidents - and yet many who have panicked over swine flu assuredly don't bother to buckle up.
That's what hysteria'll do for ya!

Congrats to the public health establishment for hoodwinking the public yet again. Avian flu, SARS, Alar, AIDS, you name it – every time there's a crisis it's exaggerated for empire-building purposes or because these officials think it's OK to lie to us for our own good. Or a combo of those factors.

Re: AIDS. I'm not downplaying how horrific the spread of AIDS was. But the fact is a 1996 Wall Street Journal investigation showed CDC purposefully exaggerated the risks to heterosexuals.

Swine Flu mutation reported in Italy

Independent, 30 November 2009, 01:00 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/swine-flu-mutation-reported-in-italy-5509918.html

The Italian Health Ministry reported the country's first case of a mutant form of swine flu on Monday.

The ministry said the variation of the A(H1N1) virus was identical to one reported in Norway on November 20. On Friday, France reported the death of two people infected by the same mutation.

The A(H1N1) variation was found three or four months ago in a patient in Monza, near Milan, Italian Deputy Health Minister Ferruccio Fazio said in comments reported by ANSA news agency.

"The Higher Institute of Health has examined around 100 strains (of the virus) found in recent months in patients from all over Italy and up to now the mutation has only been found in one patient," the ministry said in a statement.

"Italian data suggest that at the moment the mutation in question is not dominating serious and fatal cases of the virus. Furthermore, the mutation seems to be sporadic and does not appear to be spreading," the ministry said.

Vaccination and anti-viral treatments were still effective against the mutation, the ministry said.

"Only vaccination protects us from the virus, which is likely to become more dangerous with mutations," Fazio said.

The Italian health institute said it had found one case of resistance to the Tamiflu antiviral treatment.

This was an isolated case involving a patient who was already very ill, the institute said, and the resistant strain did not appear to be spreading.

THE FLU CASE

CDC whips up Swine Flu Hysteria among traveller as quarantine stations wait to be filled up

The Flu Case, 30 November 2009
https://web.archive.org/web/20100102044507/http://theflucase.com/index.php?option=com_content&view=article&id=2124%3Acdc-whips-up-swine-flu-hysteria-among-traveller-as-quarantine-stations-wait-to-be-filled-up-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Atlanta-based Centers for Disease Control and Prevention has launched a program called "Travel Well" allegedly to "combat the spread of the H1N1 virus."

The CDC been funding a program to set up "Quarantine Stations" in US airports from 2003 and that most major US airports now have such sections where travellers can be taken into isolation.

By law, airlines are required to report to CDC when someone is attempting to enter the United States with an infectious disease. http://www.wpxi.com/h1n1/21667692/detail.html – deleted

CDC Launches 'Travel Well' To Combat H1N1

"It is the largest public awareness campaign ever to inform travelers how to stay healthy while on the road," according to a report.

VeriChip Corporation has announced a so-called Glucose-Sensing RFID Microchip and Virus Triage Detection System for the H1N1 Virus that can be used at airports.

However, it has been shown that only very sophisticated lab tests can detect the swine flu virus. Therefore, it is not clear how this so called Glucose Sensing Detection System is supposed to work. What is the science that allows it to detect a H1N1 virus as you pass through it if a lab test is required for all other cases?

As CBS has reported, only 2 % of the swine flu cases reported in California were confirmed in lab tests.

If this Verichip detection machine blinks red when a traveller goes through it, even if it is an error or dud science, that travellor could, all the same, find themselves marched off to quarantine sector and facing indefinite imprisonment and perhaps even forced vaccination.

The hacked emails from the University of East Anglia and the CRU have revealed the fraudulent data and methods being used by scientists to float the myth that the globe is warming up due to carbon emissions.

Are we about to see the same fraudulent data and methods being used by the CDC and Verichip as a pretext to quarantine and imprison travellers in the USA?

Posted: 5:11 pm EST November 19, 2009

The Centers for Disease Control and Prevention *launched a program called "Travel Well" to combat the spread of the H1N1 virus. It is the largest public awareness campaign ever to inform travelers how to stay healthy while on the road. The CDC said consider buying travelers insurance in case you have to cancel because of illness. Officials said to stay home if you are sick. Wash your hands often and cover your mouth when coughing or sneezing. "Anytime people are close together, there is possibility of germs spreading," said CDC official Dr. Anne Schuchat. "One of the most important things people can do is travel only if they're well." Since April, the H1N1 virus has caused more than 4,000 deaths in the United States.*

THE FLU CASE

Walter Burien

There are many variants to the H1N1, Says CFR1

The Flu Case, 30 November 2009
https://web.archive.org/web/20100102030924/http://theflucase.com/index.php?option=com_content&view=article&id=2243%3Athere-are-many-variants-to-the-h1n1-says-cfr1&catid=1%3Alatest-news&Itemid=64&lang=de

Why are the powers at large "marketing" one strain out of thousands of H1N1 to circulate tens of millions of doses of a vaccine? What is the real intent behind this "created" event?

What follows is a listing of H1N1 virus strains and as you can see it is not short list. With so many, (thousands) what makes one strain of the Avian Swine Flu H1N1 stand out so much?

Answer: Good marketing. See how many swine flue viruses you can count on the list. Look at the year each strain was identified and where from around the world it was found as shown in each link.

Each link will bring you to that variant. Hit your browser back button to return to the complete list. Here is a partial list of swine flu variants:
95% of the people think there is just one H1N1 - WRONG!

Variant:Influenza A virus (A/AA/Marton/1943(H1N1))
Variant:Influenza A virus (A/Aichi/100/2007(H1N1))
Variant:Influenza A virus (A/Aichi/10/2008(H1N1))
Variant:Influenza A virus (A/Aichi/102/1999(H1N1))
Variant:Influenza A virus (A/Aichi/103/2006(H1N1))
Variant:Influenza A virus (A/Aichi/111/2006(H1N1))
Variant:Influenza A virus (A/Aichi/11/2006(H1N1))
Variant:Influenza A virus (A/Aichi/11/2008(H1N1))
Variant:Influenza A virus (A/Aichi/1/2008(H1N1))
Variant:Influenza A virus (A/Aichi/12/2008(H1N1))
Variant:Influenza A virus (A/Aichi/124/2008(H1N1))
Variant:Influenza A virus (A/Aichi/125/2008(H1N1))
Variant:Influenza A virus (A/Aichi/13/2008(H1N1))
Variant:Influenza A virus (A/Aichi/132/2006(H1N1))

and hundreds more at the link below:
https://web.archive.org/web/20100131043857/http://cafr1.com/variants.html

Questions:
If there are hundreds of 'created', identified and/or cataloged H1N1 virus strains, are they not stockpiled as biological warfare weapons?
Can the more virulent strains not be surreptitiously released as 'mutations' in what the WHO has termed 'mock-up' trials**.**
How can the current H1N1 vaccine, produced globally by multiple vaccine manufacturers with various unregulated quality control standards, be safe and effective a virus that WHO says is undergoing a continuous state of mutation?

THE FLU CASE

More people in Germany file criminal charges over the swine flu

The Flu Case, 30 November 2009, 13:38

https://web.archive.org/web/20100102052134/http://theflucase.com/index.php?option=com_content&view=article&id=2121%3Amore-people-in-german-file-criminal-charges-over-the-swine-flu&catid=41%3Ahighlighted-news&Itemid=105&lang=en

More people in Germany have filed criminal charges over the swine flu scam, including Stefan Sigler from Backnang.

He filed comprehensive charges with his local police against the German government and those doctor's associations and university facultiies recommending the swine flu jab for corruption (accepting bribes), fraudulent misuse of tax funds, membership of terrorist organisations, illegal manufacture and possession of bioweapons, with the suspicion of using them with the intention of causing death and bodily harm and also genocide.

In der Angelegenheit Amoklauf mit Todesfolgen in Winnenden im März 2009 erstatte ich, Stefan Sigler, Backnang hiermit Anzeige

1. gegen am Tatort Albertville-Realschule beteiligte Polizeieinsatzkräfte wegen unterlassener

   Hilfeleistung mit Todesfolge

2. gegen die beteiligten Ermittlungsbehörden sowie die Herren Polizeipräsident Hettger, Innenminister Rech und Ministerpräsident Oettinger wegen des Verdachts der vorsätzlichen Beugung in der Ermittlung und Beweisfindung durch

   Vereitelung (unterlassene Obduktion bzw. kriminaltechnische Untersuchung der Opfer und der Waffe),

   Verschleierung durch Falschaussagen

   Unterdrückung und Zurückhaltung von Beweismaterial (insbesondere hier Videoüberwachungsdokumente, Kommunikationsdokumentation)

   Fälschung durch nachträgliche Zudichtung (Rucksack/Abschiedsbrief)

3. gegen oben genannte wegen des Verdachts auf Bildung, Mitwirkung, Unterstützung oder Mitwissen um eine terroristische Vereinigung innerhalb der Staatsbehörden

Diese Anzeige richtet sich nicht pauschal gegen DIE POLIZEI - ich achte und schätze ihre

Arbeit - solange sie dem menschlichen Miteinander dient.

Backnang, Sonntag 29.11.2009

In der Angelegenheit Schweinegrippe im Besonderen ,Impfung im allgemeinen erstatte ich, Stefan Sigler, Backnang hiermit Anzeige gegen die an der Beschlussfassung zur und Beschaffung von Impfstoffen beteiligten staatlichen Behörden sowie gegen die die Impfung empfehlenden Ärztevereinigungen und die Impfung ausführenden Personen

- wegen des Verdachts der Beschaffung und illegalen Besitz von Bio-Waffen und deren Weiterreichung
- wegen des Verdachts der vorsätzlichen, zumindest mutwilligen und grob fahrlässigen Körperverletzung mit Todesfolgen sowie wegen des planstabsmäßig organisierten Versuch eines Genozid an der deutschen Bevölkerung
- wegen des Verdachts auf Bildung oder Mitgliedschaft oder Unterstützung einer terroristischen Vereinigung
- wegen des Verdachts der Bestechlichkeit und Vortelsnahme durch die Impfstoffverkäufer und Veruntreuung von Steuergeld für die Beschaffung der als Impfstoff getarnten Killegalen Kampfstoffe.
- gegen alle beteiligten Ärzte wegen Eidesbruch
- gegen diejenigen Lehrstuhlinhaber an Medizinischen Fakultäten, die entgegen ihrem wissenschaftlichen Auftrag Irrlehren über das Impfen verbreiten

Grippe A: 10 décèsdans le week-end en France

Challenges, 30 novembre 2009, à 19h14
https://www.challenges.fr/economie/grippe-a-10-decesdans-le-week-end-en-france_360661

La Commission européenne a approuvé, lundi 30 novembre, l'injection unique de deux vaccins (le Focetria de Novartis AG et le Pandemrix de GlaxoSmithKline) contre la grippe A/H1N1, au lieu de deux injections pour les adultes et les enfants les plus âgées. Ainsi, les campagnes de vaccination pourraient s'accélérer. Peu avant, la ministre de la Santé a annoncé 8 nouveaux décès liés à l'épidémie de grippe A/H1N1 enregistrés au cours du week-end. Il s'agit d'une épidémie qui "peut avoir des formes majoritairement peu sévères mais qui montre des formes sévères, en particulier chez des jeunes enfants", a-t-elle rappelé sur RMC-Info. Roselyne Bachelot, qui devait rencontrer Nicolas Sarkozy dans la matinée, a jugé "possible" que la France passe au niveau six du plan de pandémie grippale, rappelant que cette phase avait été "imaginée au moment de la grippe aviaire". "Il y a des outils dans le niveau six qui peuvent d'ores et déjà être utilisés, par exemple l'interdiction des rassemblements". "Mais ça ne veut pas dire qu'on utilisera forcément" tous ces "outils".

Priorité aux personnes fragiles

La ministre de la Santé a répondu également aux médecins généralistes qui souhaitent organiser la vaccination contre la grippe A/H1N1 dans leur cabinet et qui affirment que les pouvoirs publics disposaient de 3 millions de doses. "Nous n'avons pas trois millions" de vaccins à dose unique, a dit Roseline Bachelot interrogée par RMC/BFM-TV, ajoutant disposer de 250.000 vaccins à monodose sans adjuvant et 500.000 avec adjuvant. "Ces vaccins j'en ai besoin parce qu'en France, il y des gens qui ne vont ni dans les centre de vaccination, ni dans les cabinets médicaux ce sont les personnes fragiles, les personnes précaires", a-t-elle déclaré. "Avec ça je vaccine les sans-domicile-fixe, je donne les doses unitaires aux équipes de maraude qui vont vacciner les plus fragiles d'entre nous".

La mutation du virus de la grippe A/H1N1 ne remet pas en cause l'efficacité de la vaccination, a déclaré la ministre de la Santé, après l'annonce de deux cas mortels de mutation, similaires à ceux détectés en Norvège.

Mobilisation le dimanche

L'Elysée a confirmé que les internes en médecine et les médecins du travail et du service de santé des armées vont renforcer dès mercredi les effectifs des centres de vaccination. Leur plages d'ouvertures vont être élargies dès la semaine prochaine en particulier le mercredi, le samedi et en début de soirée, précisent les services de Nicolas Sarkozy dans un communiqué publié à l'issue d'une réunion à l'Elysée avec le Premier ministre, les ministres de l'Intérieur, de l'Education nationale, de la Défense et de la Santé.

Par ailleurs, le ministre de la Défense a assuré lundi: "on est tout à fait capable au titre des armées de mettre entre 100 et 150 équipes vaccinales", soit un médecin et une infirmière, au service de la campagne de vaccination.

Plus d'un million de personnes ont été déjà été vaccinées en France, et l'objectif est de dépasser les 100.000 vaccinations par jour, selon le professeur Didier Houssin, directeur général de la Santé.

Une question de pognon

La vaccination chez le médecin contre la grippe A/H1N1 a créé la polémique dimanche. Le syndicat de médecins généralistes MG France a demandé de pouvoir pratiquer des vaccins en cabinet médical, affirmant que "3 millions de vaccins conditionnés sous forme de monodoses auraient été livrés selon lui à l'organisme en charge des stocks de vaccins". La présentation du vaccin, jusqu'à présent en flacons multidoses, était l'une des raisons invoquées pour refuser la vaccination chez le médecin. Pour le gouvernement, elle n'était pas compatible avec les cabinets médicaux.

Interrogé lors du "Grand rendez-vous" Europe 1/Le Parisien-Aujourd'hui en France, François Chérèque, le dirigeant de la CFDT, s'est déclaré contre cette perspective, dénonçant "une question de coût" et ajoutant: "il y a toujours une question de pognon derrière ça". "Si vous allez chez votre médecin pour vous faire vacciner, vous allez payer une visite. On nous dit c'est 8 euros, mais on se moque de nous, parce que vous allez y aller, vous allez faire voir un autre problème de santé, et ce sera 22 + 8, ce sera 30 euros". Dans une déclaration à l'AFP, Michel Chassang, le président du principal syndicat de médecins libéraux (CSMF), a rappelé que "les médecins dans les centres de vaccination sont payés par les caisses d'assurance-maladie" et que "personne ne travaille gratuitement dans ces centres".

248 établissements fermés

Dix nouveaux décès liés au virus de la grippe H1N1 ont été signalés en France métropolitaine depuis le dernier bilan de vendredi, portant à 86 le nombre de personnes décédées en métropole depuis le début de l'épidémie, selon l'Institut de veille sanitaire. L'InVS a également recensé 41 nouveaux cas graves par rapport au dernier bilan. Au total, depuis le début de l'épidémie, 461 personnes ont été hospitalisées en métropole. Parmi elles, 137 sont toujours en réanimation ou unités de soins intensifs.

Lundi matin, 248 établissements scolaires et 402 classes étaient fermés en France en raison de la grippe A/H1N1, selon les chiffres communiqués par le ministère de l'Education nationale.

CDC and WHO admit Swine Flu "Pandemic" has peaked

The Flu Case, 1 December 2009 11:34

https://web.archive.org/web/20100102041146/http://theflucase.com/index.php?option=com_content&view=article&id=2146%3Acdc-and-who-admit-swine-flu-qpandemicq-has-peaked-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Steve Sternberg, Four-week decline in flu-like cases, officials say. – USA Today, 1 December 2009.

Federal health officials reported Monday that cases of flu-like illness in the USA have declined for four weeks in a row, though hospitalization rates remain high, especially for children younger than 4.

The steady decline in the USA and elsewhere prompted the World Health Organization to propose Friday that swine flu may have peaked in North America, the Caribbean and parts of Europe, though the "winter influenza season continues to be intense."

U.S. officials challenged WHO's hopeful assessment, saying it is too soon to declare that swine flu is tapering off.

"We are certainly nowhere near the end," says Daniel Jernigan of the Centers for Disease Control and Prevention, noting that, even after the month-long decline, "we're still above the peak we had last winter."

Jernigan says there also was a drop in cases at this stage of the 1957 pandemic, which appears to offer the closest parallel to today's outbreak. But flu cases and deaths rebounded after the Christmas and New Year's holidays. "The conditions that influenza likes – winter with people crowding together – haven't even come yet," he says.

Deaths of children continue to mount, the CDC reported, with a record 27 during the week ending Nov. 21. That's the highest one-week total since swine flu, also known as H1N1, was identified in April. Doctors have reported about 200 pediatric swine flu deaths to the CDC, which says many more deaths probably have gone unreported.

As of Monday, 66 million doses of swine flu vaccine were available for states to order, and more were on the way, the CDC's Thomas Skinner says.

AGORA VOX

Bernard Dugué

H1N1: le niveau 6 du plan pandémie envisagé par Mme Bachelot

AgoraVox, 1 Décembre 2009.

https://www.agoravox.fr/tribune-libre/article/h1n1-le-niveau-6-du-plan-pandemie-65927

La grippe H1N1pdm a occasionné dix nouveaux décès notifiés selon le dernier bulletin de l'InVS daté du 30 novembre. Le chiffre 10 est donc à prendre avec circonspection puisqu'il s'agit de décès notifiés, et comme le précise le manuel de l'InVS, l'authentification du virus H1N1pdm n'est pas systématiquement appliquée et parmi les cas, il y a des sujets porteurs du virus et des cas dits «probables». Qu'est-ce qu'un cas probable ? C'est un patient qui vient de décéder après hospitalisation. Avant de décéder, le patient, étant en soins de réanimation, est répertorié comme cas grave. Et d'après la définition de l'InVS, un cas grave est un cas suspecté de grippe A(H1N1) ayant séjourné en unité de soins intensifs, en réanimation, ou décédé. Le plus souvent, ces malades placés en soins intensifs sont affectés par une IRA, infection respiratoire aiguë. On peut néanmoins suspecter une confusion dans l'établissement des causalités car tous ces cas répertoriés risquent un recouvrement avec une pathologie elle-même mal connue et qui est le SDRA, syndrome de détresse respiratoire aiguë. L'incidence est de 3 cas pour 100 000 h/an. Ce qui pour la France, donne environ 2000 cas.

Pour l'instant, l'InVS a répertorié depuis le début de l'épidémie 460 hospitalisations, 86 décès et actuellement, 137 personnes en soins intensifs. Certes, cette comptabilité est macabre mais les chiffres semblent éloignés d'une situation d'urgence. Le plan pandémie, faut-il le préciser, a été conçu en 2005 pour faire face à une menace de grippe aviaire avec contagion et taux de mortalité conséquent. Pour l'instant, nous sommes sans doute dans une situation sanitaire comparable à celle des autres années. Quant aux chiffres exacts liés à la grippe, ils peuvent être biaisés et peu ou prou surévalués.

Pourtant, Madame Bachelot, se basant sur ces dix nouveaux décès notifiés, nous a averti qu'elle sonnera le tocsin prochainement. Pardon, je voulais dire qu'elle annoncera le passage au niveau 6 de pandémie avec des mesures piquées dans cette extraordinaire document produit par l'usine à gaz bureaucratique française. Le tocsin, c'était une autre époque, quand les cloches des églises sonnaient, pour avertir les habitants d'un danger imminent. L'annonce d'un niveau pandémie relève plutôt des sirènes qu'on entendait pendant la guerre. Planquez-vous, les bombes tombent, restez chez vous, le virus attaque ! Contrairement aux minarets servant à rassembler les fidèles pour la prière, les sirènes du système sanitaire invitent les gens à rester chez eux. C'est en effet l'une des mesures du plan pandémie dans la version 5B/6.

Restriction des déplacements, fermeture généralisée des écoles, surveillance aux frontières, fermeture des lignes de transport très fréquentées, interdiction des manifestations sportives à haute densité de foule, comme dans le foot, annulation des spectacles, création d'un statut de fonctionnaire volontaire, gestion du ravitaillement, approvisionnement des distributeurs de billets, collecte de lait, recours aux jeunes retraités, aux étudiants expérimentés, transfert d'activités sur des régions moins touchées, cellule psychologique pour les familles affectées par des décès, communication pour inciter les gens à acheter groupés pour ne pas avoir trop de circulation dans les centres commerciaux …

Bref, je n'ai livré que le dixième, et encore, de ce plan dont on se demande d'où il est sorti et comment il peut fonctionner. Même la ministre a jugé que le document n'était qu'un ensemble de propositions qu'il faut sélectionner. Autrement dit, piquer ça et là quelques mesures et quelques bras (lol). La décision de passer au plan pandémie de niveau 6 est prévue mais pas pour demain déclarait Didier Houssin, haut fonctionnaire en charge de la santé. Bref, les Français ne savent pas à quelle sauce bureaucratique ils vont être assaisonnés (lol). La mise en place de ce dispositif reste cependant possible et c'est ce qu'il y a de plus à craindre depuis que ce 6 juin 2009, M. Chan a sonné le tocsin de la pandémie depuis son minaret de l'OMS (lol).

Que dire de plus. Confirmation d'un signe crépusculaire avec perte de rationalité. 86 décès depuis le début de la pandémie, et pas tous confirmés H1N1 et de plus, beaucoup de sujets à risque et quelques cas atypiques mais dans toutes les pathologies, on trouvera deux ou trois sujets qui réagissent différemment, soit qu'ils périssent, soit qu'ils résistent, comme on le voit dans ces cas exceptionnels répertoriés dans un journal de médecine.

Depuis le début de la pandémie, il y a eu 2000 décès sur les routes. Pourquoi ne pas interdire alors les déplacements routiers, par exemple la nuit et le dimanche. La pandémie, elle est surtout dans les esprits. Le battage médiatique affole les gens et les autorités s'affolent de ce que les gens puissent être affolés et ne savent plus quel plan concocter.

Le coup de la cellule psychologique est édifiant. La mort n'est plus un événement privé mais recomposé par un pathos médiatique faisant que certain décès sont subis, par on ne sait quel mécanisme psychique, plus intensément, dès lors que les médias en parlent. Du reste, c'est aussi le cas de cette grippe qui apparaît comme une menace alors que la situation sanitaire est comparable à celle des autres années.

THE AUSTRALIAN

Adam Cresswell

Swine flu 'is no worse than seasonal strains'

The Australian, 1 December 2009
https://web.archive.org/web/20100102040900/http://theflucase.com/index.php?option=com_content&view=article&id=2130%3Aswine-flu-is-no-worse-than-seasonal-strains-australian-experts-say&catid=1%3Alatest-news&Itemid=64&lang=en
https://www.nzno.org.nz/resources/library/library_newsletter/artmid/4773/articleid/803/issue-120---3-dec-2009

The dominant expert view that swine flu is much more dangerous than seasonal strains is under attack from Australian research, which has found little to no difference in patients infected by the two types.

In results that could undermine uptake of the swine flu vaccine, researchers tracked the progress of all patients admitted to a major Sydney hospital during the recent epidemic, finding the course of the illness was "comparable to those of the current circulating seasonal influenza in Sydney". The findings threaten to debunk the firming medical orthodoxy that swine flu hits patients much harder than the strains that circulate every winter, particularly children and pregnant women.

The results have already been criticised by some infectious diseases experts, who say the findings are based on very small numbers and do, in fact, point to a greater danger from swine flu.

The study's authors, from Sydney's Liverpool Hospital, the Sydney South West Pathology Service and the University of Western Sydney, said their results showed that high numbers of hospital admissions for swine flu reflected the rapid spread of the disease, not any increased virulence of the H1N1 virus.

"Our findings show that, for hospitalised patients, the clinical manifestations and severity of pandemic (H1N1) 2009 and seasonal influenza were similar," they wrote in the study published online yesterday by the Medical Journal of Australia.

Even among pregnant women – a group that was said to have been particularly at risk of severe complications in the recent epidemic – the authors said they were "unable to demonstrate a difference in clinical severity" compared with pregnant women with annual flu strains. For the research, the authors tracked all 64 adults who were admitted to Liverpool Hospital with influenza from June 17 until July 31.

Scottish Government reclassifying all Flu deaths as Swine Flu deaths

The Flu Case, 1 December 2009, 11:47
https://web.archive.org/web/20100102015357/http://theflucase.com/index.php?option=com_content&view=article&id=2148%3Ascottish-government-reclassifying-all-flu-deaths-as-swine-flu-deaths&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Information requested under the Freedom of Information (Scotland) Act 2002 reveals that there have been no deaths from seasonal influenza in Scotland since the start of the H1N1 Swine Flu pandemic according to the government's official. ...

The death toll linked to swine flu in Scotland has risen to 48, the Scottish Government said yesterday.
Health secretary Nicola Sturgeon confirmed that an adult from the NHS Ayrshire and Arran Health Board area had died after contracting the H1N1 virus. The patient had underlying health conditions." The absence of any deaths attributed to the seasonal flu in Scotland and the simultaneous jump in deaths attributed to the swine flu will spark fears that the Scottsh government is deliberately manipulating data to exaggerate the dangers of the swine flu by reclassifying all seasonal flu deaths as swine flu deaths in order to be able to better justify a mass swine flu vaccination campaign.
Many of the suspected swine flu cases have tested negative in the UK with only about 15,000 cases confirmed in labs according to another Freedom of Information request.
It, therefore, seems highly unlikely that every single person who has died in Scotland from the flu so far this year has died from the swine flu while not a single one has died from the seasonal flu.

This is the FOI request:
Chief Medical Officer and Public Health Directorate
Public Health Division
T: 0131-244 5542 F: 0131-244 2157
E: [email address]
Mr McGillivray
By email to: [FOI #22372 email]

Los Angeles Times

Thomas H. Maugh II

H1N1 flu cases decline, but still taking heavy toll

Los Angeles Times, 1 December 2009
https://web.archive.org/web/20091204134751/http://www.latimes.com/news/nation-and-world/la-sci-swine-flu1-2009dec01,0,1161370.story

Though the current wave of the pandemic flu appears to have peaked, the number of pediatric deaths has not, the CDC reports.

The current wave of pandemic H1N1 appears to have peaked, with four weeks of declines in several key indicators, the Centers for Disease Control and Prevention said Monday. Despite the decrease, the outbreak is continuing to take a heavy toll of hospitalizations and deaths, especially among children.

Widespread activity of H1N1, also called swine flu, was reported in 32 states – including California – in the week ending Nov. 21, down from 43 states the week before and 48 a month ago. Influenza-like illnesses accounted for 4.3% of all visits to doctors' offices during the week, down from nearly double that proportion in October. That is still well above the normal level, 2.3%, for this time of year, however.

From Aug. 30 to Nov. 21, there were 29,348 laboratory-confirmed swine flu hospitalizations and 1,224 deaths in the United States, although those numbers are generally assumed to be very low. Two weeks ago the CDC estimated that at least 4,000 people have died from swine flu, 98,000 have been hospitalized and 22 million have contracted the virus. New figures are expected in a couple of weeks.

In the week that ended Nov. 21, there were 27 laboratory-confirmed swine flu deaths in infants and children younger than 18 and seven from influenza A that was not tested to see if it was H1N1; it was the largest toll in a single week since the pandemic began in April. That brings the total number of pediatric deaths from influenza to 234 since April. A normal flu season is typically marked by about 30 to 40 pediatric deaths.

The number of pediatric deaths apparently has not peaked yet, the CDC says, because death reporting often lags by three or four weeks. For example, one of the seasonal flu deaths included in this week's report occurred in May.

The Washington Post

Rob Stein

Second wave of swine flu may have peaked

Washington Post, 1 December 2009
https://www.washingtonpost.com/wp-dyn/content/article/2009/11/30/AR2009113003836.html?wprss=rss_health

The level of flu activity across the nation has dropped for the fourth week in a row, federal health officials reported Monday, indicating that the second wave of the swine flu pandemic in the United States has peaked.

While officials warned that the number of people getting infected with the H1N1 virus remains high, and cases could surge again, the extended period of falling activity suggests that the intensity of the outbreak has reached a high.

"We're certainly on the downward slope of the curve," said Thomas Skinner, spokesman for the Centers for Disease Control and Prevention in Atlanta.

The CDC noted, however, that 27 deaths from swine flu among people younger than 18 had been confirmed in the most recent week – the largest one-week tally of pediatric deaths since the pandemic started – bringing the total to at least 198. About 40 or 50 children usually die from the flu during an entire season.

Skinner said officials were hesitant to use the term "peak" because of concerns about creating the impression that the outbreak was over.

"We're far from being out of the woods," Skinner said. "There's still a lot of flu out there. And we wouldn't be surprised to see another uptick in activity as we approach the end of December and beginning of January, when kids come back from Christmas break."

But other experts said they thought the wave had peaked.

"Most of the time with the flu you have a four-week or sometimes six-week rise to a peak and then a four- to six-week fall. I think we're past the peak. We're probably on the way down," said Richard Wenzel, an infectious disease specialist at Virginia Commonwealth University. "I think the worst is over."

Wenzel also predicted that if there is another surge, it will be relatively mild because millions of people have either been exposed to the virus or will have been vaccinated.

"After a while the virus runs out of susceptible people," Wenzel said. "This virus is running out of hits."

Michael T. Osterholm, an infectious disease expert at the University of Minnesota, agreed that the current wave has peaked. "Just about everywhere now the numbers are coming down and pretty much in all age groups," he said. But Osterholm worried that the drop would prompt people to stop trying to get vaccinated, which he said could be disastrous if another wave hits.

In its weekly update on flu activity, the CDC reported that the number of states experiencing widespread flu cases during the week that ended Nov. 21 had fallen to 32, down from 43 states the week before and a high of 48 states in late October. Influenza-like illnesses accounted for 4.3 percent of all visits to doctor's offices during the week, down from nearly double that proportion in October.

At the same time, the number of U.S. school closings due to swine flu has been steadily falling. The Department of Education reported Monday that no new closings had occurred in the past week.

Since the virus emerged in April, the swine flu has sickened at least 22 million Americans, hospitalized 98,000 and killed at least 4,000, the CDC estimates. While the seasonal flu typically hits the elderly hardest, the H1N1 virus has affected children and young adults much more because most have little or no immunity against it.

Experts suspect another surge in cases could occur this month or the beginning of 2010, similar to what happened during the 1957 flu pandemic, which most resembles the H1N1 pandemic.

"We certainly won't be surprised if we see another uptick of activity late this year or early next year if we look at the 1957 pandemic as a gauge," Skinner said.

The federal government has spent more than $2 billion to buy vaccine. But production problems slowed the campaign, causing widespread frustration and intense criticism, including from members of Congress.

More than 60 million doses of vaccine have become available and officials are predicting millions more will be shipped to states in the coming weeks.

KFF Health News

Swine Flu cases appear to have peaked

Morning Briefing:
Summaries of health policy coverage from major news organizations

KFF Health News, 1 December 2009
https://kffhealthnews.org/morning-breakout/swine-flu-4/

The Los Angeles Times:"The current wave of pandemic H1N1 appears to have peaked, with four weeks of declines in several key indicators, the Centers for Disease Control and Prevention said Monday. Despite the decrease, the outbreak is continuing to take a heavy toll of hospitalizations and deaths, especially among children. Widespread activity of H1N1, also called swine flu, was reported in 32 states ... in the week ending Nov. 21, down from 43 states the week before and 48 a month ago. Influenza-like illnesses accounted for 4.3% of all visits to doctors' offices during the week, down from nearly double that proportion in October. That is still well above the normal level, 2.3%, for this time of year, however" (Maugh, 12/1).

The Washington Post: "While officials warned that the number of people getting infected with the H1N1 virus remains high, and cases could surge again, the extended period of falling activity suggests that the intensity of the outbreak has reached a high. ... 'We're far from being out of the woods,' [Thomas Skinner, spokesman for the Centers for Disease Control and Prevention in Atlanta] said. 'There's still a lot of flu out there. And we wouldn't be surprised to see another uptick in activity as we approach the end of December and beginning of January, when kids come back from Christmas break.' But other experts said they thought the wave had peaked" (Stein, 12/1).

USA Today reports: "The steady decline in the USA and elsewhere prompted the World Health Organization to propose Friday that swine flu may have peaked in North America, the Caribbean and parts of Europe, though the 'winter influenza season continues to be intense.' U.S. officials challenged WHO's hopeful assessment, saying it is too soon to declare that swine flu is tapering off. ... As of Monday, 66 million doses of swine flu vaccine were available for states to order, and more were on the way, the CDC's Thomas Skinner says" (Sternberg, 11/30).

Meanwhile, The San Bernardino (Calif.) Sun reports that fewer blacks are receiving the vaccine: "San Bernardino County public health officials this week plan to make a special pitch to get more blacks to roll up their sleeves for the H1N1 vaccine. ... Alonzo Louis Plough, director of emergency preparedness and response at the Los Angeles County Department of Public Health, said last week that his agency had already made attempts at special outreach and participation in the H1N1 campaign, and participation is still lagging. ... Dr. Eric Frykman, health officer for Riverside County, said that he has asked clinic managers to informally start tracking participation by ethnic group" (Steinberg, 11/29).

MAX-PLANCK-GESELLSCHAFT 75 JAHRE

Software predicts dangerous variants of influenza viruses

Max-Planck-Gesselschaft, 1 December 2009.
https://www.mpg.de/research/computer-software-against-influenza-epidemics

Experts working with Alice Carolyn McHardy from the Max Planck Institute for Informatics in Saarbrücken are developing software that detects, in viral genomes, suspicious patterns that betray the presence of the next trigger of a global flu epidemic – even before the next flu season has begun.

During the cold winter months, a sneeze on an airplane or a cough on a train is enough to make us all think of the flu. And since spring 2009, a new pathogen has been traveling the world, accompanying people by air and sea from America to all other continents. It even made newspaper headlines in fall 2009: the new H1N1 virus.

By mid-January 2010, *22,000 people around the world had died* of the infection commonly referred to as the "swine flu". Just how many people have been infected is anyone's guess. What is certain, however, is that H1N1 has presented humanity with the first case of global influenza, the first pandemic of the 21st century. And yet, up to now, the virus has proven relatively harmless: in 1918, a predecessor of the new H1N1 virus was responsible for the deaths of almost 50 million people. That pandemic went down in history as the Spanish flu. Strangely, this strain of the virus mainly claims the lives of strong young people, while the old and weak tend to remain unharmed.

Flu vaccine development – a race against the clock

For a long time, doctors had no explanation to offer for this. It was not until a few years ago that researchers were able to observe a similar phenomenon in monkeys. The pathogen clearly allows the immune system to "boil over." If a person is infected, his or her immune response releases an excess of infection messengers – inflammation-promoting substances that are supposed to help fight the pathogen, but that attack the body's own tissues in the process. The immune systems of strong young people, in particular, simply produce too much of a good thing here.

Scientists are now very familiar with the flu virus. It has long been classified into different groups that can be clearly differentiated on the basis of genetic characteristics and typical protein structures. Large volumes of vaccine are produced against human flu viruses every year, with the intention of protecting against infection. However, sometimes the viruses mutate so rapidly and unexpectedly in some corner of the world that humans are unable to act against them in time. A new pathogen that is not targeted by existing vaccines spreads quickly. The fight against flu viruses is thus, above all, a race against the clock.

Will the scientists succeed in tracking down a new virus variant in time before it establishes itself globally in the next impending flu epidemic? Only then can manufacturers adapt the vaccines to the new pathogens before they trigger a major flu epidemic. The researchers usually win this race. Around every four years, however, the viruses outrace them.

The scientists from the Max Planck Institute for Informatics are thus arming themselves with computing power in the war against the flu virus. The experts working with Alice Carolyn McHardy are developing software that specializes in extracting secrets from the genetic material of viruses and

bacteria. One aim of the bioinformaticians is that computers will one day be able to detect, in viral genomes, suspicious patterns that betray the presence of the next trigger of a global flu epidemic – even before the flu season has begun.

Which genetic change makes the virus dangerous?

There are three types of influenza viruses: types A, B and C. The most significant are the influenza A pathogens, as these cause the major pandemics. For influenza A, there are many dozens of different flu virus strains that circulate among birds, but also among pigs. Occasionally, a virus emerges from these animal viruses that makes the transition to humans, like the current swine flu virus. The normal human flu viruses, in contrast, continue to develop from year to year, particularly in Southeast Asia. From there they spread throughout the world just in time for the annual flu season.

A flu virus is like a prickly ball whose spines are formed by the protein hemagglutinin. At the tips of the spines is a kind of lock structure at which the virus can deliberately dock onto the surface of animal and human cells. Whether or not the structures on the cell surface fit into the virus hemagglutinin and thereby gain entry into a cell depends primarily on the fine structure of this binding site. Should the two parts find each other, the disaster takes its course. The membrane of the host cell opens and the virus slips into the cell and releases its genetic strands in the interior of the cell.

The virus reprograms the cell into a compliant zombie and the cell becomes a virus production site. It obediently synthesizes virus components that are then combined to form hundreds of new viruses. At this point, a second important virus protein, neuraminidase, becomes active. The neuraminidase opens the cell membrane in such a way that the freshly produced viruses can pour out like soldiers from a troop carrier.

Viruses can carry different variants of the hemagglutinin (H) and neuraminidase (N) proteins on their membranes and are classified accordingly: H1N1 or H3N2, for example. But how do viruses from pigs transform themselves into potent human pathogens? First, through changes in their genetic material. Viruses replicate at breakneck speed. After just a few hours, infected cells release millions of new viruses. The genome must be duplicated for each new virus generation. Errors frequently arise in this process. Some genetic components (the bases) are copied incorrectly during the reading of the genomic template. Such mutations are occasionally fatal to the virus itself. Sometimes they are irrelevant. From time to time, however, the virus becomes really dangerous as a result of this process.

Moreover, another characteristic of the flu viruses gives them an extraordinary capacity for adaptation: their genome is not composed of a single strand, but is cleanly packed in eight individual packages called segments. Like suitcases at an airport, it is entirely possible for such packages to become mixed up. This can happen if a cell is simultaneously infected by two viruses – a human virus and a pig virus, for example. Both viruses pour their genomic segments into the cell – a total of 16 segments that are replicated at breakneck speed.

A dense search grid

From time to time, the following sequence of events unfolds: During the assembly of the new viruses, the reproductive apparatus steers a segment from the wrong virus into the offspring. This mixing of the genetic material is known as reassortment. This may well have occurred with the swine flu: different viruses contributed segments to the new virus and this changed its characteristics in such a way that it became an agent of disease that is also transmitted between humans.

When the vaccine developed against the H1N1 virus is administered, the body produces antibodies that recognize and block the hemagglutinin on the virus. The virus can no longer dock onto the cells, and the infection is halted.

Researchers are constantly on the lookout for genetic changes in influenza A viruses that could pose a threat – not only in the new H1N1 swine flu virus, but also in the other known suspects, such

as the classic human H1N1 and H3N2 viruses. The global search grid is dense. Blood samples are regularly taken from patients at 112 institutions and clinics in 83 countries on behalf of the World Health Organization (WHO). They are then genetically analyzed and sent to four large flu centers.

Every six months, a committee of experts convenes to examine the latest genetic analysis data to detect suspicious mutations or even reassortments. The experts try to identify from the gene sequences how the virus' form, its proteins, the hemagglutinin and the antigen will change to enable the virus to circumvent the current vaccine. They try to predict what form a new vaccine that will help fight such a virus should take if the virus in question were to pose a threat. Accordingly, the vaccines are developed on an ongoing basis and adapted to the modern influenza A types. But this does not always work.

"Up to now, the exact links between the genetic changes and the emergence of a new flu strain have not been fully understood," says Alice Carolyn McHardy, head of the Independent Research Group Computational Genomics & Epidemiology. "For example, why do some reassortments cause viruses to trigger the illness, while others do not? Does this require other genetic characteristics?" In an attempt to find answers to these questions, McHardy has transformed the computers in her office in Saarbrücken into prognosis tools whose task it is to unravel the complex interactions at work here.

She uses statistical learning techniques for this purpose. "These methods are able to relate the most wideranging data sets with each other and to track down hidden connections between them." To begin with, the learning method is fed with known data, such as the genetic information from viruses that triggered flu epidemics in the past. To this is added the information about when and where the virus showed up or the form taken by the protein structure of the hemagglutinin. Based on a process akin to a dragnet operation, the computer becomes acquainted with the typical perpetrator profiles of disease-causing viruses.

More reliable prognosis for the dominant virus

When the method has been trained extensively with the existing data sets, things really get going. McHardy feeds the computer with the genetic information of an influenza A virus whose level of danger is unknown. The learning method then compares new data with what is already known – that is, it orders the information in such a way that the current input values approximate the learned patterns as closely as possible. The computer then produces numerical values that answer the following questions: To what extent do the new gene sequences resemble the structures of a successful virus? How likely is it that there will be an outbreak of the disease?

McHardy uses support vector machines (SVM) and other statistical learning techniques for this work. These transform information into data points: numerical values that hang like stars in the firmament of a vast number space. When new data is entered into the system, the SVM assigns the new values to the floating numbers – the closer they are to a trained value, the more similar the data.

The Saarbrücken-based researchers are as yet unable to provide current forecasts for the new flu season, as the programs are still being optimized. Nevertheless, when McHardy recently entered the data for a well-known flu virus into the SVM for test purposes, it duly responded "very likely to be infectious."

"But we don't just want to find out whether a new virus variant will become established in the future and become the flu pathogen of the season," says McHardy. "We also want to be able to forecast when this will happen." The WHO experts are currently trying to predict for one year the new virus strain that will dominate and thus spread throughout the world as the agent of the disease in the ensuing flu season. They currently miss this target in one out of four cases. When this happens, a different variant of the virus becomes established than the one they expected, and then there is no well-matched vaccine available for it.

McHardy's goal is to increase the reliability of this annual forecast. Flu arises in the northern hemisphere primarily from November to February, when weather conditions are cold and damp. In the

southern hemisphere, people are affected by the illness in the southern winter months, between May and October. Such data are also fed into the SVM and other learning methods to be able to understand the viruses. McHardy has no doubt that it will one day be possible to produce a more reliable forecast. The software program Geno2Pheno, with which doctors can determine how quickly resistance to AIDS drugs develops, was already developed at her institute (Maxplanckresearch 4/2005, p. 21 ff.).

Moreover, McHardy has an abundance of computing resources to draw on in her work, as GISAID, the world’s largest virus gene database, is located in the cellar of the institute. For a few years now, researchers from all over the world have been feeding the results of the genetic analysis of influenza viruses into this database, which other researchers can access free of charge. "It makes complete sense to pool the data about the viruses, as this helps us to understand their nature as a whole," says McHardy. "Viruses are small with a very manageable genome. Researching causal relationships with them is thus a straightforward matter."

Viruses are one of McHardy’s interests. The other is the genome of bacteria, which she also aims to decode with the help of support vector machines and related learning processes. The researcher specializes in imposing order on metagenomes – a wild mixture of genetic sequences identified from a variety of different microorganisms. A metagenome does not represent the genetic material of a single individual, but of many organisms – sometimes even thousands of them. But what is the point of studying this chaos?

The search for superproteins

It is a known fact that extreme habitats, such as hot springs, for example, spawn special life forms – for instance, bacteria that can thrive in water as hot as 120 degrees Celsius. Scientists and industry expect that studying these bacteria will give rise to new substances, such as heat-resistant proteins. These could be used, for example, in the production of cosmetics or foodstuffs, namely for production processes that require high temperatures. For this reason, scientists are now searching on land and at sea for such extraordinary new microbes.

The simplest solution would be to be able to breed the unicellular organisms in the laboratory and investigate them thoroughly there for new substances. However, many bacteria do not thrive in test tubes. Researchers have thus been rolling up their sleeves for some time now, collecting soil samples by the shovelful and immediately analyzing the entire genetic material of the microbial inhabitants. The hope is that promising genes will be found that contain information about new superproteins.

The problem, however, is that metagenomic analysis usually provides thousands of minute genetic fragments, of which only a few can be assigned to an organism. This is where McHardy’s method, which the researcher has already fed with the genetic fragments of known bacterial groups, comes into play. In this instance, the support vector machine was trained especially in a characteristic of the bacterial genome: short, recurring sequences of bases, known as oligomers, such as the base sequence ACTGAT. Interestingly, certain oligomers are characteristic of the genome of different bacterial groups, just like a fingerprint.

These oligomers arise not only in one, but in several locations of the DNA strand. As a result, oligomers offer a highly suitable means of imposing order on the metagenomic puzzle. When the support vector machine had learned which oligomers are associated with certain bacterial groups, McHardy fed new metagenome sequences of unknown origin into the system, for example sequences from microbe- rich sewage sludge. Once again, the data hovered past the learned numerical values in the vast number space. The experiment was successful: "Based on the characteristic oligomers, the program was able to assign many of the short metagenome sequences to certain bacteria."

Digestion without any methane emissions

This process is called "binning" and involves the assignment to the correct bacterial group – the respective "bin" – fragment by fragment. In some cases, the statistical learning method can allocate

up to 90 percent of the genetic fragments correctly based on the oligomers. How well the method works depends, ultimately, on the volume and quality of the training data. The computer scientists in Saarbrücken only occasionally achieved values of between 30 and 40 percent.

Among the most intriguing metagenome studies in which Alice Carolyn McHardy has participated is the analysis of bacterial communities from the intestines of termites and digestive systems of the Australian wallaby, a bush kangaroo. Both species digest wood and release hydrogen, the molecule that humans aim to one day exploit on a mass scale in the production of fuel cells.

The distinctive feature of the digestive process of these insects and mammals is that, unlike bovine digestion, almost no climate-damaging methane gas is released during hydrogen production. If scientists could succeed in imitating this process in the laboratory, it may be possible to develop a completely new environmentally friendly method of hydrogen production.

The results of the analysis are promising. McHardy's SVM was able to assign the crucial metagenome fragments to different microorganisms. As a result, it is now known which bacteria in the animal intestine participate in the miracle of climate-neutral hydrogen production – and, moreover, which proteins and metabolic processes lead to hydrogen. "Work is now being carried out to identify from the samples the microorganisms that are involved, and to analyze them further," says McHardy.

The metagenome analysis is still in its early days. Many habitats have thus far been studied only at a very basic level. "And we always need some preliminary knowledge to train our methods," says the Max Planck researcher. "But the advantage of the SVM method is that its training requires only small volumes of data," she adds. And McHardy has already shown what can be achieved. The search for the secrets contained in genome sequences continues. Thanks to the hunt in extreme habitats, such as the Arctic, where bacteria thrive in minus temperatures, metagenomics is gaining in significance. And thanks to bioinformatics, some other new, out-of-the-ordinary discoveries are bound to soon join the wallaby intestinal flora.

US Swine Flu spray plane shot down in China

SIASAT, 1 December 2009
https://www.siasat.pk/threads/us-swine-flu-spray-plane-shot-down-in-china-must-read.28519/

Reports circulating in the Kremlin today are stating that a US government contracted airplane piloted by American CIA agents and carrying a cargo of a mutated swine flu virus intended for aerial spraying was shot down [photo top left] at Chinas Shanghai Pudong airport by a saboteur team of what are believed to be Israeli Mossad soldiers seeking to prevent an American attack upon one of their Central Asian bases located in the Central Asian Nation of Kyrgyzstan.

According to Chinese media reports on this incident the stricken Zimbabwean MD-ll plane, owned by the CIA linked Avient Aviation company operated by a former British military officer named Andrew Smith and registered in the UK, killed 3 American CIA agents and injured 4 other personal who are reported to be from United States, Indonesia, Belgium and Zimbabwe.

Most interesting to note in these reports on the victims of this plane shootdown is that the Indonesian man currently being treated for his injuries has confessed to Chinese secret police forces that he is a technician employed by the United States Navy at their mysterious Naval Medical Research Unit No. 2 (NAMRU-2) located in Indonesia that Indonesian Defense Minister Juwono Sudarsono had previously called for the closing of because its operations were too secretive and were incompatible with Indonesias security interests.

Even more interesting to note about this US Navy secret bio-weapons base in Indonesia (the Worlds largest Muslim Nation) was its establishment in cooperation with the Rockefeller Institute, especially with it being the main center for the Americans Viral Diseases Program (VDP) they describe as the research of epidemiologic and laboratory research on viral hemorrhagic fevers, influenza, encephalitis, and rickettsioses and the head of this institute, David Rockefeller, long calling for a massive reduction in our Worlds population.

And to the agenda currently underway to radically change our World through the mass death of its population we need look no further for its explanation than David Rockefellers own words he spoke before the secretive Trilateral Commission in June, 1991, when he said:

We are grateful to The Washington Post, The New York Times, Time Magazine and other great publications whose directors have attended our meetings and respected their promises of discretion for almost forty years. It would have been impossible for us to develop our plan for the world if we had been subject to the bright lights of publicity during those years. But, the work is now much more sophisticated and prepared to march towards a world government. The supranational sovereignty of an intellectual elite and world bankers is surely preferable to the national auto determination practiced in past centuries.

To the United States employing planes to spread a mutated swine flu virus around the World we have further reports from China, and as we can read:

June 26 Suspicious aircrafts were forced to land. A US operated AN-124 changed its call sign from civillian to military which then triggered a response from the IAF upon entering Pakistani air space, the plane was forced to land in Mumbai while the second one was forced down by Nigerian figther jets that also arrested the crew.

According to reports China (Chinas Peoples Liberation Army Air Force) contacted the Indian and Nigerian intelligence officials about the presence of these US operated Ukranian aircrafts amidst growing concern that the United States were spreading biological agents in the Earths atmosphere also which some Chinese officals believed to be a attempt to mass genocide via the spread of h1n1 swine flu.

The strange thing about these reports and arrests as well as the forcing down of the planes were that these aircrafts were carrying waste disposal systems that could spray up to 45000kg or 100pounds of aerial type mist from sophisticated network of nano pipes that led throughout the trailing edges of the wings thereby dispersing whatever was in these tanks through a mist.

Reports of these US planes over Ukraine have been reported as well, and as we can further read:

Authorities in the town of Kiev, Ukraine denied any spraying of aerosolized medication by aircraft over the city. This after it was reported that light aircrafts were seen flying over the forest market area that sprayed a aerosol substance to fight h1n1 or swine flu.

5 Sources confirms this and the local newspapers of Kiev also received hundreds of phone calls from residents and business owners close to the area the planes were spraying the suspicious substance. Not only that but local businesses and retailers were advised to stay indoors during the day by the local authorities.

As if that is not enough, the government authorities also pushed the radio stations in Kiev to deny the reports. Online on forums, websites and blogs reports came in about eye witness accounts that confirms this. There was also reports of helicopters spraying aerosols over Kiev, Lviv, Ternopil and throughout Ukraine.

Most disturbing of the effects of the spraying of this mutated swine flu virus over the Ukraine is the devastating toll it has taken on the people of that country, and as we can read:

Almost 40 000 people got infected since yesterday in the Ukraine by what we still call the Ukraine plague but doctors have said recently that this is a stronger case of h1n1 or swine flu that has mutated and has that affect on the lungs where it destroys the lungs and fills it with blood.

But, to the most horrible outcome of this mutated swine flu virus is the World Health Organization now reporting that it is killing people in France, Norway, Brazil, China, Japan, Mexico, Ukraine, and the United States as the death toll from this Global Pandemic is now reported to be nearing 8,000 and China now reporting that this deadly disease has now crossed over into dogs.

Important to also note in these reports is that the US spray plane shot down in China was reported to be targeting a secret Israeli base located in the Central Asian Nation of Kyrgyzstan, which many Ashkenazi Jews (Ashkenazi Jews make up approximately 80% of Jews Worldwide) consider their spiritual homeland after their long exile their under Soviet Communist rule, and where Russian Intelligence Analysts report the Israelis are nearing the end of their decades long deciphering of the ancient Epic of Manas manuscript (with close to half a million lines the Epic of Manas is twenty times longer than Homers Odyssey and Iliad combined) that they believe contains our Worlds oldest warning to our present age and which (coincidentally?) agrees with the ancient Mayan peoples that the year of 2012 will see the ending of our present age.

To the final outcome of these events it is not in our knowing; other than to state the obvious, that the truths of these things are continued to be ignored, even scoffed at, by the very people whose extermination has been longed planned by these monsters and is now being carried out, and who still have no idea whatsoever how truly easy it has become for them to be controlled by their propaganda masters.

One can only hope that they awaken before all is lost for them, the facts suggest they wont.

Heute

Schweinegrippe: Auch Stöger kritisiert Hysterie

Heute, 1 Decebre 2009, 18:59
https://web.archive.org/web/20091205191830/http://www.heute.at/news/politik/Schweinegrippe-Auch-Stoeger-kritisiert-Hysterie;art422,166218
https://web.archive.org/web/20100102010507/http://theflucase.com/index.php?option=com_content&view=article&id=2157%3Aaustrian-health-ministers-admits-no-pandemic-criticses-who-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Nun reagiert auch Gesundheitsminister Stöger auf die Schweinegrippe-Hysterie. Der SPÖ-Politiker kritisierte beim heutigen Treffen der EU-Gesundheitsminister in Brüssel die Pandemiewarnung der Weltgesundheitsorganisation (WHO) als übertrieben. "Die Gefahr ist nicht höher als bei einer normalen Grippe", so Stöger zur APA

Das Regime der WHO sollte überprüft werden, sagte der Gesundheitsminister. "Es muss einen Zusammenhang geben zwischen der Schwere der Krankheit und den Maßnahmen, die man setzt."

"Gefahr nicht höher als bei normaler Grippe"
Die neue Grippe habe sich zwar rasch über Ansteckung ausgebreitet. "Die Gefahr, die mit dieser Krankheit verbunden ist, ist aber nicht höher als eine normale saisonale Gripp", so Stöger. In Zukunft müsste das Vorgehen der tatsächlichen Gefahr besser entsprechen.

Grippe-Panik: So wurden wir belogen
- Gesundheitsexperten warnten: 2,4 Millionen Patienten – aber nur 100.000 Österreicher wurden bisher krank
- Schmutziges Spiel mit der Angst: Pharmaindustrie sagte 6000 Todesopfer voraus und kassiert Milliarden

Der Sager von Hubert Hrabcik war so schockierend wie eindeutig: 30 Prozent der österreichischen Bevölkerung werden sich mit dem lebensgefährlichen Grippevirus H1N1 infizieren, mehr als 2,4 Millionen Patienten zu beklagen sein, posaunte der Generaldirektor für öffentliche Gesundheit im ORF-Interview aus ("Heute" berichtete). Pharmaindustrie, Mediziner und Apotheker setzen sogar noch eins drauf: 6000 Todesopfer sollte die biblisch anmutenden Seuche in unserem Land fordern. Die Wirtschaftskammer sah in einem Katastrophenszenario gar unsere Wirtschaft zusammenbrechen. Österreich, ein Land am Abgrund also.

Hubert Hrabcik schockte mit Grippe-Warnung
Das Problem dabei: Die Realität sieht völlig anders aus. Mutige Schätzungen gehen von eben einmal 100.000 Grippe-Patienten aus – 55.000 davon haben die Krankheit bereits besiegt. Fünf Opfer sind zu betrauern – aber eine "normale", saisonale Grippe kann in Österreich jährlich bis zu 4000 Tote fordern. Bei den wirklich sagenhaften Gewinnen der Pillendreher – Roche sackte bisher mehr als 1,7 Milliarden Euro für Tamiflu-Behandlungen ein und selbst mit (den wenigen) Impfungen wurde bisher ein Umsatz von 20 Millionen Euro gemacht – wird vielmehr der Verdacht laut, dass hier "Geschäftemacherei im Spiel ist", wie auch Niederösterreichs Patientenanwalt Gerald Bachinger betonte.

Ein deutscher Virologe traf es auf den Punkt: "Ja, es ist eine Pandemie – aber es ist auch eine schrecklich harmlose Gripp

THE FLU CASE

Austrian Health Ministers admits no pandemic, criticses WHO

The Flu Case, 2 December 2009, 12:24
https://web.archive.org/web/20100102010507/http://theflucase.com/index.php?option=com_content&view=article&id=2157%3Aaustrian-health-ministers-admits-no-pandemic-criticses-who-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

After Austrians refused to flock to the vaccine centers to take their untested swine flu jabs as the Health Minister Alois Stöger urged them to, Stöger has done a sudden about face and is now presenting himself as a critic of WHO for declaring a pandemic level 6 because of a mild flu.

According to a report in the newspaper "Heute", Stöger said at an EU meeting in Brussels this week that WHO's pandemic declaration system has to be re-evaluated.

=> See above: Schweinegrippe: Auch Stöger kritisiert Hysterie. – Heute, 1 Decebre 2009

"There has to be a connection between the gravity of the disease and the measures taken," he said.

"The danger that is associated with this sickness is not higher than with the normal flu," he said.

Stöger has, therefore, just admitted that the entire swine flu pandemic is a fraudulent scam.

Stöger's crticism is valid but would have had more credibility if he had made it in June on the declaration of the WHO pandemic level 6.

Instead, he has made it at the start of December after it is clear that the mass vaccination campaign launched by WHO with his help and the help of officials like Hubert Hrabcik in Austria has failed.

Only 100,000 Austrians have taken the swine flu jab in spite of enormous media generated scare mongering and government misinformation about the untested Baxter jab.

In addition, Stöger issued no public statement and made no investigation into Baxter's contamination of 72 kilos of seasonal flu vaccine with the live bird flu virus in its facilities in Austria in February. This nearly triggered a global bird flu pandemic.

Because Baxter is obliged to adhere to biosafety level 3 regulations, an accidental contamination can be ruled out.

In spite of that, the State Prosecutor in Korneuburg closed a criminal investigation initiated by charges I filed in April at the end of September, obviously with the agreement of Stöger.

The Prosecutor Christian Pawle has refused to reply to emails asking to see his files to enable an evaluation of the basis of his decision.

I, therefore, consider it necessary to file charges against him for abuse of office because officials are in office to fulfil their duties under the law toand not to hide or distort evidence of a crime because of personal or financial links.

Also Stöger has allowed an Austrian pandemic plan to be partially implemented that criminalises being suspected of the swine flu and allows forced vaccination and quarantines.

In a case of a severe violation of their basic civic rights, a family in Austria was kept under quarantine for a week and had to rely on neighbours to provide them with supplies as a result of instructions from Stöger's Ministry in spite of the overwhelming evidence that there was no pandemic.

Hubert Hrabcik, who appears to be responsible also for the vaccine contracts with Baxter, misued his position and ensured huge profits for the pharma companies by spreading fear by making false claims in the media that 30% of the Austrians would be infected with a "dangerous" virus.

It is time to prosecute Stöger, Hrabcik and others for their role in manipulating facts and data about the swine flu virus and vaccine in order to justify this fraud as big in scale as the global warming hoax.

LE FIGARO

Grippe A: l'alerte maximale envisagée en France

LeFigaro, 1 December 2009, 10:10
https://web.archive.org/web/20091203104652/http://www.lefigaro.fr/sante/2009/12/01/01004-20091201ARTFIG00023-grippe-a-passage-au-niveau-6-envisage-.php

La décision de passer au niveau 6 pourrait être prise prochainement. Le Figaro fait le tour des mesures qui pourraient être appliquées.

Lundi, la ministre de la Santé, Roselyne Bachelot, a évoqué la possibilité que la France passe bientôt au niveau 6 du plan de pandémie grippale. Dix nouveaux décès ont été enregistrés depuis vendredi, «avec des personnes qui pour la plupart n'avaient ni facteur de risque, ni problème particulier». Mme Bachelot s'est empressée toutefois de rappeler que ce plan a été imaginé au moment de la grippe aviaire et qu'il constitue avant tout une «boîte à outils». «Il y a des outils dans le niveau 6 qui peuvent d'ores et déjà être utilisés, par exemple l'interdiction des rassemblements. Mais ça ne veut pas dire qu'on (les) utilisera forcément tous», a-t-elle expliqué sur RMC. « La décision de passer au niveau 6 est envisagée mais pas pour demain», expliquait de son côté Didier Houssin, directeur général de la santé. En France métropolitaine, 2 762 000 personnes ont été touchées par la grippe A. On dénombre 86 décès (plus 28 dans les collectivités d'outre-mer), 305 cas graves dont 101 sont encore en réanimation parmi lesquels 20 % d'enfants de moins de 15 ans.

» Ce que prévoit le niveau 6:

• Le ministère de l'Intérieur à la tête des opérations: Le passage au niveau 6 pourrait amener des changements dans l'organigramme de la gestion de la pandémie. Le ministère de l'Intérieur pourrait prendre la main et être appelé à piloter les nouvelles mesures, ces dernières étant toujours décidées dans le cadre de la cellule interministérielle de crise. La Place Bauveau serait également chargée de coordonner les actions conduites au niveau départemental et municipal.

• Rassemblements, réunions publiques et déplacements limités: Le plan prévoit toute une série de mesures barrières visant à freiner et à limiter l'extension de la pandémie. Est citée en priorité la fermeture des crèches, des établissements d'enseignement et de formation, des internats et des centres d'accueil de mineurs. Des mesures indispensables dont l'efficacité est démontrée pour limiter la contagion lors d'épidémies grippales, selon les rédacteurs du plan. L'interruption ou la réduction de certains transports locaux, lieux potentiels de transmission du virus, est également indiquée. Les spectacles, les rencontres sportives, les foires et salons ainsi que les rassemblements festifs pourraient eux aussi être suspendus. Ce type de décision s'inscrirait dans une vraie perspective de santé publique à la différence des récents reports de match de foot motivés avant tout par le fait que plusieurs footballeurs étaient infectés par le virus H1N1. Le plan envisage la suspension de la distribution de documents publicitaires par porteurs.

• Visites et accès limités à certains lieux publics: Le plan évoque la possibilité de restreindre les visites et les accès aux établissements hospitaliers, aux maisons de retraite, aux prisons et aux établissements sociaux et médico-sociaux.

• Mesures d'isolement et port de masques: Les opérations de vaccination des dernières semaines ont éclipsé plusieurs mesures d'hygiène qui avaient été abondamment évoquées au début de l'épidémie. Le passage au niveau 6 pourrait remettre à l'ordre du jour le port de protections respiratoires par les personnels de santé ou le port du masque chirurgical par les personnes indemnes dans les espaces publics qui pourrait être rendu obligatoire dans certains lieux.

• Distribution de sacs plastiques à lien pour les déchets des malades: Le plan tient par certains côtés du catalogue à la Prévert. «Les Français ont l'habitude de construire des cathédrales technocratiques et d'essayer de faire rentrer la réalité des choses dans des mesures administratives», ironisait Roselyne Bachelot lundi sur RMC. Exemple, quelques lignes après avoir évoqué la mise en place du contrôle des prix qui pourrait être décidée sur proposition du ministre des Finances, le plan envisage de déroger aux prescriptions techniques applicables aux véhicules funéraires et, en cas de pénurie, de distribuer des sacs plastiques à lien pour les déchets des malades à domicile.

THE FLU CASE

French government about to implement full scale Martial Law in pandemic crackdown

The Flu Case, 2 December 2009
an original in French see above
https://web.archive.org/web/20100102051237/http://theflucase.com/index.php?option=com_content&view=article&id=2165%3Afrench-government-about-to-implement-full-scale-martial-law-in-pandemic-crackdown&catid=41%3Ahighlighted-news&Itemid=105&lang=en
http://www.lefigaro.fr/sante/2009/12/01/01004-20091201ARTFIG00023-grippe-a-passage-au-niveau-6-envisage-.php

The French government is about to move the country to the highest pandemic alert level allowing the implementation of full-scale martial law, according to a report in Le Figaro.

Measures allowed under the country's highest pandemic level, 6, include:

*forced vaccination
*forced quarantine/isolation
*compulsory wearing of face masks/respirators for health personnel
*the distribution of plastic body bags for the "deceased"
*a ban on public gatherings
*a ban on transporting documents by courrier
*closure of all schools and education establishments
*restricted movement
*restricted access to hospitals, old people's homes, prisons and other social institutions
*restrictions in transport, also of food and other supplies

The move to pandemic level 6 under WHO's instructions will strip French people of their basic civic rights at a time when the government has set up the infrastructure for the mass vaccination of the entire population by force mobilising military units to work in the special vaccine centers.

Only about 85 people in France have died from the swine flu according to the authorities, far fewer than for the regular flu.

There are no reliable figures for how many of these deaths were really due to the swine flu and how many were seasonal flu deaths reclassified as swine flu deaths by the government as has been proven to have occured in Scotland.

According to the French government, two to three million people have visited their doctor and are suspected of having the swine flu - and this is enough to enact the draconian legislation and move to compulsory vaccination with an untested and toxic jab for which the pharma companies have no liability.

However, this is clearly a fraudulent manipulation of scientific data to justify an illegal and criminal power grab.

People vaccinated in the special vaccine centers in Laxou en Lorraine have left comments on Le Figaro, saying they had to sit for 2 hours on the floor of a gymnasium before being given the swine flu jab in a box measuring one meter by one meter without any curtains and in full of view of everyone else.

"It is shameful!" says the person.

Are the people of France to be subjected to a degrading vaccination with toxic substances causing long term damage and death – in many cases, indeed, immediate death – by force in the full sight of the entire world?

And does the government of France, specifically President Nicolas Sarkozy, Health Minister Roselyne Bachelot and Defence Minister Herve Morin, really think they can get away with this mass murder by closing borders and shutting down the internet?

They can not.

We, the People, of The World refuse to allow this crime to occur, and the people responsible to go unpunished.

We refuse to let it occur in France or any country of the globe.

It is time to End the WHO, End the EU, and bring these criminals in the French and other governments to trial.

The Washington Post

Rob Stein

Nation's preparedness for health threats will be reviewed

The Washington Post, 2 December 2009
https://www.washingtonpost.com/wp-dyn/content/article/2009/12/01/AR2009120101288.html?hpid=topnews

Citing the balky swine flu vaccination campaign and other shortcomings in the nation's medical defenses, a top Obama administration official has announced a major review of the government's efforts to develop new protections against pandemics, bioterrorism and other health threats.

Health and Human Services Secretary Kathleen Sebelius said she had ordered the review in part because the swine flu vaccine shortage had highlighted the nation's dependence on antiquated technology.

"We'll look for the fastest ways to move to new technologies that will let us quickly produce countermeasures that are more dependable and more robust," she told the American Medical Association's Third National Congress on Health System Readiness, which is being held in Washington. "Not just for flu and not just for infectious diseases, but for all the public health threats we face today."

The review will be led by Nicole Lurie, assistant secretary for preparedness and response, and will be complete by "early next year," Sebelius said.

"Today, we face a wider range of public health threats than ever before in our history," Sebelius said. "It could be anthrax delivered in an envelope. It could be a dirty bomb set off in a subway car. It could be a new strain of flu that our bodies have no immunity to."

The nation's ability to respond to such threats depends not only on having enough hospital beds, emergency rooms, doctors, and equipment such as masks and ventilators, but also on state-of-the-art diagnostic tests, medications and vaccines, she said.

"But the countermeasure that saves the day during a quick-hitting public health emergency can often take years to discover, develop, manufacture and distribute," she said. "Like a lot of countries, we've often failed to make the kind of long-term investments in countermeasures we need to stay safe."

Sebelius defended the government's response to H1N1, noting that the virus was identified quickly, diagnostic tests were produced and distributed rapidly, and the immunization program was started as soon as possible. At least 69 million doses of vaccine are now available. But the vaccine was produced much more slowly than officials predicted it would be, leading to long lines and frustration nationwide and heavy criticism in Congress. The lag is a clear example of the shortcomings of today's technologies, Sebelius said.

"We were fighting the 2009 H1N1 flu with vaccine technology from the 1950s. We could race to begin vaccine production, but there was nothing we could do if vaccine grew slowly in eggs. We could make deals with foreign vaccine producers ahead of time, but we still wouldn't have as much control over the vaccine as if they were based in the U.S.," she said.

"If we wanted to avoid these problems in the future, we needed to make some long-term investments in developing countermeasures that were just as safe and effective, but could be produced faster and more reliably," she said.

Progress has been made, she said. A new facility that can make flu vaccine using cells instead of eggs opened last week in Holly Springs, N.C., after Novartis received more than $400 million in federal funding. But that factory would still be able to produce perhaps only half the vaccine the nation would need in a pandemic, and that process is still prone to delays, she said.

"There are gaps at every stage in the process, from the laboratory to the factory floor, that are slowing or stalling the development of key countermeasures," Sebelius said, referring to the nation's reliance on research conducted at the National Institutes of Health and the Defense Department, which is often not focused on government priorities, as well as the lack of incentive for companies to invest in making new products for public health emergencies.

"In this age of growing public health threats against which countermeasures are often our best defense, that's dangerous," she said.

The review came as the federal Centers for Disease Control and Prevention urged Americans to continue to seek the H1N1 vaccine, even though the peak of the second wave appears to have passed. The virus is still spreading widely and a third wave could occur later this winter, said CDC Director Thomas R. Frieden.

"We are in a window of opportunity," he said. "We're going from a time when there was lots of disease and not enough vaccine to a time when disease is gradually decreasing and we're having a steady increase in the amount of vaccine available."

Swine flu labelled a conspiracy

PharmaTime, 2 December 2009
https://pharmatimes.com/news/swine_flu_labelled_a_conspiracy_984175/

The swine flu pandemic has been named as the "most ambitious scam and corruption of our time" after pharma has been found to be in bed with the World Health Organisation.

Journalists from Denmark have reported links between the World Health Organisation and pharmaceutical companies where firms have been covertly paying top WHO scientists. In the meantime, pharma profits from flu drugs have soared.

The journalists from the newspaper *Information* claim the public and political hysteria to swine flu is a result of an efficient public relations campaign, spearheaded by the WHO experts that have been prejudiced by pharma's ready cash.

The lead target in the allegations is Dutch doctor Albert Ostenhaus, who has promoted the need for vaccinations through the WHO and the media and headed a panel that advised the WHO to announce that swine flu had reached pandemic level. Reports claim Ostenhaus is paid by several vaccine manufacturers and the Netherlands government is believed to be investigating his activities.

Other WHO advisors are understood to also advise big pharma and have been allegedly concealing their pharma-funded salaries.

Meanwhile, further questions have been raised about the WHO's independence over the H1N1 flu virus after various documents found medicines and vaccinations were mentioned more than 40 times while traditional hand washing and the use of masks to combat the disease were only mentioned twice.

The pharma industry is expected to make between seven and 10 billion euros in 2009 from the sales of swine flu related drugs, according to JP Morgan.

Ljerka Bratonja Martinović

Milinović lagao, građani potpisom skidaju odgovornost s države za nuspojave

Novi List, 2 December 2009, 07:40h

https://web.archive.org/web/20100105000314/http://www.novilist.hr/2009/12/02/milinovic-lagao-gradani-potpisom.aspx

Zagreb – Kronični bolesnici, trudnice i ostali iz prioritetnih skupina koje su obiteljski liječnici pozvali da se cijepe protiv svinjske gripe, i jučer su bojkotirali cijepljenje u strahu od mogućih nuspojava. Ministar zdravstva Darko Milinović pozvao je sve rizične skupine da se odazovu pozivu na cijepljenje, kako protiv sezonske, tako i protiv pandemijske gripe, kao najboljem obliku zaštite. No, pristanak kojega građani moraju potpisati da bi se cijepili pandemijskim cjepivom, mnoge je odvratio od toga. Dok ministar tvrdi da obveza potpisivanja nije uvedena zbog nesigurnosti ili nedovoljno testiranog cjepiva, te da država time ne skida sa sebe odgovornost za teže nuspojave, pravnici tvrde suprotno: potpis na obrazac znači da pacijent preuzima na sebe punu odgovornost za posljedice cijepljenja.

– Pacijent dajući svoj potpis preuzima na sebe odgovornost za bilo kakve štetne posljedice, jer potpisom zapravo daje suglasnost da one nastupe – tumači odvjetnik Rajko Mlinarić. Obrascem koji potpisuje pacijent, zdravstvene vlasti se u pravnom smislu ograđuju od odgovornosti za nuspojavu koja može nastupiti, i pacijent više nikoga ne može utužiti za štetnu posljedicu koja se dogodi, tvrdi Mlinarić.

Tumačenje koje je ponudilo Ministarstvo, odnosno Imunološki zavod, je da se pristanak potpisuje zbog bolje evidencije cijepljenih, ograničene količine cjepiva te efikasnijeg prijavljivanja nuspojava. Takav će se pristanak, najavili su, od iduće sezone, po uzoru na praksu zemalja EU, potpisivati i za sezonsko cjepivo. Agencija za lijekove i medicinske proizvode objavila je cijeli niz obrazaca za brzo prijavljivanje nuspojava pandemijskog cjepiva, te podugački popis mogućih, uglavnom rijetkih nuspojava koje mogu biti i vrlo teške.

Jučer je započela distribucija dodatnih 195.000 doza cjepiva protiv sezonske gripe, koje bi već danas trebalo biti u ordinacijama. Pacijenti su se za sezonsko cjepivo već raspitivali, dok će ono pandemijsko, ako se bojkot nastavi, uglavnom završiti u smeću. Radi se o ukupno milijun i pol doza cjepiva u vrijednosti od 70 milijuna kuna, koje je ministarstvo zdravstva osiguralo za trećinu stanovništva.

– Nitko od 50 kroničnih bolesnika u mojoj ordinaciji nije se htio cijepiti. Ne znam niti jednog kolegu koji se hoće cijepiti protiv pandemijske gripe, iako se protiv sezonske redovito cijepe, kaže obiteljski liječnik i predsjednik KoHOM-a, Mario Malnar. Razlog zbog kojeg se ni liječnici ne žele cijepiti, kaže, uglavnom leži u strahu od nuspojava te jer su već tjednima u kontaktu sa zaraženim pacijentima.

Cijepljenje dodatno otežava činjenica da je ono dozirano u većim bočicama, s količinom cjepiva dostatnom za deset pacijenata. Kad se bočica otvori, mora se potrošiti u roku od 24 sata jer postoji opasnost od kontaminacije. No, liječnici uglavnom ne uspijevaju skupiti dovoljno pacijenata, pa su u nekim ambulantama cjepiva već završila u smeću.

Cijepljenju protiv svinjske gripe se nisu odazvali čak ni neki liječnici u Klinici za infektivne bolesti »Dr. Fran Mihaljević«, iako su oni u najvećem riziku i u neprestanom kontaktu s oboljelima.

U Klinici »Dr. Fran Mihaljević« jučer je ležalo 89 pacijenata s komplikacijama svinjske gripe, njih 15, od toga dvoje djece, priključeno je na respirator zbog zatajenja pluća, a troje je pacijenata i na dijalizi. U posljednjih tjedan dana u toj bolnici nije bilo smrtnih slučajeva zbog gripe, a ravnatelj Antun Beus navodi da je u zadnja tri dana čak devetero ljudi »prošlo« respirator i relativno se brzo oporavilo. Beus ističe da nemaju mnogo kroničnih bolesnika, te da su to uglavnom ljudi koji prethodno nisu bolovali od težih bolesti.

Homeland Security News Wire

Obama administration to review U.S. response to health threats

Homeland Security News Wire, 2 December 2009
https://www.homelandsecuritynewswire.com/obama-administration-review-us-response-health-threats

Health and Human Services Secretary Kathleen Sebelius said that she ordered the evaluation of the U.S. responses to health threats in part because the H1N1 vaccine shortage had highlighted the nation's dependence on antiquated technology

Citing the balky swine flu vaccination campaign and other shortcomings in the U.S. medical defenses, a top Obama administration official has announced a major review of the government's efforts to develop new protections against pandemics, bioterrorism and other health threats. *Washington Post*'s Rob Stein writes that Health and Human Services Secretary Kathleen Sebelius said Tuesday that she ordered the evaluation in part because the H1N1 vaccine shortage had highlighted the nation's dependence on antiquated technology.
=> https://www.washingtonpost.com/wp-dyn/content/article/2009/12/01/AR2009120101288.html?hpid=topnews

"We'll look for the fastest ways to move to new technologies that will let us quickly produce countermeasures that are more dependable and more robust," she told the American Medical Association's Third National Congress on Health System Readiness, which is being held in Washington. "Not just for flu and not just for infectious diseases, but for all the public health threats we face today."

The review will be led by Nicole Lurie, assistant secretary for preparedness and response, and will be complete by "early next year," Sebelius said. LiveInternet

Свиной грипп. Тема закрыта?
(Дымовая завеса или пособие по запугиванию населения)

Live Internet, 2 декабря 2009, 22:09
https://www.liveinternet.ru/users/2483533/post115824120/

Собственно, случилось то, что случилось. Партком НМП отменил пандемию и свернул весь проект "Пандемия свиного гриппа". Больше ни одно центральное СМИ не будет запугивать вас страшной смертью от "свиного гриппа", больше никто не будет делить вас на избранных (привитых) и неизбранных (непривитых). Концлагеря так и останутся законсервированными, а СМИ-машина сделает все возможное, чтобы уже через несколько месяцев никто из вас и не вспоминал о гриппе A/H1N1, как не вспоминает никто уже ни о птичьем гриппе, ни о прочих предыдущих "концах света". Проект свернут ПОЛНОСТЬЮ. Все отголоски - трескотня региональных чиновников, угрозы не пускать в сад-школу-работу без прививки - все это только эхо, которое сойдет очень скоро, и жизнь - конечно, на время, но все равно немного приятно - вернется в привычное русло. Все могут перевести дыхание. Всё. Финиш.

Это стало понятно еще три дня назад, 24 ноября, когда "государственный служащий" и "защитник" нашего с вами здоровья от всех мировых бед крипт Геннадий Онищенко заявил:

Удельный вес случаев гриппа H1N1 среди выявляемых в России заболеваний гриппом и ОРВИ начал снижаться. Об этом рассказал "Интерфаксу" главный санитарный врач Геннадий Онищенко.

По данным Онищенко, в настоящее время на новый вирус H1N1 приходится около 29 процентов случаев выявляемых в России острых респираторных инфекций, тогда как на прошлой неделе новый грипп был определен у 34 процентов заболевших.

По словам главного санитарного врача эпидемиологическая ситуация по гриппу H1N1 в России по-прежнему лучше, чем в странах Европы, где удельный вес этого вируса превышает 60 процентов в общем объеме ОРВИ.

Онищенко подчеркнул, что в большинстве российских регионов уровень заболеваемости гриппом не достигает эпидемического порога. Кроме того, в 11 регионах РФ, где эпидемический порог ранее был превышен, отмечено снижение заболеваемости.

Это тот самый Онищенко, который с пеной у рта орал о необходимости повальной вакцинации и угрозе такой смертельной эпидемии, которой никто и не видывал. Это тот самый Онищенко, который - напару со своим товарищем Львовым - нагнетал панику и страх среди населения России похлеще подпольных революционных газет начала 20-го века. Это тот самый Онищенко, который с плохо скрываемой радостью лично докладывал всем российским центральным СМИ о первых случаях смертности от великого и ужасного "свиного гриппа". То есть понятно, что это он таким образом о проделанной работе отчитывался перед начальством с Запада, но все-таки - старания были налицо. А тут. не моргнув глазом - "Удельный вес случаев гриппа H1N1... начал снижаться".

Три дня назад я это прочел и задумался, о чем это нам говорит. А это говорит только об одном - высокое сионистское начальство дало отмашку нашему Геннадию - все, мол, Гена. хорош, тема закрывается. А раз тему сдул Онищенко, то буквально через день-два это же должны сделать и Власти. Они и сделали это. Вчера.

Вот заголовки новостей. Обратите внимание - Первый канал, Вести и все-все-все. Это вам не "Зарубежом.ком" - тут все официально и только с высочащего одобрения, сами понимаете. Вся СМИ-машина в едином порыве бросилась разоблачать организаторов пандемии и говорить нам, что все это - блеф и пшик.

Вот выдержка с Первого канала:

"Паника вокруг вируса A(H1N1) позволила производителям препаратов получить баснословные прибыли. Журналисты делают смелые предположения, что объявленная ВОЗ пандемия нового гриппа может оказаться грандиозной мистификацией.

Заводы работают денно и нощно, в четыре смены, производя спасительные лекарства. Объем заказов крупнейших фармацевтических фирм – все население Европы, плюс все население Америки, плюс сотни миллионов доз для Азии и Африки. Паника снесла защитные барьеры Евросоюза - в виде исключения вакцина допущена беспрекословно в европейские страны без проведения достаточных клинических испытаний". http://www.1tv.ru/news/health/156289

Сколько было информации о смертельных случаях после вакцинации? Сколько было информации о добавках в вакцине? Сколько было заявлений о том, что все это - заговор? Сколько было призывов не вакцинироваться, потому что и идиоту понятно, что вакцинация Во время эпидемии, а не до нее - это чушь, клиника и дурость? Их были - тысячи. Только в этом блоге пару сотен источников было озвучено за последние месяцы. А что СМИ? Где был Первый канал? Первый канал рожей Онищенко убеждал нас одеть маску и дать колоть в себя то, что захочется людям в белом. А теперь - все СМИ в едином порыве сбросили покрывало с гриппа, и под шкурой волка оказался шакал. Молодцы, СМИ, спасибо за журналистскую смелость. Только где она была месяц назад, два месяца назад, три?...

В общем, тему свиного гриппа "слили" окончательно и бесповоротно.

А теперь давайте подумаем - почему.

Во-первых, часть дела "свиной грипп" все-таки сделал. И еще как. Как вчера писал вышень, доходы от ситуации вокруг вируса позволили фармацевтам заработать 7 миллиардов долларов, уступив пальму первенства только секс-индустрии и торговле оружием. Соответственно, нефть, азартные игры, наркотики - это все по доходности в сравнении со "свиным гриппом" - просто тьфу.

Во-вторых, на наших с вами глазах осуществлена грандиозная подготовка к окончательному установлению НМП диктаторского типа. Посудите сами - пандемия отменяется, но принято огромное количество законов, позволяющих засунуть демократию, свободу выбора и свободу принятия решений, конституционные права граждан и многое, многое другое в очень дальний и неприлично звучащий, так сказать, угол (обо всем этом ранее тут писалось, можете покопаться в ленте сообщений). Все эти законы - в первую очередь в США и Европе - приняты на случай чрезвычайного положения. И, чтобы ввести в большинстве стран открытую сионистскую диктатуру, теперь не нужно такой подготовки - истерия вокруг "свиного гриппа" позволила сделать это сейчас. Если раздувать "свиной грипп" и дальше, то станет уже совсем всем понятно, что и законы принимались для этого. а эпидемия - только повод. Но если пандемию отменить, а все законы оставить, тогда можно будет спокойно ждать другой паники. Например, гусеничного или червякового гриппа. И тогда уже никто не сможет упрекнуть власти в том, что они воспользовались червяковым гриппом для введения диктатуры - ведь законы, позволяющие это сделать, принимались задолго-задолго до червякового гриппа. При свином гриппе в 2009 году.

В-третьих, вот о чем я говорил три недели назад (см. http://literra.listbb.ru/viewtopic.php?f=6&t=610): "Вакцинация, как известно, будет проводиться в три этапа. Кстати, первый этап начался сегодня. Так вот, на третьем этапе, то есть после третьего укола, начнется мор людей, потому что даже самый чистый организм не выдержит такой лютой интоксикации. Но мор должен быть не внезапным, а в течение нескольких месяцев, вплоть до года, и желательно на фоне еще

одного "ужасного" вируса. Кошачий грипп, коровий грипп или что они там еще придумают. Чтобы население не увязало факт своего вымирания с тотальной вакцинацией, начавшейся в частности в России 9 ноября с. г. А то знаете ли - на пороге смерти у кого-то может возникнуть нехорошая мысль "с собой пару гадов" забрать, если два факта в голове увяжутся. А они могут увязаться - сейчас благодаря интернету слишком много информации гуляет."

Как видите, сворачивание проекта "Свиной грипп" и окончание пандемии, передышка - это в любом случае необходимое условие.

В-четвертых, Интернет и энтазиасты-конспирологи. Благодаря сети Интернет миллионы людей по всему миру ежедневно получали информацию о новой болезни не только от официальных представителей ВОЗ и национальных минздравов, но и со стороны. Получилась огромная лавина таких. как мы с вами, людей, которые не верили и не верят в спасительность вакцины от гриппа A/H1N1 а наоборот, уверены, что вакцина во много раз страшнее самого вируса. СМИ все это игнорировали до последнего, но в любом случае стало понятно, что сопротивление слишком сильно и тема дальше "не пойдет". В США Барак Обама уже предложил запретить Интернет на время пандемии (об этом здесь тоже было, ниже в ленте), потому что, дескать, людям придется сидеть дома, нагрузка на интернет-сети возрастет слишком во много раз и вся экономика от этого "коллапснется". Опять-таки, сейчас действительный запрет Интернета вызовет просто бурю, но это сейчас. Вот увидите - когда весь шум вокруг "свиного гриппа" спадет окончательно, то тут, то там будут появляться эксперты, которые будут нам, дуралеям, на пальцах объяснять очевидную вещь - на случай возможных новых эпидемий (от которых, сами понимаете, никто не застрахован!) нужно действительно разработать закон, ограничивающий нагрузку на сеть путем ограничения доступа к ней. Либо такие законы примутся и вовсе втихую**,** а людей просто поставят перед фактом и напомнят, что на такое решение законодателей надоумило. Тогда с нехорошими планами на наш с вами счет эти идеи увязать будет намного труднее. чем сейчас.

Есть и еще один момент. Включите новости, можно прямо сейчас, и посмотрите, что об этом говорят. Да ничего не говорят. Мол, это неважно уже. Ну нет свиного гриппа - и нет, что об этом говорить-то?

Вчера около полуночи я увидел сюжет об "отмене" "свиного гриппа" по каналу Вести. Это был 10-й или 12-й сюжет новостного блока, длина сюжета – около 40-45 секунд. Так, мол, и так, ВОЗ договорилась с фармацевтами, обманула 7 миллиардов человек, заработала столько же миллиардов долларов, искусственно создав панику вокруг вируса H1N1. А когда панику раздували, свиному гриппу - даже когда в России не было еще ни одного заболевшего - отводили по 2-3 минуты в каждом новостном блоке, сюжеты шли первыми! То есть уже сейчас тема сливается из "топовых" в "проходные" и даже дальше - в "корзину". Тогда как новость о заговоре - это главная новость последних месяцев в масштабах планеты, потому что она всем нам доказывает, что паника, болезни, истерия - дело рук определенной небольшой группы людей *известной национальности*, заработавшей на гоях *миллиарды долларов* в кратчайшие сроки. Не говоря уже обо всем остальном.

Swine Flu Recedes, Vaccine Supply Grows

The New American, 2 December 2009 10:30
https://web.archive.org/web/20130207005202/http://www.thenewamerican.com/usnews/health-care/item/1689-swine-flu-recedes-vaccine-supply-grows

The number of H1N1 swine flu infections has been dropping steadily for four weeks as vaccine stockpiles continue to grow, the U.S. Centers for Disease Control and Prevention (CDC) reported Monday afternoon.

"Visits to doctors for influenza-like illness (ILI) nationally decreased sharply this week over last week with all regions showing declines in ILI," announced the Atlanta-based CDC on its website, referring to a preliminary analysis of the week ending on November 21. "This is the fourth consecutive week of national decreases in ILI." According to the update, the number of states reporting undefined "widespread influenza activity" also dropped by 11 during that week; from 43 to 32.

The agency "guesstimated" last month that around 4,000 Americans have died so far from complications linked to the swine flu, though the figure is disputed by some experts and the CDC was recently caught inflating the number of cases. Around the globe, the World Health Organization (WHO) reported that there have been about 6,000 deaths connected to the virus. By comparison, the CDC claims 36,000 Americans die from seasonal influenza each year, while world wide the WHO estimates that figure at between 250,000 and 500,000.

Based on testing selections of samples, the vast majority of flu cases cropping up still appear to be caused by the H1N1 swine flu virus. And according to the CDC, the number of cases is still above what is considered normal during this period in a typical flu season, though many experts say the peak has already been reached.

But despite the month-long decline in cases, the CDC emphasized that there could still be more to come. "We wouldn't be surprised to see another rise in activity later this year or early next year when schools are back in session after the Christmas break," said a CDC spokesman quoted by Bloomberg. "There's still a lot of flu out there." An informal CDC poll of about a dozen experts showed that about half expected another wave.

Government health officials also took the opportunity to continue promoting the vaccine. "We are going from a time where there was lots of disease and not enough vaccine to a time where disease is decreasing and there's a steady increase in vaccine," claimed CDC director Dr. Thomas Frieden, noting that there was a current supply of almost 70 million inoculations with more on the way soon. He celebrated the "window of opportunity," during which time he urged citizens to go and take their shots in case of a resurgence.

But some experts celebrated news reports stating that interest in the vaccine was in decline. "This novel flu vaccine has not been properly tested for safety or efficacy, contains dangerous preservatives such as thimerosal and now the public is not interested," explained Dr. Mayer Einstein, a strong critic of the shots. "How awesome is that!"

If it turns out that there is no “third wave,” the government is going to appear even more ridiculous than it already does after all the fear mongering and spending billions of taxpayer dollars on vaccines that are not even really in demand.

Originally, officials were scaring the public with “potential” scenarios involving almost 100,000 dead Americans from swine flu. Now those figures seem preposterous barring some unforeseen mutation, which the vaccine would not even protect people against. And as infections wane in the U.K. as well, the government there has already had to reduce its predictions from an incredible 65,000 dead to a more modest 1,000.

But no matter what happens with the number of flu cases, Americans should still be cautious about heeding government advice. Educating oneself on the risks and efficacy of the vaccine along with the dangers of contracting swine flu is absolutely essential in making informed decisions. Meanwhile, the government should stick to its constitutional duties and stop scaring and prodding the populace.

International Swine Flu Conference
in London, UK on December 2-3, 2009

Institute Pasteur of Shanhai, Chinese Academy of Sciences
https://english.shanghaipasteur.cas.cn/tal/ue/201003/t20100325_52350.html

Conference: December 2-3, 2009 Workshop: December 4, 2009 London, UK

Top leaders and key decision-makers of major companies representing a broad range of industries will meet with distinguished scientists, public health officials, law enforcers, first responders, and other experts to discuss pandemic prevention, preparedness, response and recovery at the 1st International Swine Flu Conference.

At the International Swine Flu Conference, attendees will be able to draw on first-hand best practices to create the solid business continuity plans that their companies and organizations need in order to prepare for, respond to, and survive a pandemic.

The International Swine Flu Conference draws on the success of the seven previous Bird Flu summits which featured as speakers several distinguished personalities such as Dr. David Nabarro, the United Nations Coordinator for Avian and Human Influenza, Alex Thiermann of the World Organization for Animal Health (OIE) and Dr. Wenqing Zhang of the WHO Epidemic and Pandemic Alert and Response.

Swine flu, bird flu viruses could form deadly cocktail: health official

Saigon GP Daily, 3 December 2009, 12:18 (GMT+7)
https://web.archive.org/web/20100107080255/http://www.saigon-gpdaily.com.vn/Health/2009/12/76628

The reappearance of bird flu has opened up the threat of the virus combining with the swine flu virus to become more lethal and capable of human transmission, a health official warned at a meeting of the National Steering Board of Human Flu Prevention on December 2.

Health officials recommend washing hands with soap as an effective measure to protect against the A/H1N1 virus

Dr. Nguyen Huy Nga, chief of the Preventive Health and Environment Department, said the H1N1 virus that causes swine flu could combine with the H5N1 virus and become more deadly than the former and more capable of human-to-human transmission than the latter, especially in winter.

He told delegates that two more people have died of swine flu, both from the Mekong delta province of An Giang -- a 33-year-old man from who died on November 20, and a 17-year-old girl who died on November 29.

On November 28 bird flu claimed its fifth victim, a 23-year-old man in the northern province of Dien Bien. Many others have been hospitalized around the country with suspected bird flu.

Officials from the Vietnam Drug Administration said at the meeting that three drug suppliers, GlaxoSmithKline (GSK), Sanoffi Aventis, and Pasteur have registered to sell swine-flu vaccines.

The administration has tested the vaccine made by GSK which would supply 1.2 million doses through the World Health Organization, they said.

They are meant for high risk groups like children aged six to 59 months, pregnant women, people with chronic health conditions including asthma, diabetes, and immune system problems, and health-care personnel who provide direct patient care, the officials added.

Besides buying one million doses of Tamiflu, Vietnam has successfully made an antiviral drug for treatment of both flus called Arbidol (Fludon H1),

So far the country has reported 10,944 swine-flu cases with 46 deaths and five deaths from bird flu.

Le Monde

La grippe H1N1 a fait 92 morts en France

Le Monde avec AFP et Reuters, 3 Décembre 2009, à 13h33,
https://www.lemonde.fr/epidemie-grippe-a/article/2009/12/03/la-grippe-h1n1-a-fait-92-morts-en-france_1275490_1225408.html

Quatre vingt-douze décès liés au virus grippal H1N1 ont été enregistrés en France métropolitaine depuis le début de l'épidémie, dont quatorze chez des personnes sans facteur de risque connu, selon le dernier point de situation arrêté au 1er décembre. Sur le total, vingt-quatre décès ont été signalés au cours de la semaine passée, précise l'Institut de veille sanitaire (InVS).

Neuf cent quatre-vingt-treize mille ont consulté la semaine dernière pour des symptômes grippaux, soit une augmentation de 40 % par rapport à la période précédente, a précisé la ministre de la santé lors d'une conférence de presse. Roselyne Bachelot a toutefois souligné que certains signes laissaient espérer un ralentissement de la progression du virus. Depuis le début du mois d'août, *"trois millions de personnes ont été infectées par le virus grippal pandémique en France"*, a-t-elle déclaré, soit *"plus que pour toute la saison de grippe saisonnière 2008-2009"*. Depuis le début de l'épidémie, 481 cas graves ont été hospitalisés, dont 18 % d'enfants de moins de quinze ans.

Vaccins: 567 Événements Indésirables

La vaccination contre la grippe A monte en puissance avec environ 1,3 million de personnes vaccinées en dix-huit jours en France métropolitaine. Dans un entretien au *Monde*, la ministre de la santé affirme que 30 millions de personnes pourront être vaccinées d'ici à la fin de février. Afin de faire face à l'afflux des demandes, tous les centres de vaccination seront désormais ouverts de 8 heures à 22 heures du lundi au samedi, a par ailleurs précisé le premier ministre. Dans les grandes agglomérations, sur décision des préfets, les centres seront ouverts sept jours sur sept à partir de dimanche prochain.

Sur les 1,3 million de personnes vaccinées, 567 événements indésirables ont été enregistrés, a indiqué, jeudi, l'Agence française de sécurité sanitaire des produits de santé (Afssaps). Le vaccin Pandemrix, avec adjuvant, de GlaxoSmithKkline, le plus utilisé jusqu'à maintenant, a été à l'origine de 562 signalements d'effets indésirables, soit 0,5 pour 1 000 doses administrées.

97 % des cas rapportés étaient d'intensité bénigne à modérée : douleurs à l'endroit de l'injection, réactions inflammatoires, douleurs générales, fièvre, fatigue, syndrome grippal... Vingt-quatre nouvelles observations *"médicalement significatives"* ont été rapportées, entraînant une gêne fonctionnelle ou une incapacité temporaire. Sept nouvelles observations graves ont été signalées, dont deux réactions allergiques (oedème de Quincke, choc anaphylactique) d'évolution favorable, deux cas de paresthésie (fourmillements dans les membres) et un cas de douleurs thoraciques. Deux cas d'embolie pulmonaire et pneumopathie sont en cours d'évaluation.

THE FLU CASE

Fake Swine Flu scare will cost France 2 billion Euros

The Flu Case, 3 December 2009 13:50
https://web.archive.org/web/20100102035349/http://theflucase.com/index.php?option=com_content&view=article&id=2173%3Afake-swine-flu-scare-will-cost-france-2-billion-euros&catid=1%3Alatest-news&Itemid=64&lang=en

The manufactured swine flu scam will cost France 2 billion euros, according to an estimate by Jean-Jacques Jegou, in charge of a French parliamentary committee.

More than 800 million euros will have been spent on the swine flu jabs.

SÉNAT

Rapport remis à Monsieur le Président du Sénat le 29 juillet 2010, N° 685
Session Extraordinaire de 2009-2010

France, Paris, SÉNAT, 29 juillet 2010
https://www.senat.fr/rap/r09-685-1/r09-685-1_mono.html

Jean-Jacques Jégou, rapporteur de la loi de finances pour 2010 devant le Sénat, au nom de la Commission des finances de cette assemblée, a présenté à ses collègues l'addition des dépenses engagées par la France pour protéger sa population de la grippe pandémique à virus A/H1N1, évaluées à plus de 1,06 milliard d'euros par le ministère de la Santé, dépense qui se répartit comme suit. A ce compte, s'ajoutent de nombreuses autres dépenses dont des dépenses territoriales qui laissent apparaître un coût total lié à la pandémie compris entre 1,8 et 2,2 milliards d'euros.

NATIONAL POST

Michael Fumento

The WHO should just give up on the flu scare

National Post, 3 December 2009
In These New Times, 8 December 2009
https://inthesenewtimes.com/2009/12/08/michael-fumento-the-who-should-just-give-up-on-the-flu-scare-read-more-httpnetwork-nationalpost-comnpblogsfullcommentarchive20091203michael-fumento-the-who-should-just-give-up-on-the-flu/

The folks who dubbed the swine flu piglet a pandemic, the World Health Organization (WHO), just won't let up.

"It is too early to say whether there has yet been a peak in infections in the northern hemisphere," Reuters paraphrased the WHO as saying, "and it will be some weeks before there is a downward trend in the numbers of those catching the virus."

Wrong across the board for both Canada and the U.S.

In the U.S., flu deaths and hospitalizations have declined for the third straight week, according to the Centers for Disease Control and Prevention (CDC). Regarding Canada specifically, the WHO claims "influenza activity remains similar but [the] number of hospitalizations and deaths is increasing." But Health Canada's FluWatch website, updated weekly, begs to differ.

"All influenza indicators declined," according to FluWatch, speaking of Nov. 27. Just what part of "all" doesn't the WHO understand?

Specifically, the website states, "The number of deaths decreased slightly this week as well as the number of intensive care unit (ICU) admissions and number of hospitalizations."

Logically, if U.S. and Canadian deaths, ICU admissions and hospitalizations are all down, and if you need to get infected with the flu before you can be sickened or die from it, then it's hardly "too early" to say whether there's "been a peak of infections," is it?

As it happens though, both the U.S. and Canada have plenty of direct measurements of swine flu infection for the WHO to ignore. In the U.S., the number of swine flu infections that laboratories have detected has been dropping for four straight weeks and is 83% off its peak; in Canada, positive specimens are half what they were two weeks ago.

In the U.S., the number of states with "geographically widespread influenza activity" has gone from 48 to just 32, while in Canada, the number of regions "reporting widespread or localized influenza activity" has declined for two weeks in a row, says FluWatch. The vast majority of the country now has only "sporadic activity," including half of Ontario and almost all of Quebec. Further the "overall number of influenza outbreaks" in Canadian schools and hospitals has fallen by over half in the last two weeks.

Yet somehow, despite all of this, the WHO doesn't perceive a "downward trend." Is it disregarding data in favour of feeling chicken entrails?

While we're at it, whatever became of the WHO's "pandemic" anyway? Until swine flu trotted in, pandemics were far deadlier than the yearly outbreaks of seasonal flu. Since seasonal flu ordinarily strikes all parts of the world, what other distinguishing feature should a flu pandemic have other than severity?

Yet swine flu, according to CDC estimates, is killing Americans at a rate that is one-third to one-12th that of seasonal flu. And that estimate is almost certainly too high. French figures, for example, are far lower as are those collected by New York City.

Every year in this country, 2,000 to 8,000 people die of flu, according to Health Canada. Swine flu, conversely, in the almost eight months since the outbreak began, has killed merely 138. Worldwide, WHO figures show fewer swine flu deaths in eight months than seasonal flu deaths every two weeks.

The WHO has been dishonest about swine flu from the very beginning. It's used its phony pandemic to cover up its five-year scarefest over an avian flu pandemic that never came, to feed at the trough of greater power and a fatter budget, and even to call for redistribution of international wealth on the basis of values "like community, solidarity, equity and social justice," in the words of its director.

There's no motivation for the WHO to suddenly use that ubiquitous hand disinfectant and come clean.

A concerned Australian journalist,

Medical Martial Law possible with New Public Health Bill in South Australia

Infowars, 4 December 2009

https://web.archive.org/web/20100102033305/http://theflucase.com/index.php?option=com_content&view=article&id=2190%3Amedical-martial-law-possible-with-new-public-health-bill-in-south-australia&catid=1%3Alatest-news&Itemid=64&lang=en

South Australia has proposed controversial new legislation, in an unprecedented move to legalize forced medicine, civil libertarians say. Under the guise of public health, the South Australian Health Minister John Hill has introduced the South Australian Public Health Bill 2009 into state Parliament. It is feared the Bill will authorize a massively expanded new public health department – in addition to the already existing one – which will wield authoritarian powers that threaten to radically change current medical practice and leave wide spread human and civil rights violations in its wake.

The state has extensive public health statutes already in place allowing the health department wide powers in case of public health risks such as epidemics, but the new Bill harmonizes with the World Health Organizations' International Health Regulations to which Australia is a signatory. The Bill introduces the new disease category of 'controlled infectious diseases', which allows authorities unprecedented powers over persons even suspected of having an infectious disease. The Bill's explanatory paper states; [The Bill] Provides for a clear scheme for the management and control of persons with controlled infectious disease … [it] provides for a compulsory scheme of clinical examination, counseling, direction, treatment orders and detention or isolation orders.

This means health department authorities can forcibly test, examine, counsel, treat, detain, or isolate anyone suffering of any disease or anyone suspected of having a disease.

Incredibly, the Bill also claims powers over those with chronic non-infectious diseases. Clause 57 allows the health minister to declare non-infectious diseases such as cancer, diabetes, obesity, and vascular problems – a public health risk. Clause 58 allows the health department to set down a 'code of practice' which impose standardized medical treatment protocols for each condition, requiring doctors to prescribe only the official drugs and treatments approved by the government. The code of practice includes government control of health information given to the public. Those in the allied health industry fear the law could restrict or end independent sources of health information, complementary medicines, health product network marketing and a choice in doctors. Consumer groups fear the Bill has the power to end health choices while reducing doctors to prescribing standardized treatments. One watchdog group spokesman said he believed the Bill gave drug companies an open door to persuade health departments to mandate their products while stifling independent information.

Libertarian groups have expressed concern about the coercive nature of the Bill. Clause 59 deals with notifiable conditions. Currently, any person seeking treatment for a sexually transmitted disease, or a childhood disease such as measles or mumps, or a simple case of the flu must be reported to the health department. Clause 60 of the Public Health Bill, imposes $10,000 fines on doctors, pathologists and labs for failing to report a case of flu or any other notifiable disease within 3 days of even 'forming a suspicion' that a person has the disease. Under the new law, the health department has the power to request any confidential information about patients, which doctors must supply on threat of a hefty fine. A special clause protects doctors from any breach of patient confidentiality or ethical breaches in case patients complain about their medical information being passed on to various government departments. The new Bill ensures the public will not be able to access public

health department information through the Freedom of Information Act 1991. Critics say this makes the health department entirely non-transparent and non-accountable to the public. The clause also expands the list of notifiable diseases to 'notifiable micro-organisms', meaning the minister can declare any disease-causing micro-organism a notifiable disease, including future, as yet unidentified new germs. Once the minister declares a micro-organism to be notifiable, Clause 64 allows the health department to seize vehicles or other belongings and impose quarantine on persons or entire regions.

While many would regard these powers reasonable and necessary to contain serious plagues, critics claim that Clause 65 widens these powers into all other non-infectious conditions. The Bill's explanatory paper states that under Clause 65: A disease or medical condition can be declared to be a controlled notifiable disease or medical condition by regulation. In the interests of public health in urgent circumstances, the Minister can declare a disease or med ical condition a controlled notifiable disease…

This means health department officials can force persons with conditions such as obesity, high blood pressure, or cancer to undergo a medical examination and testing followed by forced treatments, and detention. Clause 70 gives the government power to force 'counseling' and 'education' or; other activities that help a person understand the implications of a controlled notifiable disease if a person has failed to participate in a relevant counseling activity despite being given a reasonable opportunity to do so'. Clause 71 gives the health department power to force persons, among other things to; reside at a certain place, to not visit specified places, to not associate with specified persons or classes of persons, to attend specified meetings and provide reasonably required information, to be under the supervision of a person nominated by the Chief Public Health Officer.

With already wide-ranging control over all diseases and conditions, the Bill gives the health department additional power to automatically override all parental consent. At the same time, large populations can be controlled through Clauses 4-6 setting out requirements for 'population monitoring' and other 'systemic measures' requiring local councils to regularly report to the health department about persons alleged or even suspected of causing health risks. Once enacted, no one will be able to avoid the legislation – even when dead. Clause 78 permits the government to carry out any procedure or tests on dead people, despite any objections from the relatives.

The Bill has extra clout with its substantial fines ranging from $60,000 to $1 million and 10 years' jail for those who do not comply with the tough new health measures.

Some have hailed the Bill as a welcome reform to public health. The South Australian health minister, John Hill writes in the Bill's explanatory paper, 'This Bill, if passed, will provide South Australia with forward looking legislation for public health that meets international standards. It will provide for systematic approaches to prevention and health promotion and stronger, more robust powers for protecting public health and for dealing with public health emergencies. It also enables South Australia to meet and respond to the public health challenges that will confront us in the 21st Century.' Meanwhile, Australian Medical Association State President, Dr Andrew Lavender said he approved of the changes, claiming they were important to protect the public.

The only politician opposing the Bill so far has been opposition health spokesman Duncan McFetridge. 'It's bordering on nanny-state legislation,' he said. 'It's understandable, but how far do we go?'

Since the Bill was introduced into the SA state Parliament, it has caused a furor among health care advocates who fear it could spell the end of health choices, undermine the public's trust in doctors, and usher in the end of democracy in the State of South Australia.

Bloomberg

Jason Gale

WHO Defends Flu Response Amid Exaggeration Claims

Bloomberg, 4 December 2009, 06:00
http://www.bloomberg.com/apps/news?pid=20601203&sid=anDw8Gp5w4eA

Dec. 4 (Bloomberg) – The World Health Organization, facing criticism that it exaggerated the threat of swine flu, said it's too soon to decide whether the pandemic is more or less deadly than seasonal flu and comparing death rates may be misleading.

Mortality from the new H1N1 strain is "unquestionably higher" than the death toll reported by national authorities, the Geneva-based agency said in a report seen by Bloomberg News before its scheduled publication today. Deaths totaled more than 7,820 as of Nov. 22, said WHO, which estimates as many as 500,000 people die each year from seasonal strains.

Health authorities worldwide are assessing whether their response to swine flu is justified by its threat as cases of flu-like illness retreat in the U.S. and U.K. While a majority of patients recover within days and reported fatalities are a fraction of the seasonal flu toll, these figures mask the full impact of swine flu on society, WHO said.

"Compared with seasonal influenza, the H1N1 virus affects a much younger age group in all categories – those most frequently infected, hospitalized, requiring intensive care, and dying," WHO said in the report.

In Australia, about 3,000 people aged 50 or older die from seasonal flu each year, according to statistical modeling. Officials counted 190 deaths associated with confirmed swine flu, Jim Bishop, the nation's chief medical officer, said last week in a report in the New England Journal of Medicine.

Younger Victims

The median age of patients who died was 53, compared with 83 in seasonal epidemics, and the number of patients treated in intensive care units for viral pneumonia was about 14 times greater than normal, Bishop said in a telephone interview from Canberra today.

"It's a different type of virus affecting younger people and putting more people into hospital and ICU," he said. "It's not attacking older people in nursing homes."

The pandemic's impact is better gauged by the number of life-years lost because of the younger age of victims compared with seasonal flu, said Michael Osterholm, director of the University of Minnesota's Center for Infectious Disease Research and Policy in Minneapolis.

"If you look at years of personal life lost, it's much higher, and that's the point we have to get across," Osterholm said in a telephone interview today. "A death in an otherwise healthy 24-year-old, to me, is a major defeat for society."

Pregnant Women

Of those infected worldwide, 1 percent to 10 percent have required hospitalization and as many as a quarter of those patients have needed intensive care, WHO said today in the Weekly Epidemiological Record newsletter. Pregnant women have a 10 times higher likelihood of requiring admission to an ICU compared with the general population, and at least 1 in 14 of all hospitalized cases are women in their second or third trimester of pregnancy, it said.

Bishop said WHO's decision to declare swine flu a pandemic in June helped guide the nation's response, which he said was "proportionate and relevant."

The United Nations agency moved to the top level of its pandemic alert following advice from a group of scientists and health officials who may have ties to the pharmaceutical industry, Sweden's Svenska Dagbladet newspaper said last week, citing reports in Danish newspaper Information and the journal Science. WHO spokesman Gregory Hartl told the newspaper that the decision to declare a pandemic was made by Director General Margaret Chan alone.

'Machine Grinding'

In July, epidemiologist Tom Jefferson told Germany's Der Spiegel that WHO, public health officials, virologists and pharmaceutical companies may have had ulterior motives in promoting the pandemic threat.

"They've built this machine around the impending pandemic," Jefferson was quoted as saying.

"There's a lot of money involved, and influence, and careers, and entire institutions," he said. "All it took was one of these influenza viruses to mutate to start the machine grinding."

Public perceptions about the pandemic and national preparedness plans have been influenced since 2004 by the threat of bird flu, "widely regarded as the virus most likely to ignite the next influenza pandemic," WHO said in a statement yesterday. The H5N1 strain of avian influenza killed 59 percent of the 444 people known to have been infected, according to WHO.

Adjusting Perceptions

"Adjusting public perceptions to suit a far less lethal virus has been problematic," WHO said. "Given the discrepancy between what was expected and what has happened, a search for ulterior motives on the part of WHO and its scientific advisers is understandable, though without justification."

Since April, at least 622,482 people have been infected with the virus in more than 207 countries and territories, according to WHO.

Swine flu infections and deaths reported to WHO are based on laboratory confirmed tests rather than mathematical modeling used to estimate fatalities from seasonal flu, the agency said.

"With the current pandemic, we really have data which is almost an anomaly, when we look at how influenza has been counted in the past," Keiji Fukuda, WHO's special adviser on pandemic influenza, told reporters on a conference call from London yesterday. "People do not typically count influenza deaths on a one-by-one basis. And so, we do not have a lot of data on laboratory-confirmed deaths for seasonal influenza."

Accurate assessments of deaths and mortality rates will probably be possible only one to two years after the pandemic has peaked, WHO said.

"What we're doing is reporting on the final score and we're only at half time," said Osterholm at the University of Minnesota. "We have no clue what's going to happen in the next three to six months."

MONTREAL GAZETTE

H1N1 pandemic ending with a whimper, not a bang

Montreal Gazette, 4 December 2009
https://web.archive.org/web/20100108093941/http://www.montrealgazette.com/health/H1N1+pandemic+ending+with+whimper+bang/2304630/story.html

With H1N1 poised to enter history as the least deadly of four global flu pandemics, some experts are calling for an end to Canada's mass vaccination program.

Nature is already achieving what we would hope to achieve by vaccinating, they say.

H1N1's "reproductive number" – the number of people each infected person passes the virus to – was above one when the epidemic began, which led to the explosive initial increase in cases.

Now it is less than one, because many people have become immune, and each old case is making less than one new case. When the reproductive number falls below one, the epidemic can't sustain itself, and fades away.

The drop in cases suggests Canada has hit the critical fraction of the population that needs to be vaccinated to control the pandemic, says Dr. David Fisman, a University of Toronto expert in infectious disease dynamics.

Fisman can't understand the rational for continuing mass vaccinations. He said that for a virus as contagious as H1N1, fewer than 30 per cent of the population needed vaccination to reach a critical level of immunity.

"I'm sure that the vaccine has prevented some deaths. I'm sure that there are people who are alive right now who would not have been alive if we hadn't vaccinated," he says. But the pandemic was already peaking, and then subsiding before the vaccination was rolling out in force.

"That's nobody's fault, that's just how long it took to make a vaccine against a brand new virus. Those were the cards we were dealt," says Fisman, an associate professor of infectious diseases epidemiology at the University of Toronto's Dalla Lana School of Public Health.

Despite that view, Canada's top doctor this week pleaded with Canadians to get vaccinated if they have not already done so. Chief public health officer David Butler-Jones said that, while 30 per cent of the population is now immune to H1N1, either because they have been vaccinated or because they have already been infected, "millions" of people are still at risk of infection.

Someone vaccinated today may be protected against infection two weeks from now, "if there is still enough of (H1N1) kicking around," Fisman says. But the benefit diminishes the further into the future we go, and he says other public health programs have suffered as staff and resources were redeployed to the H1N1 campaign. In some jurisdictions, breastfeeding support programs, sexually transmitted diseases clinics and other usual activities were cancelled or postponed as public health was forced to bear the brunt of delivering the largest immunization program in Canada's history.

"At this point, in terms of saying everybody must get vaccinated because there is a pandemic abroad, it's kind of done," Fisman says.

H1N1 will likely die out with a death rate lower than that for regular seasonal flu.

Harvard University infectious disease expert Marc Lipsitch is pegging H1N1's case fatality rate – the proportion of people infected with a disease who die of it – at less than 0.1 per cent, placing human swine flu in a category 1 pandemic, the lowest level of severity for a worldwide disease outbreak. Swine flu's case fatality rate is less than what was seen for the three worldwide flu outbreaks in the 20th century: 1918, 1957 and 1968.

Unless the virus mutates, and there is no strong sign H1N1 is becoming noticeably different, "it's almost certainly going to be the mildest of the four (pandemics) that we have good data on," says Lipsitch, a professor of epidemiology at the Harvard School of Public Health.

When the World Health Organization declared the pandemic in June, officials warned the rogue virus threatened all of humanity. The reality is so far proving strikingly different from what was expected.

The world agency, and Canada, had done their pandemic planning with a different flu virus in mind. They spent five years watching H5N1, or "bird flu," which kills up to 60 per cent of those it infects.

We got off lucky when the real pandemic hit, WHO says, but the public doesn't always understand that.

"Adjusting public perceptions to suit a far less lethal virus has been problematic," WHO said in a statement Thursday, issued in response to media reports that ties with the drug industry among expert advisers may have influenced WHO's policy decisions related to H1N1.

"Given the discrepancy between what was expected and what has happened, a search for ulterior motives on the part of WHO and its scientific advisers is understandable, though without justification.

"WHO has consistently assessed the impact of the current influenza pandemic as moderate. WHO has consistently reminded the medical community, public and the media that the overwhelming majority of patients experience mild influenza-like illness and recover fully within a week, even without any form of medical treatment."

But some critics say WHO set itself up for blame.

"They had been talking for years about the possibility of some kind of reprise of the 1918 pandemic," says Philip Alcabes, author of Dread: How Fear and Fantasy Have Fueled Epidemics from the Black Death to the Avian Flu. "A huge amount of money and person power was devoted to preparing" for the next outbreak, he says.

But, "there was never any evidence, not from Day 1, and not anytime since, that this strain of flu was going to be a particularly dangerous strain, either in terms of its capacity to make people sick or its capacity to kill people," says Alcabes, associate professor in urban public health at Hunter College's School of Health Sciences in the City University of New York.

"Yet that's the story that's always been told, almost every single day since it appeared in April. 'We don't know what's going to happen.' Essentially, 'the sky might fall.'"

Lipsitch, of Harvard, says that when the first reports were coming out of Mexico, the case fatality rate estimates were as high as four per cent, which is twice the rate for the 1918 Spanish flu.

"If you don't know how bad your enemy is, you plan as if it's bad, and you hope that you're over-planning. In this case, that's exactly what was done," he says.

"I think the response has been appropriate for what we knew at each stage, but what we know has changed, because the data gets better."

Sarkozy annonce la création de milices de quartier

Unis Face au Vaccin, 4 Décembre 2009, 12:03
https://web.archive.org/web/20100102050555/http://www.unisfaceauvaccin.org/actualites/campagnes-de-vaccination/366-sarkozy-annonce-la-creation-de-milices-de-quartier-.html

La grippe s’avérant bénigne, on prépare toujours davantage l’état d’urgence, que l’on considère semble-t-il comme une étape obligée.

Dans la perspective des élections régionales de mars prochain, Nicolas Sarkozy s’est rendu en Seine-Saint-Denis, mardi 24 novembre, pour remettre le thème de l’insécurité sur le devant de la scène. Un passage de son discours est passé à peu près inaperçu: Jean-Luc Mélenchon invité de France Inter dimanche soir, l’a mis en évidence. Le Président de la République n’a rien annoncé de moins que la création de milices citoyennes pour assurer le maintien de l’ordre:

«Des réservistes expérimentés seront recrutés comme délégués à la cohésion police-population. Ils s’appuieront sur des "volontaires citoyens de la police nationale", c’est à dire des habitants dont je veux engager le recrutement pour qu’ils s’impliquent dans la sécurité de leur propre quartier».

Mélenchon a repris l’information dans son blog; voici son article:
"*Action Urgent: Refuser La Creation des Milices Sarkochiourmes*

Ce soir sur France inter, dans l’émission de Pierre Weill, "c’est demain la veille" j’ai évoqué un fait à propos du contenu du discours de Nicolas Sarkozy sur la sécurité en banlieue qui a fait figure de révélation comme l’a souligné Jean-Marie Colombani présent sur le plateau. Je recommence donc ici, sur ce blog, pour que la nouvelle ne reste pas confinée. Comment se fait-il qu’aucun média ne l’ai relevé? Peut être parce que Nicolas Sarkozy fait tellement de discours que leur contenu n’est plus étudié par personne. Nous allons voir combien de temps il faudra pour que le sujet que je soulève vienne en débat dans les médias. Je rappelle en résumé le contexte:

Le 24 novembre Sarkozy s’est rendu à Bobigny, Epinay (93) et Le Perreux (94) annonçant que «ça va beaucoup bouger sur la sécurité» avec «un plan anti-drogue, un développement accru de la vidéosurveillance, et de nouveaux moyens d’enquête pour la police.» Etrange déjà de voir quelqu’un en 1ère ligne et en responsabilité sur la sécurité depuis plus de 7 ans, depuis son accession au ministère de l’intérieur en 2002, affirmé qu’il faut faire bouger beaucoup de chose dans son domaine d’action prioritaire. Passons. Mais une annonce qu’il a faite, énorme, est passée totalement inaperçue. Lisez cet extrait de son discours: «Des réservistes expérimentés seront recrutés comme délégués à la cohésion police-population.

Ils s’appuieront sur des "volontaires citoyens de la police nationale", c’est à dire des habitants dont je veux engager le recrutement pour qu’ils s’impliquent dans la sécurité de leur propre quartier». Ainsi il s’agit là du système expérimenté par Silvio Berlusconi en Italie et que l’on appelle «les chemises jaunes » du nom de la couleur de la chemise de ces miliciens. Ainsi Nicolas Sarkozy a l’ intention de faire des milices et personne ne dit rien ? Avez-vous bien lu? Dans votre quartier, certains habitants du quartier auront des fonctions de police dans le quartier lui-même.

Qui peut être d’accord avec ça? Imaginez-vous concrètement ce que cela veut dire de pouvoir exorbitants accordé à ces personnes? Il faut rapidement que nos parlementaires et nos élus locaux s’opposent à cette absurdité. Les milices locales sont la fin du maintien de l’ordre républicain. Aucune des imperfections et lacunes béantes de ce dernier ne justifie que l’on régresse à cette logique milicienne qui va déclencher des abus prévisibles et des inquisitions intolérables dans un pays libre."

THE FLU CASE

French President announces creation of Paramility groups

The Flu Case, 5 December 2009, 14:46

https://web.archive.org/web/20100102050555/http://theflucase.com/index.php?option=com_content&view=article&id=2187%3Afrench-president-announces-creation-of-paramility-groups&catid=41%3Ahighlighted-news&Itemid=105&lang=en

French President Nicolas Sarokozy has announced plans to form paramilitary groups to patrol parts of cities, the "banlieu", where large numbers of immigrants live, in a move that has disturbing echoes of Fascist Europe in the 1930s.

Private "citizen" paramilitary groups are supposed to keep "law and order" in the banlieue. But the decision to set them up ahead of the up ahead of up-coming regional elections will spark fears that will be employed to intimidate political opponents.

Allowing an uregulated armed force to patrol high rise ghettos, blighted by unemployment and poverty and where the residents are disadvanatged by systematic racism, is also sure to create an atrmosphere of intimidation and violence and could ignite large scale social unrest.

The increasingly unpopular Sarkozy and his globalist backers might well, however, be hoping to hang onto power by using the divide and rule tactic.

Funding private armies will drag France down into a spiral of violence, deflecting attention from their financial and other crimes, such as the use of toxic vaccines in vaccination centers.

Shooting protestors is also permitted under the Lisbon Treaty, which came into force on December 1st, and which put Europe under a quasi dictatorship by means of the use of the manipulation of the election process.

As a result of this fraudulent treaty, an EU police force is theoretically allowed to arrest anyone without even having to a reason to the local police, putting their operations outside the law.

However, the Lisbon Treaty has itself no basis in law.

The Nazi German Judges Trail of 1947 ruled that judges and lawyers who assisted the Nazi government in stripping people of their constitutional rights so that they have little or no legal security against the arbitary and brutal violence of state organs are guilty of a crime, specifically of abusing of the judicial and penal process.

The Nuremberg Trial of 1947 also ruled lawyers and judges who had not activity promote Nazi lynch justice and state – organised terror were also guilty on the grounds that their decision to continue in office lent credibility to what had become a criminal justice system.

The same ruling applies to the EU and the Lisbon Treaty and any judge who attempts to enforce its provisions.

An EU law criminalising legitimate reporting of EU crimes is itself an obvious crime.

Europe's drug regulator, the EMEA – two-thirds funded by the pharmaceutical industry – allowed uintested and dangerous "swine flu" vaccines to be approved on the market, but now you can be arrested by the EU police for pointing these facts out.

But this is just one example how the EU is being used as front to further the agenda of an international corporate crime syndicate.

This totalitarian EU structure allowing paramilitary groups and organised corporate funded crime to flourish must be dismantled and the people of Europe need to return to democracy and the rule of law as soon as possible.

Polskaweb News

Tötet der H1N1- Impfstoff?
Russland droht WHO

PolskaWeb News, 5 December 2009
https://web.archive.org/web/20091215032125/http://polskaweb.eu/index2.php?option=com_content&task=view&id=3013&pop=1&page=0&Itemid=419

Russland fordert Untersuchung wegen Korruptionsverdacht bei WHO Berlin - Jeder ist in erster Linie für seine Gesundheit selbst verantwortlich, doch viele Menschen sind gezwungen diese Verantwortung auch für andere zu übernehmen. Kinder oder ältere Leute zum Beispiel die nicht selbst entscheiden können oder wollen sind somit ihren Erziehungsberechtigten oder einem Arzt voll ausgeliefert, wenn es um die möglicherweise tödlichen Folgen von Impfungen gegen den Schweinegrippe- Virus (H1N1) geht. Wir warnen diesbezüglich dringendst vor übereilten Entscheidungen für sich und andere, denn die bis jetzt bekannten Grippemittel scheinen weder sicher noch hilfreich zu sein und ihre Hersteller stehen international bereits unter Korruptionsverdacht. Heute sind wieder Menschen in Deutschland nach Impfungen mit Pandemrix gestorben, ebenso in Italien und Slowenien und wahrscheinlich auch vielen anderen Ländern. In Dänemark, Holland, Russland und Polen ermitteln Journalisten und Politiker bereits gegen mögliche Verantwortliche einer nicht mehr auszuschliessenden gigantischen Verschwörung und Korruption.

Warnung vor Behörden, Instituten und Medien

Meldungen der Weltgesundheitsorganisation WHO, Gesundheitsämtern, Einrichtungen wie dem Robert-Koch- und Paul-Ehrlich-Institut sowie Medien wie z.B. Bild-Zeitung, Welt, Focus, Rheinische Post und selbst der ARD- Tageschau sollten Sie nicht blind vertrauen, denn durch ihre anhaltende Panikmache bez. der dubiosen Schweingrippe, stehen sie gleichfalls unter Verdacht Gelder von den Produzenten der Impfstoffe erhalten zu haben. Es ist definitv gelogen, dass Impfstoffe knapp seien und es deshalb Wartelisten gebe, die Impfung gegen Schweinegrippe völlig harmlos sei und die Grippe dagegen gefährlich. Es ist sogar nicht auszuschliessen, dass in Deutschland bereits mehr Menschen durch Impfungen starben als an den Folgen einer dubiosen Schweinegrippe. Die großen Pharma-Produzenten pflegen nur ca. 11 Prozent ihres Umsatzes in die Forschung zu stecken, aber 37 % in die PR für ihre Produkte. Selbst Milliarden Bestechungsgelder könnten somit bereits geflossen sein.

Drohungen aus Russland gegen die WHO

Während in Russland die Ausbreitung einer Grippeepidemie bereits unter Kontrolle der Gesundheitsbehörden zu sein scheint und die Zahlen der Erkrankten zurückgehen, sind jetzt auch hier die WHO und die Pharmaindustrie unter Korruptionsverdacht geraten. Beide versuchen schon seit Monaten gemeinsam, mittels "druckvollen Empfehlungen", Moskau zum Kauf des Anti-Virus-Präparates Tamiflu des schweizer Arzneimittelherstellers "Roche" zu bringen. Die russische Regierung hat aber, ebenso wie schon früher die polnische Gesundheitsministerin Kopacz, Bedenken gegen die angebliche Gefahr der Schweinegrippe geäussert und alle diesbezüglichen Gegenmittel folgerichtig in Frage gestellt.

Russland fordert internationale Untersuchung

Der Dumaabgeordnete und Vorsitzende des russischen Gesundheitsausschusses Igor Barinow hat den ständigen Vertreter Russlands bei der WHO angewiesen, Ermittlungen in Zusammenhang mit den sich mehrenden Korruptionsvorwürfen gegen die Organisation und der Pharmaindustrie anzustellen. "Es gibt schwerwiegende Vorwürfe wegen Korruption innerhalb der WHO. Eine internationale Untersuchung hierzu ist unabdinglich. Wir haben bereits 4 Milliarden Rubel im Kampf gegen die neue Grippe ausgegeben, dieses Geld hätte für wesentlich dringlichere Probleme ausgegeben werden können. Wenn sich derartige Vorwürfe von Verschwörung und Korruption bestätigen, könnte dies auch einen Austritt Russlands aus der WHO bedeuten" - sagte Barinow am Freitag und fügte hinzu, dass niemand an der Stichhaltigkeit der WHO im Kampf gegen Malaria, Pocken und HIV im zwanzigsten Jahrhundert zweifele, doch jetzt aber müsse geklärt werden, ob die Organisation selbst nicht mit Korrupten Subjekten infiziert sei.

"Polskaweb News" macht die Welt schon seit Monaten auf Ungereimtheiten um die Schweinegrippe aufmerksam. Leider werden die Behörden aber wieder erst reagieren wenn den Tätern ausreichend Zeit gelassen wurde, ihre Verbrechen zu verschleiern und Beweise zu vernichten. Lesen Sie hier mehr über die dubiosen Ereignisse um die angebliche tödliche Seuche (Bild-Zeitung).

Uusi Suomi Blogit

Riikka Söyring

An open letter to all members of the WMA, World Medical Association, and healthcare personnel all over the world

Uusi Suomi, 6 December 2009

https://puheenvuoro.uusisuomi.fi/riikkasoyring/24669-an-open-letter-to-all-members-of-the-wma-world-medical-association-and-healthcare-personnel-all-over-the-world/

My name is Riikka Söyring.
I am from Finland.
I write to you as I think it is necessary to share this information about the swineflu and vaccinations.

A couple of days ago there was "news" in the paper that STM (finnish Social- and Health Ministry) is monitoring chats, blogs and netforums to keep a track of discussions concerning Swineflu.

Hospital personnel has told us -anonymously- that THL (finnish Health- and Wellbeing-department) has forbidden to keep a register of the symptoms people get after vaccination and the dead are neither to be registered.

Private clinics are forbidden by THL to take Swineflutests.

How can it be said that we have a pandemic going on if it is not followed with records?
How does this fits in with democracy, transparency and the spirit of the WMA declaration of Helsinki?

It does not, in my humble opinion.
It is a breach of a Constitution in many countries.

I personally have contacted the finnish health-committee, MEPs, Chancelor of Justice, Ministers but I am not getting any answers. Not even one. I have contacted Transparency Finland, I have contacted media. No answers.

I have seen a document GlaxoSmithKline demands it´s employees to undersign. By signing it they release GSK from the responsibility of the all harmfull effects this Pandemrix might cause them.

We suspect that Pandemrix is a nanovaccine. They are not patented, licensed, tested yet. If this is so, it is extremely dangerous for pregnant women as it causes irreversible changes in the mitochondryo of the phoetus.

There is a person who is demanding in the court that THL submit the papers revealing the real substance of Pandemrix. So far they have refused to do so.

I ´ll enclose a link, it´s a graphic so that even if you do not understand the language you´ll understand the names (some familiar among them…) and euro-marks

here´s the link http://www.svd.se/nyheter/utrikes/artikel_3866223.svd?service=graphic

Juhani Eskola and Pekka Puska, chief of finnish THL, both do get money from BigPharma. There are others too in the THL. Also, Terhi Kilpi from THL, actually admits that this H1N1-vaccine was, and is, untested and therefore I conclude that this vaccination-campaign because of "pandemy" was, and is, a large scale test of the vaccine on humans.

http://www.infosota.fi/2009/11/17/terveyden-ja-hyvinvoinnin-laitos-hallinto-oikeuteen-salaisten-h1n1-sopimuspaperien-takia/

Pekka Puska undersigned, as a head of THL, also his acceptance to a law that would allow minors to be used in medical experiments with their own consent only; no written agreement is needed after/if this law passes, no consent of the parents.

The pharmaseutical companies are to have no responsibility of the side-effects or deaths which may result of these medical experiments if this law passes.

I suggest that everyone now, immediately, checks if a law similar to this is on a round and waiting to be accepted in your country.

We are communicating with Sweden also and they tell us that the media in Sweden ignores information about the Swineflu and vaccines as if they were told to do so. Netherland confirms that Pandemrix is a nanovaccine:

"Our gouverment has declared they will shut down web-site's about the true information about the vaccine and the flu. Today our minister of health told about theire interactions on blog's and forum's; so they'll know how the opnions are. We are aware of that, so we have to be carefull. I can confirm that Pandemrix is a nano-vaccine.

We are still in court with our minister of health, to give the information about the ingredients in the vaccine. Further more; our advisor of our health minister is Ab Osterhaus who has 13 side-jobs in the farmaceutical industry. Read this:

WHO announced the swine flu pandemic under pressure from a panel of advisers, headed by a Dutch doctor, Albert Osterhaus, nicknamed 'Dr. Flu' (from the name 'Tamiflu') because he was active in promoting mass vaccination of the population through WHO and the Western media.

Ever since I've been investigating the HPV-vaccine's I'm no longer on the gouverment mail-list. They've blocked me.

I have daily information about so many terrible affects of this vaccine. Woman who miscarriage, GBS.

We know now, since the vaccinations took place a week ago at least 7 people died. We only know that by internet -sources. Our media is absolutely quiet about that.

*I have proof that our so called Health Commite, lie's about the people who'll have this flu-shot. People were stuck in lines for TV as if they were all there for a Mex. flu-shot. In fact, it was a shot of people in line for a sale and had nothing to do with the Mex. flu shot. They've announced special openings in the weekend, because of the overwhelming amount of people standing in line for the Mex. flu sho*t."

I have a report from Germany. Vaccine was analyzed and found containing particles that do not belong into them. Same in Belgium.

Vaccines could be used as a bioterrosrism weapon. It is against this
http://ec.europa.eu/social/BlobServlet?docId=3852&langId=en
I am thinking about how a 72 kg of Avian flu-medication got mysteriously contaminated.
The afore mentioned portion was made by Baxter Biopharma, a company with a biosafetylevel3.
